- bool operator!= (const istream_iterator &__x, const istream_iterator &__y)
- bool operator== (const istream_iterator &__x, const istream_iterator &__y)

4.660.1 Detailed Description

template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>, typename _Dist = ptrdiff_t>
class std::istream_iterator< _Tp, _CharT, _Traits, _Dist >

Provides input iterator semantics for streams.
Definition at line 49 of file stream_iterator.h.

4.660.2 Member Typedef Documentation

4.660.2.1 difference_type `typedef ptrdiff_t std::iterator< input_iterator_tag , _Tp, ptrdiff_t , const _Tp * , const _Tp & >::difference_type [inherited]`

Distance between iterators is represented as this type.
Definition at line 134 of file stl_iterator_base_types.h.

4.660.2.2 iterator_category `typedef input_iterator_tag std::iterator< input_iterator_tag , _Tp, ptrdiff_t , const _Tp * , const _Tp & >::iterator_category [inherited]`

One of the tag types.
Definition at line 130 of file stl_iterator_base_types.h.

4.660.2.3 pointer

```
typedef const _Tp * std::iterator< input_iterator_tag , _Tp, ptrdiff_t , const
_Tp * , const _Tp & >::pointer [inherited]
```

This type represents a pointer-to-value_type.
Definition at line 136 of file stl_iterator_base_types.h.

4.660.2.4 reference

```
typedef const _Tp & std::iterator< input_iterator_tag , _Tp, ptrdiff_t , const
_Tp * , const _Tp & >::reference [inherited]
```

This type represents a reference-to-value_type.
Definition at line 138 of file stl_iterator_base_types.h.

4.660.2.5 value_type

```
typedef _Tp std::iterator< input_iterator_tag , _Tp, ptrdiff_t , const _Tp *
, const _Tp & >::value_type [inherited]
```

The type "pointed to" by the iterator.
Definition at line 132 of file stl_iterator_base_types.h.

4.660.3 Constructor & Destructor Documentation

4.660.3.1 istream_iterator() [1/2]

```
template<typename _Tp , typename _CharT = char, typename _Traits
= char_traits<_CharT>, typename _Dist = ptrdiff_t>
constexpr std::istream_iterator< _Tp, _CharT, _Traits, _Dist >::istream_iterator ( ) [inline],
[constexpr]
```

Construct end of input stream iterator.
Definition at line 67 of file stream_iterator.h.

4.660.3.2 istream_iterator() [2/2]

```
template<typename _Tp , typename _CharT = char, typename _Traits
= char_traits<_CharT>, typename _Dist = ptrdiff_t>
std::istream_iterator< _Tp, _CharT, _Traits, _Dist >::istream_iterator (
            istream_type & __s ) [inline]
```

Construct start of input stream iterator.
Definition at line 71 of file stream_iterator.h.

4.660.4 Friends And Related Function Documentation

4.660.4.1 operator"!=

```
template<typename _Tp , typename _CharT = char, typename _Traits = char_↩
traits<_CharT>, typename _Dist = ptrdiff_t>
bool operator!= (
            const istream_iterator< _Tp, _CharT, _Traits, _Dist > & __x,
            const istream_iterator< _Tp, _CharT, _Traits, _Dist > & __y ) [friend]
```

Return true if the iterators refer to different streams, or if one is at end-of-stream and the other is not.
Definition at line 153 of file stream_iterator.h.

4.660.4.2 operator==

```
template<typename _Tp , typename _CharT = char, typename _Traits = char_↩
traits<_CharT>, typename _Dist = ptrdiff_t>
bool operator== (
```

```
const istream_iterator< _Tp, _CharT, _Traits, _Dist > & __x,
const istream_iterator< _Tp, _CharT, _Traits, _Dist > & __y )  [friend]
```

Return true if the iterators refer to the same stream, or are both at end-of-stream.
Definition at line 147 of file stream_iterator.h.
The documentation for this class was generated from the following file:

- stream_iterator.h

4.661 std::istreambuf_iterator< _CharT, _Traits > Class Template Reference

Inheritance diagram for std::istreambuf_iterator< _CharT, _Traits >:

4.661.1 Detailed Description

template<typename _CharT, typename _Traits>
class std::istreambuf_iterator< _CharT, _Traits >

Provides input iterator semantics for streambufs.
Definition at line 50 of file streambuf_iterator.h.

4.661.2 Member Typedef Documentation

4.661.2.1 char_type

```
template<typename _CharT , typename _Traits >
typedef _CharT std::istreambuf_iterator< _CharT, _Traits >::char_type
```

Public typedefs.
Definition at line 66 of file streambuf_iterator.h.

4.661.2.2 difference_type

```
typedef _Traits::off_type std::iterator< input_iterator_tag , _CharT ,
_Traits::off_type , _CharT * , _CharT >::difference_type [inherited]
```

Distance between iterators is represented as this type.
Definition at line 134 of file stl_iterator_base_types.h.

4.661.2.3 int_type

```
template<typename _CharT , typename _Traits >
typedef _Traits::int_type std::istreambuf_iterator< _CharT, _Traits >::int_type
```

Public typedefs.
Definition at line 68 of file streambuf_iterator.h.

4.661.2.4 istream_type

```
template<typename _CharT , typename _Traits >
typedef basic_istream<_CharT, _Traits> std::istreambuf_iterator< _CharT, _Traits >::istream_type
```

Public typedefs.
Definition at line 70 of file streambuf_iterator.h.

4.661.2.5 iterator_category

```
typedef input_iterator_tag std::iterator< input_iterator_tag , _CharT ,
_Traits::off_type , _CharT * , _CharT >::iterator_category [inherited]
```

One of the tag types.
Definition at line 130 of file stl_iterator_base_types.h.

4.661.2.6 pointer

```
typedef _CharT * std::iterator< input_iterator_tag , _CharT , _Traits::off_type
, _CharT * , _CharT >::pointer [inherited]
```

This type represents a pointer-to-value_type.
Definition at line 136 of file stl_iterator_base_types.h.

4.661.2.7 reference

```
typedef _CharT std::iterator< input_iterator_tag , _CharT , _Traits::off_type
, _CharT * , _CharT >::reference [inherited]
```

This type represents a reference-to-value_type.
Definition at line 138 of file stl_iterator_base_types.h.

4.661.2.8 streambuf_type

```
template<typename _CharT , typename _Traits >
typedef basic_streambuf<_CharT, _Traits> std::istreambuf_iterator< _CharT, _Traits >::streambuf_type
```

Public typedefs.
Definition at line 69 of file streambuf_iterator.h.

4.661.2.9 traits_type

```
template<typename _CharT , typename _Traits >
typedef _Traits std::istreambuf_iterator< _CharT, _Traits >::traits_type
```

Public typedefs.
Definition at line 67 of file streambuf_iterator.h.

4.661.2.10 value_type

```
typedef _CharT std::iterator< input_iterator_tag , _CharT , _Traits::off_↩
type , _CharT * , _CharT >::value_type  [inherited]
```

The type "pointed to" by the iterator.
Definition at line 132 of file stl_iterator_base_types.h.

4.661.3 Constructor & Destructor Documentation

4.661.3.1 istreambuf_iterator() [1/3]

```
template<typename _CharT , typename _Traits >
constexpr std::istreambuf_iterator< _CharT, _Traits >::istreambuf_iterator ( )  [inline], [constexpr],
[noexcept]
```

Construct end of input stream iterator.
Definition at line 115 of file streambuf_iterator.h.

4.661.3.2 istreambuf_iterator() [2/3]

```
template<typename _CharT , typename _Traits >
std::istreambuf_iterator< _CharT, _Traits >::istreambuf_iterator (
            istream_type & __s )  [inline], [noexcept]
```

Construct start of input stream iterator.
Definition at line 130 of file streambuf_iterator.h.

4.661.3.3 istreambuf_iterator() [3/3]

```
template<typename _CharT , typename _Traits >
std::istreambuf_iterator< _CharT, _Traits >::istreambuf_iterator (
            streambuf_type * __s )  [inline], [noexcept]
```

Construct start of streambuf iterator.
Definition at line 134 of file streambuf_iterator.h.

4.661.4 Member Function Documentation

4.661.4.1 equal()

```
template<typename _CharT , typename _Traits >
bool std::istreambuf_iterator< _CharT, _Traits >::equal (
            const istreambuf_iterator< _CharT, _Traits > & __b ) const  [inline]
```

Return true both iterators are end or both are not end.
Definition at line 194 of file streambuf_iterator.h.

4.661.4.2 operator*() template<typename _CharT , typename _Traits >

char_type std::istreambuf_iterator< _CharT, _Traits >::operator* ( ) const [inline]

Return the current character pointed to by iterator. This returns streambuf.sgetc(). It cannot be assigned. NB: The result of operator*() on an end of stream is undefined.
Definition at line 146 of file streambuf_iterator.h.

4.661.4.3 operator++() [1/2] template<typename _CharT , typename _Traits >

istreambuf_iterator& std::istreambuf_iterator< _CharT, _Traits >::operator++ ( ) [inline]

Advance the iterator. Calls streambuf.sbumpc().
Definition at line 162 of file streambuf_iterator.h.

4.661.4.4 operator++() [2/2] template<typename _CharT , typename _Traits >

istreambuf_iterator std::istreambuf_iterator< _CharT, _Traits >::operator++ (int) [inline]

Advance the iterator. Calls streambuf.sbumpc().
Definition at line 176 of file streambuf_iterator.h.
The documentation for this class was generated from the following files:

- iosfwd
- streambuf_iterator.h

4.662 __gnu_pbds::detail::pat_trie_base::_Inode< _ATraits, Metadata >::iterator Struct Reference

Inheritance diagram for __gnu_pbds::detail::pat_trie_base::_Inode< _ATraits, Metadata >::iterator:

Friends

- bool **operator!=** (const iterator &__lhs, const iterator &__rhs)
- bool **operator==** (const iterator &__lhs, const iterator &__rhs)
- class **path**

4.663.1 Detailed Description

An iterator for the components of a path.
Definition at line 847 of file experimental/bits/fs_path.h.
The documentation for this class was generated from the following file:

- experimental/bits/fs_path.h

4.664 std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference > Struct Template Reference

Public Types

- typedef _Distance difference_type
- typedef _Category iterator_category
- typedef _Pointer pointer
- typedef _Reference reference
- typedef _Tp value_type

4.664.1 Detailed Description

template<typename _Category, typename _Tp, typename _Distance = ptrdiff_t, typename _Pointer = _Tp*, typename _Reference = _Tp&>
struct std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >

Common iterator class.
This class does nothing but define nested typedefs. Iterator classes can inherit from this class to save some work. The typedefs are then used in specializations and overloading.
In particular, there are no default implementations of requirements such as `operator++` and the like. (How could there be?)
Definition at line 127 of file stl_iterator_base_types.h.

4.664.2 Member Typedef Documentation

4.664.2.1 difference_type

```
template<typename _Category , typename _Tp , typename _Distance = ptrdiff_t, typename _Pointer = _Tp*, typename _Reference = _Tp&>
typedef _Distance std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >::difference_type
```

Distance between iterators is represented as this type.
Definition at line 134 of file stl_iterator_base_types.h.

4.664.2.2 iterator_category

```
template<typename _Category , typename _Tp , typename _Distance = ptrdiff_t, typename _Pointer = _Tp*, typename _Reference = _Tp&>
typedef _Category std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >::iterator_category
```

One of the tag types.
Definition at line 130 of file stl_iterator_base_types.h.

4.664.2.3 pointer

```
template<typename _Category , typename _Tp , typename _Distance = ptrdiff_t, typename _Pointer = _Tp*, typename _Reference = _Tp&>
typedef _Pointer std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >::pointer
```

This type represents a pointer-to-value_type.
Definition at line 136 of file stl_iterator_base_types.h.

4.664.2.4 reference

```
template<typename _Category , typename _Tp , typename _Distance = ptrdiff_t, typename _Pointer = _Tp*, typename _Reference = _Tp&>
typedef _Reference std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >::reference
```

This type represents a reference-to-value_type.
Definition at line 138 of file stl_iterator_base_types.h.

4.664.2.5 value_type

```
template<typename _Category , typename _Tp , typename _Distance = ptrdiff_t, typename _Pointer = _Tp*, typename _Reference = _Tp&>
typedef _Tp std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >::value_type
```

The type "pointed to" by the iterator.
Definition at line 132 of file stl_iterator_base_types.h.
The documentation for this struct was generated from the following file:

- stl_iterator_base_types.h

4.665 std::iterator_traits< _Iterator > Struct Template Reference

Inherits std::__iterator_traits< _Iterator, typename >.

4.665.1 Detailed Description

template<typename _Iterator>
struct std::iterator_traits< _Iterator >

Traits class for iterators.
This class does nothing but define nested typedefs. The general version simply *forwards* the nested typedefs from the Iterator argument. Specialized versions for pointers and pointers-to-const provide tighter, more correct semantics.
Definition at line 177 of file stl_iterator_base_types.h.
The documentation for this struct was generated from the following file:

- cpp_type_traits.h

4.666 std::iterator_traits< _Tp * > Struct Template Reference

Public Types

- typedef ptrdiff_t **difference_type**
- typedef random_access_iterator_tag **iterator_category**
- typedef _Tp * **pointer**
- typedef _Tp & **reference**
- typedef _Tp **value_type**

4.666.1 Detailed Description

template<typename _Tp>
struct std::iterator_traits< _Tp * >

Partial specialization for pointer types.
Definition at line 210 of file stl_iterator_base_types.h.
The documentation for this struct was generated from the following file:

- stl_iterator_base_types.h

4.667 std::iterator_traits< const _Tp * > Struct Template Reference

Public Types

- typedef ptrdiff_t **difference_type**
- typedef random_access_iterator_tag **iterator_category**
- typedef const _Tp * **pointer**
- typedef const _Tp & **reference**
- typedef _Tp **value_type**

4.667.1 Detailed Description

template<typename _Tp>
struct std::iterator_traits< const _Tp * >

Partial specialization for const pointer types.
Definition at line 221 of file stl_iterator_base_types.h.
The documentation for this struct was generated from the following file:

- stl_iterator_base_types.h

4.668 __gnu_pbds::join_error Struct Reference

Inheritance diagram for __gnu_pbds::join_error:

Public Member Functions

- virtual const char * what () const noexcept

4.668.1 Detailed Description

A join cannot be performed logical reasons (i.e., the ranges of the two container objects being joined overlaps.
Definition at line 70 of file exception.hpp.

4.668.2 Member Function Documentation

4.668.2.1 what() `virtual const char* std::logic_error::what ( ) const [virtual], [noexcept], [inherited]`

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from std::exception.
Reimplemented in std::future_error.
The documentation for this struct was generated from the following file:

- exception.hpp

4.669 __gnu_pbds::detail::left_child_next_sibling_heap< Value_Type, Cmp_Fn, Node_Metadata, _Alloc > Class Template Reference

Inherits Cmp_Fn.

4.670.1 Detailed Description

template<typename Node, typename _Alloc>
class __gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_< Node, _Alloc >

Const point-type iterator.
Definition at line 60 of file left_child_next_sibling_heap_/const_iterator.hpp.

4.670.2 Member Typedef Documentation

4.670.2.1 const_pointer

```
template<typename Node , typename _Alloc >
typedef base_type::const_pointer __gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_<
Node, _Alloc >::const_pointer
```

Iterator's const pointer type.
Definition at line 81 of file left_child_next_sibling_heap_/const_iterator.hpp.

4.670.2.2 const_reference template<typename Node , typename _Alloc >

typedef base_type::const_reference __gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_< Node, _Alloc >::const_reference

Iterator's const reference type.

Definition at line 87 of file left_child_next_sibling_heap_/const_iterator.hpp.

4.670.2.3 difference_type template<typename Node , typename _Alloc >

typedef _Alloc::difference_type __gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_< Node, _Alloc >::difference_type

Difference type.

Definition at line 72 of file left_child_next_sibling_heap_/const_iterator.hpp.

4.670.2.4 iterator_category template<typename Node , typename _Alloc >

typedef std::forward_iterator_tag __gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_< Node, _Alloc >::iterator_category

Category.

Definition at line 69 of file left_child_next_sibling_heap_/const_iterator.hpp.

4.670.2.5 pointer template<typename Node , typename _Alloc >

typedef base_type::pointer __gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_< Node, _Alloc >::pointer

Iterator's pointer type.

Definition at line 78 of file left_child_next_sibling_heap_/const_iterator.hpp.

4.670.2.6 reference template<typename Node , typename _Alloc >

typedef base_type::reference __gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_< Node, _Alloc >::reference

Iterator's reference type.

4.680.1 Detailed Description

template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
class std::linear_congruential_engine< _UIntType, __a, __c, __m >

A model of a linear congruential random number generator.
A random number generator that produces pseudorandom numbers via linear function:

$$x_{i+1} \leftarrow (ax_i + c) \bmod m$$

The template parameter _UIntType must be an unsigned integral type large enough to store values up to (__m-1). If the template parameter __m is 0, the modulus __m used is std::numeric_limits<_UIntType>::max() plus 1. Otherwise, the template parameters __a and __c must be less than __m.
The size of the state is 1.
Definition at line 255 of file random.h.

4.680.2 Member Typedef Documentation

4.680.2.1 result_type `template<typename _UIntType , _UIntType __a, _UIntType __c, _UIntType __m>`

`typedef _UIntType std::linear_congruential_engine< _UIntType, __a, __c, __m >::result_type`

The type of the generated random value.
Definition at line 268 of file random.h.

4.680.3 Constructor & Destructor Documentation

4.680.3.1 linear_congruential_engine() [1/3] `template<typename _UIntType , _UIntType __a, _UIntType __c, _UIntType __m>`

`std::linear_congruential_engine< _UIntType, __a, __c, __m >::linear_congruential_engine ( ) [inline]`

Constructs a linear_congruential_engine random number generator engine with seed 1.
Definition at line 282 of file random.h.

4.680.3.2 linear_congruential_engine() [2/3] `template<typename _UIntType , _UIntType __a, _UIntType __c, _UIntType __m>`

```
std::linear_congruential_engine< _UIntType, __a, __c, __m >::linear_congruential_engine (
            result_type __s ) [inline], [explicit]
```

Constructs a linear_congruential_engine random number generator engine with seed __s. The default seed value is 1.

Parameters

_↩ _s	The initial seed value.

Definition at line 293 of file random.h.
References std::linear_congruential_engine< _UIntType, __a, __c, __m >::seed().

4.680.3.3 linear_congruential_engine() [3/3]

```
template<typename _UIntType , _UIntType __a, _UIntType __c, _UIntType __m>
template<typename _Sseq , typename = _If_seed_seq<_Sseq>>
std::linear_congruential_engine< _UIntType, __a, __c, __m >::linear_congruential_engine (
            _Sseq & __q ) [inline], [explicit]
```

Constructs a linear_congruential_engine random number generator engine seeded from the seed sequence __q.

Parameters

_↩ _q	the seed sequence.

Definition at line 304 of file random.h.
References std::linear_congruential_engine< _UIntType, __a, __c, __m >::seed().

4.680.4 Member Function Documentation

4.680.4.1 discard()

```
template<typename _UIntType , _UIntType __a, _UIntType __c, _UIntType __m>
void std::linear_congruential_engine< _UIntType, __a, __c, __m >::discard (
            unsigned long long __z ) [inline]
```

Discard a sequence of random numbers.
Definition at line 348 of file random.h.

4.680.4.2 max()

```
template<typename _UIntType , _UIntType __a, _UIntType __c, _UIntType __m>
static constexpr result_type std::linear_congruential_engine< _UIntType, __a, __c, __m >::max ( )
[inline], [static], [constexpr]
```

Gets the largest possible value in the output range.
Definition at line 341 of file random.h.

4.680.4.3 min()

```
template<typename _UIntType , _UIntType __a, _UIntType __c, _UIntType __m>
static constexpr result_type std::linear_congruential_engine< _UIntType, __a, __c, __m >::min ( )
[inline], [static], [constexpr]
```

Gets the smallest possible value in the output range.
The minimum depends on the __c parameter: if it is zero, the minimum generated must be > 0, otherwise 0 is allowed.
Definition at line 334 of file random.h.

4.680.4.4 operator()()

```
template<typename _UIntType , _UIntType __a, _UIntType __c, _UIntType __m>
result_type std::linear_congruential_engine< _UIntType, __a, __c, __m >::operator() ( ) [inline]
```

Gets the next random number in the sequence.
Definition at line 358 of file random.h.

4.680.4.5 seed() [1/3]

```
template<typename _UIntType , _UIntType __a, _UIntType __c, _UIntType __m>
template<typename _Sseq >
_If_seed_seq<_Sseq> std::linear_congruential_engine< _UIntType, __a, __c, __m >::seed (
            _Sseq & __q )
```

Reseeds the linear_congruential_engine random number generator engine sequence using values from the seed sequence __q.

Parameters

_↩ _q	the seed sequence.

4.680.4.6 seed() [2/3]

```
template<typename _UIntType , _UIntType __a, _UIntType __c, _UIntType __m>
template<typename _Sseq >
auto std::linear_congruential_engine< _UIntType, __a, __c, __m >::seed (
            _Sseq & __q ) -> _If_seed_seq<_Sseq>
```

Seeds the LCR engine with a value generated by __q.
Definition at line 132 of file bits/random.tcc.
References std::__lg().

4.680.4.7 seed() [3/3]

```
template<typename _UIntType , _UIntType __a, _UIntType __c, _UIntType __m>
void std::linear_congruential_engine< _UIntType, __a, __c, __m >::seed (
            result_type __s = default_seed )
```

Reseeds the linear_congruential_engine random number generator engine sequence to the seed __s.

Parameters

_↩ _s	The new seed.

Seeds the LCR with integral value __s, adjusted so that the ring identity is never a member of the convergence set.
Definition at line 116 of file bits/random.tcc.
Referenced by std::linear_congruential_engine< _UIntType, __a, __c, __m >::linear_congruential_engine().

4.680.5 Friends And Related Function Documentation

4.680.5.1 operator<<

```
template<typename _UIntType , _UIntType __a, _UIntType __c, _UIntType __m>
template<typename _UIntType1 , _UIntType1 __a1, _UIntType1 __c1, _UIntType1 __m1, typename _CharT
, typename _Traits >
std::basic_ostream<_CharT, _Traits>& operator<< (
            std::basic_ostream< _CharT, _Traits > & __os,
            const std::linear_congruential_engine< _UIntType1, __a1, __c1, __m1 > & __lcr )
[friend]
```

Writes the textual representation of the state x(i) of x to __os.

Parameters

__os	The output stream.

Parameters

__lcr	A % linear_congruential_engine random number generator.

Returns

__os.

4.680.5.2 operator== `template<typename _UIntType , _UIntType __a, _UIntType __c, _UIntType __m>`

```
bool operator== (
            const linear_congruential_engine< _UIntType, __a, __c, __m > & __lhs,
            const linear_congruential_engine< _UIntType, __a, __c, __m > & __rhs )  [friend]
```

Compares two linear congruential random number generator objects of the same type for equality.

Parameters

__lhs	A linear congruential random number generator object.
__rhs	Another linear congruential random number generator object.

Returns

true if the infinite sequences of generated values would be equal, false otherwise.

Definition at line 376 of file random.h.

4.680.5.3 operator>> `template<typename _UIntType , _UIntType __a, _UIntType __c, _UIntType __m>`

```
template<typename _UIntType1 , _UIntType1 __a1, _UIntType1 __c1, _UIntType1 __m1, typename _CharT
, typename _Traits >
std::basic_istream<_CharT, _Traits>& operator>> (
            std::basic_istream< _CharT, _Traits > & __is,
            std::linear_congruential_engine< _UIntType1, __a1, __c1, __m1 > & __lcr )  [friend]
```

Sets the state of the engine by reading its textual representation from __is.
The textual representation must have been previously written using an output stream whose imbued locale and whose type's template specialization arguments _CharT and _Traits were the same as those of __is.

Parameters

__is	The input stream.
__lcr	A % linear_congruential_engine random number generator.

Returns

__is.

4.680.6 Member Data Documentation

4.680.6.1 increment `template<typename _UIntType , _UIntType __a, _UIntType __c, _UIntType __m>`

```
constexpr _UIntType std::linear_congruential_engine< _UIntType, __a, __c, __m >::increment  [static],
```

[constexpr]
An increment.
Definition at line 273 of file random.h.

4.680.6.2 modulus

template<typename _UIntType , _UIntType __a, _UIntType __c, _UIntType __m>
constexpr _UIntType std::linear_congruential_engine< _UIntType, __a, __c, __m >::modulus [static], [constexpr]
The modulus.
Definition at line 275 of file random.h.

4.680.6.3 multiplier

template<typename _UIntType , _UIntType __a, _UIntType __c, _UIntType __m>
constexpr _UIntType std::linear_congruential_engine< _UIntType, __a, __c, __m >::multiplier [static], [constexpr]
The multiplier.
Definition at line 271 of file random.h.
The documentation for this class was generated from the following files:

- random.h
- bits/random.tcc

4.681 __gnu_pbds::linear_probe_fn< Size_Type > Class Template Reference

Public Types

- typedef Size_Type **size_type**

Public Member Functions

- void **swap** (linear_probe_fn< Size_Type > &other)

Protected Member Functions

- size_type operator() (size_type i) const

4.681.1 Detailed Description

template<typename Size_Type = std::size_t>
class __gnu_pbds::linear_probe_fn< Size_Type >

A probe sequence policy using fixed increments.
Definition at line 61 of file hash_policy.hpp.

4.681.2 Member Function Documentation

4.681.2.1 operator()()

template<typename Size_Type = std::size_t>
size_type __gnu_pbds::linear_probe_fn< Size_Type >::operator() (
size_type *i*) const [inline], [protected]
Returns the i-th offset from the hash value.
The documentation for this class was generated from the following file:

- hash_policy.hpp

4.682.1 Detailed Description

template<typename _Tp, typename _Allocator = std::allocator<_Tp>>
class std::__debug::list< _Tp, _Allocator >

Class std::list with safety/checking/debug instrumentation.
Definition at line 50 of file debug/list.

4.682.2 Member Function Documentation

4.682.2.1 _M_detach_all() `void __gnu_debug::_Safe_sequence_base::_M_detach_all ( ) [protected], [inherited]`

Detach all iterators, leaving them singular.
Referenced by __gnu_debug::_Safe_sequence_base::~_Safe_sequence_base().

4.682.2.2 _M_detach_singular() `void __gnu_debug::_Safe_sequence_base::_M_detach_singular ( ) [protected], [inherited]`

Detach all singular iterators.

Postcondition

for all iterators i attached to this sequence, i->_M_version == _M_version.

4.682.2.3 _M_get_mutex() `__gnu_cxx::__mutex& __gnu_debug::_Safe_sequence_base::_M_get_mutex ( ) throw ( ) [protected], [inherited]`

For use in _Safe_sequence.
Referenced by __gnu_debug::_Safe_sequence< _Sequence >::_M_transfer_from_if().

4.682.2.4 _M_invalidate_all() `void __gnu_debug::_Safe_sequence_base::_M_invalidate_all ( ) const [inline], [protected], [inherited]`

Invalidates all iterators.
Definition at line 256 of file safe_base.h.
References __gnu_debug::_Safe_sequence_base::_M_version.

4.682.2.5 _M_invalidate_if() template<typename _Sequence >
template<typename _Predicate >
void __gnu_debug::_Safe_sequence< _Sequence >::_M_invalidate_if (
_Predicate __pred) [inherited]

Invalidates all iterators x that reference this sequence, are not singular, and for which __pred(x) returns true. __pred will be invoked with the normal iterators nested in the safe ones.
Definition at line 37 of file safe_sequence.tcc.

4.682.2.6 _M_revalidate_singular() void __gnu_debug::_Safe_sequence_base::_M_revalidate_singular ( ) [protected], [inherited]

Revalidates all attached singular iterators. This method may be used to validate iterators that were invalidated before (but for some reason, such as an exception, need to become valid again).

4.682.2.7 _M_swap() void __gnu_debug::_Safe_sequence_base::_M_swap (
_Safe_sequence_base & __x) [protected], [noexcept], [inherited]

Swap this sequence with the given sequence. This operation also swaps ownership of the iterators, so that when the operation is complete all iterators that originally referenced one container now reference the other container.

4.682.2.8 _M_transfer_from_if() template<typename _Sequence >
template<typename _Predicate >
void __gnu_debug::_Safe_sequence< _Sequence >::_M_transfer_from_if (
_Safe_sequence< _Sequence > & __from,
_Predicate __pred) [inherited]

Transfers all iterators x that reference from sequence, are not singular, and for which __pred(x) returns true. __pred will be invoked with the normal iterators nested in the safe ones.
Definition at line 68 of file safe_sequence.tcc.
References std::__addressof(), __gnu_debug::_Safe_sequence_base::_M_const_iterators, __gnu_debug::_Safe_iterator_base::_M_detach_single(), __gnu_debug::_Safe_sequence_base::_M_get_mutex(), __gnu_debug::_Safe_sequence_base::_M_iterators, __gnu_debug::_Safe_iterator_base::_M_next, __gnu_debug::_Safe_iterator_base::_M_prior, __gnu_debug::_Safe_iterator_base::_M_sequence, and __gnu_debug::_Safe_iterator_base::_M_version.

4.682.3 Member Data Documentation

4.682.3.1 _M_const_iterators _Safe_iterator_base* __gnu_debug::_Safe_sequence_base::_M_const_iterators [inherited]

The list of constant iterators that reference this container.
Definition at line 197 of file safe_base.h.
Referenced by __gnu_debug::_Safe_sequence< _Sequence >::_M_transfer_from_if().

4.682.3.2 _M_iterators _Safe_iterator_base* __gnu_debug::_Safe_sequence_base::_M_iterators [inherited]

The list of mutable iterators that reference this container.
Definition at line 194 of file safe_base.h.
Referenced by __gnu_debug::_Safe_sequence< _Sequence >::_M_transfer_from_if().

4.682.3.3 _M_version unsigned int __gnu_debug::_Safe_sequence_base::_M_version [mutable], [inherited]

The container version number. This number may never be 0.
Definition at line 200 of file safe_base.h.
Referenced by __gnu_debug::_Safe_sequence_base::_M_invalidate_all().

4.683.1 Detailed Description

template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
class std::list< _Tp, _Alloc >

A standard container with linear time access to elements, and fixed time insertion/deletion at any point in the sequence.

Template Parameters

_Tp	Type of element.
_Alloc	Allocator type, defaults to allocator<_Tp>.

Meets the requirements of a `container`, a `reversible container`, and a `sequence`, including the `optional sequence requirements` with the exception of `at` and `operator[]`.
This is a *doubly linked* list. Traversal up and down the list requires linear time, but adding and removing elements (or *nodes*) is done in constant time, regardless of where the change takes place. Unlike std::vector and std::deque, random-access iterators are not provided, so subscripting ([]) access is not allowed. For algorithms which only need sequential access, this lack makes no difference.
Also unlike the other standard containers, std::list provides specialized algorithms unique to linked lists, such as splicing, sorting, and in-place reversal.
A couple points on memory allocation for list<Tp>:
First, we never actually allocate a Tp, we allocate List_node<Tp>'s and trust [20.1.5]/4 to DTRT. This is to ensure that after elements from list<X,Alloc1> are spliced into list<X,Alloc2>, destroying the memory of the second list is a valid operation, i.e., Alloc1 giveth and Alloc2 taketh away.
Second, a list conceptually represented as
```
A <---> B <---> C <---> D
```
is actually circular; a link exists between A and D. The list class holds (as its only data member) a private list::iterator pointing to *D*, not to *A!* To get to the head of the list, we start at the tail and move forward by one. When this member iterator's next/previous pointers refer to itself, the list is empty.
Definition at line 556 of file stl_list.h.

4.683.2 Constructor & Destructor Documentation

4.683.2.1 list() [1/8] `template<typename _Tp , typename _Alloc = std::allocator<_Tp>>`

`std::list< _Tp, _Alloc >::list ( ) [default]`

Creates a list with no elements.

4.683.2.2 list() [2/8] `template<typename _Tp , typename _Alloc = std::allocator<_Tp>>`

```
std::list< _Tp, _Alloc >::list (
            const allocator_type & __a ) [inline], [explicit], [noexcept]
```

Creates a list with no elements.

Parameters

_↩ _a	An allocator object.

Definition at line 683 of file stl_list.h.

4.683.2.3 list() [3/8]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
std::list< _Tp, _Alloc >::list (
            size_type __n,
            const allocator_type & __a = allocator_type() )  [inline], [explicit]
```

Creates a list with default constructed elements.

Parameters

_↩ _n	The number of elements to initially create.
_↩ _a	An allocator object.

This constructor fills the list with *__n* default constructed elements.
Definition at line 696 of file stl_list.h.

4.683.2.4 list() [4/8]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
std::list< _Tp, _Alloc >::list (
            size_type __n,
            const value_type & __value,
            const allocator_type & __a = allocator_type() )  [inline]
```

Creates a list with copies of an exemplar element.

Parameters

__n	The number of elements to initially create.
__value	An element to copy.
__a	An allocator object.

This constructor fills the list with *__n* copies of *__value*.
Definition at line 708 of file stl_list.h.

4.683.2.5 list() [5/8]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
std::list< _Tp, _Alloc >::list (
            const list< _Tp, _Alloc > & __x )  [inline]
```

List copy constructor.

Parameters

_↩ _x	A list of identical element and allocator types.

The newly-created list uses a copy of the allocation object used by *__x* (unless the allocator traits dictate a different object).
Definition at line 735 of file stl_list.h.
References std::list< _Tp, _Alloc >::begin(), and std::list< _Tp, _Alloc >::end().

4.683.2.6 list() [6/8]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
std::list< _Tp, _Alloc >::list (
            list< _Tp, _Alloc > &&  )  [default]
```

List move constructor.
The newly-created list contains the exact contents of the moved instance. The contents of the moved instance are a valid, but unspecified list.

4.683.2.7 list() [7/8]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
std::list< _Tp, _Alloc >::list (
            initializer_list< value_type > __l,
            const allocator_type & __a = allocator_type() )  [inline]
```

Builds a list from an initializer_list.

Parameters

__l	An initializer_list of value_type.
__a	An allocator object.

Create a list consisting of copies of the elements in the initializer_list *__l*. This is linear in __l.size().
Definition at line 758 of file stl_list.h.

4.683.2.8 list() [8/8]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
template<typename _InputIterator , typename = std::_RequireInputIter<_InputIterator>>
std::list< _Tp, _Alloc >::list (
            _InputIterator __first,
            _InputIterator __last,
            const allocator_type & __a = allocator_type() )  [inline]
```

Builds a list from a range.

Parameters

__first	An input iterator.
__last	An input iterator.
__a	An allocator object.

Create a list consisting of copies of the elements from [*__first*,*__last*). This is linear in N (where N is distance(*__first*,*__last*)).
Definition at line 803 of file stl_list.h.

4.683.2.9 ~list()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
std::list< _Tp, _Alloc >::~list ( )  [default]
```

No explicit dtor needed as the _Base dtor takes care of things. The _Base dtor only erases the elements, and note that

if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

4.683.3 Member Function Documentation

4.683.3.1 _M_create_node() template<typename _Tp , typename _Alloc = std::allocator<_Tp>> template<typename... _Args> _Node* std::list< _Tp, _Alloc >::_M_create_node (_Args &&... __args) [inline], [protected]

Parameters

__args	An instance of user data.

Allocates space for a new node and constructs a copy of *__args* in it.
Definition at line 632 of file stl_list.h.

4.683.3.2 assign() [1/3] template<typename _Tp , typename _Alloc = std::allocator<_Tp>> template<typename _InputIterator , typename = std::_RequireInputIter<_InputIterator>> void std::list< _Tp, _Alloc >::assign (_InputIterator __first, _InputIterator __last) [inline]

Assigns a range to a list.

Parameters

__first	An input iterator.
__last	An input iterator.

This function fills a list with copies of the elements in the range [*__first*,*__last*).
Note that the assignment completely changes the list and that the resulting list's size is the same as the number of elements assigned.
Definition at line 908 of file stl_list.h.

4.683.3.3 assign() [2/3] template<typename _Tp , typename _Alloc = std::allocator<_Tp>> void std::list< _Tp, _Alloc >::assign (initializer_list< value_type > *__l*) [inline]

Assigns an initializer_list to a list.

Parameters

__l	An initializer_list of value_type.

Replace the contents of the list with copies of the elements in the initializer_list *__l*. This is linear in __l.size().
Definition at line 930 of file stl_list.h.

4.683.3.4 assign() [3/3] template<typename _Tp , typename _Alloc = std::allocator<_Tp>>

```
void std::list< _Tp, _Alloc >::assign (
            size_type __n,
            const value_type & __val )  [inline]
```

Assigns a given value to a list.

Parameters

__n	Number of elements to be assigned.
__val	Value to be assigned.

This function fills a list with *__n* copies of the given value. Note that the assignment completely changes the list and that the resulting list's size is the same as the number of elements assigned.
Definition at line 889 of file stl_list.h.
Referenced by std::list< _Tp, _Alloc >::operator=().

4.683.3.5 back() [1/2] template<typename _Tp , typename _Alloc = std::allocator<_Tp>>

```
const_reference std::list< _Tp, _Alloc >::back ( ) const  [inline], [noexcept]
```

Returns a read-only (constant) reference to the data at the last element of the list.
Definition at line 1142 of file stl_list.h.
References std::list< _Tp, _Alloc >::end().

4.683.3.6 back() [2/2] template<typename _Tp , typename _Alloc = std::allocator<_Tp>>

```
reference std::list< _Tp, _Alloc >::back ( )  [inline], [noexcept]
```

Returns a read/write reference to the data at the last element of the list.
Definition at line 1130 of file stl_list.h.
References std::list< _Tp, _Alloc >::end().

4.683.3.7 begin() [1/2] template<typename _Tp , typename _Alloc = std::allocator<_Tp>>

```
const_iterator std::list< _Tp, _Alloc >::begin ( ) const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the list. Iteration is done in ordinary element order.
Definition at line 954 of file stl_list.h.

4.683.3.8 begin() [2/2] template<typename _Tp , typename _Alloc = std::allocator<_Tp>>

```
iterator std::list< _Tp, _Alloc >::begin ( )  [inline], [noexcept]
```

Returns a read/write iterator that points to the first element in the list. Iteration is done in ordinary element order.
Definition at line 945 of file stl_list.h.
Referenced by std::list< _Tp, _Alloc >::list(), std::list< _Tp, _Alloc >::crend(), std::list< _Tp, _Alloc >::front(), std::list< _Tp, _Alloc >::insert(), std::list< _Tp, _Alloc >::merge(), std::operator<(), std::list< _Tp, _Alloc >::operator=(), std::operator==(), std::list< _Tp, _Alloc >::pop_front(), std::list< _Tp, _Alloc >::push_front(), std::list< _Tp, _Alloc >::rend(), and std::list< _Tp, _Alloc >::splice().

4.683.3.9 cbegin() template<typename _Tp , typename _Alloc = std::allocator<_Tp>>

```
const_iterator std::list< _Tp, _Alloc >::cbegin ( ) const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the list. Iteration is done in ordinary element order.
Definition at line 1018 of file stl_list.h.

4.683.3.10 cend()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
const_iterator std::list< _Tp, _Alloc >::cend ( ) const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the list. Iteration is done in ordinary element order.
Definition at line 1027 of file stl_list.h.

4.683.3.11 clear()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::clear ( )  [inline], [noexcept]
```

Erases all the elements. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
Definition at line 1498 of file stl_list.h.

4.683.3.12 crbegin()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::list< _Tp, _Alloc >::crbegin ( ) const  [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the list. Iteration is done in reverse element order.
Definition at line 1036 of file stl_list.h.
References std::list< _Tp, _Alloc >::end().

4.683.3.13 crend()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::list< _Tp, _Alloc >::crend ( ) const  [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first element in the list. Iteration is done in reverse element order.
Definition at line 1045 of file stl_list.h.
References std::list< _Tp, _Alloc >::begin().

4.683.3.14 emplace()

```
template<typename _Tp , typename _Alloc >
template<typename...  _Args>
list< _Tp, _Alloc >::iterator list::emplace (
            const_iterator __position,
            _Args &&...  __args )
```

Constructs object in list before specified iterator.

Parameters

__position	A const_iterator into the list.
__args	Arguments.

Returns

An iterator that points to the inserted data.

This function will insert an object of type T constructed with T(std::forward<Args>(args)...) before the specified location. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references.

Definition at line 89 of file list.tcc.
Referenced by std::list< _Tp, _Alloc >::insert().

4.683.3.15 empty()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
bool std::list< _Tp, _Alloc >::empty ( ) const  [inline], [noexcept]
```

Returns true if the list is empty. (Thus begin() would equal end().)
Definition at line 1055 of file stl_list.h.
Referenced by std::list< _Tp, _Alloc >::insert(), and std::list< _Tp, _Alloc >::splice().

4.683.3.16 end() [1/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
const_iterator std::list< _Tp, _Alloc >::end ( ) const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the list. Iteration is done in ordinary element order.
Definition at line 972 of file stl_list.h.

4.683.3.17 end() [2/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
iterator std::list< _Tp, _Alloc >::end ( )  [inline], [noexcept]
```

Returns a read/write iterator that points one past the last element in the list. Iteration is done in ordinary element order.
Definition at line 963 of file stl_list.h.
Referenced by std::list< _Tp, _Alloc >::list(), std::list< _Tp, _Alloc >::back(), std::list< _Tp, _Alloc >::crbegin(), std::list< _Tp, _Alloc >::merge(), std::operator<(), std::list< _Tp, _Alloc >::operator=(), std::operator==(), std::list< _Tp, _Alloc >::push_back(), std::list< _Tp, _Alloc >::rbegin(), and std::list< _Tp, _Alloc >::splice().

4.683.3.18 erase() [1/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
iterator std::list< _Tp, _Alloc >::erase (
            const_iterator __first,
            const_iterator __last )  [inline], [noexcept]
```

Remove a range of elements.

Parameters

__first	Iterator pointing to the first element to be erased.
__last	Iterator pointing to one past the last element to be erased.

Returns

An iterator pointing to the element pointed to by *last* prior to erasing (or end()).

This function will erase the elements in the range [first,last) and shorten the list accordingly.
This operation is linear time in the size of the range and only invalidates iterators/references to the element being removed. The user is also cautioned that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
Definition at line 1456 of file stl_list.h.
References std::list< _Tp, _Alloc >::erase().

4.683.3.19 erase() [2/2]

```
template<typename _Tp , typename _Alloc >
list< _Tp, _Alloc >::iterator list::erase (
            const_iterator __position )  [noexcept]
```

Remove element at given position.

Parameters

__position	Iterator pointing to element to be erased.

Returns

An iterator pointing to the next element (or end()).

This function will erase the element at the given position and thus shorten the list by one.
Due to the nature of a list this operation can be done in constant time, and only invalidates iterators/references to the element being removed. The user is also cautioned that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
Definition at line 150 of file list.tcc.
Referenced by std::list< _Tp, _Alloc >::erase().

4.683.3.20 front() [1/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
const_reference std::list< _Tp, _Alloc >::front ( ) const  [inline], [noexcept]
```

Returns a read-only (constant) reference to the data at the first element of the list.
Definition at line 1122 of file stl_list.h.
References std::list< _Tp, _Alloc >::begin().

4.683.3.21 front() [2/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
reference std::list< _Tp, _Alloc >::front ( )  [inline], [noexcept]
```

Returns a read/write reference to the data at the first element of the list.
Definition at line 1114 of file stl_list.h.
References std::list< _Tp, _Alloc >::begin().

4.683.3.22 get_allocator()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
allocator_type std::list< _Tp, _Alloc >::get_allocator ( ) const  [inline], [noexcept]
```

Get a copy of the memory allocation object.
Definition at line 936 of file stl_list.h.

4.683.3.23 insert() [1/5]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
iterator std::list< _Tp, _Alloc >::insert (
            const_iterator __p,
            initializer_list< value_type > __l )  [inline]
```

Inserts the contents of an initializer_list into list before specified const_iterator.

Parameters

__↩ _p	A const_iterator into the list.
__↩ _l	An initializer_list of value_type.

Returns

An iterator pointing to the first element inserted (or __position).

This function will insert copies of the data in the initializer_list *l* into the list before the location specified by *p*.
This operation is linear in the number of elements inserted and does not invalidate iterators and references.
Definition at line 1327 of file stl_list.h.
References std::list< _Tp, _Alloc >::insert().

4.683.3.24 insert() [2/5] template<typename _Tp , typename _Alloc > template<typename _InputIterator , typename > list< _Tp, _Alloc >::iterator list::insert (const_iterator __position, _InputIterator __first, _InputIterator __last)

Inserts a range into the list.

Parameters

__position	A const_iterator into the list.
__first	An input iterator.
__last	An input iterator.

Returns

An iterator pointing to the first element inserted (or __position).

This function will insert copies of the data in the range [*first*,*last*) into the list before the location specified by *position*.
This operation is linear in the number of elements inserted and does not invalidate iterators and references.
Definition at line 133 of file list.tcc.
References std::list< _Tp, _Alloc >::begin(), and std::list< _Tp, _Alloc >::empty().

4.683.3.25 insert() [3/5] template<typename _Tp , typename _Alloc > list< _Tp, _Alloc >::iterator list::insert (const_iterator __position, const value_type & __x)

Inserts given value into list before specified iterator.

Parameters

__position	A const_iterator into the list.
__x	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a copy of the given value before the specified location. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references.
Definition at line 101 of file list.tcc.
Referenced by std::list< _Tp, _Alloc >::insert().

4.683.3.26 insert() [4/5] template<typename _Tp , typename _Alloc >

```
list< _Tp, _Alloc >::iterator list::insert (
            const_iterator __position,
            size_type __n,
            const value_type & __x )
```

Inserts a number of copies of given data into the list.

Parameters

__position	A const_iterator into the list.
__n	Number of elements to be inserted.
__x	Data to be inserted.

Returns

An iterator pointing to the first element inserted (or __position).

This function will insert a specified number of copies of the given data before the location specified by *position*.
This operation is linear in the number of elements inserted and does not invalidate iterators and references.
Definition at line 117 of file list.tcc.
References std::list< _Tp, _Alloc >::begin().

4.683.3.27 insert() [5/5] template<typename _Tp , typename _Alloc = std::allocator<_Tp>>

```
iterator std::list< _Tp, _Alloc >::insert (
            const_iterator __position,
            value_type && __x )  [inline]
```

Inserts given rvalue into list before specified iterator.

Parameters

__position	A const_iterator into the list.
__x	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a copy of the given rvalue before the specified location. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references.
Definition at line 1308 of file stl_list.h.
References std::list< _Tp, _Alloc >::emplace(), and std::move().

4.683.3.28 max_size() template<typename _Tp , typename _Alloc = std::allocator<_Tp>>

```
size_type std::list< _Tp, _Alloc >::max_size ( ) const  [inline], [noexcept]
```

Returns the size() of the largest possible list.

Definition at line 1065 of file stl_list.h.
References __gnu_cxx::__alloc_traits< _Alloc, typename >::max_size().

4.683.3.29 merge() [1/2] template<typename _Tp , typename _Alloc >

```
void list::merge (
            list< _Tp, _Alloc > && __x )
```

Merge sorted lists.

Parameters

_↩ _x	Sorted list to merge.

Assumes that both __x and this list are sorted according to operator<(). Merges elements of __x into this list in sorted order, leaving __x empty when complete. Elements in this list precede elements in __x that are equal.
Definition at line 392 of file list.tcc.
References std::__addressof(), std::list< _Tp, _Alloc >::begin(), std::begin(), std::list< _Tp, _Alloc >::end(), std::end(), and std::list< _Tp, _Alloc >::size().

4.683.3.30 merge() [2/2] template<typename _Tp , typename _Alloc >

```
template<typename _StrictWeakOrdering >
void list::merge (
            list< _Tp, _Alloc > && __x,
            _StrictWeakOrdering __comp )
```

Merge sorted lists according to comparison function.

Template Parameters

_StrictWeakOrdering	Comparison function defining sort order.

Parameters

__x	Sorted list to merge.
__comp	Comparison functor.

Assumes that both __x and this list are sorted according to StrictWeakOrdering. Merges elements of __x into this list in sorted order, leaving __x empty when complete. Elements in this list precede elements in __x that are equivalent according to StrictWeakOrdering().
Definition at line 439 of file list.tcc.
References std::__addressof(), std::list< _Tp, _Alloc >::begin(), std::begin(), std::list< _Tp, _Alloc >::end(), std::end(), and std::list< _Tp, _Alloc >::size().

4.683.3.31 operator=() [1/3] template<typename _Tp , typename _Alloc >

```
list< _Tp, _Alloc > & list::operator= (
            const list< _Tp, _Alloc > & __x )
```

List assignment operator.

Parameters

_↩ _x	A list of identical element and allocator types.

All the elements of __x are copied.

Whether the allocator is copied depends on the allocator traits.
Definition at line 267 of file list.tcc.
References std::__addressof(), std::list< _Tp, _Alloc >::begin(), and std::list< _Tp, _Alloc >::end().

4.683.3.32 operator=() [2/3]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
list& std::list< _Tp, _Alloc >::operator= (
            initializer_list< value_type > __l )  [inline]
```

List initializer list assignment operator.

Parameters

↩ _↩ ↩ _↩ *l*	An initializer_list of value_type.

Replace the contents of the list with copies of the elements in the initializer_list *__l*. This is linear in l.size().
Definition at line 871 of file stl_list.h.
References std::list< _Tp, _Alloc >::assign().

4.683.3.33 operator=() [3/3]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
list& std::list< _Tp, _Alloc >::operator= (
            list< _Tp, _Alloc > && __x )  [inline], [noexcept]
```

List move assignment operator.

Parameters

_↩ *_x*	A list of identical element and allocator types.

The contents of *__x* are moved into this list (without copying).
Afterwards *__x* is a valid, but unspecified list
Whether the allocator is moved depends on the allocator traits.
Definition at line 853 of file stl_list.h.
References std::move().

4.683.3.34 pop_back()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::pop_back ( )  [inline], [noexcept]
```

Removes last element.
This is a typical stack operation. It shrinks the list by one. Due to the nature of a list this operation can be done in constant time, and only invalidates iterators/references to the element being removed.
Note that no data is returned, and if the last element's data is needed, it should be retrieved before pop_back() is called.
Definition at line 1246 of file stl_list.h.

4.683.3.35 pop_front()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::pop_front ( )  [inline], [noexcept]
```

Removes first element.

This is a typical stack operation. It shrinks the list by one. Due to the nature of a list this operation can be done in constant time, and only invalidates iterators/references to the element being removed.
Note that no data is returned, and if the first element's data is needed, it should be retrieved before pop_front() is called.
Definition at line 1197 of file stl_list.h.
References std::list< _Tp, _Alloc >::begin().

4.683.3.36 push_back() template<typename _Tp , typename _Alloc = std::allocator<_Tp>>

```
void std::list< _Tp, _Alloc >::push_back (
            const value_type & __x )  [inline]
```

Add data to the end of the list.

Parameters

_↩ _x	Data to be added.

This is a typical stack operation. The function creates an element at the end of the list and assigns the given data to it. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references.
Definition at line 1211 of file stl_list.h.
References std::list< _Tp, _Alloc >::end().

4.683.3.37 push_front() template<typename _Tp , typename _Alloc = std::allocator<_Tp>>

```
void std::list< _Tp, _Alloc >::push_front (
            const value_type & __x )  [inline]
```

Add data to the front of the list.

Parameters

_↩ _x	Data to be added.

This is a typical stack operation. The function creates an element at the front of the list and assigns the given data to it. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references.
Definition at line 1161 of file stl_list.h.
References std::list< _Tp, _Alloc >::begin().

4.683.3.38 rbegin() [1/2] template<typename _Tp , typename _Alloc = std::allocator<_Tp>>

```
const_reverse_iterator std::list< _Tp, _Alloc >::rbegin ( ) const  [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the list. Iteration is done in reverse element order.
Definition at line 990 of file stl_list.h.
References std::list< _Tp, _Alloc >::end().

4.683.3.39 rbegin() [2/2] template<typename _Tp , typename _Alloc = std::allocator<_Tp>>

```
reverse_iterator std::list< _Tp, _Alloc >::rbegin ( )  [inline], [noexcept]
```

Returns a read/write reverse iterator that points to the last element in the list. Iteration is done in reverse element order.
Definition at line 981 of file stl_list.h.
References std::list< _Tp, _Alloc >::end().

4.683.3.40 remove() template<typename _Tp , typename _Alloc >

```
list< _Tp, _Alloc >::__remove_return_type list::remove (
            const _Tp & __value )
```

Remove all elements equal to value.

Parameters

__value	The value to remove.

Removes every element in the list equal to *value*. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
Definition at line 331 of file list.tcc.
References std::__addressof(), std::begin(), and std::end().

4.683.3.41 remove_if() template<typename _Tp , typename _Alloc >

```
template<typename _Predicate >
list< _Tp, _Alloc >::__remove_return_type list::remove_if (
            _Predicate __pred )
```

Remove all elements satisfying a predicate.

Template Parameters

_Predicate	Unary predicate function or object.

Removes every element in the list for which the predicate returns true. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
Definition at line 533 of file list.tcc.
References std::begin(), and std::end().

4.683.3.42 rend() [1/2] template<typename _Tp , typename _Alloc = std::allocator<_Tp>>

```
const_reverse_iterator std::list< _Tp, _Alloc >::rend ( ) const  [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first element in the list. Iteration is done in reverse element order.
Definition at line 1008 of file stl_list.h.
References std::list< _Tp, _Alloc >::begin().

4.683.3.43 rend() [2/2] template<typename _Tp , typename _Alloc = std::allocator<_Tp>>

```
reverse_iterator std::list< _Tp, _Alloc >::rend ( )  [inline], [noexcept]
```

Returns a read/write reverse iterator that points to one before the first element in the list. Iteration is done in reverse element order.
Definition at line 999 of file stl_list.h.
References std::list< _Tp, _Alloc >::begin().

4.683.3.44 resize() [1/2] template<typename _Tp , typename _Alloc >

```
void list::resize (
            size_type __new_size )
```

Resizes the list to the specified number of elements.

Parameters

__new_size	Number of elements the list should contain.

This function will resize the list to the specified number of elements. If the number is smaller than the list's current size the list is truncated, otherwise default constructed elements are appended.
Definition at line 230 of file list.tcc.

4.683.3.45 resize() [2/2] template<typename _Tp , typename _Alloc >

```
void list::resize (
            size_type __new_size,
            const value_type & __x )
```

Resizes the list to the specified number of elements.

Parameters

__new_size	Number of elements the list should contain.
__x	Data with which new elements should be populated.

This function will resize the list to the specified number of elements. If the number is smaller than the list's current size the list is truncated, otherwise the list is extended and new elements are populated with given data.
Definition at line 242 of file list.tcc.
References std::end().

4.683.3.46 reverse() template<typename _Tp , typename _Alloc = std::allocator<_Tp>>

```
void std::list< _Tp, _Alloc >::reverse ( )  [inline], [noexcept]
```

Reverse the elements in list.
Reverse the order of elements in the list in linear time.
Definition at line 1798 of file stl_list.h.

4.683.3.47 size() template<typename _Tp , typename _Alloc = std::allocator<_Tp>>

```
size_type std::list< _Tp, _Alloc >::size ( ) const  [inline], [noexcept]
```

Returns the number of elements in the list.

Definition at line 1060 of file stl_list.h.
Referenced by std::list< _Tp, _Alloc >::merge(), and std::operator==().

4.683.3.48 sort() [1/2] template<typename _Tp , typename _Alloc >

```
void list::sort
```

Sort the elements.
Sorts the elements of this list in NlogN time. Equivalent elements remain in list order.
Definition at line 486 of file list.tcc.

4.683.3.49 sort() [2/2] template<typename _Tp , typename _Alloc >

```
template<typename _StrictWeakOrdering >
void list::sort (
            _StrictWeakOrdering __comp )
```

Sort the elements according to comparison function.
Sorts the elements of this list in NlogN time. Equivalent elements remain in list order.
Definition at line 584 of file list.tcc.

4.683.3.50 splice() [1/5]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::splice (
            const_iterator __position,
            list< _Tp, _Alloc > && __x )  [inline], [noexcept]
```

Insert contents of another list.

Parameters

__position	Iterator referencing the element to insert before.
__x	Source list.

The elements of *__x* are inserted in constant time in front of the element referenced by *__position*. *__x* becomes an empty list.
Requires this != *__x*.
Definition at line 1518 of file stl_list.h.
References std::list< _Tp, _Alloc >::begin(), std::list< _Tp, _Alloc >::empty(), and std::list< _Tp, _Alloc >::end().
Referenced by std::list< _Tp, _Alloc >::splice().

4.683.3.51 splice() [2/5]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::splice (
            const_iterator __position,
            list< _Tp, _Alloc > && __x,
            const_iterator __first,
            const_iterator __last )  [inline], [noexcept]
```

Insert range from another list.

Parameters

__position	Const_iterator referencing the element to insert before.
__x	Source list.
__first	Const_iterator referencing the start of range in x.
__last	Const_iterator referencing the end of range in x.

Removes elements in the range [__first,__last) and inserts them before *__position* in constant time.
Undefined if *__position* is in [__first,__last).
Definition at line 1614 of file stl_list.h.
References std::__addressof().

4.683.3.52 splice() [3/5]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::splice (
            const_iterator __position,
            list< _Tp, _Alloc > && __x,
            const_iterator __i )  [inline], [noexcept]
```

Insert element from another list.

Parameters

__position	Const_iterator referencing the element to insert before.
__x	Source list.
__i	Const_iterator referencing the element to move.

Removes the element in list *__x* referenced by *__i* and inserts it into the current list before *__position*.
Definition at line 1553 of file stl_list.h.
References std::__addressof().

4.683.3.53 splice() [4/5] template<typename _Tp , typename _Alloc = std::allocator<_Tp>>

```
void std::list< _Tp, _Alloc >::splice (
            const_iterator __position,
            list< _Tp, _Alloc > & __x,
            const_iterator __first,
            const_iterator __last )  [inline], [noexcept]
```

Insert range from another list.

Parameters

__position	Const_iterator referencing the element to insert before.
__x	Source list.
__first	Const_iterator referencing the start of range in x.
__last	Const_iterator referencing the end of range in x.

Removes elements in the range [__first,__last) and inserts them before *__position* in constant time.
Undefined if *__position* is in [__first,__last).
Definition at line 1664 of file stl_list.h.
References std::move(), and std::list< _Tp, _Alloc >::splice().

4.683.3.54 splice() [5/5] template<typename _Tp , typename _Alloc = std::allocator<_Tp>>

```
void std::list< _Tp, _Alloc >::splice (
            const_iterator __position,
            list< _Tp, _Alloc > & __x,
            const_iterator __i )  [inline], [noexcept]
```

Insert element from another list.

Parameters

__position	Const_iterator referencing the element to insert before.
__x	Source list.
__i	Const_iterator referencing the element to move.

Removes the element in list *__x* referenced by *__i* and inserts it into the current list before *__position*.
Definition at line 1595 of file stl_list.h.
References std::move(), and std::list< _Tp, _Alloc >::splice().

4.683.3.55 swap() template<typename _Tp , typename _Alloc = std::allocator<_Tp>>

```
void std::list< _Tp, _Alloc >::swap (
            list< _Tp, _Alloc > & __x )  [inline], [noexcept]
```
Swaps data with another list.

Parameters

_↩ _x	A list of the same element and allocator types.

This exchanges the elements between two lists in constant time. Note that the global std::swap() function is specialized such that std::swap(l1,l2) will feed to this function.
Whether the allocators are swapped depends on the allocator traits.
Definition at line 1478 of file stl_list.h.

4.683.3.56 unique() [1/2] template<typename _Tp , typename _Alloc >

```
list< _Tp, _Alloc >::__remove_return_type list::unique
```
Remove consecutive duplicate elements.
For each consecutive set of elements with the same value, remove all but the first one. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
Definition at line 367 of file list.tcc.
References std::begin(), and std::end().

4.683.3.57 unique() [2/2] template<typename _Tp , typename _Alloc >

```
template<typename _BinaryPredicate >
list< _Tp, _Alloc >::__remove_return_type list::unique (
            _BinaryPredicate __binary_pred )
```
Remove consecutive elements satisfying a predicate.

Template Parameters

_BinaryPredicate	Binary predicate function or object.

For each consecutive set of elements [first,last) that satisfy predicate(first,i) where i is an iterator in [first,last), remove all but the first one. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
Definition at line 556 of file list.tcc.
References std::begin(), and std::end().
The documentation for this class was generated from the following files:

- stl_list.h
- list.tcc

4.684 __gnu_pbds::list_update< Key, Mapped, Eq_Fn, Update_Policy, _Alloc > Class Template Reference

Inherits detail::container_base_dispatch::type.

Public Types

- typedef list_update_tag **container_category**

- typedef Eq_Fn **eq_fn**
- typedef Update_Policy **update_policy**

Public Member Functions

- **list_update** (const list_update &other)
- template<typename It >
  list_update (It first, It last)
- list_update & **operator=** (const list_update &other)
- void **swap** (list_update &other)

4.684.1 Detailed Description

template<typename Key, typename Mapped, class Eq_Fn = typename detail::default_eq_fn<Key>::type, class Update_Policy = detail::default_update_policy::type, class _Alloc = std::allocator<char>>
class __gnu_pbds::list_update< Key, Mapped, Eq_Fn, Update_Policy, _Alloc >

A list-update based associative container.

Template Parameters

Key	Key type.
Mapped	Map type.
Eq_Fn	Equal functor.
Update_Policy	Update policy, determines when an element will be moved to the front of the list.
_Alloc	Allocator type.

Base is detail::lu_map.
Definition at line 815 of file assoc_container.hpp.

4.684.2 Constructor & Destructor Documentation

4.684.2.1 list_update() `template<typename Key , typename Mapped , class Eq_Fn = typename detail::default_eq_fn<Key>::type, class Update_Policy = detail::default_update_policy::type, class _Alloc = std::allocator<char>>`

```
template<typename It >
__gnu_pbds::list_update< Key, Mapped, Eq_Fn, Update_Policy, _Alloc >::list_update (
            It first,
            It last )  [inline]
```

Constructor taking __iterators to a range of value_types. The value_types between first_it and last_it will be inserted into the container object.
Definition at line 831 of file assoc_container.hpp.
The documentation for this class was generated from the following file:

- assoc_container.hpp

4.686.1 Detailed Description

Container class for localization functionality.
The locale class is first a class wrapper for C library locales. It is also an extensible container for user-defined localization. A locale is a collection of facets that implement various localization features such as money, time, and number printing. Constructing C++ locales does not change the C library locale.
This library supports efficient construction and copying of locales through a reference counting implementation of the locale class.
Definition at line 62 of file locale_classes.h.

4.686.2 Member Typedef Documentation

4.686.2.1 category `typedef int std::locale::category`

Definition of locale::category.
Definition at line 67 of file locale_classes.h.

4.686.3 Constructor & Destructor Documentation

4.686.3.1 locale() [1/8] `std::locale::locale ( ) throw ( )`

Default constructor.
Constructs a copy of the global locale. If no locale has been explicitly set, this is the C locale.

4.686.3.2 locale() [2/8]

```
std::locale::locale (
            const locale & __other ) throw ( )
```

Copy constructor.
Constructs a copy of *other*.

Parameters

__other	The locale to copy.

4.686.3.3 locale() [3/8] std::locale::locale (const char * __s) [explicit]

Named locale constructor.
Constructs a copy of the named C library locale.

Parameters

__s	Name of the locale to construct.

Exceptions

std::runtime_error	if __s is null or an undefined locale.

4.686.3.4 locale() [4/8] std::locale::locale (const locale & __base, const char * __s, category __cat)

Construct locale with facets from another locale.
Constructs a copy of the locale *base*. The facets specified by *cat* are replaced with those from the locale named by *s*. If base is named, this locale instance will also be named.

Parameters

__base	The locale to copy.
__s	Name of the locale to use facets from.
__cat	Set of categories defining the facets to use from __s.

Exceptions

std::runtime_error	if __s is null or an undefined locale.

4.686.3.5 locale() [5/8] std::locale::locale (const std::string & __s) [inline], [explicit]

Named locale constructor.
Constructs a copy of the named C library locale.

Parameters

_↩ _s	Name of the locale to construct.

Exceptions

std::runtime_error	if __s is an undefined locale.

Definition at line 163 of file locale_classes.h.

4.686.3.6 locale() [6/8] std::locale::locale (

```
const locale & __base,
const std::string & __s,
category __cat ) [inline]
```

Construct locale with facets from another locale.
Constructs a copy of the locale *base*. The facets specified by *cat* are replaced with those from the locale named by *s*. If base is named, this locale instance will also be named.

Parameters

__base	The locale to copy.
__s	Name of the locale to use facets from.
__cat	Set of categories defining the facets to use from __s.

Exceptions

std::runtime_error	if __s is an undefined locale.

Definition at line 177 of file locale_classes.h.

4.686.3.7 locale() [7/8] std::locale::locale (

```
const locale & __base,
const locale & __add,
category __cat )
```

Construct locale with facets from another locale.
Constructs a copy of the locale *base*. The facets specified by *cat* are replaced with those from the locale *add*. If *base* and *add* are named, this locale instance will also be named.

Parameters

__base	The locale to copy.
__add	The locale to use facets from.
__cat	Set of categories defining the facets to use from add.

4.686.3.8 locale() [8/8] template<typename _Facet >

```
std::locale::locale (
            const locale & __other,
            _Facet * __f )
```

Construct locale with another facet.
Constructs a copy of the locale *__other*. The facet *__f* is added to *__other*, replacing an existing facet of type Facet if there is one. If *__f* is null, this locale is a copy of *__other*.

Parameters

__other	The locale to copy.
__f	The facet to add in.

Definition at line 44 of file locale_classes.tcc.

4.686.3.9 ~locale() std::locale::~locale ( ) throw ( )

Locale destructor.

4.686.4 Member Function Documentation

4.686.4.1 classic() static const locale& std::locale::classic ( ) [static]

Return reference to the C locale.

4.686.4.2 combine() template<typename _Facet >

```
locale std::locale::combine (
            const locale & __other ) const
```

Construct locale with another facet.
Constructs and returns a new copy of this locale. Adds or replaces an existing facet of type Facet from the locale *other* into the new locale.

Template Parameters

_Facet	The facet type to copy from other

Parameters

__other	The locale to copy from.

Returns

Newly constructed locale.

Exceptions

std::runtime_error	if __other has no facet of type _Facet.

Definition at line 62 of file locale_classes.tcc.

4.686.4.3 global() `static locale std::locale::global ( const locale & __loc ) [static]`

Set global locale.

This function sets the global locale to the argument and returns a copy of the previous global locale. If the argument has a name, it will also call std::setlocale(LC_ALL, loc.name()).

Parameters

__loc	The new locale to make global.

Returns

Copy of the old global locale.

4.686.4.4 name() `_GLIBCXX_DEFAULT_ABI_TAG string std::locale::name ( ) const`

Return locale name.

Returns

Locale name or "*" if unnamed.

4.686.4.5 operator"!=() `bool std::locale::operator!= ( const locale & __other ) const throw ( ) [inline]`

Locale inequality.

Parameters

__other	The locale to compare against.

Returns

! (*this == __other)

Definition at line 265 of file locale_classes.h.

References operator==().

4.686.4.6 operator()() `template<typename _Char , typename _Traits , typename _Alloc > bool std::locale::operator() ( const basic_string< _Char, _Traits, _Alloc > & __s1, const basic_string< _Char, _Traits, _Alloc > & __s2 ) const`

Compare two strings according to collate.

Template operator to compare two strings using the compare function of the collate facet in this locale. One use is to provide the locale to the sort function. For example, a vector v of strings could be sorted according to locale loc by doing:

```
std::sort(v.begin(), v.end(), loc);
```

Parameters

__s1	First string to compare.
__s2	Second string to compare.

Returns

True if collate<_Char> facet compares __s1 < __s2, else false.

4.686.4.7 operator=()

```
const locale& std::locale::operator= (
        const locale & __other ) throw ( )
```

Assignment operator.
Set this locale to be a copy of *other*.

Parameters

__other	The locale to copy.

Returns

A reference to this locale.

4.686.4.8 operator==()

```
bool std::locale::operator== (
        const locale & __other ) const throw ( )
```

Locale equality.

Parameters

__other	The locale to compare against.

Returns

True if other and this refer to the same locale instance, are copies, or have the same name. False otherwise.

Referenced by operator!=().

4.686.5 Friends And Related Function Documentation

4.686.5.1 has_facet

```
template<typename _Facet >
bool has_facet (
        const locale &  ) throw ( )   [friend]
```

Test for the presence of a facet.
has_facet tests the locale argument for the presence of the facet type provided as the template parameter. Facets derived from the facet parameter will also return true.

Template Parameters

_Facet	The facet type to test the presence of.

Parameters

__loc	The locale to test.

Returns

true if __loc contains a facet of type _Facet, else false.

Definition at line 104 of file locale_classes.tcc.

4.686.5.2 use_facet `template<typename _Facet >`

```
const _Facet& use_facet (
            const locale &  )  [friend]
```

Return a facet.
use_facet looks for and returns a reference to a facet of type Facet where Facet is the template parameter. If has_facet(locale) is true, there is a suitable facet to return. It throws std::bad_cast if the locale doesn't contain a facet of type Facet.

Template Parameters

_Facet	The facet type to access.

Parameters

__loc	The locale to use.

Returns

Reference to facet of type Facet.

Exceptions

std::bad_cast	if __loc doesn't contain a facet of type _Facet.

Definition at line 132 of file locale_classes.tcc.

- logic_error (const string &__arg) _GLIBCXX_TXN_SAFE
- **logic_error** (logic_error &&) noexcept
- logic_error & **operator=** (const logic_error &)=default
- logic_error & **operator=** (logic_error &&) noexcept
- virtual const char * what () const noexcept

4.688.1 Detailed Description

One of two subclasses of exception.
Logic errors represent problems in the internal logic of a program; in theory, these are preventable, and even detectable before the program runs (e.g., violations of class invariants).
Definition at line 113 of file stdexcept.

4.688.2 Constructor & Destructor Documentation

4.688.2.1 logic_error() `std::logic_error::logic_error ( const string & __arg ) [explicit]`

Takes a character string describing the error.

4.688.3 Member Function Documentation

4.688.3.1 what() `virtual const char* std::logic_error::what ( ) const [virtual], [noexcept]`

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from std::exception.
Reimplemented in std::future_error.
The documentation for this class was generated from the following file:

- stdexcept

4.689 std::logical_and< _Tp > Struct Template Reference

4.695.1 Detailed Description

template<typename _RealType = double>
class std::lognormal_distribution< _RealType >

A lognormal_distribution random number distribution.
The formula for the normal probability mass function is

$$p(x|m,s) = \frac{1}{sx\sqrt{2\pi}} \exp -\frac{(\ln x - m)^2}{2s^2}$$

Definition at line 2191 of file random.h.

4.695.2 Member Typedef Documentation

4.695.2.1 result_type `template<typename _RealType = double>`

```
typedef _RealType std::lognormal_distribution< _RealType >::result_type
```

The type of the range of the distribution.
Definition at line 2198 of file random.h.

4.695.3 Member Function Documentation

4.695.3.1 max() template<typename _RealType = double>

result_type std::lognormal_distribution< _RealType >::max ( ) const [inline]

Returns the least upper bound value of the distribution.

Definition at line 2289 of file random.h.

References std::numeric_limits< _Tp >::max().

4.695.3.2 min() template<typename _RealType = double>

result_type std::lognormal_distribution< _RealType >::min ( ) const [inline]

Returns the greatest lower bound value of the distribution.

Definition at line 2282 of file random.h.

4.695.3.3 operator()() template<typename _RealType = double>

```
template<typename _UniformRandomNumberGenerator >
result_type std::lognormal_distribution< _RealType >::operator() (
            _UniformRandomNumberGenerator & __urng ) [inline]
```

Generating functions.

Definition at line 2297 of file random.h.

4.695.3.4 param() [1/2] template<typename _RealType = double>

param_type std::lognormal_distribution< _RealType >::param ( ) const [inline]

Returns the parameter set of the distribution.

Definition at line 2267 of file random.h.

4.695.3.5 param() [2/2] template<typename _RealType = double>

```
void std::lognormal_distribution< _RealType >::param (
            const param_type & __param ) [inline]
```

Sets the parameter set of the distribution.

Parameters

__param	The new parameter set of the distribution.

Definition at line 2275 of file random.h.

4.695.3.6 reset() template<typename _RealType = double>

void std::lognormal_distribution< _RealType >::reset ( ) [inline]

Resets the distribution state.

Definition at line 2249 of file random.h.

References std::normal_distribution< _RealType >::reset().

4.695.4 Friends And Related Function Documentation

4.695.4.1 operator<< template<typename _RealType = double>

```
template<typename _RealType1 , typename _CharT , typename _Traits >
std::basic_ostream<_CharT, _Traits>& operator<< (
```

```
            std::basic_ostream< _CharT, _Traits > & __os,
            const std::lognormal_distribution< _RealType1 > & __x )  [friend]
```

Inserts a lognormal_distribution random number distribution __x into the output stream __os.

Parameters

__os	An output stream.
__x	A lognormal_distribution random number distribution.

Returns

The output stream with the state of __x inserted or in an error state.

4.695.4.2 operator== `template<typename _RealType = double>`

```
bool operator== (
            const lognormal_distribution< _RealType > & __d1,
            const lognormal_distribution< _RealType > & __d2 )  [friend]
```

Return true if two lognormal distributions have the same parameters and the sequences that would be generated are equal.
Definition at line 2334 of file random.h.

4.695.4.3 operator>> `template<typename _RealType = double>`

```
template<typename _RealType1 , typename _CharT , typename _Traits >
std::basic_istream<_CharT, _Traits>& operator>> (
            std::basic_istream< _CharT, _Traits > & __is,
            std::lognormal_distribution< _RealType1 > & __x )  [friend]
```

Extracts a lognormal_distribution random number distribution __x from the input stream __is.

Parameters

_↩ _is	An input stream.
_↩ _x	A lognormal_distribution random number generator engine.

Returns

The input stream with __x extracted or in an error state.

The documentation for this class was generated from the following files:

- random.h

4.697.1 Detailed Description

template<**std::size_t Max_Count = 5, typename _Alloc = std::allocator**<**char**>>
class __gnu_pbds::lu_counter_policy< **Max_Count, _Alloc** >

A list-update policy that moves elements to the front of the list based on the counter algorithm.
Definition at line 91 of file list_update_policy.hpp.

4.697.2 Member Typedef Documentation

4.697.2.1 metadata_reference

```
template<std::size_t Max_Count = 5, typename _Alloc = std::allocator<char>>
typedef detail::rebind_traits<_Alloc, metadata_type>::reference __gnu_pbds::lu_counter_policy<
Max_Count, _Alloc >::metadata_reference
```

Reference to metadata on which this functor operates.
Definition at line 114 of file list_update_policy.hpp.

4.697.2.2 metadata_type

```
template<std::size_t Max_Count = 5, typename _Alloc = std::allocator<char>>
typedef detail::lu_counter_metadata<size_type> __gnu_pbds::lu_counter_policy< Max_Count, _Alloc
>::metadata_type
```

Metadata on which this functor operates.
Definition at line 106 of file list_update_policy.hpp.

4.697.3 Member Enumeration Documentation

4.697.3.1 anonymous enum

```
template<std::size_t Max_Count = 5, typename _Alloc = std::allocator<char>>
anonymous enum
```

Enumerator

max_count	When some element is accessed this number of times, it will be moved to the front of the list.

Definition at line 98 of file list_update_policy.hpp.

4.697.4 Member Function Documentation

4.697.4.1 operator()() [1/2]

```
template<std::size_t Max_Count = 5, typename _Alloc = std::allocator<char>>
metadata_type __gnu_pbds::lu_counter_policy< Max_Count, _Alloc >::operator() ( ) const  [inline]
```

Creates a metadata object.
Definition at line 118 of file list_update_policy.hpp.
References __gnu_pbds::lu_counter_policy< Max_Count, _Alloc >::max_count.

4.697.4.2 operator()() [2/2]

```
template<std::size_t Max_Count = 5, typename _Alloc = std::allocator<char>>
bool __gnu_pbds::lu_counter_policy< Max_Count, _Alloc >::operator() (
            metadata_reference r_data ) const  [inline]
```

Decides whether a metadata object should be moved to the front of the list.
Definition at line 124 of file list_update_policy.hpp.

4.700.1 Detailed Description

template<typename _Alloc = std::allocator<char>>
class __gnu_pbds::lu_move_to_front_policy< _Alloc >

A list-update policy that unconditionally moves elements to the front of the list. A null type means that each link in a list-based container does not actually need metadata.
Definition at line 58 of file list_update_policy.hpp.

4.700.2 Member Typedef Documentation

4.700.2.1 metadata_reference `template<typename _Alloc = std::allocator<char>>`

`typedef detail::rebind_traits<_Alloc, metadata_type>::reference __gnu_pbds::lu_move_to_front_policy< _Alloc >::metadata_reference`

Reference to metadata on which this functor operates.
Definition at line 69 of file list_update_policy.hpp.

4.700.2.2 metadata_type `template<typename _Alloc = std::allocator<char>>`

`typedef null_type __gnu_pbds::lu_move_to_front_policy< _Alloc >::metadata_type`

Metadata on which this functor operates.
Definition at line 64 of file list_update_policy.hpp.

4.700.3 Member Function Documentation

4.700.3.1 operator()() [1/2] `template<typename _Alloc = std::allocator<char>>`

`metadata_type __gnu_pbds::lu_move_to_front_policy< _Alloc >::operator() ( ) const [inline]`

Creates a metadata object.
Definition at line 73 of file list_update_policy.hpp.

4.700.3.2 operator()() [2/2] `template<typename _Alloc = std::allocator<char>>`

```
bool __gnu_pbds::lu_move_to_front_policy< _Alloc >::operator() (
            metadata_reference r_metadata ) const [inline]
```

Decides whether a metadata object should be moved to the front of the list.
Definition at line 79 of file list_update_policy.hpp.

4.704.1 Detailed Description

template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Allocator = std::allocator<std::pair<const _Key, _Tp> > >
class std::__debug::map< _Key, _Tp, _Compare, _Allocator >

Class std::map with safety/checking/debug instrumentation.
Definition at line 44 of file map.h.

4.704.2 Member Function Documentation

4.704.2.1 _M_detach_all() void __gnu_debug::_Safe_sequence_base::_M_detach_all ( ) [protected], [inherited]

Detach all iterators, leaving them singular.
Referenced by __gnu_debug::_Safe_sequence_base::~_Safe_sequence_base().

4.704.2.2 _M_detach_singular() void __gnu_debug::_Safe_sequence_base::_M_detach_singular ( ) [protected], [inherited]

Detach all singular iterators.

Postcondition

for all iterators i attached to this sequence, i->_M_version == _M_version.

4.704.2.3 _M_get_mutex() __gnu_cxx::__mutex& __gnu_debug::_Safe_sequence_base::_M_get_mutex ( ) throw ( ) [protected], [inherited]

For use in _Safe_sequence.
Referenced by __gnu_debug::_Safe_sequence< _Sequence >::_M_transfer_from_if().

4.704.2.4 _M_invalidate_all() void __gnu_debug::_Safe_sequence_base::_M_invalidate_all ( ) const [inline], [protected], [inherited]

Invalidates all iterators.
Definition at line 256 of file safe_base.h.
References __gnu_debug::_Safe_sequence_base::_M_version.

4.704.2.5 _M_invalidate_if() template<typename _Sequence > template<typename _Predicate > void __gnu_debug::_Safe_sequence< _Sequence >::_M_invalidate_if (_Predicate __pred) [inherited]

Invalidates all iterators `x` that reference this sequence, are not singular, and for which `__pred(x)` returns `true`. `__pred` will be invoked with the normal iterators nested in the safe ones.
Definition at line 37 of file safe_sequence.tcc.

4.704.2.6 _M_revalidate_singular() void __gnu_debug::_Safe_sequence_base::_M_revalidate_singular ( ) [protected], [inherited]

Revalidates all attached singular iterators. This method may be used to validate iterators that were invalidated before (but for some reason, such as an exception, need to become valid again).

4.704.2.7 _M_swap() void __gnu_debug::_Safe_sequence_base::_M_swap (_Safe_sequence_base & __x) [protected], [noexcept], [inherited]

Swap this sequence with the given sequence. This operation also swaps ownership of the iterators, so that when the operation is complete all iterators that originally referenced one container now reference the other container.

4.704.2.8 _M_transfer_from_if() template<typename _Sequence > template<typename _Predicate > void __gnu_debug::_Safe_sequence< _Sequence >::_M_transfer_from_if (_Safe_sequence< _Sequence > & *__from*, _Predicate *__pred*) [inherited]

Transfers all iterators `x` that reference `from` sequence, are not singular, and for which `__pred(x)` returns `true`. `__pred` will be invoked with the normal iterators nested in the safe ones.
Definition at line 68 of file safe_sequence.tcc.
References std::__addressof(), __gnu_debug::_Safe_sequence_base::_M_const_iterators, __gnu_debug::_Safe_iterator_base::_M_detach_single(), __gnu_debug::_Safe_sequence_base::_M_get_mutex(), __gnu_debug::_Safe_sequence_base::_M_iterators, __gnu_debug::_Safe_iterator_base::_M_next, __gnu_debug::_Safe_iterator_base::_M_prior, __gnu_debug::_Safe_iterator_base::_M_sequence, and __gnu_debug::_Safe_iterator_base::_M_version.

4.704.3 Member Data Documentation

4.704.3.1 _M_const_iterators _Safe_iterator_base* __gnu_debug::_Safe_sequence_base::_M_const_iterators [inherited]

The list of constant iterators that reference this container.
Definition at line 197 of file safe_base.h.
Referenced by __gnu_debug::_Safe_sequence< _Sequence >::_M_transfer_from_if().

4.704.3.2 _M_iterators _Safe_iterator_base* __gnu_debug::_Safe_sequence_base::_M_iterators [inherited]

The list of mutable iterators that reference this container.
Definition at line 194 of file safe_base.h.
Referenced by __gnu_debug::_Safe_sequence< _Sequence >::_M_transfer_from_if().

4.704.3.3 _M_version unsigned int __gnu_debug::_Safe_sequence_base::_M_version [mutable], [inherited]

The container version number. This number may never be 0.
Definition at line 200 of file safe_base.h.
Referenced by __gnu_debug::_Safe_sequence_base::_M_invalidate_all().

4.705.1 Detailed Description

template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> > >
class std::map< _Key, _Tp, _Compare, _Alloc >

A standard container made up of (key,value) pairs, which can be retrieved based on a key, in logarithmic time.

Template Parameters

_Key	Type of key objects.
_Tp	Type of mapped objects.
_Compare	Comparison function object type, defaults to less<_Key>.
_Alloc	Allocator type, defaults to allocator<pair<const _Key, _Tp>.

Meets the requirements of a container, a reversible container, and an associative container (using unique keys). For a map<Key,T> the key_type is Key, the mapped_type is T, and the value_type is std::pair<const Key,T>.
Maps support bidirectional iterators.
The private tree data is declared exactly the same way for map and multimap; the distinction is made entirely in how the

tree functions are called (*_unique versus *_equal, same as the standard).
Definition at line 100 of file stl_map.h.

4.705.2 Constructor & Destructor Documentation

4.705.2.1 map() [1/12]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
std::map< _Key, _Tp, _Compare, _Alloc >::map ( )  [default]
```

Default constructor creates no elements.

4.705.2.2 map() [2/12]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
std::map< _Key, _Tp, _Compare, _Alloc >::map (
            const _Compare & __comp,
            const allocator_type & __a = allocator_type() )  [inline], [explicit]
```

Creates a map with no elements.

Parameters

__comp	A comparison object.
__a	An allocator object.

Definition at line 194 of file stl_map.h.

4.705.2.3 map() [3/12]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
std::map< _Key, _Tp, _Compare, _Alloc >::map (
            const map< _Key, _Tp, _Compare, _Alloc > &  )  [default]
```

Map copy constructor.
Whether the allocator is copied depends on the allocator traits.

4.705.2.4 map() [4/12]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
std::map< _Key, _Tp, _Compare, _Alloc >::map (
            map< _Key, _Tp, _Compare, _Alloc > &&  )  [default]
```

Map move constructor.
The newly-created map contains the exact contents of the moved instance. The moved instance is a valid, but unspecified, map.

4.705.2.5 map() [5/12]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
std::map< _Key, _Tp, _Compare, _Alloc >::map (
            initializer_list< value_type > __l,
            const _Compare & __comp = _Compare(),
            const allocator_type & __a = allocator_type() )  [inline]
```

Builds a map from an initializer_list.

Parameters

__l	An initializer_list.
__comp	A comparison object.
__a	An allocator object.

Create a map consisting of copies of the elements in the initializer_list *__l*. This is linear in N if the range is already sorted, and NlogN otherwise (where N is *__l.size()*).
Definition at line 228 of file stl_map.h.

4.705.2.6 map() [6/12]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
std::map< _Key, _Tp, _Compare, _Alloc >::map (
            const allocator_type & __a )  [inline], [explicit]
```

Allocator-extended default constructor.
Definition at line 236 of file stl_map.h.

4.705.2.7 map() [7/12]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
std::map< _Key, _Tp, _Compare, _Alloc >::map (
            const map< _Key, _Tp, _Compare, _Alloc > & __m,
            const allocator_type & __a )  [inline]
```

Allocator-extended copy constructor.
Definition at line 240 of file stl_map.h.

4.705.2.8 map() [8/12]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
std::map< _Key, _Tp, _Compare, _Alloc >::map (
            map< _Key, _Tp, _Compare, _Alloc > && __m,
            const allocator_type & __a )  [inline], [noexcept]
```

Allocator-extended move constructor.
Definition at line 244 of file stl_map.h.

4.705.2.9 map() [9/12]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
std::map< _Key, _Tp, _Compare, _Alloc >::map (
            initializer_list< value_type > __l,
            const allocator_type & __a )  [inline]
```

Allocator-extended initialier-list constructor.
Definition at line 250 of file stl_map.h.

4.705.2.10 map() [10/12]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
template<typename _InputIterator >
std::map< _Key, _Tp, _Compare, _Alloc >::map (
            _InputIterator __first,
```

```
            _InputIterator __last,
            const allocator_type & __a )  [inline]
```

Allocator-extended range constructor.
Definition at line 256 of file stl_map.h.

4.705.2.11 map() [11/12]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<↩
_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
template<typename _InputIterator >
std::map< _Key, _Tp, _Compare, _Alloc >::map (
            _InputIterator __first,
            _InputIterator __last )  [inline]
```

Builds a map from a range.

Parameters

__first	An input iterator.
__last	An input iterator.

Create a map consisting of copies of the elements from [__first,__last). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(__first,__last)).
Definition at line 273 of file stl_map.h.

4.705.2.12 map() [12/12]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<↩
_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
template<typename _InputIterator >
std::map< _Key, _Tp, _Compare, _Alloc >::map (
            _InputIterator __first,
            _InputIterator __last,
            const _Compare & __comp,
            const allocator_type & __a = allocator_type() )  [inline]
```

Builds a map from a range.

Parameters

__first	An input iterator.
__last	An input iterator.
__comp	A comparison functor.
__a	An allocator object.

Create a map consisting of copies of the elements from [__first,__last). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(__first,__last)).
Definition at line 290 of file stl_map.h.

4.705.2.13 ~map()

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
std::map< _Key, _Tp, _Compare, _Alloc >::~map ( )  [default]
```

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

4.705.3 Member Function Documentation

4.705.3.1 at() template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>

```
mapped_type& std::map< _Key, _Tp, _Compare, _Alloc >::at (
            const key_type & __k )  [inline]
```

Access to map data.

Parameters

_↩ _k	The key for which data should be retrieved.

Returns

A reference to the data whose key is equivalent to __k, if such a data is present in the map.

Exceptions

std::out_of_range	If no such data is present.

Definition at line 537 of file stl_map.h.
References std::map< _Key, _Tp, _Compare, _Alloc >::end(), std::map< _Key, _Tp, _Compare, _Alloc >::key_comp(), and std::map< _Key, _Tp, _Compare, _Alloc >::lower_bound().

4.705.3.2 begin() [1/2] template<typename _Key , typename _Tp , typename _Compare = std::less<_↩ Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>

```
const_iterator std::map< _Key, _Tp, _Compare, _Alloc >::begin ( ) const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first pair in the map. Iteration is done in ascending order according to the keys.
Definition at line 365 of file stl_map.h.

4.705.3.3 begin() [2/2] template<typename _Key , typename _Tp , typename _Compare = std::less<_↩ Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>

```
iterator std::map< _Key, _Tp, _Compare, _Alloc >::begin ( )  [inline], [noexcept]
```

Returns a read/write iterator that points to the first pair in the map. Iteration is done in ascending order according to the keys.
Definition at line 356 of file stl_map.h.

4.705.3.4 cbegin() template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>

```
const_iterator std::map< _Key, _Tp, _Compare, _Alloc >::cbegin ( ) const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first pair in the map. Iteration is done in ascending order according to the keys.
Definition at line 429 of file stl_map.h.

4.705.3.5 cend() template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>

const_iterator std::map< _Key, _Tp, _Compare, _Alloc >::cend ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points one past the last pair in the map. Iteration is done in ascending order according to the keys.

Definition at line 438 of file stl_map.h.

4.705.3.6 clear() template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>

void std::map< _Key, _Tp, _Compare, _Alloc >::clear ( ) [inline], [noexcept]

Erases all elements in a map. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1133 of file stl_map.h.

4.705.3.7 count() [1/2] template<typename _Key , typename _Tp , typename _Compare = std::less<_↩ Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> template<typename _Kt >

auto std::map< _Key, _Tp, _Compare, _Alloc >::count (const _Kt & __x) const -> decltype(_M_t._M_count_tr(__x)) [inline]

Finds the number of elements with given key.

Parameters

_↩ _x	Key of (key, value) pairs to be located.

Returns

Number of elements with specified key.

This function only makes sense for multimaps; for map the result will either be 0 (not present) or 1 (present).

Definition at line 1221 of file stl_map.h.

4.705.3.8 count() [2/2] template<typename _Key , typename _Tp , typename _Compare = std::less<_↩ Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>

size_type std::map< _Key, _Tp, _Compare, _Alloc >::count (const key_type & __x) const [inline]

Finds the number of elements with given key.

Parameters

_↩ _x	Key of (key, value) pairs to be located.

Returns

Number of elements with specified key.

This function only makes sense for multimaps; for map the result will either be 0 (not present) or 1 (present).

Definition at line 1215 of file stl_map.h.

4.705.3.9 crbegin()

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
const_reverse_iterator std::map< _Key, _Tp, _Compare, _Alloc >::crbegin ( ) const  [inline],
[noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last pair in the map. Iteration is done in descending order according to the keys.
Definition at line 447 of file stl_map.h.

4.705.3.10 crend()

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
const_reverse_iterator std::map< _Key, _Tp, _Compare, _Alloc >::crend ( ) const  [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first pair in the map. Iteration is done in descending order according to the keys.
Definition at line 456 of file stl_map.h.

4.705.3.11 emplace()

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
template<typename...  _Args>
std::pair<iterator, bool> std::map< _Key, _Tp, _Compare, _Alloc >::emplace (
            _Args &&...  __args )  [inline]
```

Attempts to build and insert a std::pair into the map.

Parameters

__args	Arguments used to generate a new pair instance (see std::piecewise_contruct for passing arguments to each part of the pair constructor).

Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to build and insert a (key, value) pair into the map. A map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the map.
Insertion requires logarithmic time.
Definition at line 576 of file stl_map.h.

4.705.3.12 emplace_hint()

```
template<typename _Key , typename _Tp , typename _Compare = std::less<↩
_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
template<typename...  _Args>
iterator std::map< _Key, _Tp, _Compare, _Alloc >::emplace_hint (
            const_iterator __pos,
            _Args &&...  __args )  [inline]
```

Attempts to build and insert a std::pair into the map.

Parameters

__pos	An iterator that serves as a hint as to where the pair should be inserted.
__args	Arguments used to generate a new pair instance (see std::piecewise_contruct for passing arguments to each part of the pair constructor).

Returns

An iterator that points to the element with key of the std::pair built from *__args* (may or may not be that std::pair).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument emplace() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.
See https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints for more on *hinting*.
Insertion requires logarithmic time (if the hint is not taken).
Definition at line 606 of file stl_map.h.

4.705.3.13 empty()

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
bool std::map< _Key, _Tp, _Compare, _Alloc >::empty ( ) const  [inline], [noexcept]
```

Returns true if the map is empty. (Thus begin() would equal end().)
Definition at line 465 of file stl_map.h.

4.705.3.14 end() [1/2]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::map< _Key, _Tp, _Compare, _Alloc >::end ( ) const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last pair in the map. Iteration is done in ascending order according to the keys.
Definition at line 383 of file stl_map.h.

4.705.3.15 end() [2/2]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
iterator std::map< _Key, _Tp, _Compare, _Alloc >::end ( )  [inline], [noexcept]
```

Returns a read/write iterator that points one past the last pair in the map. Iteration is done in ascending order according to the keys.
Definition at line 374 of file stl_map.h.
Referenced by std::map< _Key, _Tp, _Compare, _Alloc >::at().

4.705.3.16 equal_range() [1/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Kt >
auto std::map< _Key, _Tp, _Compare, _Alloc >::equal_range (
            const _Kt & __x ) -> decltype(pair<iterator, iterator>(_M_t._M_equal_range_tr(__x)))
[inline]
```

Finds a subsequence matching given key.

Parameters

__x	Key of (key, value) pairs to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to
```
std::make_pair(c.lower_bound(val),
               c.upper_bound(val))
```
(but is faster than making the calls separately).
This function probably only makes sense for multimaps.
Definition at line 1358 of file stl_map.h.

4.705.3.17 equal_range() [2/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Kt >
auto std::map< _Key, _Tp, _Compare, _Alloc >::equal_range (
            const _Kt & __x ) const -> decltype(pair<const_iterator, const_iterator>( _M_t._M_equal_range_tr(__x)))   [inline]
```

Finds a subsequence matching given key.

Parameters

_x	Key of (key, value) pairs to be located.

Returns

Pair of read-only (constant) iterators that possibly points to the subsequence matching given key.

This function is equivalent to
```
std::make_pair(c.lower_bound(val),
               c.upper_bound(val))
```
(but is faster than making the calls separately).
This function probably only makes sense for multimaps.
Definition at line 1387 of file stl_map.h.

4.705.3.18 equal_range() [3/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
std::pair<iterator, iterator> std::map< _Key, _Tp, _Compare, _Alloc >::equal_range (
            const key_type & __x )  [inline]
```

Finds a subsequence matching given key.

Parameters

_x	Key of (key, value) pairs to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to
```
std::make_pair(c.lower_bound(val),
               c.upper_bound(val))
```
(but is faster than making the calls separately).
This function probably only makes sense for multimaps.

Definition at line 1352 of file stl_map.h.

4.705.3.19 equal_range() [4/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
std::pair<const_iterator, const_iterator> std::map< _Key, _Tp, _Compare, _Alloc >::equal_range (
            const key_type & __x ) const  [inline]
```

Finds a subsequence matching given key.

Parameters

_x	Key of (key, value) pairs to be located.

Returns

Pair of read-only (constant) iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
               c.upper_bound(val))
```

(but is faster than making the calls separately).
This function probably only makes sense for multimaps.
Definition at line 1381 of file stl_map.h.

4.705.3.20 erase() [1/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
size_type std::map< _Key, _Tp, _Compare, _Alloc >::erase (
            const key_type & __x )  [inline]
```

Erases elements according to the provided key.

Parameters

_x	Key of element to be erased.

Returns

The number of elements erased.

This function erases all the elements located by the given key from a map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
Definition at line 1068 of file stl_map.h.

4.705.3.21 erase() [2/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
iterator std::map< _Key, _Tp, _Compare, _Alloc >::erase (
            const_iterator __first,
            const_iterator __last )  [inline]
```

Erases a [first,last) range of elements from a map.

Parameters

__first	Iterator pointing to the start of the range to be erased.
__last	Iterator pointing to the end of the range to be erased.

Returns

The iterator *__last*.

This function erases a sequence of elements from a map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
Definition at line 1088 of file stl_map.h.

4.705.3.22 erase() [3/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_↩
Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
iterator std::map< _Key, _Tp, _Compare, _Alloc >::erase (
            const_iterator __position )  [inline]
```

Erases an element from a map.

Parameters

__position	An iterator pointing to the element to be erased.

Returns

An iterator pointing to the element immediately following *position* prior to the element being erased. If no such element exists, end() is returned.

This function erases an element, pointed to by the given iterator, from a map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
Definition at line 1031 of file stl_map.h.

4.705.3.23 erase() [4/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_↩
Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
_GLIBCXX_ABI_TAG_CXX11 iterator std::map< _Key, _Tp, _Compare, _Alloc >::erase (
            iterator __position )  [inline]
```

Erases an element from a map.

Parameters

__position	An iterator pointing to the element to be erased.

Returns

An iterator pointing to the element immediately following *position* prior to the element being erased. If no such element exists, end() is returned.

This function erases an element, pointed to by the given iterator, from a map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1037 of file stl_map.h.

4.705.3.24 find() [1/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_↩
Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Kt >
auto std::map< _Key, _Tp, _Compare, _Alloc >::find (
            const _Kt & __x ) -> decltype(_M_t._M_find_tr(__x))   [inline]
```

Tries to locate an element in a map.

Parameters

_↩ _x	Key of (key, value) pair to be located.

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end (`end()`) iterator.
Definition at line 1175 of file stl_map.h.

4.705.3.25 find() [2/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_↩
Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Kt >
auto std::map< _Key, _Tp, _Compare, _Alloc >::find (
            const _Kt & __x ) const -> decltype(_M_t._M_find_tr(__x))   [inline]
```

Tries to locate an element in a map.

Parameters

_↩ _x	Key of (key, value) pair to be located.

Returns

Read-only (constant) iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns a constant iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end (`end()`) iterator.
Definition at line 1200 of file stl_map.h.

4.705.3.26 find() [3/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_↩
Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
iterator std::map< _Key, _Tp, _Compare, _Alloc >::find (
            const key_type & __x )  [inline]
```

Tries to locate an element in a map.

Parameters

_↩ _x	Key of (key, value) pair to be located.

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end (`end()`) iterator.
Definition at line 1169 of file stl_map.h.

4.705.3.27 find() [4/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_↩
Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::map< _Key, _Tp, _Compare, _Alloc >::find (
            const key_type & __x ) const  [inline]
```

Tries to locate an element in a map.

Parameters

_↩ _x	Key of (key, value) pair to be located.

Returns

Read-only (constant) iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns a constant iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end (`end()`) iterator.
Definition at line 1194 of file stl_map.h.

4.705.3.28 get_allocator()

```
template<typename _Key , typename _Tp , typename _Compare = std::less<↩
_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
allocator_type std::map< _Key, _Tp, _Compare, _Alloc >::get_allocator ( ) const  [inline], [noexcept]
```

Get a copy of the memory allocation object.
Definition at line 346 of file stl_map.h.

4.705.3.29 insert() [1/8]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_↩
Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
template<typename _InputIterator >
void std::map< _Key, _Tp, _Compare, _Alloc >::insert (
            _InputIterator __first,
            _InputIterator __last )  [inline]
```

Template function that attempts to insert a range of elements.

Parameters

__first	Iterator pointing to the start of the range to be inserted.
__last	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.
Definition at line 893 of file stl_map.h.

4.705.3.30 insert() [2/8]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_↩
Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Pair >
__enable_if_t<is_constructible<value_type, _Pair>::value, pair<iterator, bool> > std::map< _↩
Key, _Tp, _Compare, _Alloc >::insert (
            _Pair && __x )  [inline]
```

Attempts to insert a std::pair into the map.

Parameters

_↩ _x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the map. A map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the map.
Insertion requires logarithmic time.
Definition at line 816 of file stl_map.h.

4.705.3.31 insert() [3/8]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_↩
Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
std::pair<iterator, bool> std::map< _Key, _Tp, _Compare, _Alloc >::insert (
            const value_type & __x )  [inline]
```

Attempts to insert a std::pair into the map.

Parameters

_↩ _x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the map. A map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the map.
Insertion requires logarithmic time.
Definition at line 803 of file stl_map.h.
Referenced by std::map< _Key, _Tp, _Compare, _Alloc >::insert().

4.705.3.32 insert() [4/8]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_↩
Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Pair >
```

```
__enable_if_t<is_constructible<value_type, _Pair>::value, iterator> std::map< _Key, _Tp, _↩
Compare, _Alloc >::insert (
            const_iterator __position,
            _Pair && __x )  [inline]
```

Attempts to insert a std::pair into the map.

Parameters

__position	An iterator that serves as a hint as to where the pair should be inserted.
__x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the element with key of *__x* (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument insert() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.
See https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.↩associative.insert_hints for more on *hinting*.
Insertion requires logarithmic time (if the hint is not taken).
Definition at line 875 of file stl_map.h.

4.705.3.33 insert() [5/8]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_↩
Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
iterator std::map< _Key, _Tp, _Compare, _Alloc >::insert (
            const_iterator __position,
            const value_type & __x )  [inline]
```

Attempts to insert a std::pair into the map.

Parameters

__position	An iterator that serves as a hint as to where the pair should be inserted.
__x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the element with key of *__x* (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument insert() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.
See https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.↩associative.insert_hints for more on *hinting*.
Insertion requires logarithmic time (if the hint is not taken).
Definition at line 860 of file stl_map.h.

4.705.3.34 insert() [6/8]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_↩
Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
iterator std::map< _Key, _Tp, _Compare, _Alloc >::insert (
            const_iterator __position,
            value_type && __x )  [inline]
```

Attempts to insert a std::pair into the map.

Parameters

__position	An iterator that serves as a hint as to where the pair should be inserted.
__x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the element with key of *__x* (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument insert() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.
See https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints for more on *hinting*.
Insertion requires logarithmic time (if the hint is not taken).

4.705.3.35 insert() [7/8]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
void std::map< _Key, _Tp, _Compare, _Alloc >::insert (
            std::initializer_list< value_type > __list )  [inline]
```

Attempts to insert a list of std::pairs into the map.

Parameters

__list	A std::initializer_list<value_type> of pairs to be inserted.

Complexity similar to that of the range constructor.
Definition at line 830 of file stl_map.h.
References std::map< _Key, _Tp, _Compare, _Alloc >::insert().

4.705.3.36 insert() [8/8]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
std::pair<iterator, bool> std::map< _Key, _Tp, _Compare, _Alloc >::insert (
            value_type && __x )  [inline]
```

Attempts to insert a std::pair into the map.

Parameters

_Key, *_Tp*	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the map. A map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the map.

Insertion requires logarithmic time.

            const _Kt & __x ) -> decltype(iterator(_M_t._M_lower_bound_tr(__x)))  [inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

_↩ _x	Key of (key, value) pair to be located.

Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.
Definition at line 1264 of file stl_map.h.

4.705.3.39 lower_bound() [2/4]

```
template<typename _Key , typename _Tp , typename _Compare = std↩
::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Kt >
auto std::map< _Key, _Tp, _Compare, _Alloc >::lower_bound (
            const _Kt & __x ) const -> decltype(const_iterator(_M_t._M_lower_bound_tr(__x)))
[inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

_↩ _x	Key of (key, value) pair to be located.

Returns

Read-only (constant) iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.
Definition at line 1289 of file stl_map.h.

4.705.3.40 lower_bound() [3/4] template<typename _Key , typename _Tp , typename _Compare = std↩ ::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>

```
iterator std::map< _Key, _Tp, _Compare, _Alloc >::lower_bound (
            const key_type & __x )  [inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

_↩ _x	Key of (key, value) pair to be located.

Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.
Definition at line 1258 of file stl_map.h.
Referenced by std::map< _Key, _Tp, _Compare, _Alloc >::at().

4.705.3.41 lower_bound() [4/4] template<typename _Key , typename _Tp , typename _Compare = std↩ ::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>

```
const_iterator std::map< _Key, _Tp, _Compare, _Alloc >::lower_bound (
            const key_type & __x ) const  [inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

_↩ _x	Key of (key, value) pair to be located.

Returns

Read-only (constant) iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.
Definition at line 1283 of file stl_map.h.

4.705.3.42 max_size() template<typename _Key , typename _Tp , typename _Compare = std::less<_↩ Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>

```
size_type std::map< _Key, _Tp, _Compare, _Alloc >::max_size ( ) const  [inline], [noexcept]
```

Returns the maximum size of the map.

Definition at line 475 of file stl_map.h.

4.705.3.43 operator=() [1/3] template<typename _Key , typename _Tp , typename _Compare = std↩ ::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>

```
map& std::map< _Key, _Tp, _Compare, _Alloc >::operator= (
            const map< _Key, _Tp, _Compare, _Alloc > &  )  [default]
```

Map assignment operator.
Whether the allocator is copied depends on the allocator traits.

4.705.3.44 operator=() [2/3]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
map& std::map< _Key, _Tp, _Compare, _Alloc >::operator= (
            initializer_list< value_type > __l )  [inline]
```

Map list assignment operator.

Parameters

__l	An initializer_list.

This function fills a map with copies of the elements in the initializer list *__l*.
Note that the assignment completely changes the map and that the resulting map's size is the same as the number of elements assigned.
Definition at line 337 of file stl_map.h.

4.705.3.45 operator=() [3/3]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
map& std::map< _Key, _Tp, _Compare, _Alloc >::operator= (
            map< _Key, _Tp, _Compare, _Alloc > &&  )  [default]
```

Move assignment operator.

4.705.3.46 operator[]()

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
mapped_type& std::map< _Key, _Tp, _Compare, _Alloc >::operator[] (
            const key_type & __k )  [inline]
```

Subscript ([]) access to map data.

Parameters

__k	The key for which data should be retrieved.

Returns

A reference to the data of the (key,data) pair.

Allows for easy lookup with the subscript ([]) operator. Returns data associated with the key specified in subscript. If the key does not exist, a pair with that key is created using default values, which is then returned.
Lookup requires logarithmic time.
Definition at line 492 of file stl_map.h.

4.705.3.47 rbegin() [1/2]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<↩
_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
const_reverse_iterator std::map< _Key, _Tp, _Compare, _Alloc >::rbegin ( ) const  [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last pair in the map. Iteration is done in descending order according to the keys.
Definition at line 401 of file stl_map.h.

4.705.3.48 rbegin() [2/2]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<↩
_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
reverse_iterator std::map< _Key, _Tp, _Compare, _Alloc >::rbegin ( )  [inline], [noexcept]
```

Returns a read/write reverse iterator that points to the last pair in the map. Iteration is done in descending order according to the keys.
Definition at line 392 of file stl_map.h.

4.705.3.49 rend() [1/2]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_↩
Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
const_reverse_iterator std::map< _Key, _Tp, _Compare, _Alloc >::rend ( ) const  [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first pair in the map. Iteration is done in descending order according to the keys.
Definition at line 419 of file stl_map.h.

4.705.3.50 rend() [2/2]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_↩
Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
reverse_iterator std::map< _Key, _Tp, _Compare, _Alloc >::rend ( )  [inline], [noexcept]
```

Returns a read/write reverse iterator that points to one before the first pair in the map. Iteration is done in descending order according to the keys.
Definition at line 410 of file stl_map.h.

4.705.3.51 size()

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
size_type std::map< _Key, _Tp, _Compare, _Alloc >::size ( ) const  [inline], [noexcept]
```

Returns the size of the map.

Definition at line 470 of file stl_map.h.

4.705.3.52 swap()

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
void std::map< _Key, _Tp, _Compare, _Alloc >::swap (
            map< _Key, _Tp, _Compare, _Alloc > & __x )  [inline], [noexcept]
```

Swaps data with another map.

Parameters

_↩ _x	A map of the same element and allocator types.

This exchanges the elements between two maps in constant time. (It is only swapping a pointer, an integer, and an instance of the `Compare` type (which itself is often stateless and empty), so it should be quite fast.) Note that the global

std::swap() function is specialized such that std::swap(m1,m2) will feed to this function.
Whether the allocators are swapped depends on the allocator traits.
Definition at line 1122 of file stl_map.h.

4.705.3.53 upper_bound() [1/4]

```
template<typename _Key , typename _Tp , typename _Compare = std↩
::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Kt >
auto std::map< _Key, _Tp, _Compare, _Alloc >::upper_bound (
            const _Kt & __x ) -> decltype(iterator(_M_t._M_upper_bound_tr(__x)))   [inline]
```

Finds the end of a subsequence matching given key.

Parameters

_↩ _x	Key of (key, value) pair to be located.

Returns

Iterator pointing to the first element greater than key, or end().

Definition at line 1309 of file stl_map.h.

4.705.3.54 upper_bound() [2/4]

```
template<typename _Key , typename _Tp , typename _Compare = std↩
::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Kt >
auto std::map< _Key, _Tp, _Compare, _Alloc >::upper_bound (
            const _Kt & __x ) const -> decltype(const_iterator(_M_t._M_upper_bound_tr(__x)))
[inline]
```

Finds the end of a subsequence matching given key.

Parameters

_↩ _x	Key of (key, value) pair to be located.

Returns

Read-only (constant) iterator pointing to first iterator greater than key, or end().

Definition at line 1329 of file stl_map.h.

4.705.3.55 upper_bound() [3/4]

```
template<typename _Key , typename _Tp , typename _Compare = std↩
::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
iterator std::map< _Key, _Tp, _Compare, _Alloc >::upper_bound (
            const key_type & __x )  [inline]
```

Finds the end of a subsequence matching given key.

Parameters

_↩ _x	Key of (key, value) pair to be located.

Returns

Iterator pointing to the first element greater than key, or end().

Definition at line 1303 of file stl_map.h.

4.705.3.56 upper_bound() [4/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::map< _Key, _Tp, _Compare, _Alloc >::upper_bound (
            const key_type & __x ) const  [inline]
```

Finds the end of a subsequence matching given key.

Parameters

_x	Key of (key, value) pair to be located.

Returns

Read-only (constant) iterator pointing to first iterator greater than key, or end().

Definition at line 1323 of file stl_map.h.

4.705.3.57 value_comp()

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
value_compare std::map< _Key, _Tp, _Compare, _Alloc >::value_comp ( ) const  [inline]
```

Returns a value comparison object, built from the key comparison object out of which the map was constructed.
Definition at line 1150 of file stl_map.h.

4.706.1 Detailed Description

template<class _Tp>
class std::mask_array< _Tp >

Reference to selected subset of an array.
A mask_array is a reference to the actual elements of an array specified by a bitmask in the form of an array of bool. The way to get a mask_array is to call operator[](valarray<bool>) on a valarray. The returned mask_array then permits carrying operations out on the referenced subset of elements in the original valarray.
For example, if a mask_array is obtained using the array (false, true, false, true) as an argument, the mask array has two elements referring to array[1] and array[3] in the underlying array.

Parameters

Tp	Element type.

Definition at line 62 of file mask_array.h.
The documentation for this class was generated from the following files:

- valarray
- mask_array.h

4.708.1 Detailed Description

template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
class std::match_results< _Bi_iter, _Alloc >

The results of a match or search operation.
A collection of character sequences representing the result of a regular expression match. Storage for the collection is allocated and freed as necessary by the member functions of class template match_results.
This class satisfies the Sequence requirements, with the exception that only the operations defined for a const-qualified Sequence are supported.
The sub_match object stored at index 0 represents sub-expression 0, i.e. the whole match. In this case the sub_↩ match member matched is always true. The sub_match object stored at index n denotes what matched the marked sub-expression n within the matched expression. If the sub-expression n participated in a regular expression match then the sub_match member matched evaluates to true, and members first and second denote the range of characters [first, second) which formed that match. Otherwise matched is false, and members first and second point to the end of the sequence that was searched.
Definition at line 1677 of file regex.h.

4.708.2 Constructor & Destructor Documentation

4.708.2.1 match_results() [1/4]

```
template<typename _Bi_iter , typename _Alloc = allocator<sub_↩
match<_Bi_iter> >>
std::match_results< _Bi_iter, _Alloc >::match_results ( )  [inline]
```

Constructs a default match_results container.

Postcondition

size() returns 0 and str() returns an empty string.

Definition at line 1728 of file regex.h.

4.708.2.2 match_results() [2/4]

```
template<typename _Bi_iter , typename _Alloc = allocator<sub_↩
match<_Bi_iter> >>
std::match_results< _Bi_iter, _Alloc >::match_results (
            const _Alloc & __a )  [inline], [explicit], [noexcept]
```

Constructs a default match_results container.

Postcondition

size() returns 0 and str() returns an empty string.

Definition at line 1735 of file regex.h.

4.708.2.3 match_results() [3/4]

```
template<typename _Bi_iter , typename _Alloc = allocator<sub_↩
match<_Bi_iter> >>
std::match_results< _Bi_iter, _Alloc >::match_results (
            const match_results< _Bi_iter, _Alloc > &  )  [default]
```

Copy constructs a match_results.

4.708.2.4 match_results() [4/4] template<typename _Bi_iter , typename _Alloc = allocator<sub_match<_Bi_iter> >>

std::match_results< _Bi_iter, _Alloc >::match_results (
match_results< _Bi_iter, _Alloc > &&) [default], [noexcept]

Move constructs a match_results.

4.708.2.5 ~match_results() template<typename _Bi_iter , typename _Alloc = allocator<sub_match<_Bi_iter> >>

std::match_results< _Bi_iter, _Alloc >::~match_results ( ) [default]

Destroys a match_results object.

4.708.3 Member Function Documentation

4.708.3.1 begin() template<typename _Bi_iter , typename _Alloc = allocator<sub_match<_Bi_iter> >>

const_iterator std::match_results< _Bi_iter, _Alloc >::begin ( ) const [inline], [noexcept]

Gets an iterator to the start of the sub_match collection.

Definition at line 1908 of file regex.h.

References std::vector< _Tp, _Alloc >::begin().

Referenced by std::match_results< _Bi_iter, _Alloc >::cbegin(), and std::operator==().

4.708.3.2 cbegin() template<typename _Bi_iter , typename _Alloc = allocator<sub_match<_Bi_iter> >>

const_iterator std::match_results< _Bi_iter, _Alloc >::cbegin ( ) const [inline], [noexcept]

Gets an iterator to the start of the sub_match collection.

Definition at line 1915 of file regex.h.

References std::match_results< _Bi_iter, _Alloc >::begin().

4.708.3.3 cend() template<typename _Bi_iter , typename _Alloc = allocator<sub_match<_Bi_iter> >>

const_iterator std::match_results< _Bi_iter, _Alloc >::cend ( ) const [inline], [noexcept]

Gets an iterator to one-past-the-end of the collection.

Definition at line 1929 of file regex.h.

References std::match_results< _Bi_iter, _Alloc >::end().

4.708.3.4 empty() template<typename _Bi_iter , typename _Alloc = allocator<sub_match<_Bi_iter> >>

bool std::match_results< _Bi_iter, _Alloc >::empty ( ) const [inline], [noexcept]

Indicates if the match_results contains no results.

Return values

true	The match_results object is empty.
false	The match_results object is not empty.

Definition at line 1804 of file regex.h.

References std::vector< _Tp, _Alloc >::size().

Referenced by std::operator==().

4.708.3.5 end()

```
template<typename _Bi_iter , typename _Alloc = allocator<sub_match<_Bi_iter> >>
const_iterator std::match_results< _Bi_iter, _Alloc >::end ( ) const  [inline], [noexcept]
```

Gets an iterator to one-past-the-end of the collection.
Definition at line 1922 of file regex.h.
References std::vector< _Tp, _Alloc >::empty(), and std::vector< _Tp, _Alloc >::end().
Referenced by std::match_results< _Bi_iter, _Alloc >::cend(), and std::operator==().

4.708.3.6 format() [1/4]

```
template<typename _Bi_iter , typename _Alloc = allocator<sub_match<_Bi_↩
iter> >>
template<typename _Out_iter , typename _St , typename _Sa >
_Out_iter std::match_results< _Bi_iter, _Alloc >::format (
            _Out_iter __out,
            const basic_string< char_type, _St, _Sa > & __fmt,
            match_flag_type __flags = regex_constants::format_default ) const  [inline]
```

Precondition

ready() == true

Definition at line 1958 of file regex.h.
References std::basic_string< _CharT, _Traits, _Alloc >::data(), std::match_results< _Bi_iter, _Alloc >::format(), and std::basic_string< _CharT, _Traits, _Alloc >::size().

4.708.3.7 format() [2/4]

```
template<typename _Bi_iter , typename _Alloc = allocator<sub_match<_Bi_↩
iter> >>
template<typename _Out_iter >
_Out_iter std::match_results< _Bi_iter, _Alloc >::format (
            _Out_iter __out,
            const char_type * __fmt_first,
            const char_type * __fmt_last,
            match_flag_type __flags = regex_constants::format_default ) const
```

Precondition

ready() == true

Referenced by std::match_results< _Bi_iter, _Alloc >::format().

4.708.3.8 format() [3/4]

```
template<typename _Bi_iter , typename _Alloc = allocator<sub_match<_Bi_↩
iter> >>
template<typename _St , typename _Sa >
basic_string<char_type, _St, _Sa> std::match_results< _Bi_iter, _Alloc >::format (
            const basic_string< char_type, _St, _Sa > & __fmt,
            match_flag_type __flags = regex_constants::format_default ) const  [inline]
```

Precondition

ready() == true

Definition at line 1970 of file regex.h.
References std::back_inserter(), and std::match_results< _Bi_iter, _Alloc >::format().

4.708.3.9 format() [4/4] template<typename _Bi_iter , typename _Alloc = allocator<sub_match<_Bi_iter> >>

```
string_type std::match_results< _Bi_iter, _Alloc >::format (
            const char_type * __fmt,
            match_flag_type __flags = regex_constants::format_default ) const  [inline]
```

Precondition

ready() == true

Definition at line 1982 of file regex.h.
References std::back_inserter(), and std::match_results< _Bi_iter, _Alloc >::format().

4.708.3.10 get_allocator() template<typename _Bi_iter , typename _Alloc = allocator<sub_match<_Bi_iter> >>

```
allocator_type std::match_results< _Bi_iter, _Alloc >::get_allocator ( ) const  [inline], [noexcept]
```

Gets a copy of the allocator.
Definition at line 2004 of file regex.h.
References std::vector< _Tp, _Alloc >::get_allocator().

4.708.3.11 length() template<typename _Bi_iter , typename _Alloc = allocator<sub_match<_Bi_iter> >>

```
difference_type std::match_results< _Bi_iter, _Alloc >::length (
            size_type __sub = 0 ) const  [inline]
```

Gets the length of the indicated submatch.

Parameters

__sub	indicates the submatch.

Precondition

ready() == true

This function returns the length of the indicated submatch, or the length of the entire match if __sub is zero (the default).
Definition at line 1823 of file regex.h.

4.708.3.12 max_size() template<typename _Bi_iter , typename _Alloc = allocator<sub_match<_Bi_iter> >>

```
size_type std::match_results< _Bi_iter, _Alloc >::max_size ( ) const  [inline], [noexcept]
```

Gets the number of matches and submatches.
The number of matches for a given regular expression will be either 0 if there was no match or mark_count() + 1 if a match was successful. Some matches may be empty.

Returns

the number of matches found.

Definition at line 1795 of file regex.h.
References std::vector< _Tp, _Alloc >::max_size().

4.708.3.13 operator=() [1/2] template<typename _Bi_iter , typename _Alloc = allocator<sub_match<↩ _Bi_iter> >>

```
match_results& std::match_results< _Bi_iter, _Alloc >::operator= (
            const match_results< _Bi_iter, _Alloc > &  )  [default]
```

Assigns rhs to ∗this.

4.708.3.14 operator=() [2/2] template<typename _Bi_iter , typename _Alloc = allocator<sub_match<↩ _Bi_iter> >>

```
match_results& std::match_results< _Bi_iter, _Alloc >::operator= (
            match_results< _Bi_iter, _Alloc > &&  )  [default]
```

Move-assigns rhs to ∗this.

4.708.3.15 operator[]() template<typename _Bi_iter , typename _Alloc = allocator<sub_match<_Bi_↩ iter> >>

```
const_reference std::match_results< _Bi_iter, _Alloc >::operator[] (
            size_type __sub ) const  [inline]
```

Gets a sub_match reference for the match or submatch.

Parameters

__sub	indicates the submatch.

Precondition

ready() == true

This function gets a reference to the indicated submatch, or the entire match if __sub is zero.
If __sub >= size() then this function returns a sub_match with a special value indicating no submatch.
Definition at line 1866 of file regex.h.

4.708.3.16 position() template<typename _Bi_iter , typename _Alloc = allocator<sub_match<_Bi_↩ iter> >>

```
difference_type std::match_results< _Bi_iter, _Alloc >::position (
            size_type __sub = 0 ) const  [inline]
```

Gets the offset of the beginning of the indicated submatch.

Parameters

__sub	indicates the submatch.

Precondition

ready() == true

This function returns the offset from the beginning of the target sequence to the beginning of the submatch, unless the value of __sub is zero (the default), in which case this function returns the offset from the beginning of the target sequence to the beginning of the match.
Definition at line 1838 of file regex.h.
References std::distance().

4.708.3.17 prefix() template<typename _Bi_iter , typename _Alloc = allocator<sub_match<_Bi_iter> >>

const_reference std::match_results< _Bi_iter, _Alloc >::prefix ( ) const [inline]

Gets a sub_match representing the match prefix.

Precondition

ready() == true

This function gets a reference to a sub_match object representing the part of the target range between the start of the target range and the start of the match.
Definition at line 1883 of file regex.h.
Referenced by std::operator==().

4.708.3.18 ready() template<typename _Bi_iter , typename _Alloc = allocator<sub_match<_Bi_iter> >>

bool std::match_results< _Bi_iter, _Alloc >::ready ( ) const [inline], [noexcept]

Indicates if the match_results is ready.

Return values

true	The object has a fully-established result state.
false	The object is not ready.

Definition at line 1774 of file regex.h.
References std::vector< _Tp, _Alloc >::empty().
Referenced by std::operator==().

4.708.3.19 size() template<typename _Bi_iter , typename _Alloc = allocator<sub_match<_Bi_iter> >>

size_type std::match_results< _Bi_iter, _Alloc >::size ( ) const [inline], [noexcept]

Gets the number of matches and submatches.
The number of matches for a given regular expression will be either 0 if there was no match or mark_count() + 1 if a match was successful. Some matches may be empty.

Returns

the number of matches found.

Definition at line 1791 of file regex.h.
References std::vector< _Tp, _Alloc >::empty(), and std::vector< _Tp, _Alloc >::size().
Referenced by std::operator==().

4.708.3.20 str() template<typename _Bi_iter , typename _Alloc = allocator<sub_match<_Bi_iter> >>

string_type std::match_results< _Bi_iter, _Alloc >::str (
size_type __sub = 0) const [inline]

Gets the match or submatch converted to a string type.

Parameters

__sub	indicates the submatch.

Precondition

ready() == true

This function gets the submatch (or match, if __sub is zero) extracted from the target range and converted to the associated string type.
Definition at line 1851 of file regex.h.

4.708.3.21 suffix()

```
template<typename _Bi_iter , typename _Alloc = allocator<sub_match<_Bi_iter> >>
const_reference std::match_results< _Bi_iter, _Alloc >::suffix ( ) const  [inline]
```

Gets a sub_match representing the match suffix.

Precondition

ready() == true

This function gets a reference to a sub_match object representing the part of the target range between the end of the match and the end of the target range.
Definition at line 1898 of file regex.h.
Referenced by std::operator==().

4.708.3.22 swap()

```
template<typename _Bi_iter , typename _Alloc = allocator<sub_match<_Bi_iter> >>
void std::match_results< _Bi_iter, _Alloc >::swap (
            match_results< _Bi_iter, _Alloc > & __that )  [inline], [noexcept]
```

Swaps the contents of two match_results.
Definition at line 2018 of file regex.h.
References std::vector< _Tp, _Alloc >::swap().

4.715.1 Detailed Description

template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f>
class std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f >

A generalized feedback shift register discrete random number generator.
This algorithm avoids multiplication and division and is designed to be friendly to a pipelined architecture. If the parameters are chosen correctly, this generator will produce numbers with a very long period and fairly good apparent entropy, although still not cryptographically strong.
The best way to use this generator is with the predefined mt19937 class.
This algorithm was originally invented by Makoto Matsumoto and Takuji Nishimura.

Template Parameters

_↩ _w	Word size, the number of bits in each element of the state vector.
_↩ _n	The degree of recursion.
_↩ _m	The period parameter.
_↩ _r	The separation point bit index.
_↩ _a	The last row of the twist matrix.
_↩ _u	The first right-shift tempering matrix parameter.
_↩ _d	The first right-shift tempering matrix mask.
_↩ _s	The first left-shift tempering matrix parameter.
_↩ _b	The first left-shift tempering matrix mask.
_↩ _t	The second left-shift tempering matrix parameter.
_↩ _c	The second left-shift tempering matrix mask.
_↩ _l	The second right-shift tempering matrix parameter.

Template Parameters

_↩ _f	Initialization multiplier.

Definition at line 472 of file random.h.

4.715.2 Member Typedef Documentation

4.715.2.1 result_type

```
template<typename _UIntType , size_t __w, size_t __n, size_t __m, size_t _↩
_r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType _↩
_c, size_t __l, _UIntType __f>
typedef _UIntType std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __↩
s, __b, __t, __c, __l, __f >::result_type
```

The type of the generated random value.
Definition at line 507 of file random.h.

4.715.3 Constructor & Destructor Documentation

4.715.3.1 mersenne_twister_engine()

```
template<typename _UIntType , size_t __w, size_t __n, size_t
__m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t,
_UIntType __c, size_t __l, _UIntType __f>
template<typename _Sseq , typename = _If_seed_seq<_Sseq>>
std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, ↩
__l, __f >::mersenne_twister_engine (
            _Sseq & __q )  [inline], [explicit]
```

Constructs a mersenne_twister_engine random number generator engine seeded from the seed sequence __q.

Parameters

_↩ _q	the seed sequence.

Definition at line 541 of file random.h.

4.715.4 Member Function Documentation

4.715.4.1 discard()

```
template<typename _UIntType , size_t __w, size_t __n, size_t __m, size_t __↩
r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c,
size_t __l, _UIntType __f>
void std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, ↩
__c, __l, __f >::discard (
            unsigned long long __z )
```

Discard a sequence of random numbers.
Definition at line 431 of file bits/random.tcc.

4.715.4.2 max()

```
template<typename _UIntType , size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f>
static constexpr result_type std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f >::max ( ) [inline], [static], [constexpr]
```

Gets the largest possible value in the output range.
Definition at line 562 of file random.h.

4.715.4.3 min()

```
template<typename _UIntType , size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f>
static constexpr result_type std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f >::min ( ) [inline], [static], [constexpr]
```

Gets the smallest possible value in the output range.
Definition at line 555 of file random.h.

4.715.5 Friends And Related Function Documentation

4.715.5.1 operator<<

```
template<typename _UIntType , size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f>
template<typename _UIntType1 , size_t __w1, size_t __n1, size_t __m1, size_t __r1, _UIntType1 __a1, size_t __u1, _UIntType1 __d1, size_t __s1, _UIntType1 __b1, size_t __t1, _UIntType1 __c1, size_t __l1, _UIntType1 __f1, typename _CharT , typename _Traits >
std::basic_ostream<_CharT, _Traits>& operator<< (
            std::basic_ostream< _CharT, _Traits > & __os,
            const std::mersenne_twister_engine< _UIntType1, __w1, __n1, __m1, __r1, __a1, __u1, __d1, __s1, __b1, __t1, __c1, __l1, __f1 > & __x ) [friend]
```

Inserts the current state of a % mersenne_twister_engine random number generator engine __x into the output stream __os.

Parameters

__os	An output stream.
__x	A % mersenne_twister_engine random number generator engine.

Returns

The output stream with the state of __x inserted or in an error state.

4.715.5.2 operator==

```
template<typename _UIntType , size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f>
bool operator== (
            const mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f > & __lhs,
            const mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f > & __rhs ) [friend]
```

Compares two % mersenne_twister_engine random number generator objects of the same type for equality.

Parameters

__lhs	A % mersenne_twister_engine random number generator object.
__rhs	Another % mersenne_twister_engine random number generator object.

Returns

true if the infinite sequences of generated values would be equal, false otherwise.

Definition at line 587 of file random.h.

4.715.5.3 operator>> `template<typename _UIntType , size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f>`

```
template<typename _UIntType1 , size_t __w1, size_t __n1, size_t __m1, size_t __r1, _UIntType1
__a1, size_t __u1, _UIntType1 __d1, size_t __s1, _UIntType1 __b1, size_t __t1, _UIntType1 __c1,
size_t __l1, _UIntType1 __f1, typename _CharT , typename _Traits >
std::basic_istream<_CharT, _Traits>& operator>> (
            std::basic_istream< _CharT, _Traits > & __is,
            std::mersenne_twister_engine< _UIntType1, __w1, __n1, __m1, __r1, __a1, __u1, __d1,
__s1, __b1, __t1, __c1, __l1, __f1 > & __x )  [friend]
```

Extracts the current state of a % mersenne_twister_engine random number generator engine `__x` from the input stream `__is`.

Parameters

__is	An input stream.
__x	A % mersenne_twister_engine random number generator engine.

Returns

The input stream with the state of `__x` extracted or in an error state.

4.716.1 Detailed Description

template<typename _CharT>
class std::messages< _CharT >

Primary class template messages.
This facet encapsulates the code to retrieve messages from message catalogs. The only thing defined by the standard for this facet is the interface. All underlying functionality is implementation-defined.
This library currently implements 3 versions of the message facet. The first version (gnu) is a wrapper around gettext, provided by libintl. The second version (ieee) is a wrapper around catgets. The final version (default) does no actual translation. These implementations are only provided for char and wchar_t instantiations.

The messages template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the messages facet.
Definition at line 1799 of file locale_facets_nonio.h.

4.716.2 Member Typedef Documentation

4.716.2.1 char_type `template<typename _CharT >`

```
typedef _CharT std::messages< _CharT >::char_type
```

Public typedefs.
Definition at line 1805 of file locale_facets_nonio.h.

4.716.2.2 string_type `template<typename _CharT >`

```
typedef basic_string<_CharT> std::messages< _CharT >::string_type
```

Public typedefs.
Definition at line 1806 of file locale_facets_nonio.h.

4.716.3 Constructor & Destructor Documentation

4.716.3.1 messages() [1/2] `template<typename _CharT >`

```
std::messages< _CharT >::messages (
            size_t __refs = 0 )  [explicit]
```

Constructor performs initialization.
This is the constructor provided by the standard.

Parameters

__refs	Passed to the base facet class.

Definition at line 44 of file messages_members.h.

4.716.3.2 messages() [2/2] `template<typename _CharT >`

```
std::messages< _CharT >::messages (
            __c_locale __cloc,
            const char * __s,
            size_t __refs = 0 )  [explicit]
```

Internal constructor. Not for general use.
This is a constructor for use by the library itself to set up new locales.

Parameters

__cloc	The C locale.
__s	The name of a locale.
__refs	Refcount to pass to the base class.

Definition at line 50 of file messages_members.h.

4.716.3.3 ~messages() template<typename _CharT >

std::messages< _CharT >::~messages [protected], [virtual]

Destructor.

Definition at line 79 of file messages_members.h.

4.716.4 Member Function Documentation

4.716.4.1 do_get() string std::messages< char >::do_get (

```
catalog ,
int ,
int ,
const string & ) const [protected]
```

Specializations for required instantiations.

Definition at line 1476 of file locale_facets_nonio.h.

4.725.3 Constructor & Destructor Documentation

4.725.3.1 money_get() template<typename _CharT , typename _InIter >

```
std::money_get< _CharT, _InIter >::money_get (
            size_t __refs = 0 )  [inline], [explicit]
```

Constructor performs initialization.
This is the constructor provided by the standard.

Parameters

__refs	Passed to the base facet class.

Definition at line 1490 of file locale_facets_nonio.h.

4.725.3.2 ~money_get() template<typename _CharT , typename _InIter >

```
virtual std::money_get< _CharT, _InIter >::~money_get ( )  [inline], [protected], [virtual]
```

Destructor.
Definition at line 1558 of file locale_facets_nonio.h.

4.725.4 Member Function Documentation

4.725.4.1 do_get() [1/2] template<typename _CharT , typename _InIter >

```
_InIter std::money_get< _CharT, _InIter >::do_get (
            iter_type __s,
            iter_type __end,
            bool __intl,
            ios_base & __io,
            ios_base::iostate & __err,
            long double & __units ) const  [protected], [virtual]
```

Read and parse a monetary value.
This function reads and parses characters representing a monetary value. This function is a hook for derived classes to change the value returned.

See also

get() for details.

Definition at line 370 of file locale_facets_nonio.tcc.
References std::basic_string< _CharT, _Traits, _Alloc >::c_str().
Referenced by std::money_get< _CharT, _InIter >::get().

4.725.4.2 do_get() [2/2]

```
template<typename _CharT , typename _InIter >
_InIter std::money_get< _CharT, _InIter >::do_get (
            iter_type __s,
            iter_type __end,
            bool __intl,
            ios_base & __io,
            ios_base::iostate & __err,
            string_type & __digits ) const  [protected], [virtual]
```

Read and parse a monetary value.
This function reads and parses characters representing a monetary value. This function is a hook for derived classes to change the value returned.

See also

get() for details.

Definition at line 383 of file locale_facets_nonio.tcc.
References std::ios_base::_M_getloc(), std::basic_string< _CharT, _Traits, _Alloc >::resize(), and std::__ctype_abstract_base< _CharT >::widen().

4.725.4.3 get() [1/2]

```
template<typename _CharT , typename _InIter >
iter_type std::money_get< _CharT, _InIter >::get (
            iter_type __s,
            iter_type __end,
            bool __intl,
            ios_base & __io,
            ios_base::iostate & __err,
            long double & __units ) const  [inline]
```

Read and parse a monetary value.
This function reads characters from *__s*, interprets them as a monetary value according to moneypunct and ctype facets retrieved from io.getloc(), and returns the result in *units* as an integral value moneypunct::frac_digits() * the actual amount. For example, the string $10.01 in a US locale would store 1001 in *units*.
Any characters not part of a valid money amount are not consumed.
If a money value cannot be parsed from the input stream, sets err=(err|io.failbit). If the stream is consumed before finishing parsing, sets err=(err|io.failbit|io.eofbit). *units* is unchanged if parsing fails.
This function works by returning the result of do_get().

Parameters

__s	Start of characters to parse.
__end	End of characters to parse.
__intl	Parameter to use_facet<moneypunct<CharT,intl> >.
__io	Source of facets and io state.
__err	Error field to set if parsing fails.
__units	Place to store result of parsing.

Returns

Iterator referencing first character beyond valid money amount.

Definition at line 1520 of file locale_facets_nonio.h.
References std::money_get< _CharT, _InIter >::do_get().

4.725.4.4 get() [2/2] template<typename _CharT , typename _InIter >

```
iter_type std::money_get< _CharT, _InIter >::get (
            iter_type __s,
            iter_type __end,
            bool __intl,
            ios_base & __io,
            ios_base::iostate & __err,
            string_type & __digits ) const  [inline]
```

Read and parse a monetary value.
This function reads characters from *__s*, interprets them as a monetary value according to moneypunct and ctype facets retrieved from io.getloc(), and returns the result in *digits*. For example, the string $10.01 in a US locale would store `1001` in *digits*.
Any characters not part of a valid money amount are not consumed.
If a money value cannot be parsed from the input stream, sets err=(err|io.failbit). If the stream is consumed before finishing parsing, sets err=(err|io.failbit|io.eofbit).
This function works by returning the result of do_get().

Parameters

__s	Start of characters to parse.
__end	End of characters to parse.
__intl	Parameter to use_facet<moneypunct<CharT,intl> >.
__io	Source of facets and io state.
__err	Error field to set if parsing fails.
__digits	Place to store result of parsing.

Returns

Iterator referencing first character beyond valid money amount.

Definition at line 1551 of file locale_facets_nonio.h.
References std::money_get< _CharT, _InIter >::do_get().

```

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

__refs	Passed to the base facet class.

Definition at line 1642 of file locale_facets_nonio.h.

4.726.3.2 ~money_put() `template<typename _CharT , typename _OutIter >`

`virtual std::money_put< _CharT, _OutIter >::~money_put ( )  [inline], [protected], [virtual]`

Destructor.

Definition at line 1692 of file locale_facets_nonio.h.

4.726.4 Member Function Documentation

4.726.4.1 do_put() [1/2] `template<typename _CharT , typename _OutIter >`

```
_OutIter std::money_put< _CharT, _OutIter >::do_put (
            iter_type __s,
            bool __intl,
            ios_base & __io,
```

```
            char_type __fill,
            const string_type & __digits ) const  [protected], [virtual]
```

Format and output a monetary value.
This function formats *digits* as a monetary value according to moneypunct and ctype facets retrieved from io.getloc(), and writes the resulting characters to *__s*. For example, the string `1001` in a US locale would write `$10.01` to *__s*. This function is a hook for derived classes to change the value returned.

See also

put().

Parameters

__s	The stream to write to.
__intl	Parameter to use_facet<moneypunct<CharT,intl> >.
__io	Source of facets and io state.
__fill	char_type to use for padding.
__digits	Place to store result of parsing.

Returns

Iterator after writing.

Definition at line 614 of file locale_facets_nonio.tcc.

4.726.4.2 do_put() [2/2]

```
template<typename _CharT , typename _OutIter >
_OutIter std::money_put< _CharT, _OutIter >::do_put (
            iter_type __s,
            bool __intl,
            ios_base & __io,
            char_type __fill,
            long double __units ) const  [protected], [virtual]
```

Format and output a monetary value.
This function formats *units* as a monetary value according to moneypunct and ctype facets retrieved from io.getloc(), and writes the resulting characters to *__s*. For example, the value 1001 in a US locale would write `$10.01` to *__s*. This function is a hook for derived classes to change the value returned.

See also

put().

Parameters

__s	The stream to write to.
__intl	Parameter to use_facet<moneypunct<CharT,intl> >.
__io	Source of facets and io state.
__fill	char_type to use for padding.
__units	Place to store result of parsing.

Returns

Iterator after writing.

Definition at line 576 of file locale_facets_nonio.tcc.
References std::ios_base::getloc(), and std::__ctype_abstract_base< _CharT >::widen().
Referenced by std::money_put< _CharT, _OutIter >::put().

4.726.4.3 put() [1/2]

```
template<typename _CharT , typename _OutIter >
iter_type std::money_put< _CharT, _OutIter >::put (
            iter_type __s,
            bool __intl,
            ios_base & __io,
            char_type __fill,
            const string_type & __digits ) const  [inline]
```

Format and output a monetary value.
This function formats *digits* as a monetary value according to moneypunct and ctype facets retrieved from io.getloc(), and writes the resulting characters to *__s*. For example, the string `1001` in a US locale would write `$10.01` to *__s*.
This function works by returning the result of do_put().

Parameters

__s	The stream to write to.
__intl	Parameter to use_facet<moneypunct<CharT,intl> >.
__io	Source of facets and io state.
__fill	char_type to use for padding.
__digits	Place to store result of parsing.

Returns

Iterator after writing.

Definition at line 1685 of file locale_facets_nonio.h.
References std::money_put< _CharT, _OutIter >::do_put().

4.726.4.4 put() [2/2]

```
template<typename _CharT , typename _OutIter >
iter_type std::money_put< _CharT, _OutIter >::put (
            iter_type __s,
            bool __intl,
            ios_base & __io,
            char_type __fill,
            long double __units ) const  [inline]
```

Format and output a monetary value.
This function formats *units* as a monetary value according to moneypunct and ctype facets retrieved from io.getloc(), and writes the resulting characters to *__s*. For example, the value 1001 in a US locale would write `$10.01` to *__s*.
This function works by returning the result of do_put().

Parameters

__s	The stream to write to.
__intl	Parameter to use_facet<moneypunct<CharT,intl> >.
__io	Source of facets and io state.

Parameters

__fill	char_type to use for padding.
__units	Place to store result of parsing.

Returns

Iterator after writing.

Definition at line 1662 of file locale_facets_nonio.h.
References std::money_put< _CharT, _OutIter >::do_put().

4.727.1 Detailed Description

template<typename _CharT, bool _Intl>
class std::moneypunct< _CharT, _Intl >

Primary class template moneypunct.
This facet encapsulates the punctuation, grouping and other formatting features of money amount string representations.
Definition at line 1024 of file locale_facets_nonio.h.

4.727.2 Member Typedef Documentation

4.727.2.1 char_type

```
template<typename _CharT , bool _Intl>
typedef _CharT std::moneypunct< _CharT, _Intl >::char_type
```

Public typedefs.
Definition at line 1030 of file locale_facets_nonio.h.

4.727.2.2 string_type

```
template<typename _CharT , bool _Intl>
typedef basic_string<_CharT> std::moneypunct< _CharT, _Intl >::string_type
```

Public typedefs.
Definition at line 1031 of file locale_facets_nonio.h.

4.727.3 Constructor & Destructor Documentation

4.727.3.1 moneypunct() [1/3]

```
template<typename _CharT , bool _Intl>
std::moneypunct< _CharT, _Intl >::moneypunct (
            size_t __refs = 0 ) [inline], [explicit]
```

Constructor performs initialization.
This is the constructor provided by the standard.

Parameters

__refs	Passed to the base facet class.

Definition at line 1053 of file locale_facets_nonio.h.

4.727.3.2 moneypunct() [2/3]

```
template<typename _CharT , bool _Intl>
std::moneypunct< _CharT, _Intl >::moneypunct (
            __cache_type * __cache,
            size_t __refs = 0 ) [inline], [explicit]
```

Constructor performs initialization.
This is an internal constructor.

Parameters

__cache	Cache for optimization.
__refs	Passed to the base facet class.

Definition at line 1066 of file locale_facets_nonio.h.

4.727.3.3 moneypunct() [3/3]

```
template<typename _CharT , bool _Intl>
std::moneypunct< _CharT, _Intl >::moneypunct (
            __c_locale __cloc,
            const char * __s,
            size_t __refs = 0 ) [inline], [explicit]
```

Internal constructor. Not for general use.
This is a constructor for use by the library itself to set up new locales.

Parameters

__cloc	The C locale.
__s	The name of a locale.
__refs	Passed to the base facet class.

Definition at line 1081 of file locale_facets_nonio.h.

4.727.3.4 ~moneypunct() `template<typename _CharT , bool _Intl>`

`virtual std::moneypunct< _CharT, _Intl >::~moneypunct ( ) [protected], [virtual]`

Destructor.

4.727.4 Member Function Documentation

4.727.4.1 curr_symbol() `template<typename _CharT , bool _Intl>`

`string_type std::moneypunct< _CharT, _Intl >::curr_symbol ( ) const [inline]`

Return currency symbol string.

This function returns a string_type to use as a currency symbol. It does so by returning returning moneypunct<char_type>::do_curr_symbol().

Returns

string_type representing a currency symbol.

Definition at line 1151 of file locale_facets_nonio.h.

References std::moneypunct< _CharT, _Intl >::do_curr_symbol().

4.727.4.2 decimal_point() `template<typename _CharT , bool _Intl>`

`char_type std::moneypunct< _CharT, _Intl >::decimal_point ( ) const [inline]`

Return decimal point character.

This function returns a char_type to use as a decimal point. It does so by returning returning moneypunct<char_type>::do_decimal_point().

Returns

char_type representing a decimal point.

Definition at line 1095 of file locale_facets_nonio.h.

References std::moneypunct< _CharT, _Intl >::do_decimal_point().

4.727.4.3 do_curr_symbol() `template<typename _CharT , bool _Intl>`

`virtual string_type std::moneypunct< _CharT, _Intl >::do_curr_symbol ( ) const [inline], [protected], [virtual]`

Return currency symbol string.

This function returns a string_type to use as a currency symbol. This function is a hook for derived classes to change the value returned.

See also

curr_symbol() for details.

Returns

string_type representing a currency symbol.

Definition at line 1297 of file locale_facets_nonio.h.
Referenced by std::moneypunct< _CharT, _Intl >::curr_symbol().

4.727.4.4 do_decimal_point()

```
template<typename _CharT , bool _Intl>
virtual char_type std::moneypunct< _CharT, _Intl >::do_decimal_point ( ) const  [inline], [protected],
[virtual]
```

Return decimal point character.
Returns a char_type to use as a decimal point. This function is a hook for derived classes to change the value returned.

Returns

char_type representing a decimal point.

Definition at line 1259 of file locale_facets_nonio.h.
Referenced by std::moneypunct< _CharT, _Intl >::decimal_point().

4.727.4.5 do_frac_digits()

```
template<typename _CharT , bool _Intl>
virtual int std::moneypunct< _CharT, _Intl >::do_frac_digits ( ) const  [inline], [protected],
[virtual]
```

Return number of digits in fraction.
This function returns the exact number of digits that make up the fractional part of a money amount. This function is a hook for derived classes to change the value returned.

See also

frac_digits() for details.

Returns

Number of digits in amount fraction.

Definition at line 1337 of file locale_facets_nonio.h.
Referenced by std::moneypunct< _CharT, _Intl >::frac_digits().

4.727.4.6 do_grouping()

```
template<typename _CharT , bool _Intl>
virtual string std::moneypunct< _CharT, _Intl >::do_grouping ( ) const  [inline], [protected],
[virtual]
```

Return grouping specification.
Returns a string representing groupings for the integer part of a number. This function is a hook for derived classes to change the value returned.

See also

grouping() for details.

Returns

String representing grouping specification.

Definition at line 1284 of file locale_facets_nonio.h.
Referenced by std::moneypunct< _CharT, _Intl >::grouping().

4.727.4.7 do_neg_format() template<typename _CharT , bool _Intl>

virtual pattern std::moneypunct< _CharT, _Intl >::do_neg_format ( ) const [inline], [protected], [virtual]

Return pattern for money values.

This function returns a pattern describing the formatting of a negative valued money amount. This function is a hook for derived classes to change the value returned.

See also

neg_format() for details.

Returns

Pattern for money values.

Definition at line 1365 of file locale_facets_nonio.h.
Referenced by std::moneypunct< _CharT, _Intl >::neg_format().

4.727.4.8 do_negative_sign() template<typename _CharT , bool _Intl>

virtual string_type std::moneypunct< _CharT, _Intl >::do_negative_sign ( ) const [inline], [protected], [virtual]

Return negative sign string.

This function returns a string_type to use as a sign for negative amounts. This function is a hook for derived classes to change the value returned.

See also

negative_sign() for details.

Returns

string_type representing a negative sign.

Definition at line 1323 of file locale_facets_nonio.h.
Referenced by std::moneypunct< _CharT, _Intl >::negative_sign().

4.727.4.9 do_pos_format() template<typename _CharT , bool _Intl>

virtual pattern std::moneypunct< _CharT, _Intl >::do_pos_format ( ) const [inline], [protected], [virtual]

Return pattern for money values.

This function returns a pattern describing the formatting of a positive valued money amount. This function is a hook for derived classes to change the value returned.

See also

pos_format() for details.

Returns

Pattern for money values.

Definition at line 1351 of file locale_facets_nonio.h.
Referenced by std::moneypunct< _CharT, _Intl >::pos_format().

4.727.4.10 do_positive_sign() template<typename _CharT , bool _Intl>

virtual string_type std::moneypunct< _CharT, _Intl >::do_positive_sign ( ) const [inline], [protected], [virtual]

Return positive sign string.

This function returns a string_type to use as a sign for positive amounts. This function is a hook for derived classes to change the value returned.

See also

positive_sign() for details.

Returns

string_type representing a positive sign.

Definition at line 1310 of file locale_facets_nonio.h.

Referenced by std::moneypunct< _CharT, _Intl >::positive_sign().

4.727.4.11 do_thousands_sep() template<typename _CharT , bool _Intl>

virtual char_type std::moneypunct< _CharT, _Intl >::do_thousands_sep ( ) const [inline], [protected], [virtual]

Return thousands separator character.

Returns a char_type to use as a thousands separator. This function is a hook for derived classes to change the value returned.

Returns

char_type representing a thousands separator.

Definition at line 1271 of file locale_facets_nonio.h.

Referenced by std::moneypunct< _CharT, _Intl >::thousands_sep().

4.727.4.12 frac_digits() template<typename _CharT , bool _Intl>

int std::moneypunct< _CharT, _Intl >::frac_digits ( ) const [inline]

Return number of digits in fraction.

This function returns the exact number of digits that make up the fractional part of a money amount. It does so by returning returning moneypunct<char_type>::do_frac_digits().

The fractional part of a money amount is optional. But if it is present, there must be frac_digits() digits.

Returns

Number of digits in amount fraction.

Definition at line 1201 of file locale_facets_nonio.h.

References std::moneypunct< _CharT, _Intl >::do_frac_digits().

4.727.4.13 grouping() template<typename _CharT , bool _Intl>

string std::moneypunct< _CharT, _Intl >::grouping ( ) const [inline]

Return grouping specification.

This function returns a string representing groupings for the integer part of an amount. Groupings indicate where thousands separators should be inserted.

Each char in the return string is interpret as an integer rather than a character. These numbers represent the number of digits in a group. The first char in the string represents the number of digits in the least significant group. If a char is negative, it indicates an unlimited number of digits for the group. If more chars from the string are required to group a number, the last char is used repeatedly.

For example, if the grouping() returns \003\002 and is applied to the number 123456789, this corresponds to 12,34,56,789. Note that if the string was 32, this would put more than 50 digits into the least significant group if the character set is ASCII.
The string is returned by calling moneypunct<char_type>::do_grouping().

Returns

string representing grouping specification.

Definition at line 1138 of file locale_facets_nonio.h.
References std::moneypunct< _CharT, _Intl >::do_grouping().

4.727.4.14 neg_format() template<typename _CharT , bool _Intl>

pattern std::moneypunct< _CharT, _Intl >::neg_format ( ) const [inline]

Return pattern for money values.
This function returns a pattern describing the formatting of a positive or negative valued money amount. It does so by returning returning moneypunct<char_type>::do_pos_format() or moneypunct<char_type>::do_neg_format().
The pattern has 4 fields describing the ordering of symbol, sign, value, and none or space. There must be one of each in the pattern. The none and space enums may not appear in the first field and space may not appear in the final field.
The parts of a money string must appear in the order indicated by the fields of the pattern. The symbol field indicates that the value of curr_symbol() may be present. The sign field indicates that the value of positive_sign() or negative_sign() must be present. The value field indicates that the absolute value of the money amount is present. none indicates 0 or more whitespace characters, except at the end, where it permits no whitespace. space indicates that 1 or more whitespace characters must be present.
For example, for the US locale and pos_format() pattern {symbol,sign,value,none}, curr_symbol() == '$' positive_sign() == '+', and value 10.01, and options set to force the symbol, the corresponding string is $+10.01.

Returns

Pattern for money values.

Definition at line 1241 of file locale_facets_nonio.h.
References std::moneypunct< _CharT, _Intl >::do_neg_format().

4.727.4.15 negative_sign() template<typename _CharT , bool _Intl>

string_type std::moneypunct< _CharT, _Intl >::negative_sign ( ) const [inline]

Return negative sign string.
This function returns a string_type to use as a sign for negative amounts. It does so by returning returning moneypunct<char_type>::do_negative_sign().
If the return value contains more than one character, the first character appears in the position indicated by neg_format() and the remainder appear at the end of the formatted string.

Returns

string_type representing a negative sign.

Definition at line 1185 of file locale_facets_nonio.h.
References std::moneypunct< _CharT, _Intl >::do_negative_sign().

4.727.4.16 pos_format() template<typename _CharT , bool _Intl>

pattern std::moneypunct< _CharT, _Intl >::pos_format ( ) const [inline]

Return pattern for money values.
This function returns a pattern describing the formatting of a positive or negative valued money amount. It does so by returning returning moneypunct<char_type>::do_pos_format() or moneypunct<char_type>::do_neg_format().

The pattern has 4 fields describing the ordering of symbol, sign, value, and none or space. There must be one of each in the pattern. The none and space enums may not appear in the first field and space may not appear in the final field. The parts of a money string must appear in the order indicated by the fields of the pattern. The symbol field indicates that the value of curr_symbol() may be present. The sign field indicates that the value of positive_sign() or negative_sign() must be present. The value field indicates that the absolute value of the money amount is present. none indicates 0 or more whitespace characters, except at the end, where it permits no whitespace. space indicates that 1 or more whitespace characters must be present.
For example, for the US locale and pos_format() pattern {symbol,sign,value,none}, curr_symbol() == '$' positive_sign() == '+', and value 10.01, and options set to force the symbol, the corresponding string is `$+10.01`.

Returns

Pattern for money values.

Definition at line 1237 of file locale_facets_nonio.h.
References std::moneypunct< _CharT, _Intl >::do_pos_format().

4.727.4.17 positive_sign() `template<typename _CharT , bool _Intl>`

`string_type std::moneypunct< _CharT, _Intl >::positive_sign ( ) const [inline]`

Return positive sign string.
This function returns a string_type to use as a sign for positive amounts. It does so by returning returning moneypunct<char_type>::do_positive_sign().
If the return value contains more than one character, the first character appears in the position indicated by pos_format() and the remainder appear at the end of the formatted string.

Returns

string_type representing a positive sign.

Definition at line 1168 of file locale_facets_nonio.h.
References std::moneypunct< _CharT, _Intl >::do_positive_sign().

4.727.4.18 thousands_sep() `template<typename _CharT , bool _Intl>`

`char_type std::moneypunct< _CharT, _Intl >::thousands_sep ( ) const [inline]`

Return thousands separator character.
This function returns a char_type to use as a thousands separator. It does so by returning returning moneypunct<char_type>::do_thousands_sep().

Returns

char_type representing a thousands separator.

Definition at line 1108 of file locale_facets_nonio.h.
References std::moneypunct< _CharT, _Intl >::do_thousands_sep().

4.728.1 Detailed Description

template<typename _CharT, bool _Intl>
class std::moneypunct_byname< _CharT, _Intl >

class moneypunct_byname [22.2.6.4].
Definition at line 1414 of file locale_facets_nonio.h.

4.728.2 Member Function Documentation

4.728.2.1 curr_symbol() `template<typename _CharT , bool _Intl>`

`string_type std::moneypunct< _CharT, _Intl >::curr_symbol ( ) const [inline], [inherited]`

Return currency symbol string.
This function returns a string_type to use as a currency symbol. It does so by returning returning moneypunct<char↩_type>::do_curr_symbol().

Returns

string_type representing a currency symbol.

Definition at line 1151 of file locale_facets_nonio.h.
References std::moneypunct< _CharT, _Intl >::do_curr_symbol().

4.728.2.2 decimal_point() template<typename _CharT , bool _Intl>

char_type std::moneypunct< _CharT, _Intl >::decimal_point ( ) const [inline], [inherited]

Return decimal point character.

This function returns a char_type to use as a decimal point. It does so by returning returning moneypunct<char_↩ type>::do_decimal_point().

Returns

char_type representing a decimal point.

Definition at line 1095 of file locale_facets_nonio.h.

References std::moneypunct< _CharT, _Intl >::do_decimal_point().

4.728.2.3 do_curr_symbol() template<typename _CharT , bool _Intl>

virtual string_type std::moneypunct< _CharT, _Intl >::do_curr_symbol ( ) const [inline], [protected], [virtual], [inherited]

Return currency symbol string.

This function returns a string_type to use as a currency symbol. This function is a hook for derived classes to change the value returned.

See also

curr_symbol() for details.

Returns

string_type representing a currency symbol.

Definition at line 1297 of file locale_facets_nonio.h.

Referenced by std::moneypunct< _CharT, _Intl >::curr_symbol().

4.728.2.4 do_decimal_point() template<typename _CharT , bool _Intl>

virtual char_type std::moneypunct< _CharT, _Intl >::do_decimal_point ( ) const [inline], [protected], [virtual], [inherited]

Return decimal point character.

Returns a char_type to use as a decimal point. This function is a hook for derived classes to change the value returned.

Returns

char_type representing a decimal point.

Definition at line 1259 of file locale_facets_nonio.h.

Referenced by std::moneypunct< _CharT, _Intl >::decimal_point().

4.728.2.5 do_frac_digits() template<typename _CharT , bool _Intl>

virtual int std::moneypunct< _CharT, _Intl >::do_frac_digits ( ) const [inline], [protected], [virtual], [inherited]

Return number of digits in fraction.

This function returns the exact number of digits that make up the fractional part of a money amount. This function is a hook for derived classes to change the value returned.

See also

frac_digits() for details.

Returns

Number of digits in amount fraction.

Definition at line 1337 of file locale_facets_nonio.h.
Referenced by std::moneypunct< _CharT, _Intl >::frac_digits().

4.728.2.6 do_grouping() `template<typename _CharT , bool _Intl>`

`virtual string std::moneypunct< _CharT, _Intl >::do_grouping ( ) const [inline], [protected], [virtual], [inherited]`

Return grouping specification.
Returns a string representing groupings for the integer part of a number. This function is a hook for derived classes to change the value returned.

See also

grouping() for details.

Returns

String representing grouping specification.

Definition at line 1284 of file locale_facets_nonio.h.
Referenced by std::moneypunct< _CharT, _Intl >::grouping().

4.728.2.7 do_neg_format() `template<typename _CharT , bool _Intl>`

`virtual pattern std::moneypunct< _CharT, _Intl >::do_neg_format ( ) const [inline], [protected], [virtual], [inherited]`

Return pattern for money values.
This function returns a pattern describing the formatting of a negative valued money amount. This function is a hook for derived classes to change the value returned.

See also

neg_format() for details.

Returns

Pattern for money values.

Definition at line 1365 of file locale_facets_nonio.h.
Referenced by std::moneypunct< _CharT, _Intl >::neg_format().

4.728.2.8 do_negative_sign() `template<typename _CharT , bool _Intl>`

`virtual string_type std::moneypunct< _CharT, _Intl >::do_negative_sign ( ) const [inline], [protected], [virtual], [inherited]`

Return negative sign string.
This function returns a string_type to use as a sign for negative amounts. This function is a hook for derived classes to change the value returned.

See also

negative_sign() for details.

Returns

string_type representing a negative sign.

Definition at line 1323 of file locale_facets_nonio.h.
Referenced by std::moneypunct< _CharT, _Intl >::negative_sign().

4.728.2.9 do_pos_format() `template<typename _CharT , bool _Intl>`

`virtual pattern std::moneypunct< _CharT, _Intl >::do_pos_format ( ) const [inline], [protected], [virtual], [inherited]`

Return pattern for money values.
This function returns a pattern describing the formatting of a positive valued money amount. This function is a hook for derived classes to change the value returned.

See also

pos_format() for details.

Returns

Pattern for money values.

Definition at line 1351 of file locale_facets_nonio.h.
Referenced by std::moneypunct< _CharT, _Intl >::pos_format().

4.728.2.10 do_positive_sign() `template<typename _CharT , bool _Intl>`

`virtual string_type std::moneypunct< _CharT, _Intl >::do_positive_sign ( ) const [inline], [protected], [virtual], [inherited]`

Return positive sign string.
This function returns a string_type to use as a sign for positive amounts. This function is a hook for derived classes to change the value returned.

See also

positive_sign() for details.

Returns

string_type representing a positive sign.

Definition at line 1310 of file locale_facets_nonio.h.
Referenced by std::moneypunct< _CharT, _Intl >::positive_sign().

4.728.2.11 do_thousands_sep() `template<typename _CharT , bool _Intl>`

`virtual char_type std::moneypunct< _CharT, _Intl >::do_thousands_sep ( ) const [inline], [protected], [virtual], [inherited]`

Return thousands separator character.
Returns a char_type to use as a thousands separator. This function is a hook for derived classes to change the value returned.

Returns

char_type representing a thousands separator.

Definition at line 1271 of file locale_facets_nonio.h.
Referenced by std::moneypunct< _CharT, _Intl >::thousands_sep().

4.728.2.12 frac_digits() template<typename _CharT , bool _Intl>

int std::moneypunct< _CharT, _Intl >::frac_digits ( ) const [inline], [inherited]

Return number of digits in fraction.

This function returns the exact number of digits that make up the fractional part of a money amount. It does so by returning returning moneypunct<char_type>::do_frac_digits().

The fractional part of a money amount is optional. But if it is present, there must be frac_digits() digits.

Returns

Number of digits in amount fraction.

Definition at line 1201 of file locale_facets_nonio.h.

References std::moneypunct< _CharT, _Intl >::do_frac_digits().

4.728.2.13 grouping() template<typename _CharT , bool _Intl>

string std::moneypunct< _CharT, _Intl >::grouping ( ) const [inline], [inherited]

Return grouping specification.

This function returns a string representing groupings for the integer part of an amount. Groupings indicate where thousands separators should be inserted.

Each char in the return string is interpret as an integer rather than a character. These numbers represent the number of digits in a group. The first char in the string represents the number of digits in the least significant group. If a char is negative, it indicates an unlimited number of digits for the group. If more chars from the string are required to group a number, the last char is used repeatedly.

For example, if the grouping() returns `\003\002` and is applied to the number 123456789, this corresponds to 12,34,56,789. Note that if the string was `32`, this would put more than 50 digits into the least significant group if the character set is ASCII.

The string is returned by calling moneypunct<char_type>::do_grouping().

Returns

string representing grouping specification.

Definition at line 1138 of file locale_facets_nonio.h.

References std::moneypunct< _CharT, _Intl >::do_grouping().

4.728.2.14 neg_format() template<typename _CharT , bool _Intl>

pattern std::moneypunct< _CharT, _Intl >::neg_format ( ) const [inline], [inherited]

Return pattern for money values.

This function returns a pattern describing the formatting of a positive or negative valued money amount. It does so by returning returning moneypunct<char_type>::do_pos_format() or moneypunct<char_type>::do_neg_format().

The pattern has 4 fields describing the ordering of symbol, sign, value, and none or space. There must be one of each in the pattern. The none and space enums may not appear in the first field and space may not appear in the final field.

The parts of a money string must appear in the order indicated by the fields of the pattern. The symbol field indicates that the value of curr_symbol() may be present. The sign field indicates that the value of positive_sign() or negative_sign() must be present. The value field indicates that the absolute value of the money amount is present. none indicates 0 or more whitespace characters, except at the end, where it permits no whitespace. space indicates that 1 or more whitespace characters must be present.

For example, for the US locale and pos_format() pattern {symbol,sign,value,none}, curr_symbol() == '$' positive_sign() == '+', and value 10.01, and options set to force the symbol, the corresponding string is `$+10.01`.

Returns

Pattern for money values.

Definition at line 1241 of file locale_facets_nonio.h.

References std::moneypunct< _CharT, _Intl >::do_neg_format().

4.728.2.15 negative_sign() template<typename _CharT , bool _Intl>

string_type std::moneypunct< _CharT, _Intl >::negative_sign ( ) const [inline], [inherited]

Return negative sign string.

This function returns a string_type to use as a sign for negative amounts. It does so by returning returning moneypunct<char_type>::do_negative_sign().

If the return value contains more than one character, the first character appears in the position indicated by neg_format() and the remainder appear at the end of the formatted string.

Returns

string_type representing a negative sign.

Definition at line 1185 of file locale_facets_nonio.h.

References std::moneypunct< _CharT, _Intl >::do_negative_sign().

4.728.2.16 pos_format() template<typename _CharT , bool _Intl>

pattern std::moneypunct< _CharT, _Intl >::pos_format ( ) const [inline], [inherited]

Return pattern for money values.

This function returns a pattern describing the formatting of a positive or negative valued money amount. It does so by returning returning moneypunct<char_type>::do_pos_format() or moneypunct<char_type>::do_neg_format().

The pattern has 4 fields describing the ordering of symbol, sign, value, and none or space. There must be one of each in the pattern. The none and space enums may not appear in the first field and space may not appear in the final field.

The parts of a money string must appear in the order indicated by the fields of the pattern. The symbol field indicates that the value of curr_symbol() may be present. The sign field indicates that the value of positive_sign() or negative_sign() must be present. The value field indicates that the absolute value of the money amount is present. none indicates 0 or more whitespace characters, except at the end, where it permits no whitespace. space indicates that 1 or more whitespace characters must be present.

For example, for the US locale and pos_format() pattern {symbol,sign,value,none}, curr_symbol() == '$' positive_sign() == '+', and value 10.01, and options set to force the symbol, the corresponding string is `$+10.01`.

Returns

Pattern for money values.

Definition at line 1237 of file locale_facets_nonio.h.

References std::moneypunct< _CharT, _Intl >::do_pos_format().

4.728.2.17 positive_sign() template<typename _CharT , bool _Intl>

string_type std::moneypunct< _CharT, _Intl >::positive_sign ( ) const [inline], [inherited]

Return positive sign string.

This function returns a string_type to use as a sign for positive amounts. It does so by returning returning moneypunct<char_type>::do_positive_sign().

If the return value contains more than one character, the first character appears in the position indicated by pos_format() and the remainder appear at the end of the formatted string.

Returns

string_type representing a positive sign.

Definition at line 1168 of file locale_facets_nonio.h.

References std::moneypunct< _CharT, _Intl >::do_positive_sign().

4.728.2.18 thousands_sep() template<typename _CharT , bool _Intl>

char_type std::moneypunct< _CharT, _Intl >::thousands_sep ( ) const [inline], [inherited]

Return thousands separator character.

This function returns a char_type to use as a thousands separator. It does so by returning returning moneypunct<char_type>::do_thousands_sep().

Returns

char_type representing a thousands separator.

Definition at line 1108 of file locale_facets_nonio.h.

References std::moneypunct< _CharT, _Intl >::do_thousands_sep().

4.728.3 Member Data Documentation

4.728.3.1 id template<typename _CharT , bool _Intl>

locale::id std::moneypunct< _CharT, _Intl >::id [static], [inherited]

Numpunct facet id.

Definition at line 1043 of file locale_facets_nonio.h.

4.729.1 Detailed Description

template<typename _Iterator>
class std::move_iterator< _Iterator >

Class template move_iterator is an iterator adapter with the same behavior as the underlying iterator except that its dereference operator implicitly converts the value returned by the underlying iterator's dereference operator to an rvalue reference. Some generic algorithms can be called with move iterators to replace copying with moving.
Definition at line 1338 of file bits/stl_iterator.h.

4.730.1 Detailed Description

template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Allocator = std::allocator<std::pair<const _Key, _Tp> >>
class std::__debug::multimap< _Key, _Tp, _Compare, _Allocator >

Class std::multimap with safety/checking/debug instrumentation.
Definition at line 44 of file multimap.h.

4.730.2 Member Function Documentation

4.730.2.1 _M_detach_all() `void __gnu_debug::_Safe_sequence_base::_M_detach_all ( ) [protected], [inherited]`

Detach all iterators, leaving them singular.
Referenced by __gnu_debug::_Safe_sequence_base::~_Safe_sequence_base().

4.730.2.2 _M_detach_singular() `void __gnu_debug::_Safe_sequence_base::_M_detach_singular ( ) [protected], [inherited]`

Detach all singular iterators.

Postcondition

for all iterators i attached to this sequence, i->_M_version == _M_version.

4.730.2.3 _M_get_mutex() `__gnu_cxx::__mutex& __gnu_debug::_Safe_sequence_base::_M_get_mutex ( ) throw ( ) [protected], [inherited]`

For use in _Safe_sequence.
Referenced by __gnu_debug::_Safe_sequence< _Sequence >::_M_transfer_from_if().

4.730.2.4 _M_invalidate_all() `void __gnu_debug::_Safe_sequence_base::_M_invalidate_all ( ) const [inline], [protected], [inherited]`

Invalidates all iterators.
Definition at line 256 of file safe_base.h.
References __gnu_debug::_Safe_sequence_base::_M_version.

4.730.2.5 _M_invalidate_if()

```
template<typename _Sequence >
template<typename _Predicate >
void __gnu_debug::_Safe_sequence< _Sequence >::_M_invalidate_if (
            _Predicate __pred ) [inherited]
```

Invalidates all iterators `x` that reference this sequence, are not singular, and for which `__pred(x)` returns `true`. `__pred` will be invoked with the normal iterators nested in the safe ones.
Definition at line 37 of file safe_sequence.tcc.

4.730.2.6 _M_revalidate_singular() `void __gnu_debug::_Safe_sequence_base::_M_revalidate_singular ( ) [protected], [inherited]`

Revalidates all attached singular iterators. This method may be used to validate iterators that were invalidated before (but for some reason, such as an exception, need to become valid again).

4.730.2.7 _M_swap()

```
void __gnu_debug::_Safe_sequence_base::_M_swap (
            _Safe_sequence_base & __x ) [protected], [noexcept], [inherited]
```

Swap this sequence with the given sequence. This operation also swaps ownership of the iterators, so that when the operation is complete all iterators that originally referenced one container now reference the other container.

4.730.2.8 _M_transfer_from_if()

```
template<typename _Sequence >
template<typename _Predicate >
void __gnu_debug::_Safe_sequence< _Sequence >::_M_transfer_from_if (
            _Safe_sequence< _Sequence > & __from,
            _Predicate __pred ) [inherited]
```

Transfers all iterators `x` that reference `from` sequence, are not singular, and for which `__pred(x)` returns `true`. `__pred` will be invoked with the normal iterators nested in the safe ones.
Definition at line 68 of file safe_sequence.tcc.
References std::__addressof(), __gnu_debug::_Safe_sequence_base::_M_const_iterators, __gnu_debug::_Safe_iterator_base::_M_detach_single(), __gnu_debug::_Safe_sequence_base::_M_get_mutex(), __gnu_debug::_Safe_sequence_base::_M_iterators, __gnu_debug::_Safe_iterator_base::_M_next, __gnu_debug::_Safe_iterator_base::_M_prior, __gnu_debug::_Safe_iterator_base::_M_sequence, and __gnu_debug::_Safe_iterator_base::_M_version.

4.730.3 Member Data Documentation

4.730.3.1 _M_const_iterators `_Safe_iterator_base* __gnu_debug::_Safe_sequence_base::_M_const_iterators [inherited]`

The list of constant iterators that reference this container.
Definition at line 197 of file safe_base.h.
Referenced by __gnu_debug::_Safe_sequence< _Sequence >::_M_transfer_from_if().

4.730.3.2 _M_iterators `_Safe_iterator_base* __gnu_debug::_Safe_sequence_base::_M_iterators [inherited]`

The list of mutable iterators that reference this container.
Definition at line 194 of file safe_base.h.
Referenced by __gnu_debug::_Safe_sequence< _Sequence >::_M_transfer_from_if().

4.730.3.3 _M_version `unsigned int __gnu_debug::_Safe_sequence_base::_M_version [mutable], [inherited]`

The container version number. This number may never be 0.
Definition at line 200 of file safe_base.h.
Referenced by __gnu_debug::_Safe_sequence_base::_M_invalidate_all().

4.731.1 Detailed Description

template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> > >
class std::multimap< _Key, _Tp, _Compare, _Alloc >

A standard container made up of (key,value) pairs, which can be retrieved based on a key, in logarithmic time.

Template Parameters

_Key	Type of key objects.
_Tp	Type of mapped objects.
_Compare	Comparison function object type, defaults to less<_Key>.
_Alloc	Allocator type, defaults to allocator<pair<const _Key, _Tp>>.

Meets the requirements of a `container`, a `reversible container`, and an `associative container` (using equivalent keys). For a `multimap<Key,T>` the key_type is Key, the mapped_type is T, and the value_type is std::pair<const Key,T>.
Multimaps support bidirectional iterators.
The private tree data is declared exactly the same way for map and multimap; the distinction is made entirely in how the tree functions are called (*_unique versus *_equal, same as the standard).
Definition at line 99 of file stl_multimap.h.

4.731.2 Constructor & Destructor Documentation

4.731.2.1 multimap() [1/12]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap ( ) [default]
```

Default constructor creates no elements.

4.731.2.2 multimap() [2/12]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (
            const _Compare & __comp,
            const allocator_type & __a = allocator_type() ) [inline], [explicit]
```

Creates a multimap with no elements.

Parameters

__comp	A comparison object.
__a	An allocator object.

Definition at line 191 of file stl_multimap.h.

4.731.2.3 multimap() [3/12]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (
            const multimap< _Key, _Tp, _Compare, _Alloc > & ) [default]
```

Multimap copy constructor.
Whether the allocator is copied depends on the allocator traits.

4.731.2.4 multimap() [4/12]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (
            multimap< _Key, _Tp, _Compare, _Alloc > && ) [default]
```

Multimap move constructor.
The newly-created multimap contains the exact contents of the moved instance. The moved instance is a valid, but unspecified multimap.

4.731.2.5 multimap() [5/12]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (
            initializer_list< value_type > __l,
            const _Compare & __comp = _Compare(),
            const allocator_type & __a = allocator_type() ) [inline]
```

Builds a multimap from an initializer_list.

Parameters

__l	An initializer_list.
__comp	A comparison functor.
__a	An allocator object.

Create a multimap consisting of copies of the elements from the initializer_list. This is linear in N if the list is already sorted, and NlogN otherwise (where N is *__l.size()*).

Definition at line 225 of file stl_multimap.h.

4.731.2.6 multimap() [6/12]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (
            const allocator_type & __a )  [inline], [explicit]
```

Allocator-extended default constructor.
Definition at line 233 of file stl_multimap.h.

4.731.2.7 multimap() [7/12]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (
            const multimap< _Key, _Tp, _Compare, _Alloc > & __m,
            const allocator_type & __a )  [inline]
```

Allocator-extended copy constructor.
Definition at line 237 of file stl_multimap.h.

4.731.2.8 multimap() [8/12]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (
            multimap< _Key, _Tp, _Compare, _Alloc > && __m,
            const allocator_type & __a )  [inline], [noexcept]
```

Allocator-extended move constructor.
Definition at line 241 of file stl_multimap.h.

4.731.2.9 multimap() [9/12]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (
            initializer_list< value_type > __l,
            const allocator_type & __a )  [inline]
```

Allocator-extended initialier-list constructor.
Definition at line 247 of file stl_multimap.h.

4.731.2.10 multimap() [10/12]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
template<typename _InputIterator >
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (
            _InputIterator __first,
            _InputIterator __last,
            const allocator_type & __a )  [inline]
```

Allocator-extended range constructor.
Definition at line 253 of file stl_multimap.h.

4.731.2.11 multimap() [11/12]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
template<typename _InputIterator >
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (
```

```
            _InputIterator __first,
            _InputIterator __last )  [inline]
```

Builds a multimap from a range.

Parameters

__first	An input iterator.
__last	An input iterator.

Create a multimap consisting of copies of the elements from [__first,__last). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(__first,__last)).
Definition at line 269 of file stl_multimap.h.

4.731.2.12 multimap() [12/12]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
template<typename _InputIterator >
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (
            _InputIterator __first,
            _InputIterator __last,
            const _Compare & __comp,
            const allocator_type & __a = allocator_type() )  [inline]
```

Builds a multimap from a range.

Parameters

__first	An input iterator.
__last	An input iterator.
__comp	A comparison functor.
__a	An allocator object.

Create a multimap consisting of copies of the elements from [__first,__last). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(__first,__last)).
Definition at line 285 of file stl_multimap.h.

4.731.2.13 ~multimap()

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
std::multimap< _Key, _Tp, _Compare, _Alloc >::~multimap ( )  [default]
```

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

4.731.3 Member Function Documentation

4.731.3.1 begin() [1/2]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::begin ( ) const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first pair in the multimap. Iteration is done in ascending order according to the keys.
Definition at line 360 of file stl_multimap.h.

4.731.3.2 begin() [2/2]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_↩
Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::begin ( )  [inline], [noexcept]
```

Returns a read/write iterator that points to the first pair in the multimap. Iteration is done in ascending order according to the keys.
Definition at line 351 of file stl_multimap.h.

4.731.3.3 cbegin()

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::cbegin ( ) const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first pair in the multimap. Iteration is done in ascending order according to the keys.
Definition at line 424 of file stl_multimap.h.

4.731.3.4 cend()

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::cend ( ) const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last pair in the multimap. Iteration is done in ascending order according to the keys.
Definition at line 433 of file stl_multimap.h.

4.731.3.5 clear()

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
void std::multimap< _Key, _Tp, _Compare, _Alloc >::clear ( )  [inline], [noexcept]
```

Erases all elements in a multimap. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
Definition at line 808 of file stl_multimap.h.

4.731.3.6 count() [1/2]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_↩
Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Kt >
auto std::multimap< _Key, _Tp, _Compare, _Alloc >::count (
            const _Kt & __x ) const -> decltype(_M_t._M_count_tr(__x))   [inline]
```

Finds the number of elements with given key.

Parameters

_↩ _x	Key of (key, value) pairs to be located.

Returns

Number of elements with specified key.

Definition at line 891 of file stl_multimap.h.

4.731.3.7 count() [2/2] template<typename _Key , typename _Tp , typename _Compare = std::less<_↩ Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>

```
size_type std::multimap< _Key, _Tp, _Compare, _Alloc >::count (
            const key_type & __x ) const  [inline]
```

Finds the number of elements with given key.

Parameters

_↩ _x	Key of (key, value) pairs to be located.

Returns

Number of elements with specified key.

Definition at line 885 of file stl_multimap.h.

4.731.3.8 crbegin() template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>

```
const_reverse_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::crbegin ( ) const  [inline],
[noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last pair in the multimap. Iteration is done in descending order according to the keys.
Definition at line 442 of file stl_multimap.h.

4.731.3.9 crend() template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>

```
const_reverse_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::crend ( ) const  [inline],
[noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first pair in the multimap. Iteration is done in descending order according to the keys.
Definition at line 451 of file stl_multimap.h.

4.731.3.10 emplace() template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>

```
template<typename...  _Args>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::emplace (
            _Args &&...  __args )  [inline]
```

Build and insert a std::pair into the multimap.

Parameters

__args	Arguments used to generate a new pair instance (see std::piecewise_contruct for passing arguments to each part of the pair constructor).

Returns

An iterator that points to the inserted (key,value) pair.

This function builds and inserts a (key, value) pair into the multimap. Contrary to a std::map the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted.

Insertion requires logarithmic time.
Definition at line 491 of file stl_multimap.h.

4.731.3.11 emplace_hint()

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
template<typename... _Args>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::emplace_hint (
            const_iterator __pos,
            _Args &&... __args ) [inline]
```

Builds and inserts a std::pair into the multimap.

Parameters

__pos	An iterator that serves as a hint as to where the pair should be inserted.
__args	Arguments used to generate a new pair instance (see std::piecewise_contruct for passing arguments to each part of the pair constructor).

Returns

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a std::map the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.
For more on *hinting*, see: https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints
Insertion requires logarithmic time (if the hint is not taken).
Definition at line 518 of file stl_multimap.h.

4.731.3.12 empty()

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
bool std::multimap< _Key, _Tp, _Compare, _Alloc >::empty ( ) const [inline], [noexcept]
```

Returns true if the multimap is empty.

Definition at line 458 of file stl_multimap.h.

4.731.3.13 end() [1/2]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::end ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last pair in the multimap. Iteration is done in ascending order according to the keys.
Definition at line 378 of file stl_multimap.h.

4.731.3.14 end() [2/2]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::end ( ) [inline], [noexcept]
```

Returns a read/write iterator that points one past the last pair in the multimap. Iteration is done in ascending order according to the keys.
Definition at line 369 of file stl_multimap.h.

4.731.3.15 equal_range() [1/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Kt >
auto std::multimap< _Key, _Tp, _Compare, _Alloc >::equal_range (
            const _Kt & __x ) -> decltype(pair<iterator, iterator>(_M_t._M_equal_range_tr(__x)))
[inline]
```

Finds a subsequence matching given key.

Parameters

_x	Key of (key, value) pairs to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
               c.upper_bound(val))
```

(but is faster than making the calls separately).
Definition at line 1026 of file stl_multimap.h.

4.731.3.16 equal_range() [2/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Kt >
auto std::multimap< _Key, _Tp, _Compare, _Alloc >::equal_range (
            const _Kt & __x ) const -> decltype(pair<const_iterator, const_iterator>( _M_t._M_equal_range_tr(__x)))   [inline]
```

Finds a subsequence matching given key.

Parameters

_x	Key of (key, value) pairs to be located.

Returns

Pair of read-only (constant) iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
               c.upper_bound(val))
```

(but is faster than making the calls separately).
Definition at line 1053 of file stl_multimap.h.

4.731.3.17 equal_range() [3/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
std::pair<iterator, iterator> std::multimap< _Key, _Tp, _Compare, _Alloc >::equal_range (
            const key_type & __x )  [inline]
```

Finds a subsequence matching given key.

Parameters

_↩ _x	Key of (key, value) pairs to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to
```
std::make_pair(c.lower_bound(val),
               c.upper_bound(val))
```
(but is faster than making the calls separately).
Definition at line 1020 of file stl_multimap.h.

4.731.3.18 equal_range() [4/4]

```
template<typename _Key , typename _Tp , typename _Compare = std↩
::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
std::pair<const_iterator, const_iterator> std::multimap< _Key, _Tp, _Compare, _Alloc >::equal_↩
range (
            const key_type & __x ) const  [inline]
```

Finds a subsequence matching given key.

Parameters

_↩ _x	Key of (key, value) pairs to be located.

Returns

Pair of read-only (constant) iterators that possibly points to the subsequence matching given key.

This function is equivalent to
```
std::make_pair(c.lower_bound(val),
               c.upper_bound(val))
```
(but is faster than making the calls separately).
Definition at line 1047 of file stl_multimap.h.

4.731.3.19 erase() [1/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_↩
Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
size_type std::multimap< _Key, _Tp, _Compare, _Alloc >::erase (
            const key_type & __x )  [inline]
```

Erases elements according to the provided key.

Parameters

_↩ _x	Key of element to be erased.

Returns

The number of elements erased.

This function erases all elements located by the given key from a multimap. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
Definition at line 739 of file stl_multimap.h.

4.731.3.20 erase() [2/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_↩
Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::erase (
            const_iterator __first,
            const_iterator __last )  [inline]
```

Erases a [first,last) range of elements from a multimap.

Parameters

__first	Iterator pointing to the start of the range to be erased.
__last	Iterator pointing to the end of the range to be erased .

Returns

The iterator *__last*.

This function erases a sequence of elements from a multimap. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
Definition at line 760 of file stl_multimap.h.

4.731.3.21 erase() [3/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_↩
Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::erase (
            const_iterator __position )  [inline]
```

Erases an element from a multimap.

Parameters

__position	An iterator pointing to the element to be erased.

Returns

An iterator pointing to the element immediately following *position* prior to the element being erased. If no such element exists, end() is returned.

This function erases an element, pointed to by the given iterator, from a multimap. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
Definition at line 702 of file stl_multimap.h.

4.731.3.22 erase() [4/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_↩
Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
```

```
_GLIBCXX_ABI_TAG_CXX11 iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::erase (
            iterator __position )  [inline]
```

Erases an element from a multimap.

Parameters

__position	An iterator pointing to the element to be erased.

Returns

An iterator pointing to the element immediately following *position* prior to the element being erased. If no such element exists, end() is returned.

This function erases an element, pointed to by the given iterator, from a multimap. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
Definition at line 708 of file stl_multimap.h.

4.731.3.23 find() [1/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_↩
Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Kt >
auto std::multimap< _Key, _Tp, _Compare, _Alloc >::find (
            const _Kt & __x ) -> decltype(_M_t._M_find_tr(__x))   [inline]
```

Tries to locate an element in a multimap.

Parameters

_↩ _x	Key of (key, value) pair to be located.

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end (`end()`) iterator.
Definition at line 849 of file stl_multimap.h.

4.731.3.24 find() [2/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_↩
Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Kt >
auto std::multimap< _Key, _Tp, _Compare, _Alloc >::find (
            const _Kt & __x ) const -> decltype(_M_t._M_find_tr(__x))   [inline]
```

Tries to locate an element in a multimap.

Parameters

_↩ _x	Key of (key, value) pair to be located.

Returns

Read-only (constant) iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns a constant iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end (`end()`) iterator.
Definition at line 873 of file stl_multimap.h.

4.731.3.25 find() [3/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_↩
Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::find (
            const key_type & __x )  [inline]
```

Tries to locate an element in a multimap.

Parameters

_↩ _x	Key of (key, value) pair to be located.

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end (`end()`) iterator.
Definition at line 843 of file stl_multimap.h.

4.731.3.26 find() [4/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_↩
Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::find (
            const key_type & __x ) const  [inline]
```

Tries to locate an element in a multimap.

Parameters

_↩ _x	Key of (key, value) pair to be located.

Returns

Read-only (constant) iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns a constant iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end (`end()`) iterator.
Definition at line 867 of file stl_multimap.h.

4.731.3.27 get_allocator()

```
template<typename _Key , typename _Tp , typename _Compare = std::less<↩
_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
allocator_type std::multimap< _Key, _Tp, _Compare, _Alloc >::get_allocator ( ) const  [inline],
[noexcept]
```

Get a copy of the memory allocation object.
Definition at line 341 of file stl_multimap.h.

4.731.3.28 insert() [1/8]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_↩
Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
template<typename _InputIterator >
void std::multimap< _Key, _Tp, _Compare, _Alloc >::insert (
            _InputIterator __first,
            _InputIterator __last )  [inline]
```

A template function that attempts to insert a range of elements.

Parameters

__first	Iterator pointing to the start of the range to be inserted.
__last	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.
Definition at line 613 of file stl_multimap.h.

4.731.3.29 insert() [2/8]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_↩
Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Pair >
__enable_if_t<is_constructible<value_type, _Pair>::value, iterator> std::multimap< _Key, _Tp, ↩
_Compare, _Alloc >::insert (
            _Pair && __x )  [inline]
```

Inserts a std::pair into the multimap.

Parameters

_↩ _x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a std::map the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted.
Insertion requires logarithmic time.
Definition at line 551 of file stl_multimap.h.

4.731.3.30 insert() [3/8]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_↩
Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::insert (
            const value_type & __x )  [inline]
```

Inserts a std::pair into the multimap.

Parameters

_↩ _x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a std::map the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted.
Insertion requires logarithmic time.
Definition at line 539 of file stl_multimap.h.
Referenced by std::multimap< _Key, _Tp, _Compare, _Alloc >::insert().

4.731.3.31 insert() [4/8]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Pair >
__enable_if_t<is_constructible<value_type, _Pair&&>::value, iterator> std::multimap< _Key, _Tp, _Compare, _Alloc >::insert (
            const_iterator __position,
            _Pair && __x )  [inline]
```

Inserts a std::pair into the multimap.

Parameters

__position	An iterator that serves as a hint as to where the pair should be inserted.
__x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a std::map the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.
For more on *hinting*, see: https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints
Insertion requires logarithmic time (if the hint is not taken).
Definition at line 594 of file stl_multimap.h.

4.731.3.32 insert() [5/8]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::insert (
            const_iterator __position,
            const value_type & __x )  [inline]
```

Inserts a std::pair into the multimap.

Parameters

__position	An iterator that serves as a hint as to where the pair should be inserted.
__x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a std::map the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.
For more on *hinting*, see: https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints
Insertion requires logarithmic time (if the hint is not taken).
Definition at line 579 of file stl_multimap.h.

4.731.3.33 insert() [6/8]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::insert (
            const_iterator __position,
            value_type && __x )  [inline]
```

Inserts a std::pair into the multimap.

Parameters

__position	An iterator that serves as a hint as to where the pair should be inserted.
__x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a std::map the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.
For more on *hinting*, see: https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints
Insertion requires logarithmic time (if the hint is not taken).
Definition at line 589 of file stl_multimap.h.
References std::move().

4.731.3.34 insert() [7/8]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
void std::multimap< _Key, _Tp, _Compare, _Alloc >::insert (
            initializer_list< value_type > __l )  [inline]
```

Attempts to insert a list of std::pairs into the multimap.

Parameters

__l	A std::initializer_list<value_type> of pairs to be inserted.

Complexity similar to that of the range constructor.

Definition at line 625 of file stl_multimap.h.
References std::multimap< _Key, _Tp, _Compare, _Alloc >::insert().

4.731.3.35 insert() [8/8]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_↩
Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::insert (
            value_type && __x )  [inline]
```

Inserts a std::pair into the multimap.

Parameters

_↩ _x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a std::map the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted.
Insertion requires logarithmic time.
Definition at line 546 of file stl_multimap.h.
References std::move().

4.731.3.36 key_comp()

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_↩
Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
key_compare std::multimap< _Key, _Tp, _Compare, _Alloc >::key_comp ( ) const  [inline]
```

Returns the key comparison object out of which the multimap was constructed.
Definition at line 817 of file stl_multimap.h.

4.731.3.37 lower_bound() [1/4]

```
template<typename _Key , typename _Tp , typename _Compare = std↩
::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Kt >
auto std::multimap< _Key, _Tp, _Compare, _Alloc >::lower_bound (
            const _Kt & __x ) -> decltype(iterator(_M_t._M_lower_bound_tr(__x)))  [inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

_↩ _x	Key of (key, value) pair to be located.

Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.
Definition at line 934 of file stl_multimap.h.

4.731.3.38 lower_bound() [2/4]

```
template<typename _Key , typename _Tp , typename _Compare = std↩
::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Kt >
auto std::multimap< _Key, _Tp, _Compare, _Alloc >::lower_bound (
            const _Kt & __x ) const -> decltype(const_iterator(_M_t._M_lower_bound_tr(__x)))
[inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

_↩ _x	Key of (key, value) pair to be located.

Returns

Read-only (constant) iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful the iterator will point to the next greatest element or, if no such greater element exists, to end().
Definition at line 959 of file stl_multimap.h.

4.731.3.39 lower_bound() [3/4]

```
template<typename _Key , typename _Tp , typename _Compare = std↩
::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::lower_bound (
            const key_type & __x )  [inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

_↩ _x	Key of (key, value) pair to be located.

Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.
Definition at line 928 of file stl_multimap.h.

4.731.3.40 lower_bound() [4/4]

```
template<typename _Key , typename _Tp , typename _Compare = std↩
::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::lower_bound (
            const key_type & __x ) const  [inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

_↩ _x	Key of (key, value) pair to be located.

Returns

Read-only (constant) iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful the iterator will point to the next greatest element or, if no such greater element exists, to end().
Definition at line 953 of file stl_multimap.h.

4.731.3.41 max_size()

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_↩
Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
size_type std::multimap< _Key, _Tp, _Compare, _Alloc >::max_size ( ) const  [inline], [noexcept]
```

Returns the maximum size of the multimap.

Definition at line 468 of file stl_multimap.h.

4.731.3.42 operator=() [1/3]

```
template<typename _Key , typename _Tp , typename _Compare = std↩
::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
multimap& std::multimap< _Key, _Tp, _Compare, _Alloc >::operator= (
            const multimap< _Key, _Tp, _Compare, _Alloc > &  )  [default]
```

Multimap assignment operator.
Whether the allocator is copied depends on the allocator traits.

4.731.3.43 operator=() [2/3]

```
template<typename _Key , typename _Tp , typename _Compare = std↩
::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
multimap& std::multimap< _Key, _Tp, _Compare, _Alloc >::operator= (
            initializer_list< value_type > __l )  [inline]
```

Multimap list assignment operator.

Parameters

↩ _↩ ↩ _↩ *l*	An initializer_list.

This function fills a multimap with copies of the elements in the initializer list *__l*.
Note that the assignment completely changes the multimap and that the resulting multimap's size is the same as the number of elements assigned.
Definition at line 332 of file stl_multimap.h.

4.731.3.44 operator=() [3/3]

```
template<typename _Key , typename _Tp , typename _Compare = std↩
::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
multimap& std::multimap< _Key, _Tp, _Compare, _Alloc >::operator= (
            multimap< _Key, _Tp, _Compare, _Alloc > &&  )  [default]
```

Move assignment operator.

4.731.3.45 rbegin() [1/2]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<↩
_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
```

const_reverse_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::rbegin ( ) const [inline], [noexcept]
Returns a read-only (constant) reverse iterator that points to the last pair in the multimap. Iteration is done in descending order according to the keys.
Definition at line 396 of file stl_multimap.h.

4.731.3.46 rbegin() [2/2]

template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
reverse_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::rbegin ( ) [inline], [noexcept]
Returns a read/write reverse iterator that points to the last pair in the multimap. Iteration is done in descending order according to the keys.
Definition at line 387 of file stl_multimap.h.

4.731.3.47 rend() [1/2]

template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
const_reverse_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::rend ( ) const [inline], [noexcept]
Returns a read-only (constant) reverse iterator that points to one before the first pair in the multimap. Iteration is done in descending order according to the keys.
Definition at line 414 of file stl_multimap.h.

4.731.3.48 rend() [2/2]

template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
reverse_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::rend ( ) [inline], [noexcept]
Returns a read/write reverse iterator that points to one before the first pair in the multimap. Iteration is done in descending order according to the keys.
Definition at line 405 of file stl_multimap.h.

4.731.3.49 size()

template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
size_type std::multimap< _Key, _Tp, _Compare, _Alloc >::size ( ) const [inline], [noexcept]
Returns the size of the multimap.

Definition at line 463 of file stl_multimap.h.

4.731.3.50 swap()

template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
void std::multimap< _Key, _Tp, _Compare, _Alloc >::swap (
multimap< _Key, _Tp, _Compare, _Alloc > & __x) [inline], [noexcept]
Swaps data with another multimap.

Parameters

_↩ _x	A multimap of the same element and allocator types.

This exchanges the elements between two multimaps in constant time. (It is only swapping a pointer, an integer, and an instance of the Compare type (which itself is often stateless and empty), so it should be quite fast.) Note that the

global std::swap() function is specialized such that std::swap(m1,m2) will feed to this function.
Whether the allocators are swapped depends on the allocator traits.
Definition at line 797 of file stl_multimap.h.

4.731.3.51 upper_bound() [1/4]

```
template<typename _Key , typename _Tp , typename _Compare = std↩
::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Kt >
auto std::multimap< _Key, _Tp, _Compare, _Alloc >::upper_bound (
            const _Kt & __x ) -> decltype(iterator(_M_t._M_upper_bound_tr(__x)))   [inline]
```

Finds the end of a subsequence matching given key.

Parameters

_↩ _x	Key of (key, value) pair to be located.

Returns

Iterator pointing to the first element greater than key, or end().

Definition at line 979 of file stl_multimap.h.

4.731.3.52 upper_bound() [2/4]

```
template<typename _Key , typename _Tp , typename _Compare = std↩
::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Kt >
auto std::multimap< _Key, _Tp, _Compare, _Alloc >::upper_bound (
            const _Kt & __x ) const -> decltype(const_iterator(_M_t._M_upper_bound_tr(__x)))
[inline]
```

Finds the end of a subsequence matching given key.

Parameters

_↩ _x	Key of (key, value) pair to be located.

Returns

Read-only (constant) iterator pointing to first iterator greater than key, or end().

Definition at line 999 of file stl_multimap.h.

4.731.3.53 upper_bound() [3/4]

```
template<typename _Key , typename _Tp , typename _Compare = std↩
::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::upper_bound (
            const key_type & __x )  [inline]
```

Finds the end of a subsequence matching given key.

Parameters

_↩ _x	Key of (key, value) pair to be located.

Returns

Iterator pointing to the first element greater than key, or end().

Definition at line 973 of file stl_multimap.h.

4.731.3.54 upper_bound() [4/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::upper_bound (
            const key_type & __x ) const  [inline]
```

Finds the end of a subsequence matching given key.

Parameters

__x	Key of (key, value) pair to be located.

Returns

Read-only (constant) iterator pointing to first iterator greater than key, or end().

Definition at line 993 of file stl_multimap.h.

4.731.3.55 value_comp()

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
value_compare std::multimap< _Key, _Tp, _Compare, _Alloc >::value_comp ( ) const  [inline]
```

Returns a value comparison object, built from the key comparison object out of which the multimap was constructed.
Definition at line 825 of file stl_multimap.h.
The documentation for this class was generated from the following files:

4.734.1 Detailed Description

template<typename _Key, typename _Compare = std::less<_Key>, typename _Allocator = std::allocator<_Key>>
class std::__debug::multiset< _Key, _Compare, _Allocator >

Class std::multiset with safety/checking/debug instrumentation.
Definition at line 44 of file multiset.h.

4.734.2 Member Function Documentation

4.734.2.1 _M_detach_all() `void __gnu_debug::_Safe_sequence_base::_M_detach_all ( ) [protected], [inherited]`

Detach all iterators, leaving them singular.
Referenced by __gnu_debug::_Safe_sequence_base::~_Safe_sequence_base().

4.734.2.2 _M_detach_singular() `void __gnu_debug::_Safe_sequence_base::_M_detach_singular ( ) [protected], [inherited]`

Detach all singular iterators.

Postcondition

for all iterators i attached to this sequence, i->_M_version == _M_version.

4.734.2.3 _M_get_mutex() `__gnu_cxx::__mutex& __gnu_debug::_Safe_sequence_base::_M_get_mutex ( ) throw ( ) [protected], [inherited]`

For use in _Safe_sequence.
Referenced by __gnu_debug::_Safe_sequence< _Sequence >::_M_transfer_from_if().

4.734.2.4 _M_invalidate_all() `void __gnu_debug::_Safe_sequence_base::_M_invalidate_all ( ) const [inline], [protected], [inherited]`

Invalidates all iterators.
Definition at line 256 of file safe_base.h.
References __gnu_debug::_Safe_sequence_base::_M_version.

4.734.2.5 _M_invalidate_if() `template<typename _Sequence > template<typename _Predicate > void __gnu_debug::_Safe_sequence< _Sequence >::_M_invalidate_if ( _Predicate __pred ) [inherited]`

Invalidates all iterators `x` that reference this sequence, are not singular, and for which `__pred(x)` returns `true`. `__pred` will be invoked with the normal iterators nested in the safe ones.
Definition at line 37 of file safe_sequence.tcc.

4.734.2.6 _M_revalidate_singular()

`void __gnu_debug::_Safe_sequence_base::_M_revalidate_singular ( ) [protected], [inherited]`

Revalidates all attached singular iterators. This method may be used to validate iterators that were invalidated before (but for some reason, such as an exception, need to become valid again).

4.734.2.7 _M_swap()

```
void __gnu_debug::_Safe_sequence_base::_M_swap (
            _Safe_sequence_base & __x ) [protected], [noexcept], [inherited]
```

Swap this sequence with the given sequence. This operation also swaps ownership of the iterators, so that when the operation is complete all iterators that originally referenced one container now reference the other container.

4.734.2.8 _M_transfer_from_if()

```
template<typename _Sequence >
template<typename _Predicate >
void __gnu_debug::_Safe_sequence< _Sequence >::_M_transfer_from_if (
            _Safe_sequence< _Sequence > & __from,
            _Predicate __pred ) [inherited]
```

Transfers all iterators `x` that reference `from` sequence, are not singular, and for which `__pred(x)` returns `true`. `__pred` will be invoked with the normal iterators nested in the safe ones.
Definition at line 68 of file safe_sequence.tcc.
References std::__addressof(), __gnu_debug::_Safe_sequence_base::_M_const_iterators, __gnu_debug::_Safe_iterator_base::_M_detach_single(), __gnu_debug::_Safe_sequence_base::_M_get_mutex(), __gnu_debug::_Safe_sequence_base::_M_iterators, __gnu_debug::_Safe_iterator_base::_M_next, __gnu_debug::_Safe_iterator_base::_M_prior, __gnu_debug::_Safe_iterator_base::_M_sequence, and __gnu_debug::_Safe_iterator_base::_M_version.

4.734.3 Member Data Documentation

4.734.3.1 _M_const_iterators

`_Safe_iterator_base* __gnu_debug::_Safe_sequence_base::_M_const_iterators [inherited]`

The list of constant iterators that reference this container.
Definition at line 197 of file safe_base.h.
Referenced by __gnu_debug::_Safe_sequence< _Sequence >::_M_transfer_from_if().

4.734.3.2 _M_iterators

`_Safe_iterator_base* __gnu_debug::_Safe_sequence_base::_M_iterators [inherited]`

The list of mutable iterators that reference this container.
Definition at line 194 of file safe_base.h.
Referenced by __gnu_debug::_Safe_sequence< _Sequence >::_M_transfer_from_if().

4.734.3.3 _M_version

`unsigned int __gnu_debug::_Safe_sequence_base::_M_version [mutable], [inherited]`

The container version number. This number may never be 0.
Definition at line 200 of file safe_base.h.
Referenced by __gnu_debug::_Safe_sequence_base::_M_invalidate_all().

4.735.1 Detailed Description

template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
class std::multiset< _Key, _Compare, _Alloc >

A standard container made up of elements, which can be retrieved in logarithmic time.

Template Parameters

_Key	Type of key objects.
_Compare	Comparison function object type, defaults to less<_Key>.
_Alloc	Allocator type, defaults to allocator<_Key>.

Meets the requirements of a container, a reversible container, and an associative container (using equivalent keys). For a multiset<Key> the key_type and value_type are Key.
Multisets support bidirectional iterators.
The private tree data is declared exactly the same way for set and multiset; the distinction is made entirely in how the tree functions are called (*_unique versus *_equal, same as the standard).
Definition at line 96 of file stl_multiset.h.

4.735.2 Constructor & Destructor Documentation

4.735.2.1 multiset() [1/12] template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>

```
std::multiset< _Key, _Compare, _Alloc >::multiset ( )  [default]
```

Default constructor creates no elements.

4.735.2.2 multiset() [2/12] template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>

```
std::multiset< _Key, _Compare, _Alloc >::multiset (
            const _Compare & __comp,
            const allocator_type & __a = allocator_type() )  [inline], [explicit]
```

Creates a multiset with no elements.

Parameters

__comp	Comparator to use.
__a	An allocator object.

Definition at line 173 of file stl_multiset.h.

4.735.2.3 multiset() [3/12]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename
_Alloc = std::allocator<_Key>>
template<typename _InputIterator >
std::multiset< _Key, _Compare, _Alloc >::multiset (
            _InputIterator __first,
            _InputIterator __last )  [inline]
```

Builds a multiset from a range.

Parameters

__first	An input iterator.
__last	An input iterator.

Create a multiset consisting of copies of the elements from [first,last). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(__first,__last)).
Definition at line 187 of file stl_multiset.h.

4.735.2.4 multiset() [4/12]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename
_Alloc = std::allocator<_Key>>
template<typename _InputIterator >
std::multiset< _Key, _Compare, _Alloc >::multiset (
            _InputIterator __first,
            _InputIterator __last,
            const _Compare & __comp,
            const allocator_type & __a = allocator_type() )  [inline]
```

Builds a multiset from a range.

Parameters

__first	An input iterator.
__last	An input iterator.
__comp	A comparison functor.
__a	An allocator object.

Create a multiset consisting of copies of the elements from [__first,__last). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(__first,__last)).
Definition at line 203 of file stl_multiset.h.

4.735.2.5 multiset() [5/12]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename
_Alloc = std::allocator<_Key>>
std::multiset< _Key, _Compare, _Alloc >::multiset (
```

```
            const multiset< _Key, _Compare, _Alloc > &  )  [default]
```

Multiset copy constructor.
Whether the allocator is copied depends on the allocator traits.

4.735.2.6 multiset() [6/12]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename
_Alloc = std::allocator<_Key>>
std::multiset< _Key, _Compare, _Alloc >::multiset (
            multiset< _Key, _Compare, _Alloc > &&  )  [default]
```

Multiset move constructor.
The newly-created multiset contains the exact contents of the moved instance. The moved instance is a valid, but unspecified multiset.

4.735.2.7 multiset() [7/12]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename
_Alloc = std::allocator<_Key>>
std::multiset< _Key, _Compare, _Alloc >::multiset (
            initializer_list< value_type > __l,
            const _Compare & __comp = _Compare(),
            const allocator_type & __a = allocator_type() )  [inline]
```

Builds a multiset from an initializer_list.

Parameters

__l	An initializer_list.
__comp	A comparison functor.
__a	An allocator object.

Create a multiset consisting of copies of the elements from the list. This is linear in N if the list is already sorted, and NlogN otherwise (where N is *__l.size()*).
Definition at line 239 of file stl_multiset.h.

4.735.2.8 multiset() [8/12]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename
_Alloc = std::allocator<_Key>>
std::multiset< _Key, _Compare, _Alloc >::multiset (
            const allocator_type & __a )  [inline], [explicit]
```

Allocator-extended default constructor.
Definition at line 247 of file stl_multiset.h.

4.735.2.9 multiset() [9/12]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename
_Alloc = std::allocator<_Key>>
std::multiset< _Key, _Compare, _Alloc >::multiset (
            const multiset< _Key, _Compare, _Alloc > & __m,
            const allocator_type & __a )  [inline]
```

Allocator-extended copy constructor.
Definition at line 251 of file stl_multiset.h.

4.735.2.10 multiset() [10/12]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename
_Alloc = std::allocator<_Key>>
std::multiset< _Key, _Compare, _Alloc >::multiset (
            multiset< _Key, _Compare, _Alloc > && __m,
            const allocator_type & __a )  [inline], [noexcept]
```

Allocator-extended move constructor.
Definition at line 255 of file stl_multiset.h.

4.735.2.11 multiset() [11/12]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename
_Alloc = std::allocator<_Key>>
std::multiset< _Key, _Compare, _Alloc >::multiset (
            initializer_list< value_type > __l,
            const allocator_type & __a )  [inline]
```

Allocator-extended initialier-list constructor.
Definition at line 261 of file stl_multiset.h.

4.735.2.12 multiset() [12/12]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename
_Alloc = std::allocator<_Key>>
template<typename _InputIterator >
std::multiset< _Key, _Compare, _Alloc >::multiset (
            _InputIterator __first,
            _InputIterator __last,
            const allocator_type & __a )  [inline]
```

Allocator-extended range constructor.
Definition at line 267 of file stl_multiset.h.

4.735.2.13 ~multiset()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _↩
Alloc = std::allocator<_Key>>
std::multiset< _Key, _Compare, _Alloc >::~multiset ( )  [default]
```

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

4.735.3 Member Function Documentation

4.735.3.1 begin()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::begin ( ) const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the multiset. Iteration is done in ascending order according to the keys.
Definition at line 340 of file stl_multiset.h.

4.735.3.2 cbegin()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc
= std::allocator<_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::cbegin ( ) const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the multiset. Iteration is done in ascending order according to the keys.
Definition at line 377 of file stl_multiset.h.

4.735.3.3 cend()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::cend ( ) const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the multiset. Iteration is done in ascending order according to the keys.
Definition at line 386 of file stl_multiset.h.

4.735.3.4 clear()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<_Key>>
void std::multiset< _Key, _Compare, _Alloc >::clear ( )  [inline], [noexcept]
```

Erases all elements in a multiset. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
Definition at line 718 of file stl_multiset.h.

4.735.3.5 count() [1/2]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _↩
Alloc = std::allocator<_Key>>
template<typename _Kt >
auto std::multiset< _Key, _Compare, _Alloc >::count (
            const _Kt & __x ) const -> decltype(_M_t._M_count_tr(__x))   [inline]
```

Finds the number of elements with given key.

Parameters

_↩ _x	Key of elements to be located.

Returns

Number of elements with specified key.

Definition at line 736 of file stl_multiset.h.

4.735.3.6 count() [2/2]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _↩
Alloc = std::allocator<_Key>>
size_type std::multiset< _Key, _Compare, _Alloc >::count (
            const key_type & __x ) const  [inline]
```

Finds the number of elements with given key.

Parameters

_↩ _x	Key of elements to be located.

Returns

Number of elements with specified key.

Definition at line 730 of file stl_multiset.h.

4.735.3.7 crbegin()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc
= std::allocator<_Key>>
reverse_iterator std::multiset< _Key, _Compare, _Alloc >::crbegin ( ) const  [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the multiset. Iteration is done in descending order according to the keys.
Definition at line 395 of file stl_multiset.h.

4.735.3.8 crend()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<_Key>>
reverse_iterator std::multiset< _Key, _Compare, _Alloc >::crend ( ) const  [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the multiset. Iteration is done in descending order according to the keys.
Definition at line 404 of file stl_multiset.h.

4.735.3.9 emplace()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc
= std::allocator<_Key>>
template<typename...  _Args>
iterator std::multiset< _Key, _Compare, _Alloc >::emplace (
            _Args &&...  __args )  [inline]
```

Builds and inserts an element into the multiset.

Parameters

__args	Arguments used to generate the element instance to be inserted.

Returns

An iterator that points to the inserted element.

This function inserts an element into the multiset. Contrary to a std::set the multiset does not rely on unique keys and thus multiple copies of the same element can be inserted.
Insertion requires logarithmic time.
Definition at line 457 of file stl_multiset.h.

4.735.3.10 emplace_hint()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename
_Alloc = std::allocator<_Key>>
template<typename...  _Args>
iterator std::multiset< _Key, _Compare, _Alloc >::emplace_hint (
            const_iterator __pos,
            _Args &&...  __args )  [inline]
```

Builds and inserts an element into the multiset.

Parameters

__pos	An iterator that serves as a hint as to where the element should be inserted.
__args	Arguments used to generate the element instance to be inserted.

Returns

An iterator that points to the inserted element.

This function inserts an element into the multiset. Contrary to a std::set the multiset does not rely on unique keys and thus multiple copies of the same element can be inserted.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.
See https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints for more on *hinting*.
Insertion requires logarithmic time (if the hint is not taken).
Definition at line 483 of file stl_multiset.h.

4.735.3.11 empty()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc
= std::allocator<_Key>>
bool std::multiset< _Key, _Compare, _Alloc >::empty ( ) const  [inline], [noexcept]
```

Returns true if the set is empty.
Definition at line 410 of file stl_multiset.h.

4.735.3.12 end()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::end ( ) const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the multiset. Iteration is done in ascending order according to the keys.
Definition at line 349 of file stl_multiset.h.

4.735.3.13 equal_range() [1/4]

```
template<typename _Key , typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>>
template<typename _Kt >
auto std::multiset< _Key, _Compare, _Alloc >::equal_range (
            const _Kt & __x ) -> decltype(pair<iterator, iterator>(_M_t._M_equal_range_tr(__x)))
[inline]
```

Finds a subsequence matching given key.

Parameters

_↩ _x	Key to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
               c.upper_bound(val))
```

(but is faster than making the calls separately).
This function probably only makes sense for multisets.
Definition at line 889 of file stl_multiset.h.

4.735.3.14 equal_range() [2/4]

```
template<typename _Key , typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>>
template<typename _Kt >
auto std::multiset< _Key, _Compare, _Alloc >::equal_range (
            const _Kt & __x ) const -> decltype(pair<iterator, iterator>(_M_t._M_equal_range_↩
tr(__x)))   [inline]
```

Finds a subsequence matching given key.

Parameters

_↩ _x	Key to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to
```
std::make_pair(c.lower_bound(val),
               c.upper_bound(val))
```
(but is faster than making the calls separately).
This function probably only makes sense for multisets.
Definition at line 895 of file stl_multiset.h.

4.735.3.15 equal_range() [3/4]

```
template<typename _Key , typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>>
std::pair<iterator, iterator> std::multiset< _Key, _Compare, _Alloc >::equal_range (
            const key_type & __x )  [inline]
```

Finds a subsequence matching given key.

Parameters

_↩ _x	Key to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to
```
std::make_pair(c.lower_bound(val),
               c.upper_bound(val))
```
(but is faster than making the calls separately).
This function probably only makes sense for multisets.
Definition at line 879 of file stl_multiset.h.

4.735.3.16 equal_range() [4/4]

```
template<typename _Key , typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>>
std::pair<const_iterator, const_iterator> std::multiset< _Key, _Compare, _Alloc >::equal_range (
            const key_type & __x ) const  [inline]
```

Finds a subsequence matching given key.

Parameters

_↩ _x	Key to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to
```
std::make_pair(c.lower_bound(val),
               c.upper_bound(val))
```
(but is faster than making the calls separately).
This function probably only makes sense for multisets.
Definition at line 883 of file stl_multiset.h.

4.735.3.17 erase() [1/3]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename ↩
_Alloc = std::allocator<_Key>>
size_type std::multiset< _Key, _Compare, _Alloc >::erase (
            const key_type & __x )  [inline]
```

Erases elements according to the provided key.

Parameters

_↩ _*x*	Key of element to be erased.

Returns

The number of elements erased.

This function erases all elements located by the given key from a multiset. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
Definition at line 669 of file stl_multiset.h.

4.735.3.18 erase() [2/3]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename ↩
_Alloc = std::allocator<_Key>>
_GLIBCXX_ABI_TAG_CXX11 iterator std::multiset< _Key, _Compare, _Alloc >::erase (
            const_iterator __first,
            const_iterator __last )  [inline]
```

Erases a [first,last) range of elements from a multiset.

Parameters

__first	Iterator pointing to the start of the range to be erased.
__last	Iterator pointing to the end of the range to be erased.

Returns

The iterator *last*.

This function erases a sequence of elements from a multiset. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
Definition at line 691 of file stl_multiset.h.

4.735.3.19 erase() [3/3]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename ↩
_Alloc = std::allocator<_Key>>
_GLIBCXX_ABI_TAG_CXX11 iterator std::multiset< _Key, _Compare, _Alloc >::erase (
            const_iterator __position )  [inline]
```

Erases an element from a multiset.

Parameters

__position	An iterator pointing to the element to be erased.

Returns

An iterator pointing to the element immediately following *position* prior to the element being erased. If no such element exists, end() is returned.

This function erases an element, pointed to by the given iterator, from a multiset. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
Definition at line 639 of file stl_multiset.h.

4.735.3.20 find() [1/4]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _↩
Alloc = std::allocator<_Key>>
template<typename _Kt >
auto std::multiset< _Key, _Compare, _Alloc >::find (
            const _Kt & __x ) -> decltype(iterator{_M_t._M_find_tr(__x)})   [inline]
```

Tries to locate an element in a set.

Parameters

_↩ _x	Element to be located.

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.
Definition at line 785 of file stl_multiset.h.

4.735.3.21 find() [2/4]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _↩
Alloc = std::allocator<_Key>>
template<typename _Kt >
auto std::multiset< _Key, _Compare, _Alloc >::find (
            const _Kt & __x ) const -> decltype(const_iterator{_M_t._M_find_tr(__x)})   [inline]
```

Tries to locate an element in a set.

Parameters

_↩ _x	Element to be located.

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.
Definition at line 791 of file stl_multiset.h.

4.735.3.22 find() [3/4]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _↩
Alloc = std::allocator<_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::find (
            const key_type & __x )  [inline]
```

Tries to locate an element in a set.

Parameters

_↩ _x	Element to be located.

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.
Definition at line 775 of file stl_multiset.h.

4.735.3.23 find() [4/4]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _↩
Alloc = std::allocator<_Key>>
const_iterator std::multiset< _Key, _Compare, _Alloc >::find (
            const key_type & __x ) const  [inline]
```

Tries to locate an element in a set.

Parameters

_↩ _x	Element to be located.

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.
Definition at line 779 of file stl_multiset.h.

4.735.3.24 get_allocator()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename
_Alloc = std::allocator<_Key>>
allocator_type std::multiset< _Key, _Compare, _Alloc >::get_allocator ( ) const  [inline], [noexcept]
```

Returns the memory allocation object.
Definition at line 331 of file stl_multiset.h.

4.735.3.25 insert() [1/4]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename
_Alloc = std::allocator<_Key>>
template<typename _InputIterator >
void std::multiset< _Key, _Compare, _Alloc >::insert (
            _InputIterator __first,
            _InputIterator __last )  [inline]
```

A template function that tries to insert a range of elements.

Parameters

__first	Iterator pointing to the start of the range to be inserted.
__last	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.
Definition at line 551 of file stl_multiset.h.

4.735.3.26 insert() [2/4]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename
_Alloc = std::allocator<_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::insert (
            const value_type & __x )  [inline]
```

Inserts an element into the multiset.

Parameters

_↩ _x	Element to be inserted.

Returns

An iterator that points to the inserted element.

This function inserts an element into the multiset. Contrary to a std::set the multiset does not rely on unique keys and thus multiple copies of the same element can be inserted.
Insertion requires logarithmic time.
Definition at line 502 of file stl_multiset.h.
Referenced by std::multiset< _Key, _Compare, _Alloc >::insert().

4.735.3.27 insert() [3/4]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename
_Alloc = std::allocator<_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::insert (
            const_iterator __position,
            const value_type & __x )  [inline]
```

Inserts an element into the multiset.

Parameters

__position	An iterator that serves as a hint as to where the element should be inserted.
__x	Element to be inserted.

Returns

An iterator that points to the inserted element.

This function inserts an element into the multiset. Contrary to a std::set the multiset does not rely on unique keys and thus multiple copies of the same element can be inserted.
Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.
See https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints for more on *hinting*.
Insertion requires logarithmic time (if the hint is not taken).
Definition at line 532 of file stl_multiset.h.

4.735.3.28 insert() [4/4]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename
_Alloc = std::allocator<_Key>>
void std::multiset< _Key, _Compare, _Alloc >::insert (
            initializer_list< value_type > __l )  [inline]
```

Attempts to insert a list of elements into the multiset.

Parameters

__l	A std::initializer_list<value_type> of elements to be inserted.

Complexity similar to that of the range constructor.
Definition at line 563 of file stl_multiset.h.
References std::multiset< _Key, _Compare, _Alloc >::insert().

4.735.3.29 key_comp()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _
Alloc = std::allocator<_Key>>
key_compare std::multiset< _Key, _Compare, _Alloc >::key_comp ( ) const  [inline]
```

Returns the comparison object.
Definition at line 323 of file stl_multiset.h.

4.735.3.30 lower_bound() [1/4]

```
template<typename _Key , typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>>
template<typename _Kt >
auto std::multiset< _Key, _Compare, _Alloc >::lower_bound (
            const _Kt & __x ) -> decltype(iterator(_M_t._M_lower_bound_tr(__x)))  [inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

__x	Key to be located.

Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists. Definition at line 820 of file stl_multiset.h.

4.735.3.31 lower_bound() [2/4]

```
template<typename _Key , typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>>
template<typename _Kt >
auto std::multiset< _Key, _Compare, _Alloc >::lower_bound (
            const _Kt & __x ) const -> decltype(iterator(_M_t._M_lower_bound_tr(__x)))   [inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

_↩ _x	Key to be located.

Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists. Definition at line 826 of file stl_multiset.h.

4.735.3.32 lower_bound() [3/4]

```
template<typename _Key , typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::lower_bound (
            const key_type & __x )  [inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

_↩ _x	Key to be located.

Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists. Definition at line 810 of file stl_multiset.h.

4.735.3.33 lower_bound() [4/4]

```
template<typename _Key , typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>>
const_iterator std::multiset< _Key, _Compare, _Alloc >::lower_bound (
            const key_type & __x ) const  [inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

_↩ _x	Key to be located.

Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.
Definition at line 814 of file stl_multiset.h.

4.735.3.34 max_size()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _↩
Alloc = std::allocator<_Key>>
size_type std::multiset< _Key, _Compare, _Alloc >::max_size ( ) const  [inline], [noexcept]
```

Returns the maximum size of the set.
Definition at line 420 of file stl_multiset.h.

4.735.3.35 operator=() [1/3]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename
_Alloc = std::allocator<_Key>>
multiset& std::multiset< _Key, _Compare, _Alloc >::operator= (
            const multiset< _Key, _Compare, _Alloc > &  )  [default]
```

Multiset assignment operator.
Whether the allocator is copied depends on the allocator traits.

4.735.3.36 operator=() [2/3]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename
_Alloc = std::allocator<_Key>>
multiset& std::multiset< _Key, _Compare, _Alloc >::operator= (
            initializer_list< value_type > __l )  [inline]
```

Multiset list assignment operator.

Parameters

↩ _↩ ↩ _↩ *l*	An initializer_list.

This function fills a multiset with copies of the elements in the initializer list *__l*.
Note that the assignment completely changes the multiset and that the resulting multiset's size is the same as the number of elements assigned.
Definition at line 312 of file stl_multiset.h.

4.735.3.37 operator=() [3/3]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename
_Alloc = std::allocator<_Key>>
multiset& std::multiset< _Key, _Compare, _Alloc >::operator= (
            multiset< _Key, _Compare, _Alloc > &&  )  [default]
```

Move assignment operator.

4.735.3.38 rbegin() template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>

reverse_iterator std::multiset< _Key, _Compare, _Alloc >::rbegin ( ) const [inline], [noexcept]

Returns a read-only (constant) reverse iterator that points to the last element in the multiset. Iteration is done in descending order according to the keys.

Definition at line 358 of file stl_multiset.h.

4.735.3.39 rend() template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>

reverse_iterator std::multiset< _Key, _Compare, _Alloc >::rend ( ) const [inline], [noexcept]

Returns a read-only (constant) reverse iterator that points to the last element in the multiset. Iteration is done in descending order according to the keys.

Definition at line 367 of file stl_multiset.h.

4.735.3.40 size() template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>

size_type std::multiset< _Key, _Compare, _Alloc >::size ( ) const [inline], [noexcept]

Returns the size of the set.

Definition at line 415 of file stl_multiset.h.

4.735.3.41 swap() template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>

void std::multiset< _Key, _Compare, _Alloc >::swap (
multiset< _Key, _Compare, _Alloc > & __x) [inline], [noexcept]

Swaps data with another multiset.

Parameters

_↩ _x	A multiset of the same element and allocator types.

This exchanges the elements between two multisets in constant time. (It is only swapping a pointer, an integer, and an instance of the Compare type (which itself is often stateless and empty), so it should be quite fast.) Note that the global std::swap() function is specialized such that std::swap(s1,s2) will feed to this function.

Whether the allocators are swapped depends on the allocator traits.

Definition at line 437 of file stl_multiset.h.

4.735.3.42 upper_bound() [1/4] template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>

template<typename _Kt >
auto std::multiset< _Key, _Compare, _Alloc >::upper_bound (
const _Kt & __x) -> decltype(iterator(_M_t._M_upper_bound_tr(__x))) [inline]

Finds the end of a subsequence matching given key.

Parameters

_↩ _x	Key to be located.

Returns

Iterator pointing to the first element greater than key, or end().

Definition at line 850 of file stl_multiset.h.

4.735.3.43 upper_bound() [2/4]

```
template<typename _Key , typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>>
template<typename _Kt >
auto std::multiset< _Key, _Compare, _Alloc >::upper_bound (
            const _Kt & __x ) const -> decltype(iterator(_M_t._M_upper_bound_tr(__x)))   [inline]
```

Finds the end of a subsequence matching given key.

Parameters

_↩ _x	Key to be located.

Returns

Iterator pointing to the first element greater than key, or end().

Definition at line 856 of file stl_multiset.h.

4.735.3.44 upper_bound() [3/4]

```
template<typename _Key , typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::upper_bound (
            const key_type & __x )  [inline]
```

Finds the end of a subsequence matching given key.

Parameters

_↩ _x	Key to be located.

Returns

Iterator pointing to the first element greater than key, or end().

Definition at line 840 of file stl_multiset.h.

4.735.3.45 upper_bound() [4/4]

```
template<typename _Key , typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>>
const_iterator std::multiset< _Key, _Compare, _Alloc >::upper_bound (
            const key_type & __x ) const  [inline]
```

Finds the end of a subsequence matching given key.

Parameters

_↩ _x	Key to be located.

Returns

Iterator pointing to the first element greater than key, or end().

Definition at line 844 of file stl_multiset.h.

4.735.3.46 value_comp() `template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>`

`value_compare std::multiset< _Key, _Compare, _Alloc >::value_comp ( ) const [inline]`

Returns the comparison object.
Definition at line 327 of file stl_multiset.h.
The documentation for this class was generated from the following file:

- stl_multiset.h

4.736 __gnu_parallel::multiway_mergesort_exact_tag Struct Reference

Inheritance diagram for __gnu_parallel::multiway_mergesort_exact_tag:

Public Member Functions

- **multiway_mergesort_exact_tag** (_ThreadIndex __num_threads)
- _ThreadIndex __get_num_threads ()
- void set_num_threads (_ThreadIndex __num_threads)

4.736.1 Detailed Description

Forces parallel sorting using multiway mergesort with exact splitting at compile time.
Definition at line 137 of file tags.h.

4.736.2 Member Function Documentation

4.736.2.1 __get_num_threads() `_ThreadIndex __gnu_parallel::parallel_tag::__get_num_threads ( ) [inline], [inherited]`

Find out desired number of threads.

Returns

Desired number of threads.

Definition at line 63 of file tags.h.
Referenced by __gnu_parallel::__parallel_sort().

4.736.2.2 set_num_threads() `void __gnu_parallel::parallel_tag::set_num_threads ( _ThreadIndex __num_threads ) [inline], [inherited]`

Set the desired number of threads.

Parameters

__num_threads	Desired number of threads.

Definition at line 73 of file tags.h.
The documentation for this struct was generated from the following file:

- tags.h

4.737 __gnu_parallel::multiway_mergesort_sampling_tag Struct Reference

Inheritance diagram for __gnu_parallel::multiway_mergesort_sampling_tag:

Public Member Functions

- **multiway_mergesort_sampling_tag** (_ThreadIndex __num_threads)
- _ThreadIndex __get_num_threads ()
- void set_num_threads (_ThreadIndex __num_threads)

4.737.1 Detailed Description

Forces parallel sorting using multiway mergesort with splitting by sampling at compile time.
Definition at line 146 of file tags.h.

4.737.2 Member Function Documentation

4.737.2.1 __get_num_threads() _ThreadIndex __gnu_parallel::parallel_tag::__get_num_threads ( ) [inline], [inherited]

Find out desired number of threads.

Returns

Desired number of threads.

Definition at line 63 of file tags.h.
Referenced by __gnu_parallel::__parallel_sort().

4.737.2.2 set_num_threads() void __gnu_parallel::parallel_tag::set_num_threads (_ThreadIndex *__num_threads*) [inline], [inherited]

Set the desired number of threads.

Parameters

__num_threads	Desired number of threads.

Definition at line 73 of file tags.h.
The documentation for this struct was generated from the following file:

- tags.h

4.738 __gnu_parallel::multiway_mergesort_tag Struct Reference

Inheritance diagram for __gnu_parallel::multiway_mergesort_tag:

Public Member Functions

- **multiway_mergesort_tag** (_ThreadIndex __num_threads)
- _ThreadIndex __get_num_threads ()
- void set_num_threads (_ThreadIndex __num_threads)

4.738.1 Detailed Description

Forces parallel sorting using multiway mergesort at compile time.
Definition at line 128 of file tags.h.

4.738.2 Member Function Documentation

4.738.2.1 __get_num_threads() `_ThreadIndex __gnu_parallel::parallel_tag::__get_num_threads ( ) [inline], [inherited]`

Find out desired number of threads.

Returns

Desired number of threads.

Definition at line 63 of file tags.h.
Referenced by __gnu_parallel::__parallel_sort().

4.738.2.2 set_num_threads() `void __gnu_parallel::parallel_tag::set_num_threads ( _ThreadIndex __num_threads ) [inline], [inherited]`

Set the desired number of threads.

Parameters

__num_threads	Desired number of threads.

Definition at line 73 of file tags.h.

  std::basic_istream< _CharT, _Traits > & operator>> (std::basic_istream< _CharT, _Traits > &__is, std::negative_binomial_distribution< _IntType1 > &__x)

4.742.1 Detailed Description

template<typename _IntType = int>
class std::negative_binomial_distribution< _IntType >

A negative_binomial_distribution random number distribution.
The formula for the negative binomial probability mass function is $p(i) = \binom{n}{i} p^i (1-p)^{t-i}$ where t and p are the parameters of the distribution.
Definition at line 4188 of file random.h.

4.742.2 Member Typedef Documentation

4.742.2.1 result_type template<typename _IntType = int>

typedef _IntType std::negative_binomial_distribution< _IntType >::result_type

The type of the range of the distribution.
Definition at line 4195 of file random.h.

4.742.3 Member Function Documentation

4.742.3.1 k() template<typename _IntType = int>

_IntType std::negative_binomial_distribution< _IntType >::k ( ) const [inline]

Return the k parameter of the distribution.
Definition at line 4255 of file random.h.

4.742.3.2 max() template<typename _IntType = int>

result_type std::negative_binomial_distribution< _IntType >::max ( ) const [inline]

Returns the least upper bound value of the distribution.
Definition at line 4291 of file random.h.
References std::numeric_limits< _Tp >::max().

4.742.3.3 min() template<typename _IntType = int>

result_type std::negative_binomial_distribution< _IntType >::min ( ) const [inline]

Returns the greatest lower bound value of the distribution.
Definition at line 4284 of file random.h.

4.742.3.4 operator()() template<typename _IntType >

template<typename _UniformRandomNumberGenerator >
negative_binomial_distribution< _IntType >::result_type std::negative_binomial_distribution< _IntType >::operator() (
_UniformRandomNumberGenerator & __urng)

Generating functions.
Definition at line 1111 of file bits/random.tcc.

4.742.3.5 p() template<typename _IntType = int>

double std::negative_binomial_distribution< _IntType >::p ( ) const [inline]

Return the p parameter of the distribution.

Definition at line 4262 of file random.h.

4.742.3.6 param() [1/2] template<typename _IntType = int>

param_type std::negative_binomial_distribution< _IntType >::param ( ) const [inline]

Returns the parameter set of the distribution.

Definition at line 4269 of file random.h.

4.742.3.7 param() [2/2] template<typename _IntType = int>

void std::negative_binomial_distribution< _IntType >::param (
const param_type & *__param*) [inline]

Sets the parameter set of the distribution.

Parameters

__param	The new parameter set of the distribution.

Definition at line 4277 of file random.h.

4.742.3.8 reset() template<typename _IntType = int>

void std::negative_binomial_distribution< _IntType >::reset ( ) [inline]

Resets the distribution state.

Definition at line 4248 of file random.h.

References std::gamma_distribution< _RealType >::reset().

4.742.4 Friends And Related Function Documentation

4.742.4.1 operator<< template<typename _IntType = int>

template<typename _IntType1 , typename _CharT , typename _Traits >
std::basic_ostream<_CharT, _Traits>& operator<< (
std::basic_ostream< _CharT, _Traits > & *__os*,
const std::negative_binomial_distribution< _IntType1 > & *__x*) [friend]

Inserts a negative_binomial_distribution random number distribution __x into the output stream __os.

Parameters

__os	An output stream.
__x	A negative_binomial_distribution random number distribution.

Returns

The output stream with the state of __x inserted or in an error state.

4.742.4.2 operator== template<typename _IntType = int>

```
bool operator== (
            const negative_binomial_distribution< _IntType > & __d1,
            const negative_binomial_distribution< _IntType > & __d2 )  [friend]
```

Return true if two negative binomial distributions have the same parameters and the sequences that would be generated are equal.
Definition at line 4340 of file random.h.

4.742.4.3 operator>> template<typename _IntType = int>

```
template<typename _IntType1 , typename _CharT , typename _Traits >
std::basic_istream<_CharT, _Traits>& operator>> (
            std::basic_istream< _CharT, _Traits > & __is,
            std::negative_binomial_distribution< _IntType1 > & __x )  [friend]
```

Extracts a negative_binomial_distribution random number distribution __x from the input stream __is.

Parameters

_↩ _is	An input stream.
_↩ _x	A negative_binomial_distribution random number generator engine.

Returns

The input stream with __x extracted or in an error state.

The documentation for this class was generated from the following files:

- template<typename _Up >
  constexpr friend bool **operator==** (const new_allocator &, const new_allocator< _Up > &) noexcept

4.746.1 Detailed Description

template<typename _Tp>
class __gnu_cxx::new_allocator< _Tp >

An allocator that uses global new, as per C++03 [20.4.1].
This is precisely the allocator defined in the C++ Standard.

- all allocation calls operator new
- all deallocation calls operator delete

Template Parameters

_Tp	Type of allocated object.

Definition at line 55 of file new_allocator.h.
The documentation for this class was generated from the following file:

- new_allocator.h

  std::basic_istream< _CharT, _Traits > & operator>> (std::basic_istream< _CharT, _Traits > &__is, std::normal_distribution< _RealType1 > &__x)

4.749.1 Detailed Description

template<typename _RealType = double>
class std::normal_distribution< _RealType >

A normal continuous distribution for random numbers.
The formula for the normal probability density function is

$$p(x|\mu,\sigma) = \frac{1}{\sigma\sqrt{2\pi}} e^{-\frac{x-\mu^2}{2\sigma^2}}$$

Definition at line 1970 of file random.h.

4.749.2 Member Typedef Documentation

4.749.2.1 result_type template<typename _RealType = double>

```
typedef _RealType std::normal_distribution< _RealType >::result_type
```

The type of the range of the distribution.
Definition at line 1977 of file random.h.

4.749.3 Constructor & Destructor Documentation

4.749.3.1 normal_distribution() template<typename _RealType = double>

```
std::normal_distribution< _RealType >::normal_distribution (
            result_type __mean,
            result_type __stddev = result_type(1) )  [inline], [explicit]
```

Constructs a normal distribution with parameters $mean$ and standard deviation.
Definition at line 2023 of file random.h.

4.749.4 Member Function Documentation

4.749.4.1 max() template<typename _RealType = double>

```
result_type std::normal_distribution< _RealType >::max ( ) const  [inline]
```

Returns the least upper bound value of the distribution.
Definition at line 2080 of file random.h.
References std::numeric_limits< _Tp >::max().

4.749.4.2 mean() template<typename _RealType = double>

```
_RealType std::normal_distribution< _RealType >::mean ( ) const  [inline]
```

Returns the mean of the distribution.
Definition at line 2044 of file random.h.

4.749.4.3 min() template<typename _RealType = double>

```
result_type std::normal_distribution< _RealType >::min ( ) const  [inline]
```

Returns the greatest lower bound value of the distribution.
Definition at line 2073 of file random.h.
References std::numeric_limits< _Tp >::lowest().

4.749.4.4 operator()() [1/2] template<typename _RealType = double>

```
template<typename _UniformRandomNumberGenerator >
result_type std::normal_distribution< _RealType >::operator() (
            _UniformRandomNumberGenerator & __urng )  [inline]
```

Generating functions.
Definition at line 2088 of file random.h.

4.749.4.5 operator()() [2/2] template<typename _RealType >

```
template<typename _UniformRandomNumberGenerator >
normal_distribution< _RealType >::result_type std::normal_distribution< _RealType >::operator()
(
            _UniformRandomNumberGenerator & __urng,
            const param_type & __param )
```

Polar method due to Marsaglia.
Devroye, L. Non-Uniform Random Variates Generation. Springer-Verlag, New York, 1986, Ch. V, Sect. 4.4.
Definition at line 1769 of file bits/random.tcc.
References std::log(), and std::sqrt().

4.749.4.6 param() [1/2] template<typename _RealType = double>

```
param_type std::normal_distribution< _RealType >::param ( ) const  [inline]
```

Returns the parameter set of the distribution.
Definition at line 2058 of file random.h.

4.749.4.7 param() [2/2] template<typename _RealType = double>

```
void std::normal_distribution< _RealType >::param (
            const param_type & __param )  [inline]
```

Sets the parameter set of the distribution.

Parameters

__param	The new parameter set of the distribution.

Definition at line 2066 of file random.h.

4.749.4.8 reset() template<typename _RealType = double>

```
void std::normal_distribution< _RealType >::reset ( )  [inline]
```

Resets the distribution state.
Definition at line 2037 of file random.h.
Referenced by std::lognormal_distribution< _RealType >::reset(), std::gamma_distribution< _RealType >::reset(), std::student_t_distribution< _RealType >::reset(), std::binomial_distribution< _IntType >::reset(), and std::poisson↩ _distribution< _IntType >::reset().

4.749.4.9 stddev() template<typename _RealType = double>

```
_RealType std::normal_distribution< _RealType >::stddev ( ) const  [inline]
```

Returns the standard deviation of the distribution.
Definition at line 2051 of file random.h.

4.749.5 Friends And Related Function Documentation

4.749.5.1 operator<< template<typename _RealType = double>

```
template<typename _RealType1 , typename _CharT , typename _Traits >
std::basic_ostream<_CharT, _Traits>& operator<< (
            std::basic_ostream< _CharT, _Traits > & __os,
            const std::normal_distribution< _RealType1 > & __x )  [friend]
```

Inserts a normal_distribution random number distribution __x into the output stream __os.

Parameters

__os	An output stream.
__x	A normal_distribution random number distribution.

Returns

The output stream with the state of __x inserted or in an error state.

4.749.5.2 operator== template<typename _RealType = double>

```
template<typename _RealType1 >
bool operator== (
            const std::normal_distribution< _RealType1 > & __d1,
            const std::normal_distribution< _RealType1 > & __d2 )  [friend]
```

Return true if two normal distributions have the same parameters and the sequences that would be generated are equal.

4.749.5.3 operator>> template<typename _RealType = double>

```
template<typename _RealType1 , typename _CharT , typename _Traits >
std::basic_istream<_CharT, _Traits>& operator>> (
            std::basic_istream< _CharT, _Traits > & __is,
            std::normal_distribution< _RealType1 > & __x )  [friend]
```

Extracts a normal_distribution random number distribution __x from the input stream __is.

Parameters

_↩ _is	An input stream.
_↩ _x	A normal_distribution random number generator engine.

Returns

The input stream with __x extracted or in an error state.

4.755.1 Detailed Description

template<typename _CharT, typename _InIter>
class std::num_get< _CharT, _InIter >

Primary class template num_get.
This facet encapsulates the code to parse and return a number from a string. It is used by the istream numeric extraction operators.
The num_get template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the num_get facet.
Definition at line 1952 of file locale_facets.h.

4.755.2 Member Typedef Documentation

4.755.2.1 char_type `template<typename _CharT , typename _InIter >`

`typedef _CharT std::num_get< _CharT, _InIter >::char_type`

Public typedefs.
Definition at line 1958 of file locale_facets.h.

4.755.2.2 iter_type `template<typename _CharT , typename _InIter >`

`typedef _InIter std::num_get< _CharT, _InIter >::iter_type`

Public typedefs.
Definition at line 1959 of file locale_facets.h.

4.755.3 Constructor & Destructor Documentation

4.755.3.1 num_get() template<typename _CharT , typename _InIter >

```
std::num_get< _CharT, _InIter >::num_get (
            size_t __refs = 0 )  [inline], [explicit]
```

Constructor performs initialization.
This is the constructor provided by the standard.

Parameters

__refs	Passed to the base facet class.

Definition at line 1973 of file locale_facets.h.

4.755.3.2 ~num_get() template<typename _CharT , typename _InIter >

```
virtual std::num_get< _CharT, _InIter >::~num_get ( )  [inline], [protected], [virtual]
```

Destructor.
Definition at line 2145 of file locale_facets.h.

4.755.4 Member Function Documentation

4.755.4.1 do_get() [1/11] template<typename _CharT , typename _InIter >

```
virtual iter_type std::num_get< _CharT, _InIter >::do_get (
            iter_type __beg,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            long & __v ) const  [inline], [protected], [virtual]
```

Numeric parsing.
Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See also

get() for more details.

Parameters

__beg	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

Definition at line 2215 of file locale_facets.h.

4.755.4.2 do_get() [2/11] template<typename _CharT , typename _InIter >

```
virtual iter_type std::num_get< _CharT, _InIter >::do_get (
            iter_type __beg,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            long long & __v ) const  [inline], [protected], [virtual]
```

Numeric parsing.
Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See also

get() for more details.

Parameters

__beg	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

Definition at line 2236 of file locale_facets.h.

4.755.4.3 do_get() [3/11] template<typename _CharT , typename _InIter >

```
virtual iter_type std::num_get< _CharT, _InIter >::do_get (
            iter_type __beg,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            unsigned int & __v ) const  [inline], [protected], [virtual]
```

Numeric parsing.
Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See also

get() for more details.

Parameters

__beg	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

Definition at line 2225 of file locale_facets.h.

4.755.4.4 do_get() [4/11] template<typename _CharT , typename _InIter >

```
virtual iter_type std::num_get< _CharT, _InIter >::do_get (
            iter_type __beg,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            unsigned long & __v ) const  [inline], [protected], [virtual]
```

Numeric parsing.
Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See also

get() for more details.

Parameters

__beg	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

Definition at line 2230 of file locale_facets.h.

4.755.4.5 do_get() [5/11] template<typename _CharT , typename _InIter >

```
virtual iter_type std::num_get< _CharT, _InIter >::do_get (
            iter_type __beg,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            unsigned long long & __v ) const  [inline], [protected], [virtual]
```

Numeric parsing.
Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See also

get() for more details.

Parameters

__beg	Start of input stream.
__end	End of input stream.

Parameters

__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

Definition at line 2241 of file locale_facets.h.

4.755.4.6 do_get() [6/11] template<typename _CharT , typename _InIter >

```
virtual iter_type std::num_get< _CharT, _InIter >::do_get (
            iter_type __beg,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            unsigned short & __v ) const  [inline], [protected], [virtual]
```

Numeric parsing.
Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See also

get() for more details.

Parameters

__beg	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

Definition at line 2220 of file locale_facets.h.

4.755.4.7 do_get() [7/11] template<typename _CharT , typename _InIter >

```
_InIter std::num_get< _CharT, _InIter >::do_get (
            iter_type __beg,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            bool & __v ) const  [protected], [virtual]
```

Numeric parsing.
Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See also

get() for more details.

Parameters

__beg	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

Definition at line 594 of file locale_facets.tcc.
References std::ios_base::_M_getloc(), std::ios_base::boolalpha, std::ios_base::eofbit, std::ios_base::failbit, std::ios_base::flags(), and std::ios_base::goodbit.
Referenced by std::num_get< _CharT, _InIter >::get().

4.755.4.8 do_get() [8/11]

```
template<typename _CharT , typename _InIter >
_InIter std::num_get< _CharT, _InIter >::do_get (
            iter_type __beg,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            double & __v ) const  [protected], [virtual]
```

Numeric parsing.
Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See also

get() for more details.

Parameters

__beg	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

Definition at line 705 of file locale_facets.tcc.
References std::basic_string< _CharT, _Traits, _Alloc >::c_str(), std::ios_base::eofbit, and std::basic_string< _CharT, _Traits, _Alloc >::reserve().

4.755.4.9 do_get() [9/11] template<typename _CharT , typename _InIter >

```
_InIter std::num_get< _CharT, _InIter >::do_get (
            iter_type __beg,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            float & __v ) const  [protected], [virtual]
```

Numeric parsing.
Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See also

get() for more details.

Parameters

__beg	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

Definition at line 690 of file locale_facets.tcc.
References std::basic_string< _CharT, _Traits, _Alloc >::c_str(), std::ios_base::eofbit, and std::basic_string< _CharT, _Traits, _Alloc >::reserve().

4.755.4.10 do_get() [10/11] template<typename _CharT , typename _InIter >

```
_InIter std::num_get< _CharT, _InIter >::do_get (
            iter_type __beg,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            long double & __v ) const  [protected], [virtual]
```

Numeric parsing.
Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See also

get() for more details.

Parameters

__beg	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

Definition at line 737 of file locale_facets.tcc.
References std::basic_string< _CharT, _Traits, _Alloc >::c_str(), std::ios_base::eofbit, and std::basic_string< _CharT, _Traits, _Alloc >::reserve().

4.755.4.11 do_get() [11/11] template<typename _CharT , typename _InIter >

```
_InIter std::num_get< _CharT, _InIter >::do_get (
            iter_type __beg,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            void *& __v ) const  [protected], [virtual]
```

Numeric parsing.
Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See also

get() for more details.

Parameters

__beg	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

Definition at line 752 of file locale_facets.tcc.
References std::ios_base::basefield, std::ios_base::flags(), and std::ios_base::hex.

4.755.4.12 get() [1/11] template<typename _CharT , typename _InIter >

```
iter_type std::num_get< _CharT, _InIter >::get (
            iter_type __in,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            bool & __v ) const  [inline]
```

Numeric parsing.
Parses the input stream into the bool *v*. It does so by calling num_get::do_get().
If ios_base::boolalpha is set, attempts to read ctype<CharT>::truename() or ctype<CharT>::falsename(). Sets *v* to true or false if successful. Sets err to ios_base::failbit if reading the string fails. Sets err to ios_base::eofbit if the stream is emptied.
If ios_base::boolalpha is not set, proceeds as with reading a long, except if the value is 1, sets *v* to true, if the value is 0, sets *v* to false, and otherwise set err to ios_base::failbit.

Parameters

__in	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

Definition at line 1999 of file locale_facets.h.
References std::num_get< _CharT, _InIter >::do_get().

4.755.4.13 get() [2/11] template<typename _CharT , typename _InIter >

```
iter_type std::num_get< _CharT, _InIter >::get (
            iter_type __in,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            double & __v ) const  [inline]
```

Numeric parsing.
Parses the input stream into the integral variable *v*. It does so by calling num_get::do_get().
The input characters are parsed like the scanf g specifier. The matching type length modifier is also used.
The decimal point character used is numpunct::decimal_point(). Digit grouping is interpreted according to numpunct::grouping() and numpunct::thousands_sep(). If the pattern of digit groups isn't consistent, sets err to ios_base::failbit.
If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets err to ios_base::failbit and leaves *v* unaltered.
Sets err to ios_base::eofbit if the stream is emptied.

Parameters

__in	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

Definition at line 2101 of file locale_facets.h.
References std::num_get< _CharT, _InIter >::do_get().

4.755.4.14 get() [3/11] template<typename _CharT , typename _InIter >

```

            ios_base & __io,
```

```
            ios_base::iostate & __err,
            float & __v ) const  [inline]
```

Numeric parsing.
Parses the input stream into the integral variable *v*. It does so by calling num_get::do_get().
The input characters are parsed like the scanf g specifier. The matching type length modifier is also used.
The decimal point character used is numpunct::decimal_point(). Digit grouping is interpreted according to numpunct↩
::grouping() and numpunct::thousands_sep(). If the pattern of digit groups isn't consistent, sets err to ios_base::failbit.
If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets err to ios_base::failbit and leaves *v* unaltered.
Sets err to ios_base::eofbit if the stream is emptied.

Parameters

__in	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

Definition at line 2096 of file locale_facets.h.
References std::num_get< _CharT, _InIter >::do_get().

4.755.4.15 get() [4/11] template<typename _CharT , typename _InIter >

```
iter_type std::num_get< _CharT, _InIter >::get (
            iter_type __in,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            long & __v ) const  [inline]
```

Numeric parsing.
Parses the input stream into the integral variable *v*. It does so by calling num_get::do_get().
Parsing is affected by the flag settings in *io*.
The basic parse is affected by the value of io.flags() & ios_base::basefield. If equal to ios_base::oct, parses like the scanf o specifier. Else if equal to ios_base::hex, parses like X specifier. Else if basefield equal to 0, parses like the i specifier. Otherwise, parses like d for signed and u for unsigned types. The matching type length modifier is also used.
Digit grouping is interpreted according to numpunct::grouping() and numpunct::thousands_sep(). If the pattern of digit groups isn't consistent, sets err to ios_base::failbit.
If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets err to ios_base::failbit and leaves *v* unaltered.
Sets err to ios_base::eofbit if the stream is emptied.

Parameters

__in	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

Definition at line 2036 of file locale_facets.h.
References std::num_get< _CharT, _InIter >::do_get().

4.755.4.16 get() [5/11]

```
template<typename _CharT , typename _InIter >
iter_type std::num_get< _CharT, _InIter >::get (
            iter_type __in,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            long double & __v ) const  [inline]
```

Numeric parsing.
Parses the input stream into the integral variable *v*. It does so by calling num_get::do_get().
The input characters are parsed like the scanf g specifier. The matching type length modifier is also used.
The decimal point character used is numpunct::decimal_point(). Digit grouping is interpreted according to numpunct::grouping() and numpunct::thousands_sep(). If the pattern of digit groups isn't consistent, sets err to ios_base::failbit.
If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets err to ios_base::failbit and leaves *v* unaltered.
Sets err to ios_base::eofbit if the stream is emptied.

Parameters

__in	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

Definition at line 2106 of file locale_facets.h.
References std::num_get< _CharT, _InIter >::do_get().

4.755.4.22 get() [11/11]

```
template<typename _CharT , typename _InIter >
iter_type std::num_get< _CharT, _InIter >::get (
```

```
        iter_type __in,
        iter_type __end,
        ios_base & __io,
        ios_base::iostate & __err,
        void *& __v ) const  [inline]
```

Numeric parsing.
Parses the input stream into the pointer variable *v*. It does so by calling num_get::do_get().
The input characters are parsed like the scanf p specifier.
Digit grouping is interpreted according to numpunct::grouping() and numpunct::thousands_sep(). If the pattern of digit groups isn't consistent, sets err to ios_base::failbit.
Note that the digit grouping effect for pointers is a bit ambiguous in the standard and shouldn't be relied on. See DR 344.
If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets err to ios_base::failbit and leaves *v* unaltered. Sets err to ios_base::eofbit if the stream is emptied.

Parameters

__in	Start of input stream.
__end	End of input stream.
__io	Source of locale and flags.
__err	Error flags to set.
__v	Value to format and insert.

Returns

Iterator after reading.

4.756.1 Detailed Description

template<typename _CharT, typename _OutIter>
class std::num_put< _CharT, _OutIter >

Primary class template num_put.
This facet encapsulates the code to convert a number to a string. It is used by the ostream numeric insertion operators. The num_put template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the num_put facet.
Definition at line 2293 of file locale_facets.h.

4.756.2 Member Typedef Documentation

4.756.2.1 char_type `template<typename _CharT , typename _OutIter >`

```
typedef _CharT std::num_put< _CharT, _OutIter >::char_type
```

Public typedefs.
Definition at line 2299 of file locale_facets.h.

4.756.2.2 iter_type `template<typename _CharT , typename _OutIter >`

```
typedef _OutIter std::num_put< _CharT, _OutIter >::iter_type
```

Public typedefs.
Definition at line 2300 of file locale_facets.h.

4.756.3 Constructor & Destructor Documentation

4.756.3.1 num_put() `template<typename _CharT , typename _OutIter >`

```
std::num_put< _CharT, _OutIter >::num_put (
            size_t __refs = 0 ) [inline], [explicit]
```

Constructor performs initialization.
This is the constructor provided by the standard.

Parameters

__refs	Passed to the base facet class.

Definition at line 2314 of file locale_facets.h.

4.756.3.2 ~num_put() `template<typename _CharT , typename _OutIter >`

virtual std::num_put< _CharT, _OutIter >::~num_put ( ) [inline], [protected], [virtual]
Destructor.
Definition at line 2493 of file locale_facets.h.

4.756.4 Member Function Documentation

4.756.4.1 do_put() [1/8] template<typename _CharT , typename _OutIter >

```
_OutIter std::num_put< _CharT, _OutIter >::do_put (
            iter_type __s,
            ios_base & __io,
            char_type __fill,
            bool __v ) const  [protected], [virtual]
```

Numeric formatting.
These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

_↩ _s	Stream to write to.
_↩ _io	Source of locale and flags.
_↩ _fill	Char_type to use for filling.
_↩ _v	Value to format and insert.

Returns

Iterator after writing.

Definition at line 1105 of file locale_facets.tcc.
References std::ios_base::_M_getloc(), std::ios_base::adjustfield, std::ios_base::boolalpha, std::ios_base::flags(), std↩ ::ios_base::left, and std::ios_base::width().
Referenced by std::num_put< _CharT, _OutIter >::put().

4.756.4.2 do_put() [2/8] template<typename _CharT , typename _OutIter >

```
virtual iter_type std::num_put< _CharT, _OutIter >::do_put (
            iter_type __s,
            ios_base & __io,
            char_type __fill,
            long __v ) const  [inline], [protected], [virtual]
```

Numeric formatting.
These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

_↩ _s	Stream to write to.

Parameters

_↩ _io	Source of locale and flags.
_↩ _fill	Char_type to use for filling.
_↩ _v	Value to format and insert.

Returns

Iterator after writing.

Definition at line 2513 of file locale_facets.h.

4.756.4.3 do_put() [3/8] template<typename _CharT , typename _OutIter >

```
virtual iter_type std::num_put< _CharT, _OutIter >::do_put (
            iter_type __s,
            ios_base & __io,
            char_type __fill,
            long long __v ) const  [inline], [protected], [virtual]
```

Numeric formatting.
These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

_↩ _s	Stream to write to.
_↩ _io	Source of locale and flags.
_↩ _fill	Char_type to use for filling.
_↩ _v	Value to format and insert.

Returns

Iterator after writing.

Definition at line 2523 of file locale_facets.h.

4.756.4.4 do_put() [4/8] template<typename _CharT , typename _OutIter >

```
virtual iter_type std::num_put< _CharT, _OutIter >::do_put (
            iter_type __s,
            ios_base & __io,
            char_type __fill,
            unsigned long __v ) const  [inline], [protected], [virtual]
```

Numeric formatting.
These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

_↩ _s	Stream to write to.
_↩ _io	Source of locale and flags.
_↩ _fill	Char_type to use for filling.
_↩ _v	Value to format and insert.

Returns

Iterator after writing.

Definition at line 2517 of file locale_facets.h.

4.756.4.5 do_put() [5/8] template<typename _CharT , typename _OutIter >

```
virtual iter_type std::num_put< _CharT, _OutIter >::do_put (
            iter_type __s,
            ios_base & __io,
            char_type __fill,
            unsigned long long __v ) const  [inline], [protected], [virtual]
```

Numeric formatting.
These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

_↩ _s	Stream to write to.
_↩ _io	Source of locale and flags.
_↩ _fill	Char_type to use for filling.
_↩ _v	Value to format and insert.

Returns

Iterator after writing.

Definition at line 2528 of file locale_facets.h.

4.756.4.6 do_put() [6/8] template<typename _CharT , typename _OutIter >

```
_OutIter std::num_put< _CharT, _OutIter >::do_put (
            iter_type __s,
            ios_base & __io,
            char_type __fill,
            const void * __v ) const  [protected], [virtual]
```

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

_↩ _s	Stream to write to.
_↩ _io	Source of locale and flags.
_↩ _fill	Char_type to use for filling.
_↩ _v	Value to format and insert.

Returns

Iterator after writing.

Definition at line 1178 of file locale_facets.tcc.
References std::ios_base::basefield, std::ios_base::flags(), std::ios_base::hex, std::ios_base::showbase, and std::ios↩ _base::uppercase.

4.756.4.7 do_put() [7/8] template<typename _CharT , typename _OutIter >

```
_OutIter std::num_put< _CharT, _OutIter >::do_put (
            iter_type __s,
            ios_base & __io,
            char_type __fill,
            double __v ) const  [protected], [virtual]
```

Numeric formatting.
These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

_↩ _s	Stream to write to.
_↩ _io	Source of locale and flags.
_↩ _fill	Char_type to use for filling.
_↩ _v	Value to format and insert.

Returns

Iterator after writing.

Definition at line 1157 of file locale_facets.tcc.

4.756.4.8 do_put() [8/8] template<typename _CharT , typename _OutIter >

```
_OutIter std::num_put< _CharT, _OutIter >::do_put (
```

```
            iter_type __s,
            ios_base & __io,
            char_type __fill,
            long double __v ) const  [protected], [virtual]
```

Numeric formatting.
These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

_↩ _s	Stream to write to.
_↩ _io	Source of locale and flags.
_↩ _fill	Char_type to use for filling.
_↩ _v	Value to format and insert.

Returns

Iterator after writing.

Definition at line 1171 of file locale_facets.tcc.

4.756.4.9 put() [1/8]

```
template<typename _CharT , typename _OutIter >
iter_type std::num_put< _CharT, _OutIter >::put (
            iter_type __s,
            ios_base & __io,
            char_type __fill,
            bool __v ) const  [inline]
```

Numeric formatting.
Formats the boolean *v* and inserts it into a stream. It does so by calling num_put::do_put().
If ios_base::boolalpha is set, writes ctype<CharT>::truename() or ctype<CharT>::falsename(). Otherwise formats *v* as an int.

Parameters

_↩ _s	Stream to write to.
_↩ _io	Source of locale and flags.
_↩ _fill	Char_type to use for filling.
_↩ _v	Value to format and insert.

Returns

Iterator after writing.

Definition at line 2332 of file locale_facets.h.

References std::num_put< _CharT, _OutIter >::do_put().

4.756.4.10 put() [2/8] template<typename _CharT , typename _OutIter >

```
iter_type std::num_put< _CharT, _OutIter >::put (
            iter_type __s,
            ios_base & __io,
            char_type __fill,
            const void * __v ) const  [inline]
```

Numeric formatting.
Formats the pointer value *v* and inserts it into a stream. It does so by calling num_put::do_put().
This function formats *v* as an unsigned long with ios_base::hex and ios_base::showbase set.

Parameters

_↩ _s	Stream to write to.
_↩ _io	Source of locale and flags.
_↩ _fill	Char_type to use for filling.
_↩ _v	Value to format and insert.

Returns

Iterator after writing.

Definition at line 2462 of file locale_facets.h.
References std::num_put< _CharT, _OutIter >::do_put().

4.756.4.11 put() [3/8] template<typename _CharT , typename _OutIter >

```
iter_type std::num_put< _CharT, _OutIter >::put (
            iter_type __s,
            ios_base & __io,
            char_type __fill,
            double __v ) const  [inline]
```

Numeric formatting.
Formats the floating point value *v* and inserts it into a stream. It does so by calling num_put::do_put().
Formatting is affected by the flag settings in *io*.
The basic format is affected by the value of io.flags() & ios_base::floatfield. If equal to ios_base::fixed, formats like the printf f specifier. Else if equal to ios_base::scientific, formats like e or E with ios_base::uppercase unset or set respectively. Otherwise, formats like g or G depending on uppercase. Note that if both fixed and scientific are set, the effect will also be like g or G.
The output precision is given by io.precision(). This precision is capped at numeric_limits::digits10 + 2 (different for double and long double). The default precision is 6.
If ios_base::showpos is set, '+' is output before positive values. If ios_base::showpoint is set, a decimal point will always be output.
The decimal point character used is numpunct::decimal_point(). Thousands separators are inserted according to numpunct::grouping() and numpunct::thousands_sep().
If io.width() is non-zero, enough *fill* characters are inserted to make the result at least that wide. If (io.flags() & ios_↩ base::adjustfield) == ios_base::left, result is padded at the end. If ios_base::internal, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

Parameters

_↩ _s	Stream to write to.
_↩ _io	Source of locale and flags.
_↩ _fill	Char_type to use for filling.
_↩ _v	Value to format and insert.

Returns

Iterator after writing.

Definition at line 2437 of file locale_facets.h.
References std::num_put< _CharT, _OutIter >::do_put().

4.756.4.12 put() [4/8] template<typename _CharT , typename _OutIter >

```
iter_type std::num_put< _CharT, _OutIter >::put (
            iter_type __s,
            ios_base & __io,
            char_type __fill,
            long __v ) const  [inline]
```

Numeric formatting.
Formats the integral value *v* and inserts it into a stream. It does so by calling num_put::do_put().
Formatting is affected by the flag settings in *io*.
The basic format is affected by the value of io.flags() & ios_base::basefield. If equal to ios_base::oct, formats like the printf o specifier. Else if equal to ios_base::hex, formats like x or X with ios_base::uppercase unset or set respectively. Otherwise, formats like d, ld, lld for signed and u, lu, llu for unsigned values. Note that if both oct and hex are set, neither will take effect.
If ios_base::showpos is set, '+' is output before positive values. If ios_base::showbase is set, '0' precedes octal values (except 0) and '0[xX]' precedes hex values.
The decimal point character used is numpunct::decimal_point(). Thousands separators are inserted according to numpunct::grouping() and numpunct::thousands_sep().
If io.width() is non-zero, enough *fill* characters are inserted to make the result at least that wide. If (io.flags() & ios_↩ base::adjustfield) == ios_base::left, result is padded at the end. If ios_base::internal, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

Parameters

_↩ _s	Stream to write to.
_↩ _io	Source of locale and flags.
_↩ _fill	Char_type to use for filling.
_↩ _v	Value to format and insert.

Returns

Iterator after writing.

Definition at line 2374 of file locale_facets.h.

4.757.1 Detailed Description

template<typename _Tp>
struct std::numeric_limits< _Tp >

Properties of fundamental types.
This class allows a program to obtain information about the representation of a fundamental type on a given platform. For non-fundamental types, the functions will return 0 and the data members will all be `false`.
Definition at line 312 of file limits.

4.757.2 Member Function Documentation

4.757.2.1 denorm_min() `template<typename _Tp >`

`static constexpr _Tp std::numeric_limits< _Tp >::denorm_min ( ) [inline], [static], [constexpr], [noexcept]`

The minimum positive denormalized value. For types where `has_denorm` is false, this is the minimum positive normalized value.

Definition at line 357 of file limits.

4.757.2.2 epsilon() `template<typename _Tp >`

`static constexpr _Tp std::numeric_limits< _Tp >::epsilon ( ) [inline], [static], [constexpr], [noexcept]`

The *machine epsilon:* the difference between 1 and the least value greater than 1 that is representable.

Definition at line 333 of file limits.
Referenced by std::generate_canonical(), std::binomial_distribution< _IntType >::operator()(), and std::poisson_distribution< _IntType >::operator()().

4.757.2.3 infinity() `template<typename _Tp >`

`static constexpr _Tp std::numeric_limits< _Tp >::infinity ( ) [inline], [static], [constexpr], [noexcept]`

The representation of positive infinity, if `has_infinity`.

Definition at line 341 of file limits.

4.757.2.4 lowest() `template<typename _Tp >`

`static constexpr _Tp std::numeric_limits< _Tp >::lowest ( ) [inline], [static], [constexpr], [noexcept]`

A finite value x such that there is no other finite value y where y < x.

Definition at line 327 of file limits.
Referenced by std::normal_distribution< _RealType >::min(), std::cauchy_distribution< _RealType >::min(), std::student_t_distribution< _RealType >::min(), and std::extreme_value_distribution< _RealType >::min().

4.757.2.5 max() template<typename _Tp >

static constexpr _Tp std::numeric_limits< _Tp >::max ( ) [inline], [static], [constexpr], [noexcept]
The maximum finite value.

Definition at line 321 of file limits.
Referenced by std::normal_distribution< _RealType >::max(), std::lognormal_distribution< _RealType >::max(), std::gamma_distribution< _RealType >::max(), std::chi_squared_distribution< _RealType >::max(), std::cauchy_distribution< _RealType >::max(), std::fisher_f_distribution< _RealType >::max(), std::student_t_distribution< _RealType >::max(), std::bernoulli_distribution::max(), std::geometric_distribution< _IntType >::max(), std::negative_binomial_distribution< _IntType >::max(), std::poisson_distribution< _IntType >::max(), std::exponential_distribution< _RealType >::max(), std::weibull_distribution< _RealType >::max(), std::extreme_value_distribution< _RealType >::max(), std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::operator()(), std::binomial_distribution< _IntType >::operator()(), and std::poisson_distribution< _IntType >::operator()().

4.757.2.6 min() template<typename _Tp >

static constexpr _Tp std::numeric_limits< _Tp >::min ( ) [inline], [static], [constexpr], [noexcept]
The minimum finite value, or for floating types with denormalization, the minimum positive normalized value.

Definition at line 317 of file limits.
Referenced by std::bernoulli_distribution::min(), and std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::operator()().

4.757.2.7 quiet_NaN() template<typename _Tp >

static constexpr _Tp std::numeric_limits< _Tp >::quiet_NaN ( ) [inline], [static], [constexpr], [noexcept]
The representation of a quiet Not a Number, if has_quiet_NaN.
Definition at line 346 of file limits.

4.757.2.8 round_error() template<typename _Tp >

static constexpr _Tp std::numeric_limits< _Tp >::round_error ( ) [inline], [static], [constexpr], [noexcept]
The maximum rounding error measurement (see LIA-1).

Definition at line 337 of file limits.

4.757.2.9 signaling_NaN() template<typename _Tp >

static constexpr _Tp std::numeric_limits< _Tp >::signaling_NaN ( ) [inline], [static], [constexpr], [noexcept]
The representation of a signaling Not a Number, if has_signaling_NaN.
Definition at line 351 of file limits.

4.757.3 Member Data Documentation

4.757.3.1 digits

`constexpr int std::__numeric_limits_base::digits [static], [constexpr], [inherited]`

The number of `radix` digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of `radix` digits in the mantissa.

Definition at line 211 of file limits.

4.757.3.2 digits10

`constexpr int std::__numeric_limits_base::digits10 [static], [constexpr], [inherited]`

The number of base 10 digits that can be represented without change.
Definition at line 214 of file limits.

4.757.3.3 has_denorm

`constexpr float_denorm_style std::__numeric_limits_base::has_denorm [static], [constexpr], [inherited]`

See std::float_denorm_style for more information.

Definition at line 266 of file limits.

4.757.3.4 has_denorm_loss

`constexpr bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr], [inherited]`

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.
Definition at line 270 of file limits.

4.757.3.5 has_infinity

`constexpr bool std::__numeric_limits_base::has_infinity [static], [constexpr], [inherited]`

True if the type has a representation for positive infinity.

Definition at line 255 of file limits.

4.757.3.6 has_quiet_NaN

`constexpr bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr], [inherited]`

True if the type has a representation for a quiet (non-signaling) Not a Number.

Definition at line 259 of file limits.

4.757.3.7 has_signaling_NaN

`constexpr bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr], [inherited]`

True if the type has a representation for a signaling Not a Number.

Definition at line 263 of file limits.

4.757.3.8 is_bounded

`constexpr bool std::__numeric_limits_base::is_bounded [static], [constexpr], [inherited]`

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.
Definition at line 279 of file limits.

4.757.3.9 is_exact

`constexpr bool std::__numeric_limits_base::is_exact [static], [constexpr], [inherited]`

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.
Definition at line 231 of file limits.

4.757.3.10 is_iec559

`constexpr bool std::__numeric_limits_base::is_iec559 [static], [constexpr], [inherited]`

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

Definition at line 274 of file limits.

4.757.3.11 is_integer

`constexpr bool std::__numeric_limits_base::is_integer [static], [constexpr], [inherited]`

True if the type is integer.

Definition at line 226 of file limits.

4.757.3.12 is_modulo

`constexpr bool std::__numeric_limits_base::is_modulo [static], [constexpr], [inherited]`

True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or $*$ on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

Definition at line 288 of file limits.

4.757.3.13 is_signed

`constexpr bool std::__numeric_limits_base::is_signed [static], [constexpr], [inherited]`

True if the type is signed.

Definition at line 223 of file limits.

4.757.3.14 is_specialized

`constexpr bool std::__numeric_limits_base::is_specialized [static], [constexpr], [inherited]`

This will be true for all fundamental types (which have specializations), and false for everything else.

Definition at line 206 of file limits.

4.757.3.15 max_digits10

`constexpr int std::__numeric_limits_base::max_digits10 [static], [constexpr], [inherited]`

The number of base 10 digits required to ensure that values which differ are always differentiated.

Definition at line 219 of file limits.

4.757.3.16 max_exponent

`constexpr int std::__numeric_limits_base::max_exponent [static], [constexpr], [inherited]`

The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

Definition at line 248 of file limits.

4.757.3.17 max_exponent10

`constexpr int std::__numeric_limits_base::max_exponent10 [static], [constexpr], [inherited]`

The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

Definition at line 252 of file limits.

4.757.3.18 min_exponent

`constexpr int std::__numeric_limits_base::min_exponent [static], [constexpr], [inherited]`

The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

Definition at line 239 of file limits.

4.757.3.19 min_exponent10

`constexpr int std::__numeric_limits_base::min_exponent10 [static], [constexpr], [inherited]`

The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

Definition at line 243 of file limits.

4.757.3.20 radix

`constexpr int std::__numeric_limits_base::radix [static], [constexpr], [inherited]`

For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

Definition at line 235 of file limits.

4.757.3.21 round_style

`constexpr float_round_style std::__numeric_limits_base::round_style [static], [constexpr], [inherited]`

See std::float_round_style for more information. This is only meaningful for floating types; integer types will all be round_toward_zero.

Definition at line 299 of file limits.

4.757.3.22 tinyness_before

`constexpr bool std::__numeric_limits_base::tinyness_before [static], [constexpr], [inherited]`

True if tininess is detected before rounding. (see IEC 559)

Definition at line 294 of file limits.

4.757.3.23 traps `constexpr bool std::__numeric_limits_base::traps [static], [constexpr], [inherited]`

True if trapping is implemented for this type.

Definition at line 291 of file limits.

4.776.1 Detailed Description

template<typename _CharT>
class std::numpunct< _CharT >

Primary class template numpunct.
This facet stores several pieces of information related to printing and scanning numbers, such as the decimal point character. It takes a template parameter specifying the char type. The numpunct facet is used by streams for many I/O operations involving numbers.
The numpunct template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from a numpunct facet.
Definition at line 1670 of file locale_facets.h.

4.776.2 Member Typedef Documentation

4.776.2.1 char_type `template<typename _CharT >`

```
typedef _CharT std::numpunct< _CharT >::char_type
```

Public typedefs.
Definition at line 1676 of file locale_facets.h.

4.776.2.2 string_type `template<typename _CharT >`

```
typedef basic_string<_CharT> std::numpunct< _CharT >::string_type
```

Public typedefs.
Definition at line 1677 of file locale_facets.h.

4.776.3 Constructor & Destructor Documentation

4.776.3.1 numpunct() [1/3] `template<typename _CharT >`

```
std::numpunct< _CharT >::numpunct (
            size_t __refs = 0 )  [inline], [explicit]
```

Numpunct constructor.

Parameters

__refs	Refcount to pass to the base class.

Definition at line 1694 of file locale_facets.h.

4.776.3.2 numpunct() [2/3] `template<typename _CharT >`

```
std::numpunct< _CharT >::numpunct (
            __cache_type * __cache,
            size_t __refs = 0 )  [inline], [explicit]
```

Internal constructor. Not for general use.
This is a constructor for use by the library itself to set up the predefined locale facets.

Parameters

__cache	__numpunct_cache object.

Parameters

__refs	Refcount to pass to the base class.

Definition at line 1708 of file locale_facets.h.

4.776.3.3 numpunct() [3/3] template<typename _CharT >

```
std::numpunct< _CharT >::numpunct (
            __c_locale __cloc,
            size_t __refs = 0 )  [inline], [explicit]
```

Internal constructor. Not for general use.
This is a constructor for use by the library itself to set up new locales.

Parameters

__cloc	The C locale.
__refs	Refcount to pass to the base class.

Definition at line 1722 of file locale_facets.h.

4.776.3.4 ~numpunct() template<typename _CharT >

```
virtual std::numpunct< _CharT >::~numpunct ( )  [protected], [virtual]
```

Destructor.

4.776.4 Member Function Documentation

4.776.4.1 decimal_point() template<typename _CharT >

```
char_type std::numpunct< _CharT >::decimal_point ( ) const  [inline]
```

Return decimal point character.
This function returns a char_type to use as a decimal point. It does so by returning returning numpunct<char_type>↩
::do_decimal_point().

Returns

char_type representing a decimal point.

Definition at line 1736 of file locale_facets.h.
References std::numpunct< _CharT >::do_decimal_point().

4.776.4.2 do_decimal_point() template<typename _CharT >

```
virtual char_type std::numpunct< _CharT >::do_decimal_point ( ) const  [inline], [protected],
[virtual]
```

Return decimal point character.
Returns a char_type to use as a decimal point. This function is a hook for derived classes to change the value returned.

Returns

char_type representing a decimal point.

Definition at line 1823 of file locale_facets.h.
Referenced by std::numpunct< _CharT >::decimal_point().

4.776.4.3 do_falsename() template<typename _CharT >

virtual string_type std::numpunct< _CharT >::do_falsename ( ) const [inline], [protected], [virtual]

Return string representation of bool false.

Returns a string_type containing the text representation for false bool variables. This function is a hook for derived classes to change the value returned.

Returns

string_type representing printed form of false.

Definition at line 1874 of file locale_facets.h.
Referenced by std::numpunct< _CharT >::falsename().

4.776.4.4 do_grouping() template<typename _CharT >

virtual string std::numpunct< _CharT >::do_grouping ( ) const [inline], [protected], [virtual]

Return grouping specification.

Returns a string representing groupings for the integer part of a number. This function is a hook for derived classes to change the value returned.

See also

grouping() for details.

Returns

String representing grouping specification.

Definition at line 1848 of file locale_facets.h.
Referenced by std::numpunct< _CharT >::grouping().

4.776.4.5 do_thousands_sep() template<typename _CharT >

virtual char_type std::numpunct< _CharT >::do_thousands_sep ( ) const [inline], [protected], [virtual]

Return thousands separator character.

Returns a char_type to use as a thousands separator. This function is a hook for derived classes to change the value returned.

Returns

char_type representing a thousands separator.

Definition at line 1835 of file locale_facets.h.
Referenced by std::numpunct< _CharT >::thousands_sep().

4.776.4.6 do_truename() template<typename _CharT >

virtual string_type std::numpunct< _CharT >::do_truename ( ) const [inline], [protected], [virtual]

Return string representation of bool true.

Returns a string_type containing the text representation for true bool variables. This function is a hook for derived classes to change the value returned.

Returns

string_type representing printed form of true.

Definition at line 1861 of file locale_facets.h.
Referenced by std::numpunct< _CharT >::truename().

4.776.4.7 falsename() template<typename _CharT >

string_type std::numpunct< _CharT >::falsename ( ) const [inline]

Return string representation of bool false.

This function returns a string_type containing the text representation for false bool variables. It does so by calling numpunct<char_type>::do_falsename().

Returns

string_type representing printed form of false.

Definition at line 1806 of file locale_facets.h.

References std::numpunct< _CharT >::do_falsename().

4.776.4.8 grouping() template<typename _CharT >

string std::numpunct< _CharT >::grouping ( ) const [inline]

Return grouping specification.

This function returns a string representing groupings for the integer part of a number. Groupings indicate where thousands separators should be inserted in the integer part of a number.

Each char in the return string is interpret as an integer rather than a character. These numbers represent the number of digits in a group. The first char in the string represents the number of digits in the least significant group. If a char is negative, it indicates an unlimited number of digits for the group. If more chars from the string are required to group a number, the last char is used repeatedly.

For example, if the grouping() returns "\003\002" and is applied to the number 123456789, this corresponds to 12,34,56,789. Note that if the string was "32", this would put more than 50 digits into the least significant group if the character set is ASCII.

The string is returned by calling numpunct<char_type>::do_grouping().

Returns

string representing grouping specification.

Definition at line 1780 of file locale_facets.h.

References std::numpunct< _CharT >::do_grouping().

4.776.4.9 thousands_sep() template<typename _CharT >

char_type std::numpunct< _CharT >::thousands_sep ( ) const [inline]

Return thousands separator character.

This function returns a char_type to use as a thousands separator. It does so by returning returning numpunct<char↩ _type>::do_thousands_sep().

Returns

char_type representing a thousands separator.

Definition at line 1749 of file locale_facets.h.

References std::numpunct< _CharT >::do_thousands_sep().

4.776.4.10 truename() template<typename _CharT >

string_type std::numpunct< _CharT >::truename ( ) const [inline]

Return string representation of bool true.

This function returns a string_type containing the text representation for true bool variables. It does so by calling numpunct<char_type>::do_truename().

Returns

string_type representing printed form of true.

Definition at line 1793 of file locale_facets.h.
References std::numpunct< _CharT >::do_truename().

4.777.2.1 decimal_point() `template<typename _CharT >`

`char_type std::numpunct< _CharT >::decimal_point ( ) const [inline], [inherited]`

Return decimal point character.
This function returns a char_type to use as a decimal point. It does so by returning returning numpunct<char_type>↩ ::do_decimal_point().

Returns

char_type representing a decimal point.

Definition at line 1736 of file locale_facets.h.
References std::numpunct< _CharT >::do_decimal_point().

4.777.2.2 do_decimal_point() `template<typename _CharT >`

`virtual char_type std::numpunct< _CharT >::do_decimal_point ( ) const [inline], [protected], [virtual], [inherited]`

Return decimal point character.
Returns a char_type to use as a decimal point. This function is a hook for derived classes to change the value returned.

Returns

char_type representing a decimal point.

Definition at line 1823 of file locale_facets.h.
Referenced by std::numpunct< _CharT >::decimal_point().

4.777.2.3 do_falsename() template<typename _CharT >

virtual string_type std::numpunct< _CharT >::do_falsename ( ) const [inline], [protected], [virtual], [inherited]

Return string representation of bool false.

Returns a string_type containing the text representation for false bool variables. This function is a hook for derived classes to change the value returned.

Returns

string_type representing printed form of false.

Definition at line 1874 of file locale_facets.h.
Referenced by std::numpunct< _CharT >::falsename().

4.777.2.4 do_grouping() template<typename _CharT >

virtual string std::numpunct< _CharT >::do_grouping ( ) const [inline], [protected], [virtual], [inherited]

Return grouping specification.

Returns a string representing groupings for the integer part of a number. This function is a hook for derived classes to change the value returned.

See also

grouping() for details.

Returns

String representing grouping specification.

Definition at line 1848 of file locale_facets.h.
Referenced by std::numpunct< _CharT >::grouping().

4.777.2.5 do_thousands_sep() template<typename _CharT >

virtual char_type std::numpunct< _CharT >::do_thousands_sep ( ) const [inline], [protected], [virtual], [inherited]

Return thousands separator character.

Returns a char_type to use as a thousands separator. This function is a hook for derived classes to change the value returned.

Returns

char_type representing a thousands separator.

Definition at line 1835 of file locale_facets.h.
Referenced by std::numpunct< _CharT >::thousands_sep().

4.777.2.6 do_truename() template<typename _CharT >

virtual string_type std::numpunct< _CharT >::do_truename ( ) const [inline], [protected], [virtual], [inherited]

Return string representation of bool true.

Returns a string_type containing the text representation for true bool variables. This function is a hook for derived classes to change the value returned.

Returns

string_type representing printed form of true.

Definition at line 1861 of file locale_facets.h.
Referenced by std::numpunct< _CharT >::truename().

4.777.2.7 falsename() template<typename _CharT >

string_type std::numpunct< _CharT >::falsename ( ) const [inline], [inherited]

Return string representation of bool false.
This function returns a string_type containing the text representation for false bool variables. It does so by calling numpunct<char_type>::do_falsename().

Returns

string_type representing printed form of false.

Definition at line 1806 of file locale_facets.h.
References std::numpunct< _CharT >::do_falsename().

4.777.2.8 grouping() template<typename _CharT >

string std::numpunct< _CharT >::grouping ( ) const [inline], [inherited]

Return grouping specification.
This function returns a string representing groupings for the integer part of a number. Groupings indicate where thousands separators should be inserted in the integer part of a number.
Each char in the return string is interpret as an integer rather than a character. These numbers represent the number of digits in a group. The first char in the string represents the number of digits in the least significant group. If a char is negative, it indicates an unlimited number of digits for the group. If more chars from the string are required to group a number, the last char is used repeatedly.
For example, if the grouping() returns "\003\002" and is applied to the number 123456789, this corresponds to 12,34,56,789. Note that if the string was "32", this would put more than 50 digits into the least significant group if the character set is ASCII.
The string is returned by calling numpunct<char_type>::do_grouping().

Returns

string representing grouping specification.

Definition at line 1780 of file locale_facets.h.
References std::numpunct< _CharT >::do_grouping().

4.777.2.9 thousands_sep() template<typename _CharT >

char_type std::numpunct< _CharT >::thousands_sep ( ) const [inline], [inherited]

Return thousands separator character.
This function returns a char_type to use as a thousands separator. It does so by returning returning numpunct<char↩ _type>::do_thousands_sep().

Returns

char_type representing a thousands separator.

Definition at line 1749 of file locale_facets.h.
References std::numpunct< _CharT >::do_thousands_sep().

4.777.2.10 truename() template<typename _CharT >

string_type std::numpunct< _CharT >::truename ( ) const [inline], [inherited]

Return string representation of bool true.

This function returns a string_type containing the text representation for true bool variables. It does so by calling numpunct<char_type>::do_truename().

Returns

string_type representing printed form of true.

Definition at line 1793 of file locale_facets.h.

References std::numpunct< _CharT >::do_truename().

4.782.1 Detailed Description

template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>>
class std::ostream_iterator< _Tp, _CharT, _Traits >

Provides output iterator semantics for streams.
This class provides an iterator to write to an ostream. The type Tp is the only type written by this iterator and there must be an operator<<(Tp) defined.

Template Parameters

_Tp	The type to write to the ostream.
_CharT	The ostream char_type.
_Traits	The ostream char_traits.

Definition at line 176 of file stream_iterator.h.

4.782.2 Member Typedef Documentation

4.782.2.1 char_type

```
template<typename _Tp , typename _CharT = char, typename _Traits = char_↩
traits<_CharT>>
typedef _CharT std::ostream_iterator< _Tp, _CharT, _Traits >::char_type
```

Public typedef.
Definition at line 185 of file stream_iterator.h.

4.782.2.2 difference_type

```
typedef void std::iterator< output_iterator_tag , void , void , void ,
void >::difference_type  [inherited]
```

Distance between iterators is represented as this type.
Definition at line 134 of file stl_iterator_base_types.h.

4.782.2.3 iterator_category

```
typedef output_iterator_tag std::iterator< output_iterator_tag , void ,
void , void , void >::iterator_category  [inherited]
```

One of the tag types.
Definition at line 130 of file stl_iterator_base_types.h.

4.782.2.4 ostream_type

```
template<typename _Tp , typename _CharT = char, typename _Traits = char_↩
traits<_CharT>>
typedef basic_ostream<_CharT, _Traits> std::ostream_iterator< _Tp, _CharT, _Traits >::ostream_type
```

Public typedef.
Definition at line 187 of file stream_iterator.h.

4.782.2.5 pointer

```
typedef void std::iterator< output_iterator_tag , void , void , void , void >↩
::pointer  [inherited]
```

This type represents a pointer-to-value_type.
Definition at line 136 of file stl_iterator_base_types.h.

4.782.2.6 reference

```
typedef void std::iterator< output_iterator_tag , void , void , void , void
>::reference  [inherited]
```

This type represents a reference-to-value_type.
Definition at line 138 of file stl_iterator_base_types.h.

4.782.2.7 traits_type

```
template<typename _Tp , typename _CharT = char, typename _Traits = char_↩
traits<_CharT>>
typedef _Traits std::ostream_iterator< _Tp, _CharT, _Traits >::traits_type
```

Public typedef.
Definition at line 186 of file stream_iterator.h.

4.782.2.8 value_type

```
typedef void std::iterator< output_iterator_tag , void , void , void , void
>::value_type  [inherited]
```

The type "pointed to" by the iterator.
Definition at line 132 of file stl_iterator_base_types.h.

4.782.3 Constructor & Destructor Documentation

4.782.3.1 ostream_iterator() [1/3]

```
template<typename _Tp , typename _CharT = char, typename _Traits
= char_traits<_CharT>>
std::ostream_iterator< _Tp, _CharT, _Traits >::ostream_iterator (
            ostream_type & __s )  [inline]
```

Construct from an ostream.
Definition at line 201 of file stream_iterator.h.

4.782.3.2 ostream_iterator() [2/3]

```
template<typename _Tp , typename _CharT = char, typename _Traits
= char_traits<_CharT>>
std::ostream_iterator< _Tp, _CharT, _Traits >::ostream_iterator (
            ostream_type & __s,
            const _CharT * __c )  [inline]
```

Construct from an ostream.
The delimiter string *c* is written to the stream after every Tp written to the stream. The delimiter is not copied, and thus must not be destroyed while this iterator is in use.

Parameters

_↩ _s	Underlying ostream to write to.
_↩ _c	CharT delimiter string to insert.

Definition at line 214 of file stream_iterator.h.

4.782.3.3 ostream_iterator() [3/3]

```
template<typename _Tp , typename _CharT = char, typename _Traits
= char_traits<_CharT>>
std::ostream_iterator< _Tp, _CharT, _Traits >::ostream_iterator (
            const ostream_iterator< _Tp, _CharT, _Traits > & __obj )  [inline]
```

Copy constructor.
Definition at line 218 of file stream_iterator.h.

4.782.4 Member Function Documentation

4.782.4.1 operator=() template<typename _Tp , typename _CharT = char, typename _Traits = char_↩ traits<_CharT>>

```
ostream_iterator& std::ostream_iterator< _Tp, _CharT, _Traits >::operator= (
            const _Tp & __value )  [inline]
```

Writes *value* to underlying ostream using operator<<. If constructed with delimiter string, writes delimiter to ostream.
Definition at line 228 of file stream_iterator.h.
The documentation for this class was generated from the following file:

- stream_iterator.h

4.783 std::experimental::fundamentals_v2::ostream_joiner< _DelimT, _CharT, _Traits > Class Template Reference

Public Types

4.784.1 Detailed Description

template<typename _CharT, typename _Traits>
class std::ostreambuf_iterator< _CharT, _Traits >

Provides output iterator semantics for streambufs.
Definition at line 239 of file streambuf_iterator.h.

4.784.2 Member Typedef Documentation

4.784.2.1 char_type `template<typename _CharT , typename _Traits >`

`typedef _CharT std::ostreambuf_iterator< _CharT, _Traits >::char_type`

Public typedefs.
Definition at line 249 of file streambuf_iterator.h.

4.784.2.2 difference_type

`typedef void std::iterator< output_iterator_tag , void , void , void , void >::difference_type [inherited]`

Distance between iterators is represented as this type.
Definition at line 134 of file stl_iterator_base_types.h.

4.784.2.3 iterator_category

`typedef output_iterator_tag std::iterator< output_iterator_tag , void , void , void , void >::iterator_category [inherited]`

One of the tag types.
Definition at line 130 of file stl_iterator_base_types.h.

4.784.2.4 ostream_type

`template<typename _CharT , typename _Traits > typedef basic_ostream<_CharT, _Traits> std::ostreambuf_iterator< _CharT, _Traits >::ostream_type`

Public typedefs.
Definition at line 252 of file streambuf_iterator.h.

4.784.2.5 pointer

`typedef void std::iterator< output_iterator_tag , void , void , void , void >::pointer [inherited]`

This type represents a pointer-to-value_type.
Definition at line 136 of file stl_iterator_base_types.h.

4.784.2.6 reference

`typedef void std::iterator< output_iterator_tag , void , void , void , void >::reference [inherited]`

This type represents a reference-to-value_type.
Definition at line 138 of file stl_iterator_base_types.h.

4.784.2.7 streambuf_type

`template<typename _CharT , typename _Traits > typedef basic_streambuf<_CharT, _Traits> std::ostreambuf_iterator< _CharT, _Traits >::streambuf_type`

Public typedefs.
Definition at line 251 of file streambuf_iterator.h.

4.784.2.8 traits_type

`template<typename _CharT , typename _Traits > typedef _Traits std::ostreambuf_iterator< _CharT, _Traits >::traits_type`

Public typedefs.
Definition at line 250 of file streambuf_iterator.h.

4.784.2.9 value_type

`typedef void std::iterator< output_iterator_tag , void , void , void , void >::value_type [inherited]`

The type "pointed to" by the iterator.
Definition at line 132 of file stl_iterator_base_types.h.

4.784.3 Constructor & Destructor Documentation

4.784.3.1 ostreambuf_iterator() [1/2]

```
template<typename _CharT , typename _Traits >
std::ostreambuf_iterator< _CharT, _Traits >::ostreambuf_iterator (
            ostream_type & __s )  [inline], [noexcept]
```

Construct output iterator from ostream.
Definition at line 274 of file streambuf_iterator.h.

4.784.3.2 ostreambuf_iterator() [2/2]

```
template<typename _CharT , typename _Traits >
std::ostreambuf_iterator< _CharT, _Traits >::ostreambuf_iterator (
            streambuf_type * __s )  [inline], [noexcept]
```

Construct output iterator from streambuf.
Definition at line 278 of file streambuf_iterator.h.

4.784.4 Member Function Documentation

4.784.4.1 failed()

```
template<typename _CharT , typename _Traits >
bool std::ostreambuf_iterator< _CharT, _Traits >::failed ( ) const  [inline], [noexcept]
```

Return true if previous operator=() failed.
Definition at line 308 of file streambuf_iterator.h.

4.784.4.2 operator*()

```
template<typename _CharT , typename _Traits >
ostreambuf_iterator& std::ostreambuf_iterator< _CharT, _Traits >::operator* ( )  [inline]
```

Return *this.
Definition at line 293 of file streambuf_iterator.h.

4.784.4.3 operator++() [1/2]

```
template<typename _CharT , typename _Traits >
ostreambuf_iterator& std::ostreambuf_iterator< _CharT, _Traits >::operator++ ( )  [inline]
```

Return *this.
Definition at line 303 of file streambuf_iterator.h.

4.784.4.4 operator++() [2/2]

```
template<typename _CharT , typename _Traits >
ostreambuf_iterator& std::ostreambuf_iterator< _CharT, _Traits >::operator++ (
            int  )  [inline]
```

Return *this.
Definition at line 298 of file streambuf_iterator.h.

4.784.4.5 operator=()

```
template<typename _CharT , typename _Traits >
ostreambuf_iterator& std::ostreambuf_iterator< _CharT, _Traits >::operator= (
            _CharT __c )  [inline]
```

Write character to streambuf. Calls streambuf.sputc().
Definition at line 283 of file streambuf_iterator.h.
References std::basic_streambuf< _CharT, _Traits >::sputc().
The documentation for this class was generated from the following files:

- iosfwd
- streambuf_iterator.h

4.785 std::out_of_range Class Reference

Inheritance diagram for std::out_of_range:

Public Member Functions

- **out_of_range** (const char *) _GLIBCXX_TXN_SAFE
- **out_of_range** (const out_of_range &)=default
- **out_of_range** (const string &__arg) _GLIBCXX_TXN_SAFE
- **out_of_range** (out_of_range &&)=default
- out_of_range & **operator=** (const out_of_range &)=default
- out_of_range & **operator=** (out_of_range &&)=default
- virtual const char * what () const noexcept

4.785.1 Detailed Description

This represents an argument whose value is not within the expected range (e.g., boundary checks in basic_string).

Definition at line 200 of file stdexcept.

4.785.2 Member Function Documentation

4.785.2.1 what() `virtual const char* std::logic_error::what ( ) const [virtual], [noexcept], [inherited]`

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from std::exception.
Reimplemented in std::future_error.
The documentation for this class was generated from the following file:

- stdexcept

4.786 std::output_iterator_tag Struct Reference

4.786.1 Detailed Description

Marking output iterators.
Definition at line 96 of file stl_iterator_base_types.h.

4.787.1 Detailed Description

template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _Alloc>
class __gnu_pbds::detail::ov_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >

Ordered-vector tree associative-container.
Definition at line 106 of file ov_tree_map_.hpp.

4.787.2 Member Function Documentation

4.787.2.1 node_begin() [1/2]

```
template<typename Key , typename Mapped , typename Cmp_Fn , typename
Node_And_It_Traits , typename _Alloc >
node_iterator __gnu_pbds::detail::ov_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc
>::node_begin ( )  [inline]
```

Returns a node_iterator corresponding to the node at the root of the tree.

4.787.2.2 node_begin() [2/2]

```
template<typename Key , typename Mapped , typename Cmp_Fn , typename
Node_And_It_Traits , typename _Alloc >
node_const_iterator __gnu_pbds::detail::ov_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _↩
Alloc >::node_begin ( ) const  [inline]
```

Returns a const node_iterator corresponding to the node at the root of the tree.

4.787.2.3 node_end() [1/2]

```
template<typename Key , typename Mapped , typename Cmp_Fn , typename Node_And_It_Traits , typename _Alloc >
node_iterator __gnu_pbds::detail::ov_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_end ( ) [inline]
```

Returns a node_iterator corresponding to a node just after a leaf of the tree.

4.787.2.4 node_end() [2/2]

```
template<typename Key , typename Mapped , typename Cmp_Fn , typename Node_And_It_Traits , typename _Alloc >
node_const_iterator __gnu_pbds::detail::ov_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::node_end ( ) const [inline]
```

Returns a const node_iterator corresponding to a node just after a leaf of the tree.

Static Protected Member Functions

- template<typename Ptr >
  static Ptr **mid_pointer** (Ptr p_begin, Ptr p_end)

4.789.1 Detailed Description

template<typename Value_Type, typename Metadata_Type, typename _Alloc>
class __gnu_pbds::detail::ov_tree_node_it_< Value_Type, Metadata_Type, _Alloc >

Node reference.
Definition at line 197 of file ov_tree_map_/node_iterators.hpp.

4.789.2 Member Function Documentation

4.789.2.1 get_l_child() `template<typename Value_Type , typename Metadata_Type , typename _Alloc > ov_tree_node_it_ __gnu_pbds::detail::ov_tree_node_it_< Value_Type, Metadata_Type, _Alloc >::get↩ _l_child ( ) const [inline]`

Returns the node reference associated with the left node.
Definition at line 239 of file ov_tree_map_/node_iterators.hpp.

4.789.2.2 get_r_child() `template<typename Value_Type , typename Metadata_Type , typename _Alloc > ov_tree_node_it_ __gnu_pbds::detail::ov_tree_node_it_< Value_Type, Metadata_Type, _Alloc >::get↩ _r_child ( ) const [inline]`

Returns the node reference associated with the right node.
Definition at line 255 of file ov_tree_map_/node_iterators.hpp.

4.789.2.3 operator*() `template<typename Value_Type , typename Metadata_Type , typename _Alloc > reference __gnu_pbds::detail::ov_tree_node_it_< Value_Type, Metadata_Type, _Alloc >::operator* ( ) const [inline]`

Access.
Definition at line 234 of file ov_tree_map_/node_iterators.hpp.
The documentation for this class was generated from the following file:

- ov_tree_map_/node_iterators.hpp

4.790 __gnu_pbds::ov_tree_tag Struct Reference

Inheritance diagram for __gnu_pbds::ov_tree_tag:

4.790.1 Detailed Description

Ordered-vector tree.
Definition at line 159 of file tag_and_trait.hpp.
The documentation for this struct was generated from the following file:

- tag_and_trait.hpp

4.791 std::overflow_error Class Reference

Inheritance diagram for std::overflow_error:

Public Member Functions

- **overflow_error** (const char *) _GLIBCXX_TXN_SAFE
- **overflow_error** (const overflow_error &)=default
- **overflow_error** (const string &__arg) _GLIBCXX_TXN_SAFE
- **overflow_error** (overflow_error &&)=default
- overflow_error & **operator=** (const overflow_error &)=default
- overflow_error & **operator=** (overflow_error &&)=default
- virtual const char * what () const noexcept

4.791.1 Detailed Description

Thrown to indicate arithmetic overflow.

Definition at line 273 of file stdexcept.

4.791.2 Member Function Documentation

4.791.2.1 what() `virtual const char* std::runtime_error::what ( ) const [virtual], [noexcept], [inherited]`

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from std::exception.
Reimplemented in std::experimental::filesystem::v1::filesystem_error.
The documentation for this class was generated from the following file:

- stdexcept

4.792 std::owner_less< _Tp > Struct Template Reference

4.792.1 Detailed Description

template<typename _Tp = void>
struct std::owner_less< _Tp >

Primary template owner_less.
Definition at line 768 of file bits/shared_ptr.h.
The documentation for this struct was generated from the following file:

- bits/shared_ptr.h

4.793 std::experimental::fundamentals_v2::owner_less< shared_ptr< _Tp > > Struct Template Reference

Inherits std::_Sp_owner_less< _Tp, _Tp1 >.

Public Types

- typedef _Tp first_argument_type
- typedef bool result_type
- typedef _Tp second_argument_type

Public Member Functions

- bool **operator()** (const _Tp &__lhs, const _Tp &__rhs) const noexcept
- bool **operator()** (const _Tp &__lhs, const _Tp1 &__rhs) const noexcept
- bool **operator()** (const _Tp1 &__lhs, const _Tp &__rhs) const noexcept

4.793.1 Detailed Description

template<typename _Tp>
struct std::experimental::fundamentals_v2::owner_less< shared_ptr< _Tp > >

Partial specialization of owner_less for shared_ptr.
Definition at line 509 of file experimental/bits/shared_ptr.h.

4.793.2 Member Typedef Documentation

4.793.2.1 first_argument_type `typedef _Tp std::binary_function< _Tp , _Tp , bool >::first_argument_type [inherited]`

`first_argument_type` is the type of the first argument
Definition at line 121 of file stl_function.h.

4.793.2.2 result_type `typedef bool std::binary_function< _Tp , _Tp , bool >::result_type [inherited]`

`result_type` is the return type
Definition at line 127 of file stl_function.h.

4.793.2.3 second_argument_type `typedef _Tp std::binary_function< _Tp , _Tp , bool >::second_argument_type [inherited]`

`second_argument_type` is the type of the second argument
Definition at line 124 of file stl_function.h.
The documentation for this struct was generated from the following file:

- experimental/bits/shared_ptr.h

4.794 std::owner_less< shared_ptr< _Tp > > Struct Template Reference

Inherits std::_Sp_owner_less< _Tp, _Tp1 >.

Public Types

- typedef _Tp first_argument_type
- typedef bool result_type
- typedef _Tp second_argument_type

Public Member Functions

- bool **operator()** (const _Tp &__lhs, const _Tp &__rhs) const noexcept
- bool **operator()** (const _Tp &__lhs, const _Tp1 &__rhs) const noexcept
- bool **operator()** (const _Tp1 &__lhs, const _Tp &__rhs) const noexcept

4.794.1 Detailed Description

template<typename _Tp>
struct std::owner_less< shared_ptr< _Tp > >

Partial specialization of owner_less for shared_ptr.
Definition at line 777 of file bits/shared_ptr.h.

4.794.2 Member Typedef Documentation

4.794.2.1 first_argument_type `typedef _Tp std::binary_function< _Tp , _Tp , bool >::first_argument_type [inherited]`

`first_argument_type` is the type of the first argument
Definition at line 121 of file stl_function.h.

4.794.2.2 result_type `typedef bool std::binary_function< _Tp , _Tp , bool >::result_type [inherited]`

`result_type` is the return type
Definition at line 127 of file stl_function.h.

4.794.2.3 second_argument_type `typedef _Tp std::binary_function< _Tp , _Tp , bool >::second_argument_type [inherited]`

`second_argument_type` is the type of the second argument
Definition at line 124 of file stl_function.h.
The documentation for this struct was generated from the following file:

- bits/shared_ptr.h

4.795 std::owner_less< void > Struct Reference

Inherits std::_Sp_owner_less< _Tp, _Tp1 >.

Public Types

- typedef _Tp first_argument_type
- typedef bool result_type
- typedef _Tp second_argument_type

Public Member Functions

- bool **operator()** (const _Tp &__lhs, const _Tp &__rhs) const noexcept
- bool **operator()** (const _Tp &__lhs, const _Tp1 &__rhs) const noexcept
- bool **operator()** (const _Tp1 &__lhs, const _Tp &__rhs) const noexcept

4.795.1 Detailed Description

Void specialization of owner_less compares either shared_ptr or weak_ptr.
Definition at line 772 of file bits/shared_ptr.h.

4.795.2 Member Typedef Documentation

4.795.2.1 first_argument_type `typedef _Tp std::binary_function< _Tp , _Tp , bool >::first_argument_type [inherited]`

`first_argument_type` is the type of the first argument
Definition at line 121 of file stl_function.h.

4.795.2.2 result_type `typedef bool std::binary_function< _Tp , _Tp , bool >::result_type [inherited]`

`result_type` is the return type
Definition at line 127 of file stl_function.h.

4.795.2.3 second_argument_type `typedef _Tp std::binary_function< _Tp , _Tp , bool >::second_argument_type [inherited]`

`second_argument_type` is the type of the second argument
Definition at line 124 of file stl_function.h.
The documentation for this struct was generated from the following file:

- bits/shared_ptr.h

4.796 std::experimental::fundamentals_v2::owner_less< weak_ptr< _Tp > > Struct Template Reference

Inherits std::_Sp_owner_less< _Tp, _Tp1 >.

Public Types

4.799.1 Detailed Description

template<typename _T1, typename _T2>
struct std::pair< _T1, _T2 >

Struct holding two objects of arbitrary type.

Template Parameters

_T1	Type of first object.
_T2	Type of second object.

https://gcc.gnu.org/onlinedocs/libstdc++/manual/utilities.html
Definition at line 211 of file stl_pair.h.

4.799.2 Member Typedef Documentation

4.799.2.1 first_type `template<typename _T1 , typename _T2 >`

```
typedef _T1 std::pair< _T1, _T2 >::first_type
```

The type of the `first` member.
Definition at line 214 of file stl_pair.h.

4.799.2.2 second_type `template<typename _T1 , typename _T2 >`

```
typedef _T2 std::pair< _T1, _T2 >::second_type
```

The type of the `second` member.
Definition at line 215 of file stl_pair.h.

4.799.3 Constructor & Destructor Documentation

4.799.3.1 pair() [1/5] `template<typename _T1 , typename _T2 >`

```
template<typename _U1 = _T1, typename _U2 = _T2, typename enable_if< __and_< __is_implicitly_↩
default_constructible< _U1 >, __is_implicitly_default_constructible< _U2 >> ::value, bool >↩
::type = true>
constexpr std::pair< _T1, _T2 >::pair ( )  [inline], [constexpr]
```

The default constructor creates `first` and `second` using their respective default constructors.

Definition at line 232 of file stl_pair.h.

4.799.3.2 pair() [2/5] `template<typename _T1 , typename _T2 >`

```
template<typename _U1 = _T1, typename _U2 = _T2, typename enable_if< _PCCP::template _Constructible↩
Pair< _U1, _U2 >() &&_PCCP::template _ImplicitlyConvertiblePair< _U1, _U2 >(), bool >::type =
true>
constexpr std::pair< _T1, _T2 >::pair (
            const _T1 & __a,
            const _T2 & __b )  [inline], [constexpr]
```

Construct from two const lvalues, allowing implicit conversions.
Definition at line 266 of file stl_pair.h.

4.799.3.3 pair() [3/5] `template<typename _T1 , typename _T2 >`

```
template<typename _U1 = _T1, typename _U2 = _T2, typename enable_if< _PCCP::template _Constructible↩
Pair< _U1, _U2 >() &&!_PCCP::template _ImplicitlyConvertiblePair< _U1, _U2 >(), bool >::type =
false>
```

```
constexpr std::pair< _T1, _T2 >::pair (
            const _T1 & __a,
            const _T2 & __b )  [inline], [explicit], [constexpr]
```

Construct from two const lvalues, disallowing implicit conversions.
Definition at line 276 of file stl_pair.h.

4.799.3.4 pair() [4/5] template<typename _T1 , typename _T2 >

```
constexpr std::pair< _T1, _T2 >::pair (
            const pair< _T1, _T2 > &  )  [constexpr], [default]
```

Copy constructor.

4.799.3.5 pair() [5/5] template<typename _T1 , typename _T2 >

```
constexpr std::pair< _T1, _T2 >::pair (
            pair< _T1, _T2 > &&  )  [constexpr], [default]
```

Move constructor.

4.799.4 Member Function Documentation

4.799.4.1 swap() template<typename _T1 , typename _T2 >

```
constexpr void std::pair< _T1, _T2 >::swap (
            pair< _T1, _T2 > & __p )  [inline], [constexpr], [noexcept]
```

Swap the first members and then the second members.
Definition at line 439 of file stl_pair.h.
References std::pair< _T1, _T2 >::first, and std::pair< _T1, _T2 >::second.
Referenced by std::pair< _T1, _T2 >::swap().

4.799.5 Member Data Documentation

4.799.5.1 first template<typename _T1 , typename _T2 >

```
_T1 std::pair< _T1, _T2 >::first
```

The first member.
Definition at line 217 of file stl_pair.h.
Referenced by std::_Temporary_buffer< _ForwardIterator, _Tp >::_Temporary_buffer(), __gnu_parallel::__find↩ _template(), std::__sample(), std::set< _Key, _Compare, _Alloc >::insert(), std::pair< _T1, _T2 >::operator<(), std::pair< _T1, _T2 >::operator==(), and std::pair< _T1, _T2 >::swap().

4.799.5.2 second template<typename _T1 , typename _T2 >

```
_T2 std::pair< _T1, _T2 >::second
```

The second member.
Definition at line 218 of file stl_pair.h.
Referenced by std::__sample(), std::set< _Key, _Compare, _Alloc >::insert(), std::pair< _T1, _T2 >::operator<(), std::pair< _T1, _T2 >::operator==(), and std::pair< _T1, _T2 >::swap().

4.800.1 Detailed Description

template<typename Value_Type, typename Cmp_Fn, typename _Alloc>
class __gnu_pbds::detail::pairing_heap< Value_Type, Cmp_Fn, _Alloc >

Pairing heap.
Definition at line 77 of file pairing_heap_.hpp.
The documentation for this class was generated from the following file:

- pairing_heap_.hpp

4.801 __gnu_pbds::pairing_heap_tag Struct Reference

Inheritance diagram for __gnu_pbds::pairing_heap_tag:

4.801.1 Detailed Description

Pairing-heap.
Definition at line 174 of file tag_and_trait.hpp.
The documentation for this struct was generated from the following file:

- tag_and_trait.hpp

4.802 __gnu_parallel::parallel_tag Struct Reference

Inheritance diagram for __gnu_parallel::parallel_tag:

Public Member Functions

- parallel_tag ()
- parallel_tag (_ThreadIndex __num_threads)
- _ThreadIndex __get_num_threads ()
- void set_num_threads (_ThreadIndex __num_threads)

4.802.1 Detailed Description

Recommends parallel execution at compile time, optionally using a user-specified number of threads.
Definition at line 46 of file tags.h.

4.802.2 Constructor & Destructor Documentation

4.802.2.1 parallel_tag() [1/2] __gnu_parallel::parallel_tag::parallel_tag ( ) [inline]

Default constructor. Use default number of threads.
Definition at line 53 of file tags.h.

4.802.2.2 parallel_tag() [2/2] __gnu_parallel::parallel_tag::parallel_tag (_ThreadIndex *__num_threads*) [inline]

Default constructor. Recommend number of threads to use.

Parameters

__num_threads	Desired number of threads.

Definition at line 58 of file tags.h.

4.802.3 Member Function Documentation

4.802.3.1 __get_num_threads() _ThreadIndex __gnu_parallel::parallel_tag::__get_num_threads ( ) [inline]

Find out desired number of threads.

Returns

Desired number of threads.

Definition at line 63 of file tags.h.
Referenced by __gnu_parallel::__parallel_sort().

4.802.3.2 set_num_threads() void __gnu_parallel::parallel_tag::set_num_threads (_ThreadIndex *__num_threads*) [inline]

Set the desired number of threads.

Parameters

__num_threads	Desired number of threads.

Definition at line 73 of file tags.h.
The documentation for this struct was generated from the following file:

- tags.h

4.803 std::bernoulli_distribution::param_type Struct Reference

Public Types

- typedef bernoulli_distribution **distribution_type**

Public Member Functions

- **param_type** (double __p)
- double **p** () const

Friends

- bool **operator!=** (const param_type &__p1, const param_type &__p2)
- bool **operator==** (const param_type &__p1, const param_type &__p2)

4.803.1 Detailed Description

Parameter type.
Definition at line 3528 of file random.h.
The documentation for this struct was generated from the following file:

- random.h

4.804 std::binomial_distribution< _IntType >::param_type Struct Reference

Public Types

- typedef binomial_distribution< _IntType > **distribution_type**

Public Member Functions

- **param_type** (_IntType __t, double __p=0.5)
- double **p** () const
- _IntType **t** () const

Friends

- class **binomial_distribution< _IntType >**
- bool **operator!=** (const param_type &__p1, const param_type &__p2)
- bool **operator==** (const param_type &__p1, const param_type &__p2)

4.804.1 Detailed Description

template<typename _IntType = int>
struct std::binomial_distribution< _IntType >::param_type

Parameter type.
Definition at line 3748 of file random.h.
The documentation for this struct was generated from the following files:

- random.h
- bits/random.tcc

4.805 std::cauchy_distribution< _RealType >::param_type Struct Reference

Public Types

- typedef cauchy_distribution< _RealType > **distribution_type**

Public Member Functions

- **param_type** (_RealType __a, _RealType __b=_RealType(1))
- _RealType **a** () const
- _RealType **b** () const

Friends

- bool **operator!=** (const param_type &__p1, const param_type &__p2)
- bool **operator==** (const param_type &__p1, const param_type &__p2)

4.805.1 Detailed Description

template<typename _RealType = double>
struct std::cauchy_distribution< _RealType >::param_type

Parameter type.
Definition at line 2864 of file random.h.
The documentation for this struct was generated from the following file:

- random.h

4.806 std::chi_squared_distribution< _RealType >::param_type Struct Reference

Public Types

- typedef chi_squared_distribution< _RealType > **distribution_type**

Public Member Functions

- **param_type** (_RealType __n)
- _RealType **n** () const

Friends

- bool **operator!=** (const param_type &__p1, const param_type &__p2)
- bool **operator==** (const param_type &__p1, const param_type &__p2)

4.806.1 Detailed Description

template<typename _RealType = double>
struct std::chi_squared_distribution< _RealType >::param_type

Parameter type.
Definition at line 2640 of file random.h.
The documentation for this struct was generated from the following file:

- random.h

4.807 std::discrete_distribution< _IntType >::param_type Struct Reference

Public Types

- typedef discrete_distribution< _IntType > **distribution_type**

Public Member Functions

- template<typename _InputIterator >
  param_type (_InputIterator __wbegin, _InputIterator __wend)
- **param_type** (const param_type &)=default
- **param_type** (initializer_list< double > __wil)
- template<typename _Func >

- bool **operator!=** (const param_type &__p1, const param_type &__p2)
- bool **operator==** (const param_type &__p1, const param_type &__p2)

4.807.1 Detailed Description

template<typename _IntType = int>
struct std::discrete_distribution< _IntType >::param_type

Parameter type.
Definition at line 5287 of file random.h.
The documentation for this struct was generated from the following files:

- random.h
- bits/random.tcc

4.808 std::exponential_distribution< _RealType >::param_type Struct Reference

Public Types

- typedef exponential_distribution< _RealType > **distribution_type**

Public Member Functions

- **param_type** (_RealType __lambda)
- _RealType **lambda** () const

Friends

- bool **operator!=** (const param_type &__p1, const param_type &__p2)
- bool **operator==** (const param_type &__p1, const param_type &__p2)

4.808.1 Detailed Description

template<typename _RealType = double>
struct std::exponential_distribution< _RealType >::param_type

Parameter type.
Definition at line 4655 of file random.h.
The documentation for this struct was generated from the following file:

- random.h

4.809 std::extreme_value_distribution< _RealType >::param_type Struct Reference

Public Types

- typedef extreme_value_distribution< _RealType > **distribution_type**

Public Member Functions

- **param_type** (_RealType __a, _RealType __b=_RealType(1.0))
- _RealType **a** () const
- _RealType **b** () const

Friends

- bool **operator!=** (const param_type &__p1, const param_type &__p2)
- bool **operator==** (const param_type &__p1, const param_type &__p2)

4.809.1 Detailed Description

template<typename _RealType = double>
struct std::extreme_value_distribution< _RealType >::param_type

Parameter type.
Definition at line 5080 of file random.h.
The documentation for this struct was generated from the following file:

- random.h

4.810 std::fisher_f_distribution< _RealType >::param_type Struct Reference

Public Types

- typedef fisher_f_distribution< _RealType > **distribution_type**

Public Member Functions

- **param_type** (_RealType __m, _RealType __n=_RealType(1))
- _RealType **m** () const
- _RealType **n** () const

Friends

- bool **operator!=** (const param_type &__p1, const param_type &__p2)
- bool **operator==** (const param_type &__p1, const param_type &__p2)

4.810.1 Detailed Description

template<typename _RealType = double>
struct std::fisher_f_distribution< _RealType >::param_type

Parameter type.
Definition at line 3072 of file random.h.
The documentation for this struct was generated from the following file:

- random.h

4.811 std::gamma_distribution< _RealType >::param_type Struct Reference

Public Types

- typedef gamma_distribution< _RealType > **distribution_type**

Public Member Functions

- **param_type** (_RealType __alpha_val, _RealType __beta_val=_RealType(1))
- _RealType **alpha** () const
- _RealType **beta** () const

Friends

- class **gamma_distribution< _RealType >**
- bool **operator!=** (const param_type &__p1, const param_type &__p2)
- bool **operator==** (const param_type &__p1, const param_type &__p2)

4.811.1 Detailed Description

template<typename _RealType = double>
struct std::gamma_distribution< _RealType >::param_type

Parameter type.
Definition at line 2412 of file random.h.
The documentation for this struct was generated from the following files:

- random.h
- bits/random.tcc

4.812 std::geometric_distribution< _IntType >::param_type Struct Reference

Public Types

- typedef geometric_distribution< _IntType > **distribution_type**

Public Member Functions

- **param_type** (double __p)
- double **p** () const

Friends

- class **geometric_distribution< _IntType >**
- bool **operator!=** (const param_type &__p1, const param_type &__p2)
- bool **operator==** (const param_type &__p1, const param_type &__p2)

4.812.1 Detailed Description

template<typename _IntType = int>
struct std::geometric_distribution< _IntType >::param_type

Parameter type.
Definition at line 3988 of file random.h.
The documentation for this struct was generated from the following file:

- random.h

4.813 std::lognormal_distribution< _RealType >::param_type Struct Reference

Public Types

- typedef lognormal_distribution< _RealType > **distribution_type**

Public Member Functions

4.824.1 Detailed Description

template<typename Key, typename Mapped, typename Node_And_It_Traits, typename _Alloc>
class __gnu_pbds::detail::pat_trie_map< Key, Mapped, Node_And_It_Traits, _Alloc >

PATRICIA trie.
This implementation loosely borrows ideas from: 1) Fast Mergeable Integer Maps, Okasaki, Gill 1998 2) Ptset: Sets of integers implemented as Patricia trees, Jean-Christophe Filliatr, 2000
Definition at line 101 of file pat_trie_.hpp.

4.824.2 Member Enumeration Documentation

4.824.2.1 node_type `enum __gnu_pbds::detail::pat_trie_base::node_type [inherited]`

Three types of nodes.
i_node is used by _Inode, leaf_node by _Leaf, and head_node by _Head.
Definition at line 58 of file pat_trie_base.hpp.

4.824.3 Member Function Documentation

4.824.3.1 node_begin() [1/2] `template<typename Key , typename Mapped , typename Node_And_It_Traits , typename _Alloc > node_iterator __gnu_pbds::detail::pat_trie_map< Key, Mapped, Node_And_It_Traits, _Alloc >::node_begin ( ) [inline]`

Returns a node_iterator corresponding to the node at the root of the tree.

4.824.3.2 node_begin() [2/2] `template<typename Key , typename Mapped , typename Node_And_It_Traits , typename _Alloc > node_const_iterator __gnu_pbds::detail::pat_trie_map< Key, Mapped, Node_And_It_Traits, _Alloc >::node_begin ( ) const [inline]`

Returns a const node_iterator corresponding to the node at the root of the tree.

4.824.3.3 node_end() [1/2] `template<typename Key , typename Mapped , typename Node_And_It_Traits , typename _Alloc > node_iterator __gnu_pbds::detail::pat_trie_map< Key, Mapped, Node_And_It_Traits, _Alloc >::node_end ( ) [inline]`

Returns a node_iterator corresponding to a node just after a leaf of the tree.

4.824.3.4 node_end() [2/2] template<typename Key , typename Mapped , typename Node_And_It_Traits , typename _Alloc >

node_const_iterator __gnu_pbds::detail::pat_trie_map< Key, Mapped, Node_And_It_Traits, _Alloc >::node_end ( ) const [inline]

Returns a const node_iterator corresponding to a node just after a leaf of the tree.

4.827.1 Detailed Description

template<typename _RealType = double>
class std::piecewise_constant_distribution< _RealType >

A piecewise_constant_distribution random number distribution.
The formula for the piecewise constant probability mass function is
Definition at line 5512 of file random.h.

4.827.2 Member Typedef Documentation

4.827.2.1 result_type `template<typename _RealType = double>`

```
typedef _RealType std::piecewise_constant_distribution< _RealType >::result_type
```

The type of the range of the distribution.
Definition at line 5519 of file random.h.

4.827.3 Member Function Documentation

4.827.3.1 densities()

```
template<typename _RealType = double>
std::vector<double> std::piecewise_constant_distribution< _RealType >::densities ( ) const  [inline]
```

Returns a vector of the probability densities.
Definition at line 5637 of file random.h.
References std::vector< _Tp, _Alloc >::empty().

4.827.3.2 intervals()

```
template<typename _RealType = double>
std::vector<_RealType> std::piecewise_constant_distribution< _RealType >::intervals ( ) const
[inline]
```

Returns a vector of the intervals.
Definition at line 5621 of file random.h.
References std::vector< _Tp, _Alloc >::empty().

4.827.3.3 max()

```
template<typename _RealType = double>
result_type std::piecewise_constant_distribution< _RealType >::max ( ) const  [inline]
```

Returns the least upper bound value of the distribution.
Definition at line 5672 of file random.h.
References std::vector< _Tp, _Alloc >::back(), and std::vector< _Tp, _Alloc >::empty().

4.827.3.4 min()

```
template<typename _RealType = double>
result_type std::piecewise_constant_distribution< _RealType >::min ( ) const  [inline]
```

Returns the greatest lower bound value of the distribution.
Definition at line 5662 of file random.h.
References std::vector< _Tp, _Alloc >::empty(), and std::vector< _Tp, _Alloc >::front().

4.827.3.5 operator()()

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator >
result_type std::piecewise_constant_distribution< _RealType >::operator() (
            _UniformRandomNumberGenerator & __urng )  [inline]
```

Generating functions.
Definition at line 5683 of file random.h.

4.827.3.6 param() [1/2]

```
template<typename _RealType = double>
param_type std::piecewise_constant_distribution< _RealType >::param ( ) const  [inline]
```

Returns the parameter set of the distribution.
Definition at line 5647 of file random.h.

4.827.3.7 param() [2/2]

```
template<typename _RealType = double>
void std::piecewise_constant_distribution< _RealType >::param (
            const param_type & __param )  [inline]
```

Sets the parameter set of the distribution.

Parameters

__param	The new parameter set of the distribution.

Definition at line 5655 of file random.h.

4.827.3.8 reset() template<typename _RealType = double>

```
void std::piecewise_constant_distribution< _RealType >::reset ( )  [inline]
```

Resets the distribution state.
Definition at line 5614 of file random.h.

4.827.4 Friends And Related Function Documentation

4.827.4.1 operator<< template<typename _RealType = double>

```
template<typename _RealType1 , typename _CharT , typename _Traits >
std::basic_ostream<_CharT, _Traits>& operator<< (
            std::basic_ostream< _CharT, _Traits > & __os,
            const std::piecewise_constant_distribution< _RealType1 > & __x )  [friend]
```

Inserts a piecewise_constant_distribution random number distribution __x into the output stream __os.

Parameters

__os	An output stream.
__x	A piecewise_constant_distribution random number distribution.

Returns

The output stream with the state of __x inserted or in an error state.

4.827.4.2 operator== template<typename _RealType = double>

```
bool operator== (
            const piecewise_constant_distribution< _RealType > & __d1,
            const piecewise_constant_distribution< _RealType > & __d2 )  [friend]
```

Return true if two piecewise constant distributions have the same parameters.
Definition at line 5718 of file random.h.

4.827.4.3 operator>> template<typename _RealType = double>

```
template<typename _RealType1 , typename _CharT , typename _Traits >
std::basic_istream<_CharT, _Traits>& operator>> (
            std::basic_istream< _CharT, _Traits > & __is,
            std::piecewise_constant_distribution< _RealType1 > & __x )  [friend]
```

Extracts a piecewise_constant_distribution random number distribution __x from the input stream __is.

Parameters

_↩ _is	An input stream.
_↩ _x	A piecewise_constant_distribution random number generator engine.

Returns

The input stream with __x extracted or in an error state.

4.829.1 Detailed Description

template<typename _RealType = double>
class std::piecewise_linear_distribution< _RealType >

A piecewise_linear_distribution random number distribution.
The formula for the piecewise linear probability mass function is
Definition at line 5783 of file random.h.

4.829.2 Member Typedef Documentation

4.829.2.1 result_type `template<typename _RealType = double>`

`typedef _RealType std::piecewise_linear_distribution< _RealType >::result_type`

The type of the range of the distribution.
Definition at line 5790 of file random.h.

4.829.3 Member Function Documentation

4.829.3.1 densities() `template<typename _RealType = double>`

`std::vector<double> std::piecewise_linear_distribution< _RealType >::densities ( ) const [inline]`

Return a vector of the probability densities of the distribution.
Definition at line 5910 of file random.h.
References std::vector< _Tp, _Alloc >::empty().

4.829.3.2 intervals() `template<typename _RealType = double>`

`std::vector<_RealType> std::piecewise_linear_distribution< _RealType >::intervals ( ) const [inline]`

Return the intervals of the distribution.
Definition at line 5893 of file random.h.
References std::vector< _Tp, _Alloc >::empty().

4.829.3.3 max() `template<typename _RealType = double>`

`result_type std::piecewise_linear_distribution< _RealType >::max ( ) const [inline]`

Returns the least upper bound value of the distribution.
Definition at line 5945 of file random.h.
References std::vector< _Tp, _Alloc >::back(), and std::vector< _Tp, _Alloc >::empty().

4.829.3.4 min() template<typename _RealType = double>

result_type std::piecewise_linear_distribution< _RealType >::min ( ) const [inline]

Returns the greatest lower bound value of the distribution.

Definition at line 5935 of file random.h.

References std::vector< _Tp, _Alloc >::empty(), and std::vector< _Tp, _Alloc >::front().

4.829.3.5 operator()() template<typename _RealType = double>

```
template<typename _UniformRandomNumberGenerator >
result_type std::piecewise_linear_distribution< _RealType >::operator() (
            _UniformRandomNumberGenerator & __urng ) [inline]
```

Generating functions.

Definition at line 5956 of file random.h.

4.829.3.6 param() [1/2] template<typename _RealType = double>

param_type std::piecewise_linear_distribution< _RealType >::param ( ) const [inline]

Returns the parameter set of the distribution.

Definition at line 5920 of file random.h.

4.829.3.7 param() [2/2] template<typename _RealType = double>

```
void std::piecewise_linear_distribution< _RealType >::param (
            const param_type & __param ) [inline]
```

Sets the parameter set of the distribution.

Parameters

__param	The new parameter set of the distribution.

Definition at line 5928 of file random.h.

4.829.3.8 reset() template<typename _RealType = double>

void std::piecewise_linear_distribution< _RealType >::reset ( ) [inline]

Resets the distribution state.

Definition at line 5886 of file random.h.

4.829.4 Friends And Related Function Documentation

4.829.4.1 operator<< template<typename _RealType = double>

```
template<typename _RealType1 , typename _CharT , typename _Traits >
std::basic_ostream<_CharT, _Traits>& operator<< (
            std::basic_ostream< _CharT, _Traits > & __os,
            const std::piecewise_linear_distribution< _RealType1 > & __x ) [friend]
```

Inserts a piecewise_linear_distribution random number distribution __x into the output stream __os.

Parameters

__os	An output stream.
__x	A piecewise_linear_distribution random number distribution.

Returns

The output stream with the state of __x inserted or in an error state.

4.829.4.2 operator== template<typename _RealType = double>

```
bool operator== (
            const piecewise_linear_distribution< _RealType > & __d1,
            const piecewise_linear_distribution< _RealType > & __d2 )  [friend]
```

Return true if two piecewise linear distributions have the same parameters.
Definition at line 5991 of file random.h.

4.829.4.3 operator>> template<typename _RealType = double>

```
template<typename _RealType1 , typename _CharT , typename _Traits >
std::basic_istream<_CharT, _Traits>& operator>> (
            std::basic_istream< _CharT, _Traits > & __is,
            std::piecewise_linear_distribution< _RealType1 > & __x )  [friend]
```

Extracts a piecewise_linear_distribution random number distribution __x from the input stream __is.

Parameters

_↩ _is	An input stream.
_↩ _x	A piecewise_linear_distribution random number generator engine.

Returns

The input stream with __x extracted or in an error state.

4.833.1 Detailed Description

template<typename _Arg, typename _Result>
class std::pointer_to_unary_function< _Arg, _Result >

One of the adaptors for function pointers.
Definition at line 1080 of file stl_function.h.

4.833.2 Member Typedef Documentation

4.833.2.1 argument_type `template<typename _Arg , typename _Result >`

`typedef _Arg std::unary_function< _Arg, _Result >::argument_type [inherited]`

`argument_type` is the type of the argument
Definition at line 108 of file stl_function.h.

4.833.2.2 result_type `template<typename _Arg , typename _Result >`

`typedef _Result std::unary_function< _Arg, _Result >::result_type [inherited]`

`result_type` is the return type
Definition at line 111 of file stl_function.h.

4.834.1 Detailed Description

template<typename _Ptr>
struct std::pointer_traits< _Ptr >

Uniform interface to all pointer-like types.
Definition at line 83 of file ptr_traits.h.

4.834.2 Member Typedef Documentation

4.834.2.1 difference_type template<typename _Ptr >

```
using std::pointer_traits< _Ptr >::difference_type = __detected_or_t<ptrdiff_t, __difference_↩
type, _Ptr>
```

The type used to represent the difference between two pointers.
Definition at line 108 of file ptr_traits.h.

4.834.2.2 element_type template<typename _Ptr >

```
using std::pointer_traits< _Ptr >::element_type = __detected_or_t<__get_first_arg_t<_Ptr>, __↩
element_type, _Ptr>
```

The type pointed to.
Definition at line 104 of file ptr_traits.h.

4.834.2.3 pointer template<typename _Ptr >

```
using std::pointer_traits< _Ptr >::pointer = _Ptr
```

The pointer type.
Definition at line 101 of file ptr_traits.h.

4.834.2.4 rebind template<typename _Ptr >

```
template<typename _Up >
using std::pointer_traits< _Ptr >::rebind = typename __rebind<_Ptr, _Up>::type
```

A pointer to a different type.
Definition at line 113 of file ptr_traits.h.

template<typename _Tp>
struct std::pointer_traits< _Tp * >

Partial specialization for built-in pointers.
Definition at line 128 of file ptr_traits.h.

4.835.2 Member Typedef Documentation

4.835.2.1 difference_type template<typename _Tp >

```
typedef ptrdiff_t std::pointer_traits< _Tp * >::difference_type
```

Type used to represent the difference between two pointers.
Definition at line 135 of file ptr_traits.h.

4.835.2.2 element_type template<typename _Tp >

```
typedef _Tp std::pointer_traits< _Tp * >::element_type
```

The type pointed to.
Definition at line 133 of file ptr_traits.h.

4.835.2.3 pointer template<typename _Tp >

```
typedef _Tp* std::pointer_traits< _Tp * >::pointer
```

The pointer type.
Definition at line 131 of file ptr_traits.h.

4.835.3 Member Function Documentation

4.835.3.1 pointer_to() template<typename _Tp >

```
static constexpr pointer std::pointer_traits< _Tp * >::pointer_to (
            __make_not_void< element_type > & __r )  [inline], [static], [constexpr], [noexcept]
```

Obtain a pointer to an object.

Parameters

↩ _↩ ↩ _↩ *r*	A reference to an object of type `element_type`

Returns

```
addressof(__r)
```

Definition at line 146 of file ptr_traits.h.
References std::addressof().

4.836.1 Detailed Description

template<typename _IntType = int>
class std::poisson_distribution< _IntType >

A discrete Poisson random number distribution.
The formula for the Poisson probability density function is $p(i|\mu) = \frac{\mu^i}{i!}e^{-\mu}$ where μ is the parameter of the distribution.
Definition at line 4419 of file random.h.

4.836.2 Member Typedef Documentation

4.836.2.1 result_type `template<typename _IntType = int>`

```
typedef _IntType std::poisson_distribution< _IntType >::result_type
```

The type of the range of the distribution.
Definition at line 4426 of file random.h.

4.836.3 Member Function Documentation

4.836.3.1 max() template<typename _IntType = int>

```
result_type std::poisson_distribution< _IntType >::max ( ) const  [inline]
```

Returns the least upper bound value of the distribution.
Definition at line 4523 of file random.h.
References std::numeric_limits< _Tp >::max().

4.836.3.2 mean() template<typename _IntType = int>

```
double std::poisson_distribution< _IntType >::mean ( ) const  [inline]
```

Returns the distribution parameter mean.
Definition at line 4494 of file random.h.

4.836.3.3 min() template<typename _IntType = int>

```
result_type std::poisson_distribution< _IntType >::min ( ) const  [inline]
```

Returns the greatest lower bound value of the distribution.
Definition at line 4516 of file random.h.

4.836.3.4 operator()() [1/2] template<typename _IntType = int>

```
template<typename _UniformRandomNumberGenerator >
result_type std::poisson_distribution< _IntType >::operator() (
            _UniformRandomNumberGenerator & __urng )  [inline]
```

Generating functions.
Definition at line 4531 of file random.h.

4.836.3.5 operator()() [2/2] template<typename _IntType >

```
template<typename _UniformRandomNumberGenerator >
poisson_distribution< _IntType >::result_type std::poisson_distribution< _IntType >::operator()
(
            _UniformRandomNumberGenerator & __urng,
            const param_type & __param )
```

A rejection algorithm when mean >= 12 and a simple method based upon the multiplication of uniform random variates otherwise. NB: The former is available only if _GLIBCXX_USE_C99_MATH_TR1 is defined.
Reference: Devroye, L. Non-Uniform Random Variates Generation. Springer-Verlag, New York, 1986, Ch. X, Sects. 3.3 & 3.4 (+ Errata!).
Definition at line 1268 of file bits/random.tcc.
References std::abs(), std::numeric_limits< _Tp >::epsilon(), std::log(), and std::numeric_limits< _Tp >::max().

4.836.3.6 param() [1/2] template<typename _IntType = int>

```
param_type std::poisson_distribution< _IntType >::param ( ) const  [inline]
```

Returns the parameter set of the distribution.
Definition at line 4501 of file random.h.

4.836.3.7 param() [2/2] template<typename _IntType = int>

```
void std::poisson_distribution< _IntType >::param (
            const param_type & __param )  [inline]
```

Sets the parameter set of the distribution.

Parameters

__param	The new parameter set of the distribution.

Definition at line 4509 of file random.h.

4.836.3.8 reset() template<typename _IntType = int>

```
void std::poisson_distribution< _IntType >::reset ( )  [inline]
```

Resets the distribution state.
Definition at line 4487 of file random.h.
References std::normal_distribution< _RealType >::reset().

4.836.4 Friends And Related Function Documentation

4.836.4.1 operator<< template<typename _IntType = int>

```
template<typename _IntType1 , typename _CharT , typename _Traits >
std::basic_ostream<_CharT, _Traits>& operator<< (
            std::basic_ostream< _CharT, _Traits > & __os,
            const std::poisson_distribution< _IntType1 > & __x )  [friend]
```

Inserts a poisson_distribution random number distribution __x into the output stream __os.

Parameters

__os	An output stream.
__x	A poisson_distribution random number distribution.

Returns

The output stream with the state of __x inserted or in an error state.

4.836.4.2 operator== template<typename _IntType = int>

```
bool operator== (
            const poisson_distribution< _IntType > & __d1,
            const poisson_distribution< _IntType > & __d2 )  [friend]
```

Return true if two Poisson distributions have the same parameters and the sequences that would be generated are equal.
Definition at line 4567 of file random.h.

4.836.4.3 operator>> template<typename _IntType = int>

```
template<typename _IntType1 , typename _CharT , typename _Traits >
std::basic_istream<_CharT, _Traits>& operator>> (
            std::basic_istream< _CharT, _Traits > & __is,
            std::poisson_distribution< _IntType1 > & __x )  [friend]
```

Extracts a poisson_distribution random number distribution __x from the input stream __is.

Parameters

_↩ _is	An input stream.
_↩ _x	A poisson_distribution random number generator engine.

Returns

The input stream with __x extracted or in an error state.

4.837.1 Detailed Description

template<typename _Tv, typename Cmp_Fn = std::less<_Tv>, typename Tag = pairing_heap_tag, typename _Alloc = std↩ ::allocator<char>>
class __gnu_pbds::priority_queue< _Tv, Cmp_Fn, Tag, _Alloc >

A priority queue composed of one specific heap policy.

Template Parameters

_Tv	Value type.
Cmp_Fn	Comparison functor.
Tag	Instantiating data structure type, see container_tag.
_Alloc	Allocator type.

Base is dispatched at compile time via Tag, from the following choices: binary_heap_tag, binomial_heap_tag, pairing_heap_tag, rc_binomial_heap_tag, thin_heap_tag
Base choices are: detail::binary_heap, detail::binomial_heap, detail::pairing_heap, detail::rc_binomial_heap, detail::thin_heap.
Definition at line 84 of file priority_queue.hpp.

4.837.2 Constructor & Destructor Documentation

4.837.2.1 priority_queue() [1/3]

```
template<typename _Tv , typename Cmp_Fn = std::less<_Tv>, typename Tag = pairing_heap_tag, typename _Alloc = std::allocator<char>>
__gnu_pbds::priority_queue< _Tv, Cmp_Fn, Tag, _Alloc >::priority_queue (
            const cmp_fn & r_cmp_fn )  [inline]
```

Constructor taking some policy objects. r_cmp_fn will be copied by the Cmp_Fn object of the container object.
Definition at line 116 of file priority_queue.hpp.

4.837.2.2 priority_queue() [2/3]

```
template<typename _Tv , typename Cmp_Fn = std::less<_Tv>, typename Tag = pairing_heap_tag, typename _Alloc = std::allocator<char>>

4.838.1 Detailed Description

template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _Sequence::value_type>> class std::priority_queue< _Tp, _Sequence, _Compare >

A standard container automatically sorting its contents.

Template Parameters

_Tp	Type of element.
_Sequence	Type of underlying sequence, defaults to vector<_Tp>.
_Compare	Comparison function object type, defaults to less<_Sequence::value_type>.

This is not a true container, but an *adaptor*. It holds another container, and provides a wrapper interface to that container. The wrapper is what enforces priority-based sorting and queue behavior. Very few of the standard container/sequence interface requirements are met (e.g., iterators).
The second template parameter defines the type of the underlying sequence/container. It defaults to std::vector, but it can be any type that supports `front()`, `push_back`, `pop_back`, and random-access iterators, such as std::deque or an appropriate user-defined type.
The third template parameter supplies the means of making priority comparisons. It defaults to `less<value_type>` but can be anything defining a strict weak ordering.
Members not found in *normal* containers are `container_type`, which is a typedef for the second Sequence parameter, and `push`, `pop`, and `top`, which are standard queue operations.

Note

No equality/comparison operators are provided for priority_queue.

Sorting of the elements takes place as they are added to, and removed from, the priority_queue using the priority_queue's member functions. If you access the elements by other means, and change their data such that the sorting order would be different, the priority_queue will not re-sort the elements for you. (How could it know to do so?)

Definition at line 456 of file stl_queue.h.

4.838.2 Constructor & Destructor Documentation

4.838.2.1 priority_queue() [1/2]

```
template<typename _Tp , typename _Sequence = vector<_Tp>, typename
_Compare = less<typename _Sequence::value_type>>
template<typename _Seq = _Sequence, typename _Requires = typename enable_if<__and_<is_default_
constructible<_Compare>, is_default_constructible<_Seq>>::value>::type>
std::priority_queue< _Tp, _Sequence, _Compare >::priority_queue ( )  [inline]
```

Default constructor creates no elements.
Definition at line 514 of file stl_queue.h.

4.838.2.2 priority_queue() [2/2]

```
template<typename _Tp , typename _Sequence = vector<_Tp>, typename
_Compare = less<typename _Sequence::value_type>>
template<typename _InputIterator >
std::priority_queue< _Tp, _Sequence, _Compare >::priority_queue (
            _InputIterator __first,
            _InputIterator __last,
            const _Compare & __x,
            const _Sequence & __s )  [inline]
```

Builds a queue from a range.

Parameters

__first	An input iterator.
__last	An input iterator.
__x	A comparison functor describing a strict weak ordering.
__s	An initial sequence with which to start.

Begins by copying *__s*, inserting a copy of the elements from [first,last) into the copy of *__s*, then ordering the copy according to *__x*.
For more information on function objects, see the documentation on functor base classes.
Definition at line 586 of file stl_queue.h.

4.838.3 Member Function Documentation

4.838.3.1 empty()

```
template<typename _Tp , typename _Sequence = vector<_Tp>, typename _Compare =
less<typename _Sequence::value_type>>
bool std::priority_queue< _Tp, _Sequence, _Compare >::empty ( ) const  [inline]
```

Returns true if the queue is empty.
Definition at line 612 of file stl_queue.h.

4.838.3.2 pop()

```
template<typename _Tp , typename _Sequence = vector<_Tp>, typename _Compare =
less<typename _Sequence::value_type>>
void std::priority_queue< _Tp, _Sequence, _Compare >::pop ( )  [inline]
```

Removes first element.
This is a typical queue operation. It shrinks the queue by one. The time complexity of the operation depends on the underlying sequence.
Note that no data is returned, and if the first element's data is needed, it should be retrieved before pop() is called.
Definition at line 675 of file stl_queue.h.

4.838.3.3 push()

```
template<typename _Tp , typename _Sequence = vector<_Tp>, typename _Compare =
less<typename _Sequence::value_type>>
void std::priority_queue< _Tp, _Sequence, _Compare >::push (
            const value_type & __x )  [inline]
```

Add data to the queue.

Parameters

__x	Data to be added.

This is a typical queue operation. The time complexity of the operation depends on the underlying sequence.
Definition at line 640 of file stl_queue.h.

4.838.3.4 size()

```
template<typename _Tp , typename _Sequence = vector<_Tp>, typename _Compare =
less<typename _Sequence::value_type>>
size_type std::priority_queue< _Tp, _Sequence, _Compare >::size ( ) const  [inline]
```

Returns the number of elements in the queue.

Definition at line 617 of file stl_queue.h.

4.838.3.5 top() `template<typename _Tp , typename _Sequence = vector<_Tp>, typename _Compare = less<typename _Sequence::value_type>>`

`const_reference std::priority_queue< _Tp, _Sequence, _Compare >::top ( ) const [inline]`

Returns a read-only (constant) reference to the data at the first element of the queue.
Definition at line 625 of file stl_queue.h.

4.848.1 Detailed Description

template<typename _Tp, typename _Sequence = deque<_Tp>>
class std::queue< _Tp, _Sequence >

A standard container giving FIFO behavior.

Template Parameters

_Tp	Type of element.
_Sequence	Type of underlying sequence, defaults to deque<_Tp>.

Meets many of the requirements of a container, but does not define anything to do with iterators. Very few of the other standard container interfaces are defined.
This is not a true container, but an *adaptor*. It holds another container, and provides a wrapper interface to that container. The wrapper is what enforces strict first-in-first-out queue behavior.
The second template parameter defines the type of the underlying sequence/container. It defaults to std::deque, but it can be any type that supports `front`, `back`, `push_back`, and `pop_front`, such as std::list or an appropriate user-defined type.
Members not found in *normal* containers are `container_type`, which is a typedef for the second Sequence parameter, and `push` and `pop`, which are standard queue/FIFO operations.
Definition at line 96 of file stl_queue.h.

4.848.2 Constructor & Destructor Documentation

4.848.2.1 queue() `template<typename _Tp , typename _Sequence = deque<_Tp>>`

```
template<typename _Seq = _Sequence, typename _Requires = typename enable_if<is_default_constructible<↩
_Seq>::value>::type>
std::queue< _Tp, _Sequence >::queue ( )  [inline]
```

Default constructor creates no elements.
Definition at line 166 of file stl_queue.h.

4.848.3 Member Function Documentation

4.848.3.1 back() [1/2] `template<typename _Tp , typename _Sequence = deque<_Tp>>`

```
reference std::queue< _Tp, _Sequence >::back ( )  [inline]
```

Returns a read/write reference to the data at the last element of the queue.
Definition at line 238 of file stl_queue.h.

4.848.3.2 back() [2/2] `template<typename _Tp , typename _Sequence = deque<_Tp>>`

```
const_reference std::queue< _Tp, _Sequence >::back ( ) const  [inline]
```

Returns a read-only (constant) reference to the data at the last element of the queue.
Definition at line 249 of file stl_queue.h.

4.848.3.3 empty() `template<typename _Tp , typename _Sequence = deque<_Tp>>`

```
bool std::queue< _Tp, _Sequence >::empty ( ) const  [inline]
```

Returns true if the queue is empty.
Definition at line 203 of file stl_queue.h.
References std::queue< _Tp, _Sequence >::c.

4.848.3.4 front() [1/2] template<typename _Tp , typename _Sequence = deque<_Tp>>

reference std::queue< _Tp, _Sequence >::front ( ) [inline]

Returns a read/write reference to the data at the first element of the queue.

Definition at line 216 of file stl_queue.h.

4.848.3.5 front() [2/2] template<typename _Tp , typename _Sequence = deque<_Tp>>

const_reference std::queue< _Tp, _Sequence >::front ( ) const [inline]

Returns a read-only (constant) reference to the data at the first element of the queue.

Definition at line 227 of file stl_queue.h.

4.848.3.6 pop() template<typename _Tp , typename _Sequence = deque<_Tp>>

void std::queue< _Tp, _Sequence >::pop ( ) [inline]

Removes first element.

This is a typical queue operation. It shrinks the queue by one. The time complexity of the operation depends on the underlying sequence.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before pop() is called.

Definition at line 298 of file stl_queue.h.

4.848.3.7 push() template<typename _Tp , typename _Sequence = deque<_Tp>>

void std::queue< _Tp, _Sequence >::push (
const value_type & __x) [inline]

Add data to the end of the queue.

Parameters

_↩ _x	Data to be added.

This is a typical queue operation. The function creates an element at the end of the queue and assigns the given data to it. The time complexity of the operation depends on the underlying sequence.

Definition at line 265 of file stl_queue.h.

References std::queue< _Tp, _Sequence >::c.

4.848.3.8 size() template<typename _Tp , typename _Sequence = deque<_Tp>>

size_type std::queue< _Tp, _Sequence >::size ( ) const [inline]

Returns the number of elements in the queue.

Definition at line 208 of file stl_queue.h.

References std::queue< _Tp, _Sequence >::c.

4.848.4 Member Data Documentation

4.848.4.1 c template<typename _Tp , typename _Sequence = deque<_Tp>>

_Sequence std::queue< _Tp, _Sequence >::c [protected]

c is the underlying container.

Definition at line 153 of file stl_queue.h.

Referenced by std::queue< _Tp, _Sequence >::empty(), std::operator<(), std::operator==(), std::queue< _Tp, _↩ Sequence >::push(), and std::queue< _Tp, _Sequence >::size().
The documentation for this class was generated from the following file:

4.849 __gnu_parallel::quicksort_tag Struct Reference

Inheritance diagram for __gnu_parallel::quicksort_tag:

Public Member Functions

- **quicksort_tag** (_ThreadIndex __num_threads)
- _ThreadIndex __get_num_threads ()
- void set_num_threads (_ThreadIndex __num_threads)

4.849.1 Detailed Description

Forces parallel sorting using unbalanced quicksort at compile time.
Definition at line 155 of file tags.h.

4.849.2 Member Function Documentation

4.849.2.1 __get_num_threads() _ThreadIndex __gnu_parallel::parallel_tag::__get_num_threads ( ) [inline], [inherited]

Find out desired number of threads.

Returns

Desired number of threads.

Definition at line 63 of file tags.h.
Referenced by __gnu_parallel::__parallel_sort().

4.849.2.2 set_num_threads() void __gnu_parallel::parallel_tag::set_num_threads (_ThreadIndex *__num_threads*) [inline], [inherited]

Set the desired number of threads.

Parameters

__num_threads	Desired number of threads.

Definition at line 73 of file tags.h.
The documentation for this struct was generated from the following file:

- tags.h

4.850 std::random_access_iterator_tag Struct Reference

Inheritance diagram for std::random_access_iterator_tag:

4.850.1 Detailed Description

Random-access iterators support a superset of bidirectional iterator operations.
Definition at line 107 of file stl_iterator_base_types.h.
The documentation for this struct was generated from the following file:

- stl_iterator_base_types.h

4.851 __gnu_cxx::random_condition Struct Reference

Inheritance diagram for __gnu_cxx::random_condition:

Classes

- struct always_adjustor

- void **operator=** (const random_device &)=delete

Static Public Member Functions

- static constexpr result_type **max** ()
- static constexpr result_type **min** ()

4.852.1 Detailed Description

A standard interface to a platform-specific non-deterministic random number generator (if any are available).
Definition at line 1608 of file random.h.

4.852.2 Member Typedef Documentation

4.852.2.1 result_type `typedef unsigned int std::random_device::result_type`

The type of the generated random value.
Definition at line 1612 of file random.h.
The documentation for this class was generated from the following file:

- random.h

4.853 std::range_error Class Reference

Inheritance diagram for std::range_error:

Public Member Functions

- **range_error** (const char *) _GLIBCXX_TXN_SAFE
- **range_error** (const range_error &)=default
- **range_error** (const string &__arg) _GLIBCXX_TXN_SAFE
- **range_error** (range_error &&)=default
- range_error & **operator=** (const range_error &)=default
- range_error & **operator=** (range_error &&)=default
- virtual const char * what () const noexcept

4.853.1 Detailed Description

Thrown to indicate range errors in internal computations.

Definition at line 258 of file stdexcept.

4.853.2 Member Function Documentation

4.853.2.1 what() `virtual const char* std::runtime_error::what ( ) const [virtual], [noexcept], [inherited]`

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from std::exception.
Reimplemented in std::experimental::filesystem::v1::filesystem_error.
The documentation for this class was generated from the following file:

- stdexcept

4.854 __gnu_pbds::range_invalidation_guarantee Struct Reference

Inheritance diagram for __gnu_pbds::range_invalidation_guarantee:

4.854.1 Detailed Description

Signifies an invalidation guarantee that includes all those of its base, and additionally, that any range-type iterator (including the returns of begin() and end()) is in the correct relative positions to other range-type iterators as long as its corresponding entry has not be erased, regardless of modifications to the container object.
Definition at line 114 of file tag_and_trait.hpp.
The documentation for this struct was generated from the following file:

- tag_and_trait.hpp

4.855 __gnu_pbds::detail::ranged_hash_fn< Key, Hash_Fn, _Alloc, Comb_Hash_Fn, Store_Hash > Class Template Reference

Inheritance diagram for __gnu_pbds::detail::ranged_hash_fn< Key, Hash_Fn, _Alloc, Comb_Hash_Fn, Store_Hash >:

4.855.1 Detailed Description

template<typename Key, typename Hash_Fn, typename _Alloc, typename Comb_Hash_Fn, bool Store_Hash>
class __gnu_pbds::detail::ranged_hash_fn< Key, Hash_Fn, _Alloc, Comb_Hash_Fn, Store_Hash >

Primary template.
Definition at line 56 of file ranged_hash_fn.hpp.
The documentation for this class was generated from the following file:

- ranged_hash_fn.hpp

4.856 __gnu_pbds::detail::ranged_hash_fn< Key, Hash_Fn, _Alloc, Comb_Hash_Fn, false > Class Template Reference

Public Types

- typedef ratio< num, den > **type**

Static Public Attributes

- static constexpr intmax_t **den**
- static constexpr intmax_t **num**

4.865.1 Detailed Description

template<intmax_t _Num, intmax_t _Den = 1>
struct std::ratio< _Num, _Den >

Provides compile-time rational arithmetic.
This class template represents any finite rational number with a numerator and denominator representable by compile-time constants of type intmax_t. The ratio is simplified when instantiated.
For example:

```
std::ratio<7,-21>::num == -1;
std::ratio<7,-21>::den == 3;
```

Definition at line 266 of file ratio.

4.872.1 Detailed Description

template<class _OutputIterator, class _Tp>
class std::raw_storage_iterator< _OutputIterator, _Tp >

This iterator class lets algorithms store their results into uninitialized memory.
Definition at line 68 of file stl_raw_storage_iter.h.

4.872.2 Member Typedef Documentation

4.872.2.1 difference_type

`typedef void std::iterator< output_iterator_tag , void , void , void , void >::difference_type [inherited]`

Distance between iterators is represented as this type.
Definition at line 134 of file stl_iterator_base_types.h.

4.872.2.2 iterator_category

`typedef output_iterator_tag std::iterator< output_iterator_tag , void , void , void , void >::iterator_category [inherited]`

One of the tag types.
Definition at line 130 of file stl_iterator_base_types.h.

4.872.2.3 pointer

`typedef void std::iterator< output_iterator_tag , void , void , void , void >::pointer [inherited]`

This type represents a pointer-to-value_type.
Definition at line 136 of file stl_iterator_base_types.h.

4.872.2.4 reference

`typedef void std::iterator< output_iterator_tag , void , void , void , void >::reference [inherited]`

This type represents a reference-to-value_type.
Definition at line 138 of file stl_iterator_base_types.h.

4.872.2.5 value_type `typedef void std::iterator< output_iterator_tag , void , void , void , void >::value_type [inherited]`

The type "pointed to" by the iterator.
Definition at line 132 of file stl_iterator_base_types.h.
The documentation for this class was generated from the following file:

- stl_raw_storage_iter.h

4.873 __gnu_cxx::rb_tree< _Key, _Value, _KeyOfValue, _Compare, _Alloc > Struct Template Reference

4.874.1 Detailed Description

template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _Alloc>
class __gnu_pbds::detail::rb_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >

Red-Black tree.
This implementation uses an idea from the SGI STL (using a *header* node which is needed for efficient iteration).
Definition at line 84 of file rb_tree_.hpp.

4.874.2 Member Function Documentation

4.874.2.1 node_begin() [1/2]

```
template<typename Key , typename Mapped , typename Cmp_Fn , typename
Node_And_It_Traits , typename _Alloc >
node_iterator __gnu_pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, ↩
_Alloc >::node_begin ( ) [inline], [inherited]
```

Returns a node_iterator corresponding to the node at the root of the tree.

4.874.2.2 node_begin() [2/2]

```
template<typename Key , typename Mapped , typename Cmp_Fn , typename
Node_And_It_Traits , typename _Alloc >
node_const_iterator __gnu_pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_↩
Traits, _Alloc >::node_begin ( ) const [inline], [inherited]
```

Returns a const node_iterator corresponding to the node at the root of the tree.

4.874.2.3 node_end() [1/2]

```
template<typename Key , typename Mapped , typename Cmp_Fn , typename
Node_And_It_Traits , typename _Alloc >
node_iterator __gnu_pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, ↩
_Alloc >::node_end ( ) [inline], [inherited]
```

Returns a node_iterator corresponding to a node just after a leaf of the tree.

4.874.2.4 node_end() [2/2]

```
template<typename Key , typename Mapped , typename Cmp_Fn , typename
Node_And_It_Traits , typename _Alloc >
node_const_iterator __gnu_pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_↩
Traits, _Alloc >::node_end ( ) const [inline], [inherited]
```

Returns a const node_iterator corresponding to a node just after a leaf of the tree.
The documentation for this class was generated from the following file:

- rb_tree_.hpp

- using **reference** = T &

4.880.1 Detailed Description

template<typename _Alloc, typename T>
struct __gnu_pbds::detail::rebind_traits< _Alloc, T >

Consistent API for accessing allocator-related types.
Definition at line 137 of file types_traits.hpp.
The documentation for this struct was generated from the following file:

- types_traits.hpp

4.881 __gnu_cxx::recursive_init_error Class Reference

Inheritance diagram for __gnu_cxx::recursive_init_error:

Public Member Functions

- virtual const char * what () const noexcept

4.881.1 Detailed Description

Exception thrown by __cxa_guard_acquire.
C++ 2011 6.7 [stmt.dcl]/4: If control re-enters the declaration recursively while the variable is being initialized, the behavior is undefined.
Since we already have a library function to handle locking, we might as well check for this situation and throw an exception. We use the second byte of the guard variable to remember that we're in the middle of an initialization.
Definition at line 696 of file cxxabi.h.

4.881.2 Member Function Documentation

4.881.2.1 what() `virtual const char* std::exception::what ( ) const [virtual], [noexcept], [inherited]`

Returns a C-style character string describing the general cause of the current error.

Reimplemented in std::runtime_error, std::logic_error, std::future_error, std::experimental::filesystem::v1::filesystem_error, std::experimental::fundamentals_v1::bad_any_cast, std::bad_function_call, std::bad_weak_ptr, std::bad_typeid, std::bad_cast, std::bad_exception, std::ios_base::failure, and std::bad_alloc.
The documentation for this class was generated from the following file:

- cxxabi.h

4.882 std::recursive_mutex Class Reference

Inherits std::__recursive_mutex_base.

Public Types

4.884 std::bitset< _Nb >::reference Class Reference

Public Member Functions

- **reference** (bitset &__b, size_t __pos) noexcept
- **reference** (const reference &)=default
- reference & **flip** () noexcept
- **operator bool** () const noexcept
- reference & **operator=** (bool __x) noexcept
- reference & **operator=** (const reference &__j) noexcept
- bool **operator~** () const noexcept

Friends

- class **bitset**

4.884.1 Detailed Description

template<size_t _Nb>
class std::bitset< _Nb >::reference

This encapsulates the concept of a single bit. An instance of this class is a proxy for an actual bit; this way the individual bit operations are done as faster word-size bitwise instructions.
Most users will never need to use this class directly; conversions to and from bool are automatic and should be transparent. Overloaded operators help to preserve the illusion.
(On a typical system, this *bit reference* is 64 times the size of an actual bit. Ha.)
Definition at line 802 of file bitset.
The documentation for this class was generated from the following file:

- bitset

4.885 std::tr2::dynamic_bitset< _WordT, _Alloc >::reference Class Reference

Public Member Functions

- **reference** (dynamic_bitset &__b, size_type __pos) noexcept
- reference & **flip** () noexcept
- **operator bool** () const noexcept
- reference & **operator=** (bool __x) noexcept
- reference & **operator=** (const reference &__j) noexcept
- bool **operator~** () const noexcept

Friends

- class **dynamic_bitset**

4.885.1 Detailed Description

template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
class std::tr2::dynamic_bitset< _WordT, _Alloc >::reference

This encapsulates the concept of a single bit. An instance of this class is a proxy for an actual bit; this way the individual bit operations are done as faster word-size bitwise instructions.
Most users will never need to use this class directly; conversions to and from bool are automatic and should be transparent. Overloaded operators help to preserve the illusion.
(On a typical system, this "bit %reference" is 64 times the size of an actual bit. Ha.)
Definition at line 513 of file dynamic_bitset.
The documentation for this class was generated from the following file:

- dynamic_bitset

4.886 std::reference_wrapper< _Tp > Class Template Reference

Inherits _Reference_wrapper_base_memfun< remove_cv< _Tp >::type >.

Public Types

  constexpr reference_wrapper< const _Tp > cref (reference_wrapper< _Tp > __t) noexcept

4.886.1 Detailed Description

template<typename _Tp>
class std::reference_wrapper< _Tp >

Primary class template for reference_wrapper.
Definition at line 294 of file refwrap.h.

4.886.2 Friends And Related Function Documentation

4.886.2.1 cref() [1/2] template<typename _Tp >

```
constexpr reference_wrapper< const _Tp > cref (
            const _Tp & __t )  [related]
```

Denotes a const reference should be taken to a variable.
Definition at line 371 of file refwrap.h.

4.886.2.2 cref() [2/2] template<typename _Tp >

```
constexpr reference_wrapper< const _Tp > cref (
            reference_wrapper< _Tp > __t )  [related]
```

std::cref overload to prevent wrapping a reference_wrapper
Definition at line 391 of file refwrap.h.

4.886.2.3 ref() [1/2] template<typename _Tp >

```
constexpr reference_wrapper< _Tp > ref (
            _Tp & __t )  [related]
```

Denotes a reference should be taken to a variable.
Definition at line 364 of file refwrap.h.

4.886.2.4 ref() [2/2] template<typename _Tp >

```
constexpr reference_wrapper< _Tp > ref (
            reference_wrapper< _Tp > __t )  [related]
```

std::ref overload to prevent wrapping a reference_wrapper
Definition at line 384 of file refwrap.h.
The documentation for this class was generated from the following files:

- type_traits
- refwrap.h

4.887 std::regex_error Class Reference

Inheritance diagram for std::regex_error:

Public Member Functions

- regex_error (regex_constants::error_type __ecode)
- regex_constants::error_type code () const
- virtual const char * what () const noexcept

Friends

- void **__throw_regex_error** (regex_constants::error_type, const char *)

4.887.1 Detailed Description

A regular expression exception class.
The regular expression library throws objects of this class on error.
Definition at line 132 of file regex_error.h.

4.887.2 Constructor & Destructor Documentation

4.887.2.1 regex_error() `std::regex_error::regex_error ( regex_constants::error_type __ecode ) [explicit]`

Constructs a regex_error object.

Parameters

__ecode	the regex error code.

4.887.3 Member Function Documentation

4.887.3.1 code() `regex_constants::error_type std::regex_error::code ( ) const [inline]`

Gets the regex error code.

Returns

the regex error code.

Definition at line 153 of file regex_error.h.

4.887.3.2 what() `virtual const char* std::runtime_error::what ( ) const [virtual], [noexcept], [inherited]`

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from std::exception.
Reimplemented in std::experimental::filesystem::v1::filesystem_error.
The documentation for this class was generated from the following file:

- regex_error.h

4.888 std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits > Class Template Reference

- const value_type * operator-> () const noexcept
- regex_iterator & operator= (const regex_iterator &)=default
- bool operator== (const regex_iterator &) const noexcept

4.888.1 Detailed Description

template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>>
class std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >

An iterator adaptor that will provide repeated calls of regex_search over a range until no more matches remain.
Definition at line 2625 of file regex.h.

4.888.2 Constructor & Destructor Documentation

4.888.2.1 regex_iterator() [1/3]

```
template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>>
std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_iterator ( ) [default]
```

Provides a singular iterator, useful for indicating one-past-the-end of a range.
Referenced by std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_iterator().

4.888.2.2 regex_iterator() [2/3]

```
template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>>
std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_iterator (
            _Bi_iter __a,
            _Bi_iter __b,
            const regex_type & __re,
            regex_constants::match_flag_type __m = regex_constants::match_default ) [inline]
```

Constructs a regex_iterator...

Parameters

_a	[IN] The start of a text range to search.
_b	[IN] One-past-the-end of the text range to search.
_re	[IN] The regular expression to match.
_m	[IN] Policy flags for match rules.

Definition at line 2648 of file regex.h.
References std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_iterator(), and std::regex_search().

4.888.2.3 regex_iterator() [3/3]

```
template<typename _Bi_iter , typename _Ch_type = typename iterator
```

```
_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>>
std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_iterator (
            const regex_iterator< _Bi_iter, _Ch_type, _Rx_traits > &  )  [default]
```

Copy constructs a regex_iterator.

4.888.3 Member Function Documentation

4.888.3.1 operator"!=()

```
template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<↩
_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>>
bool std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator!= (
            const regex_iterator< _Bi_iter, _Ch_type, _Rx_traits > & __rhs ) const  [inline],
[noexcept]
```

Tests the inequivalence of two regex iterators.
Definition at line 2682 of file regex.h.

4.888.3.2 operator*()

```
template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<↩
_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>>
const value_type& std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator* ( ) const
[inline], [noexcept]
```

Dereferences a regex_iterator.
Definition at line 2689 of file regex.h.

4.888.3.3 operator++() [1/2]

```
template<typename _Bi_iter , typename _Ch_type = typename iterator_↩
traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>>
regex_iterator& std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator++ ( )
```

Increments a regex_iterator.

4.888.3.4 operator++() [2/2]

```
template<typename _Bi_iter , typename _Ch_type = typename iterator_↩
traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>>
regex_iterator std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator++ (
            int  )  [inline]
```

Postincrements a regex_iterator.
Definition at line 2709 of file regex.h.

4.888.3.5 operator->()

```
template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<↩
_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>>
const value_type* std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator-> ( ) const
[inline], [noexcept]
```

Selects a regex_iterator member.
Definition at line 2696 of file regex.h.

4.888.3.6 operator=()

```
template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<↩
_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>>
regex_iterator& std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator=
            const regex_iterator< _Bi_iter, _Ch_type, _Rx_traits > &  )  [default]
```

Copy assigns one regex_iterator to another.

4.888.3.7 operator==() `template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<↩ _Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>>`

```
bool std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator== (
            const regex_iterator< _Bi_iter, _Ch_type, _Rx_traits > &  ) const  [noexcept]
```

Tests the equivalence of two regex iterators.
The documentation for this class was generated from the following file:

- regex.h

4.889.1 Detailed Description

template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>>
class std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >

Iterates over submatches in a range (or *splits* a text string).
The purpose of this iterator is to enumerate all, or all specified, matches of a regular expression within a text range. The dereferenced value of an iterator of this class is a std::sub_match object.
Definition at line 2742 of file regex.h.

4.889.2 Constructor & Destructor Documentation

4.889.2.1 regex_token_iterator() [1/6]

```
template<typename _Bi_iter , typename _Ch_type = typename
iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>>
std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator ( )  [inline]
```

Default constructs a regex_token_iterator.
A default-constructed regex_token_iterator is a singular iterator that will compare equal to the one-past-the-end value for any iterator of the same type.
Definition at line 2760 of file regex.h.

4.889.2.2 regex_token_iterator() [2/6]

```
template<typename _Bi_iter , typename _Ch_type = typename
iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>>
std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator (
            _Bi_iter __a,
            _Bi_iter __b,
            const regex_type & __re,
            int __submatch = 0,
            regex_constants::match_flag_type __m = regex_constants::match_default )  [inline]
```

Constructs a regex_token_iterator...

Parameters

__a	[IN] The start of the text to search.
__b	[IN] One-past-the-end of the text to search.
__re	[IN] The regular expression to search for.
__submatch	[IN] Which submatch to return. There are some special values for this parameter: • -1 each enumerated subexpression does NOT match the regular expression (aka field splitting) • 0 the entire string matching the subexpression is returned for each match within the text. • >0 enumerates only the indicated subexpression from a match within the text.
__m	[IN] Policy flags for match rules.

Definition at line 2782 of file regex.h.

4.889.2.3 regex_token_iterator() [3/6]

```
template<typename _Bi_iter , typename _Ch_type = typename
iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>>
std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator (
```

```
            _Bi_iter __a,
            _Bi_iter __b,
            const regex_type & __re,
            const std::vector< int > & __submatches,
            regex_constants::match_flag_type __m = regex_constants::match_default )  [inline]
```

Constructs a regex_token_iterator...

Parameters

__a	[IN] The start of the text to search.
__b	[IN] One-past-the-end of the text to search.
__re	[IN] The regular expression to search for.
__submatches	[IN] A list of subexpressions to return for each regular expression match within the text.
__m	[IN] Policy flags for match rules.

Definition at line 2798 of file regex.h.

4.889.2.4 regex_token_iterator() [4/6]

```
template<typename _Bi_iter , typename _Ch_type = typename
iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>>
std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator (
            _Bi_iter __a,
            _Bi_iter __b,
            const regex_type & __re,
            initializer_list< int > __submatches,
            regex_constants::match_flag_type __m = regex_constants::match_default )  [inline]
```

Constructs a regex_token_iterator...

Parameters

__a	[IN] The start of the text to search.
__b	[IN] One-past-the-end of the text to search.
__re	[IN] The regular expression to search for.
__submatches	[IN] A list of subexpressions to return for each regular expression match within the text.
__m	[IN] Policy flags for match rules.

Definition at line 2815 of file regex.h.

4.889.2.5 regex_token_iterator() [5/6]

```
template<typename _Bi_iter , typename _Ch_type = typename
iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>>
template<std::size_t _Nm>
std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator (
            _Bi_iter __a,
            _Bi_iter __b,
            const regex_type & __re,
            const int(&) __submatches[_Nm],
            regex_constants::match_flag_type __m = regex_constants::match_default )  [inline]
```

Constructs a regex_token_iterator...

Parameters

__a	[IN] The start of the text to search.
__b	[IN] One-past-the-end of the text to search.
__re	[IN] The regular expression to search for.
__submatches	[IN] A list of subexpressions to return for each regular expression match within the text.
__m	[IN] Policy flags for match rules.

Definition at line 2833 of file regex.h.

4.889.2.6 regex_token_iterator() [6/6]

```
template<typename _Bi_iter , typename _Ch_type = typename
iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>>
std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator (
            const regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits > & __rhs )  [inline]
```

Copy constructs a regex_token_iterator.

Parameters

__rhs	[IN] A regex_token_iterator to copy.

Definition at line 2865 of file regex.h.

4.889.3 Member Function Documentation

4.889.3.1 operator"!=()

```
template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<↩
_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>>
bool std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator!= (
            const regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits > & __rhs ) const  [inline]
```

Compares a regex_token_iterator to another for inequality.
Definition at line 2887 of file regex.h.

4.889.3.2 operator*()

```
template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<↩
_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>>
const value_type& std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator* ( )
const  [inline]
```

Dereferences a regex_token_iterator.
Definition at line 2894 of file regex.h.

4.889.3.3 operator++() [1/2]

```
template<typename _Bi_iter , typename _Ch_type = typename iterator_↩
traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>>
regex_token_iterator& std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator++ ( )
```

Increments a regex_token_iterator.

4.889.3.4 operator++() [2/2]

```
template<typename _Bi_iter , typename _Ch_type = typename iterator_↩
traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>>
```

```
regex_token_iterator std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator++ (
            int  )  [inline]
```

Postincrements a regex_token_iterator.
Definition at line 2914 of file regex.h.

4.889.3.5 operator->() template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<↩ _Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>>

```
const value_type* std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator-> ( )
const  [inline]
```

Selects a regex_token_iterator member.
Definition at line 2901 of file regex.h.

4.889.3.6 operator=() template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<↩ _Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>>

```
regex_token_iterator& std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator= (
            const regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits > & __rhs )
```

Assigns a regex_token_iterator to another.

Parameters

__rhs	[IN] A regex_token_iterator to copy.

4.889.3.7 operator==() template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<↩ _Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>>

```
bool std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator== (
            const regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits > & __rhs ) const
```

Compares a regex_token_iterator to another for equality.

4.890.1 Detailed Description

template<typename _Ch_type>
class std::regex_traits< _Ch_type >

Describes aspects of a regular expression.
A regular expression traits class that satisfies the requirements of section [28.7].
The class regex is parameterized around a set of related types and functions used to complete the definition of its semantics. This class satisfies the requirements of such a traits class.
Definition at line 80 of file regex.h.

4.890.2 Constructor & Destructor Documentation

4.890.2.1 regex_traits() `template<typename _Ch_type >`

```
std::regex_traits< _Ch_type >::regex_traits ( )  [inline]
```

Constructs a default traits object.
Definition at line 159 of file regex.h.

4.890.3 Member Function Documentation

4.890.3.1 getloc() `template<typename _Ch_type >`

```
locale_type std::regex_traits< _Ch_type >::getloc ( ) const  [inline]
```

Gets a copy of the current locale in use by the regex_traits object.
Definition at line 372 of file regex.h.

4.890.3.2 imbue() `template<typename _Ch_type >`

```
locale_type std::regex_traits< _Ch_type >::imbue (
            locale_type __loc )  [inline]
```

Imbues the regex_traits object with a copy of a new locale.

Parameters

__loc	A locale.

Returns

a copy of the previous locale in use by the regex_traits object.

Note

Calling imbue with a different locale than the one currently in use invalidates all cached data held by *this.

Definition at line 361 of file regex.h.

4.890.3.3 isctype() `template<typename _Ch_type >`

```
bool std::regex_traits< _Ch_type >::isctype (
            _Ch_type __c,
            char_class_type __f ) const
```

Determines if `c` is a member of an identified class.

Parameters

_c	a character.
_f	a class type (as returned from lookup_classname).

Returns

true if the character `__c` is a member of the classification represented by `__f`, false otherwise.

Exceptions

std::bad_cast	if the current locale does not have a ctype facet.

4.890.3.4 length() `template<typename _Ch_type >`

```
static std::size_t std::regex_traits< _Ch_type >::length (
            const char_type * __p )  [inline], [static]
```

Gives the length of a C-style string starting at `__p`.

Parameters

_p	a pointer to the start of a character sequence.

Returns

the number of characters between `*__p` and the first default-initialized value of type `char_type`. In other words, uses the C-string algorithm for determining the length of a sequence of characters.

Definition at line 172 of file regex.h.

4.890.3.5 lookup_classname() `template<typename _Ch_type >`

```
template<typename _Fwd_iter >
```

```
char_class_type std::regex_traits< _Ch_type >::lookup_classname (
            _Fwd_iter __first,
            _Fwd_iter __last,
            bool __icase = false ) const
```

Maps one or more characters to a named character classification.

Parameters

__first	beginning of the character sequence.
__last	one-past-the-end of the character sequence.
__icase	ignores the case of the classification name.

Returns

an unspecified value that represents the character classification named by the character sequence designated by the iterator range [__first, __last). If `icase` is true, the returned mask identifies the classification regardless of the case of the characters to be matched (for example, [[:lower:]] is the same as [[:alpha:]]), otherwise a case-dependent classification is returned. The value returned shall be independent of the case of the characters in the character sequence. If the name is not recognized then returns a value that compares equal to 0.

At least the following names (or their wide-character equivalent) are supported.

- d
- w
- s
- alnum
- alpha
- blank
- cntrl
- digit
- graph
- lower
- print
- punct
- space
- upper
- xdigit

4.890.3.6 lookup_collatename() `template<typename _Ch_type >`

```
template<typename _Fwd_iter >
string_type std::regex_traits< _Ch_type >::lookup_collatename (
            _Fwd_iter __first,
            _Fwd_iter __last ) const
```

Gets a collation element by name.

Parameters

__first	beginning of the collation element name.
__last	one-past-the-end of the collation element name.

Returns

a sequence of one or more characters that represents the collating element consisting of the character sequence designated by the iterator range [__first, __last). Returns an empty string if the character sequence is not a valid collating element.

4.890.3.7 transform()

```
template<typename _Ch_type >
template<typename _Fwd_iter >
string_type std::regex_traits< _Ch_type >::transform (
            _Fwd_iter __first,
            _Fwd_iter __last ) const  [inline]
```

Gets a sort key for a character sequence.

Parameters

__first	beginning of the character sequence.
__last	one-past-the-end of the character sequence.

Returns a sort key for the character sequence designated by the iterator range [F1, F2) such that if the character sequence [G1, G2) sorts before the character sequence [H1, H2) then v.transform(G1, G2) < v.transform(H1, H2).
What this really does is provide a more efficient way to compare a string to multiple other strings in locales with fancy collation rules and equivalence classes.

Returns

a locale-specific sort key equivalent to the input range.

Exceptions

std::bad_cast	if the current locale does not have a collate facet.

Definition at line 225 of file regex.h.
References std::basic_string< _CharT, _Traits, _Alloc >::data(), and std::basic_string< _CharT, _Traits, _Alloc >::size().
Referenced by std::regex_traits< _Ch_type >::transform_primary().

4.890.3.8 transform_primary()

```
template<typename _Ch_type >
template<typename _Fwd_iter >
string_type std::regex_traits< _Ch_type >::transform_primary (
            _Fwd_iter __first,
            _Fwd_iter __last ) const  [inline]
```

Gets a sort key for a character sequence, independent of case.

Parameters

__first	beginning of the character sequence.
__last	one-past-the-end of the character sequence.

Effects: if typeid(use_facet<collate<_Ch_type> >) == typeid(collate_byname<_Ch_type>) and the form of the sort key returned by collate_byname<_Ch_type>::transform(__first, __last) is known and can be converted into a primary sort key then returns that key, otherwise returns an empty string.

Todo Implement this function correctly.

Definition at line 249 of file regex.h.
References std::vector< _Tp, _Alloc >::data(), std::vector< _Tp, _Alloc >::size(), and std::regex_traits< _Ch_type >::transform().

4.890.3.9 translate() `template<typename _Ch_type >`

```
char_type std::regex_traits< _Ch_type >::translate (
            char_type __c ) const  [inline]
```

Performs the identity translation.

Parameters

_↩ _c	A character to the locale-specific character set.

Returns

__c.

Definition at line 183 of file regex.h.

4.890.3.10 translate_nocase() `template<typename _Ch_type >`

```
char_type std::regex_traits< _Ch_type >::translate_nocase (
            char_type __c ) const  [inline]
```

Translates a character into a case-insensitive equivalent.

Parameters

_↩ _c	A character to the locale-specific character set.

Returns

the locale-specific lower-case equivalent of __c.

Exceptions

std::bad_cast	if the imbued locale does not support the ctype facet.

Definition at line 196 of file regex.h.

4.890.3.11 value() template<typename _Ch_type >

```
int std::regex_traits< _Ch_type >::value (
            _Ch_type __ch,
            int __radix ) const
```

Converts a digit to an int.

Parameters

__ch	a character representing a digit.
__radix	the radix if the numeric conversion (limited to 8, 10, or 16).

Returns

the value represented by the digit __ch in base radix if the character __ch is a valid digit in base radix; otherwise returns -1.

4.901.1 Detailed Description

template<typename _Iterator>
class std::reverse_iterator< _Iterator >

Bidirectional and random access iterators have corresponding reverse iterator adaptors that iterate through the data structure in the opposite direction. They have the same signatures as the corresponding iterators. The fundamental relation between a reverse iterator and its corresponding iterator `i` is established by the identity:

```
&*(reverse_iterator(i)) == &*(i - 1)
```

This mapping is dictated by the fact that while there is always a pointer past the end of an array, there might not be a valid pointer before the beginning of an array. [24.4.1]/1,2

Reverse iterators can be tricky and surprising at first. Their semantics make sense, however, and the trickiness is a side effect of the requirement that the iterators must be safe.

Definition at line 126 of file bits/stl_iterator.h.

4.901.2 Member Typedef Documentation

4.901.2.1 iterator_category

```
typedef iterator_traits< _Iterator >::iterator_category std::iterator<
iterator_traits< _Iterator >::iterator_category , iterator_traits< _Iterator >::value_type ,
iterator_traits< _Iterator >::difference_type , iterator_traits< _Iterator >::pointer , iterator_traits<
_Iterator >::reference >::iterator_category  [inherited]
```

One of the tag types.
Definition at line 130 of file stl_iterator_base_types.h.

4.901.2.2 value_type

```
typedef iterator_traits< _Iterator >::value_type std::iterator< iterator_traits<
_Iterator >::iterator_category , iterator_traits< _Iterator >::value_type , iterator_traits< _↩
Iterator >::difference_type , iterator_traits< _Iterator >::pointer , iterator_traits< _Iterator
>::reference >::value_type  [inherited]
```

The type "pointed to" by the iterator.
Definition at line 132 of file stl_iterator_base_types.h.

4.901.3 Constructor & Destructor Documentation

4.901.3.1 reverse_iterator() [1/4]

```
template<typename _Iterator >
constexpr std::reverse_iterator< _Iterator >::reverse_iterator ( )  [inline], [constexpr]
```

The default constructor value-initializes member `current`. If it is a pointer, that means it is zero-initialized.
Definition at line 165 of file bits/stl_iterator.h.
Referenced by std::reverse_iterator< _Iterator >::operator+(), and std::reverse_iterator< _Iterator >::operator-().

4.901.3.2 reverse_iterator() [2/4]

```
template<typename _Iterator >
constexpr std::reverse_iterator< _Iterator >::reverse_iterator (
            iterator_type __x )  [inline], [explicit], [constexpr]
```

This iterator will move in the opposite direction that `x` does.
Definition at line 171 of file bits/stl_iterator.h.

4.901.3.3 reverse_iterator() [3/4]

```
template<typename _Iterator >
constexpr std::reverse_iterator< _Iterator >::reverse_iterator (
            const reverse_iterator< _Iterator > & __x )  [inline], [constexpr]
```

The copy constructor is normal.
Definition at line 177 of file bits/stl_iterator.h.

4.901.3.4 reverse_iterator() [4/4]

```
template<typename _Iterator >
template<typename _Iter >
constexpr std::reverse_iterator< _Iterator >::reverse_iterator (
            const reverse_iterator< _Iter > & __x )  [inline], [constexpr]
```

A reverse_iterator across other types can be copied if the underlying iterator can be converted to the type of `current`.
Definition at line 190 of file bits/stl_iterator.h.

4.901.4 Member Function Documentation

4.901.4.1 base() template<typename _Iterator >

```
constexpr iterator_type std::reverse_iterator< _Iterator >::base ( ) const  [inline], [constexpr]
```

Returns

current, the iterator used for underlying work.

Definition at line 197 of file bits/stl_iterator.h.
Referenced by std::operator==().

4.901.4.2 operator*() template<typename _Iterator >

```
constexpr reference std::reverse_iterator< _Iterator >::operator* ( ) const  [inline], [constexpr]
```

Returns

A reference to the value at -current

This requires that -current is dereferenceable.

Warning

This implementation requires that for an iterator of the underlying iterator type, x, a reference obtained by *x remains valid after x has been modified or destroyed. This is a bug: http://gcc.gnu.org/PR51823

Definition at line 211 of file bits/stl_iterator.h.

4.901.4.3 operator+() template<typename _Iterator >

```
constexpr reverse_iterator std::reverse_iterator< _Iterator >::operator+ (
            difference_type __n ) const  [inline], [constexpr]
```

Returns

A reverse_iterator that refers to current - *__n*

The underlying iterator must be a Random Access Iterator.
Definition at line 292 of file bits/stl_iterator.h.
References std::reverse_iterator< _Iterator >::reverse_iterator().

4.901.4.4 operator++() [1/2] template<typename _Iterator >

```
constexpr reverse_iterator& std::reverse_iterator< _Iterator >::operator++ ( )  [inline], [constexpr]
```

Returns

*this

Decrements the underlying iterator.
Definition at line 242 of file bits/stl_iterator.h.

4.901.4.5 operator++() [2/2] template<typename _Iterator >

```
constexpr reverse_iterator std::reverse_iterator< _Iterator >::operator++ (
            int  )  [inline], [constexpr]
```

Returns

The original value of *this

Decrements the underlying iterator.
Definition at line 254 of file bits/stl_iterator.h.

4.901.4.6 operator+=() template<typename _Iterator >

```
constexpr reverse_iterator& std::reverse_iterator< _Iterator >::operator+= (
            difference_type __n )  [inline], [constexpr]
```

Returns

*this

Moves the underlying iterator backwards *__n* steps. The underlying iterator must be a Random Access Iterator.
Definition at line 302 of file bits/stl_iterator.h.

4.901.4.7 operator-() template<typename _Iterator >

```
constexpr reverse_iterator std::reverse_iterator< _Iterator >::operator- (
            difference_type __n ) const  [inline], [constexpr]
```

Returns

A reverse_iterator that refers to `current` - *__n*

The underlying iterator must be a Random Access Iterator.
Definition at line 314 of file bits/stl_iterator.h.
References std::reverse_iterator< _Iterator >::reverse_iterator().

4.901.4.8 operator--() [1/2] template<typename _Iterator >

```
constexpr reverse_iterator& std::reverse_iterator< _Iterator >::operator-- ( )  [inline], [constexpr]
```

Returns

`*this`

Increments the underlying iterator.
Definition at line 267 of file bits/stl_iterator.h.

4.901.4.9 operator--() [2/2] template<typename _Iterator >

```
constexpr reverse_iterator std::reverse_iterator< _Iterator >::operator-- (
            int  )  [inline], [constexpr]
```

Returns

A reverse_iterator with the previous value of `*this`

Increments the underlying iterator.
Definition at line 279 of file bits/stl_iterator.h.

4.901.4.10 operator-=() template<typename _Iterator >

```
constexpr reverse_iterator& std::reverse_iterator< _Iterator >::operator-= (
            difference_type __n )  [inline], [constexpr]
```

Returns

*this

Moves the underlying iterator forwards *__n* steps. The underlying iterator must be a Random Access Iterator.
Definition at line 324 of file bits/stl_iterator.h.

4.901.4.11 operator->() template<typename _Iterator >

constexpr pointer std::reverse_iterator< _Iterator >::operator-> ( ) const [inline], [constexpr]

Returns

A pointer to the value at -current

This requires that -current is dereferenceable.
Definition at line 223 of file bits/stl_iterator.h.

4.901.4.12 operator[]() template<typename _Iterator >

constexpr reference std::reverse_iterator< _Iterator >::operator[] (
difference_type __n) const [inline], [constexpr]

Returns

The value at current - __n - 1

The underlying iterator must be a Random Access Iterator.
Definition at line 336 of file bits/stl_iterator.h.
The documentation for this class was generated from the following file:

- bits/stl_iterator.h

4.902.1 Detailed Description

template<class _CharT, class _Alloc>
class __gnu_cxx::rope< _CharT, _Alloc >

This is an SGI extension.

Todo Needs documentation! See http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation_style.html

Definition at line 1524 of file rope.
The documentation for this class was generated from the following files:

- rope
- ropeimpl.h

4.903 std::runtime_error Class Reference

Inheritance diagram for std::runtime_error:

Public Member Functions

- **runtime_error** (const char *) _GLIBCXX_TXN_SAFE
- **runtime_error** (const runtime_error &)=default
- runtime_error (const string &__arg) _GLIBCXX_TXN_SAFE
- **runtime_error** (runtime_error &&) noexcept
- runtime_error & **operator=** (const runtime_error &)=default
- runtime_error & **operator=** (runtime_error &&) noexcept
- virtual const char * what () const noexcept

4.903.1 Detailed Description

One of two subclasses of exception.
Runtime errors represent problems outside the scope of a program; they cannot be easily predicted and can generally only be caught as the program executes.
Definition at line 219 of file stdexcept.

4.903.2 Constructor & Destructor Documentation

4.903.2.1 runtime_error() `std::runtime_error::runtime_error ( const string & __arg ) [explicit]`

Takes a character string describing the error.

4.903.3 Member Function Documentation

4.903.3.1 what() `virtual const char* std::runtime_error::what ( ) const [virtual], [noexcept]`

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from std::exception.
Reimplemented in std::experimental::filesystem::v1::filesystem_error.
The documentation for this class was generated from the following file:

- stdexcept

4.904 __gnu_pbds::sample_probe_fn Class Reference

Public Types

- typedef std::size_t **size_type**

Public Member Functions

- sample_probe_fn ()
- sample_probe_fn (const sample_probe_fn &)
- void swap (sample_probe_fn &)

Protected Member Functions

- size_type operator() (key_const_reference r_key, size_type i) const

4.904.1 Detailed Description

A sample probe policy.
Definition at line 47 of file sample_probe_fn.hpp.

4.904.2 Constructor & Destructor Documentation

4.904.2.1 sample_probe_fn() [1/2] __gnu_pbds::sample_probe_fn::sample_probe_fn ( )

Default constructor.

4.904.2.2 sample_probe_fn() [2/2] __gnu_pbds::sample_probe_fn::sample_probe_fn (const sample_probe_fn &)

Copy constructor.

4.904.3 Member Function Documentation

4.904.3.1 operator()() size_type __gnu_pbds::sample_probe_fn::operator() (key_const_reference *r_key*, size_type *i*) const [inline], [protected]

Returns the i-th offset from the hash value of some key r_key.

4.904.3.2 swap() void __gnu_pbds::sample_probe_fn::swap (sample_probe_fn &) [inline]

Swaps content.
The documentation for this class was generated from the following file:

- sample_probe_fn.hpp

4.905 __gnu_pbds::sample_range_hashing Class Reference

Public Types

- typedef std::size_t size_type

Public Member Functions

- sample_range_hashing ()
- sample_range_hashing (const sample_range_hashing &other)
- void swap (sample_range_hashing &other)

Protected Member Functions

- void notify_resized (size_type)
- size_type operator() (size_type) const

4.905.1 Detailed Description

A sample range-hashing functor.
Definition at line 47 of file sample_range_hashing.hpp.

4.905.2 Member Typedef Documentation

4.905.2.1 size_type `typedef std::size_t __gnu_pbds::sample_range_hashing::size_type`

Size type.
Definition at line 51 of file sample_range_hashing.hpp.

4.905.3 Constructor & Destructor Documentation

4.905.3.1 sample_range_hashing() [1/2] `__gnu_pbds::sample_range_hashing::sample_range_hashing ( )`

Default constructor.

4.905.3.2 sample_range_hashing() [2/2] `__gnu_pbds::sample_range_hashing::sample_range_hashing ( const sample_range_hashing & other )`

Copy constructor.

4.905.4 Member Function Documentation

4.905.4.1 notify_resized() `void __gnu_pbds::sample_range_hashing::notify_resized ( size_type ) [protected]`

Notifies the policy object that the container's size has changed to argument's size.

4.905.4.2 operator()() `size_type __gnu_pbds::sample_range_hashing::operator() ( size_type ) const [inline], [protected]`

Transforms the __hash value hash into a ranged-hash value.

4.905.4.3 swap() `void __gnu_pbds::sample_range_hashing::swap ( sample_range_hashing & other ) [inline]`

Swaps content.
The documentation for this class was generated from the following file:

- sample_range_hashing.hpp

4.906 __gnu_pbds::sample_ranged_hash_fn Class Reference

Public Types

4.908.1 Detailed Description

A sample resize policy.
Definition at line 47 of file sample_resize_policy.hpp.

4.908.2 Member Typedef Documentation

4.908.2.1 size_type `typedef std::size_t __gnu_pbds::sample_resize_policy::size_type`

Size type.
Definition at line 51 of file sample_resize_policy.hpp.

4.908.3 Constructor & Destructor Documentation

4.908.3.1 sample_resize_policy() `__gnu_pbds::sample_resize_policy::sample_resize_policy ( )`

Default constructor.

4.908.4 Member Function Documentation

4.908.4.1 get_new_size() `size_type __gnu_pbds::sample_resize_policy::get_new_size ( size_type size, size_type num_used_e ) const [protected]`

Queries what the new size should be.

4.908.4.2 is_resize_needed() `bool __gnu_pbds::sample_resize_policy::is_resize_needed ( ) const [inline], [protected]`

Queries whether a resize is needed.

4.908.4.3 notify_cleared() `void __gnu_pbds::sample_resize_policy::notify_cleared ( ) [protected]`

Notifies the table was cleared.

4.908.4.4 notify_erase_search_collision() `void __gnu_pbds::sample_resize_policy::notify_erase_search_collision ( ) [inline], [protected]`

Notifies a search encountered a collision.

4.908.4.5 notify_erase_search_end()

`void __gnu_pbds::sample_resize_policy::notify_erase_search_end ( ) [inline], [protected]`

Notifies a search ended.

4.908.4.6 notify_erase_search_start()

`void __gnu_pbds::sample_resize_policy::notify_erase_search_start ( ) [inline], [protected]`

Notifies a search started.

4.908.4.7 notify_erased()

`void __gnu_pbds::sample_resize_policy::notify_erased ( size_type num_e ) [inline], [protected]`

Notifies an element was erased.

4.908.4.8 notify_find_search_collision()

`void __gnu_pbds::sample_resize_policy::notify_find_search_collision ( ) [inline], [protected]`

Notifies a search encountered a collision.

4.908.4.9 notify_find_search_end()

`void __gnu_pbds::sample_resize_policy::notify_find_search_end ( ) [inline], [protected]`

Notifies a search ended.

4.908.4.10 notify_find_search_start()

`void __gnu_pbds::sample_resize_policy::notify_find_search_start ( ) [inline], [protected]`

Notifies a search started.

4.908.4.11 notify_insert_search_collision()

`void __gnu_pbds::sample_resize_policy::notify_insert_search_collision ( ) [inline], [protected]`

Notifies a search encountered a collision.

4.908.4.12 notify_insert_search_end()

`void __gnu_pbds::sample_resize_policy::notify_insert_search_end ( ) [inline], [protected]`

Notifies a search ended.

4.908.4.13 notify_insert_search_start()

`void __gnu_pbds::sample_resize_policy::notify_insert_search_start ( ) [inline], [protected]`

Notifies a search started.

4.908.4.14 notify_inserted()

`void __gnu_pbds::sample_resize_policy::notify_inserted ( size_type num_e ) [inline], [protected]`

Notifies an element was inserted.

4.908.4.15 notify_resized() void __gnu_pbds::sample_resize_policy::notify_resized (size_type *new_size*) [protected]

Notifies the table was resized to new_size.

4.908.4.16 sample_range_hashing() __gnu_pbds::sample_resize_policy::sample_range_hashing (const sample_resize_policy & *other*)

Copy constructor.

4.908.4.17 swap() void __gnu_pbds::sample_resize_policy::swap (sample_resize_policy & *other*) [inline]

Swaps content.
The documentation for this class was generated from the following file:

- sample_resize_policy.hpp

4.909 __gnu_pbds::sample_resize_trigger Class Reference

Public Types

- typedef std::size_t size_type

Public Member Functions

4.909.1 Detailed Description

A sample resize trigger policy.
Definition at line 47 of file sample_resize_trigger.hpp.

4.909.2 Member Typedef Documentation

4.909.2.1 size_type

```
typedef std::size_t __gnu_pbds::sample_resize_trigger::size_type
```

Size type.
Definition at line 51 of file sample_resize_trigger.hpp.

4.909.3 Constructor & Destructor Documentation

4.909.3.1 sample_resize_trigger()

```
__gnu_pbds::sample_resize_trigger::sample_resize_trigger ( )
```

Default constructor.

4.909.4 Member Function Documentation

4.909.4.1 is_grow_needed()

```
bool __gnu_pbds::sample_resize_trigger::is_grow_needed (
            size_type size,
            size_type num_entries ) const  [inline], [protected]
```

Queries whether a grow is needed.

4.909.4.2 is_resize_needed()

```
bool __gnu_pbds::sample_resize_trigger::is_resize_needed ( ) const
[inline], [protected]
```

Queries whether a resize is needed.

4.909.4.3 notify_cleared()

```
void __gnu_pbds::sample_resize_trigger::notify_cleared ( )  [protected]
```

Notifies the table was cleared.

4.909.4.4 notify_erase_search_collision()

```
void __gnu_pbds::sample_resize_trigger::notify_erase_↩
search_collision ( )  [inline], [protected]
```

Notifies a search encountered a collision.

4.909.4.5 notify_erase_search_end()

```
void __gnu_pbds::sample_resize_trigger::notify_erase_search_end
( )  [inline], [protected]
```

Notifies a search ended.

4.909.4.6 notify_erase_search_start()

```
void __gnu_pbds::sample_resize_trigger::notify_erase_search_↩
start ( )  [inline], [protected]
```

Notifies a search started.

4.909.4.7 notify_erased()

```
void __gnu_pbds::sample_resize_trigger::notify_erased (
            size_type num_entries )  [inline], [protected]
```

Notifies an element was erased.

4.909.4.8 notify_externally_resized()

```
void __gnu_pbds::sample_resize_trigger::notify_externally_resized (
            size_type new_size )  [protected]
```

Notifies the table was resized externally.

4.909.4.9 notify_find_search_collision()

```
void __gnu_pbds::sample_resize_trigger::notify_find_search_collision ( )  [inline], [protected]
```

Notifies a search encountered a collision.

4.909.4.10 notify_find_search_end()

```
void __gnu_pbds::sample_resize_trigger::notify_find_search_end ( )  [inline], [protected]
```

Notifies a search ended.

4.909.4.11 notify_find_search_start()

```
void __gnu_pbds::sample_resize_trigger::notify_find_search_start ( )  [inline], [protected]
```

Notifies a search started.

4.909.4.12 notify_insert_search_collision()

```
void __gnu_pbds::sample_resize_trigger::notify_insert_search_collision ( )  [inline], [protected]
```

Notifies a search encountered a collision.

4.909.4.13 notify_insert_search_end()

```
void __gnu_pbds::sample_resize_trigger::notify_insert_search_end ( )  [inline], [protected]
```

Notifies a search ended.

4.909.4.14 notify_insert_search_start()

```
void __gnu_pbds::sample_resize_trigger::notify_insert_search_start ( )  [inline], [protected]
```

Notifies a search started.

4.909.4.15 notify_inserted()

```
void __gnu_pbds::sample_resize_trigger::notify_inserted (
            size_type num_entries )  [inline], [protected]
```

Notifies an element was inserted. the total number of entries in the table is num_entries.

4.909.4.16 notify_resized()

```
void __gnu_pbds::sample_resize_trigger::notify_resized (
            size_type new_size )  [protected]
```

Notifies the table was resized as a result of this object's signifying that a resize is needed.

4.909.4.17 sample_range_hashing()

```
__gnu_pbds::sample_resize_trigger::sample_range_hashing (
            const sample_resize_trigger &  )
```

Copy constructor.

4.909.4.18 swap() void __gnu_pbds::sample_resize_trigger::swap (sample_resize_trigger &) [inline]

Swaps content.
The documentation for this class was generated from the following file:

- sample_resize_trigger.hpp

4.910 __gnu_pbds::sample_size_policy Class Reference

Public Types

- typedef std::size_t size_type

Public Member Functions

- sample_size_policy ()
- sample_range_hashing (const sample_size_policy &)
- void swap (sample_size_policy &other)

Protected Member Functions

- size_type get_nearest_larger_size (size_type size) const
- size_type get_nearest_smaller_size (size_type size) const

4.910.1 Detailed Description

A sample size policy.
Definition at line 47 of file sample_size_policy.hpp.

4.910.2 Member Typedef Documentation

4.910.2.1 size_type typedef std::size_t __gnu_pbds::sample_size_policy::size_type

Size type.
Definition at line 51 of file sample_size_policy.hpp.

4.910.3 Constructor & Destructor Documentation

4.910.3.1 sample_size_policy() __gnu_pbds::sample_size_policy::sample_size_policy ( )

Default constructor.

4.910.4 Member Function Documentation

4.910.4.1 get_nearest_larger_size() size_type __gnu_pbds::sample_size_policy::get_nearest_larger_size (size_type *size*) const [inline], [protected]

Given a __size size, returns a __size that is larger.

4.910.4.2 get_nearest_smaller_size()

```
size_type __gnu_pbds::sample_size_policy::get_nearest_smaller_size (
            size_type size ) const  [inline], [protected]
```

Given a __size size, returns a __size that is smaller.

4.910.4.3 sample_range_hashing()

```
__gnu_pbds::sample_size_policy::sample_range_hashing (
            const sample_size_policy &  )
```

Copy constructor.

4.910.4.4 swap()

```
void __gnu_pbds::sample_size_policy::swap (
            sample_size_policy & other )  [inline]
```

Swaps content.
The documentation for this class was generated from the following file:

- sample_size_policy.hpp

4.911 __gnu_pbds::sample_tree_node_update< Const_Node_Iter, Node_Iter, Cmp_Fn, _Alloc > Class Template Reference

4.911.1 Detailed Description

template<typename Const_Node_Iter, typename Node_Iter, typename Cmp_Fn, typename _Alloc>
class __gnu_pbds::sample_tree_node_update< Const_Node_Iter, Node_Iter, Cmp_Fn, _Alloc >

A sample node updator.
Definition at line 49 of file sample_tree_node_update.hpp.
The documentation for this class was generated from the following file:

- sample_tree_node_update.hpp

4.912 __gnu_pbds::sample_trie_access_traits Struct Reference

Public Types

- enum { **max_size** }
- typedef std::string::const_iterator **const_iterator**
- typedef char e_type
- typedef rebind_traits< _Alloc, key_type >::const_reference **key_const_reference**
- typedef std::string **key_type**
- typedef std::size_t **size_type**

Static Public Member Functions

- static const_iterator begin (key_const_reference)
- static size_type e_pos (e_type)
- static const_iterator end (key_const_reference)

4.912.1 Detailed Description

A sample trie element access traits.
Definition at line 47 of file sample_trie_access_traits.hpp.

4.912.2 Member Typedef Documentation

4.912.2.1 e_type `typedef char __gnu_pbds::sample_trie_access_traits::e_type`

Element type.
Definition at line 57 of file sample_trie_access_traits.hpp.

4.912.3 Member Function Documentation

4.912.3.1 begin() `static const_iterator __gnu_pbds::sample_trie_access_traits::begin ( key_const_reference ) [inline], [static]`

Returns a const_iterator to the first element of r_key.

4.912.3.2 e_pos() `static size_type __gnu_pbds::sample_trie_access_traits::e_pos ( e_type ) [inline], [static]`

Maps an element to a position.

4.912.3.3 end() `static const_iterator __gnu_pbds::sample_trie_access_traits::end ( key_const_reference ) [inline], [static]`

Returns a const_iterator to the after-last element of r_key.
The documentation for this struct was generated from the following file:

- sample_trie_access_traits.hpp

4.913 __gnu_pbds::sample_trie_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc > Class Template Reference

Public Types

- typedef std::size_t **metadata_type**

Protected Member Functions

- sample_trie_node_update ()
- void operator() (node_iterator, node_const_iterator) const

4.913.1 Detailed Description

template<typename Node_CItr, typename Node_Itr, typename _ATraits, typename _Alloc>
class __gnu_pbds::sample_trie_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >

A sample node updator.
Definition at line 49 of file sample_trie_node_update.hpp.

4.913.2 Constructor & Destructor Documentation

4.913.2.1 sample_trie_node_update() template<typename Node_CItr , typename Node_Itr , typename _ATraits , typename _Alloc >

__gnu_pbds::sample_trie_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >::sample_trie_node_update ( ) [protected]

Default constructor.

4.913.3 Member Function Documentation

4.913.3.1 operator()() template<typename Node_CItr , typename Node_Itr , typename _ATraits , typename _Alloc >

void __gnu_pbds::sample_trie_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >::operator() (node_iterator , node_const_iterator) const [inline], [protected]

Updates the rank of a node through a node_iterator node_it; end_nd_it is the end node iterator.

The documentation for this class was generated from the following file:

- sample_trie_node_update.hpp

4.914 __gnu_pbds::sample_update_policy Struct Reference

Public Member Functions

- sample_update_policy ()
- sample_update_policy (const sample_update_policy &)
- void swap (sample_update_policy &other)

Protected Types

- typedef some_metadata_type metadata_type

Protected Member Functions

- metadata_type operator() () const
- bool operator() (metadata_reference) const

4.914.1 Detailed Description

A sample list-update policy.

Definition at line 47 of file sample_update_policy.hpp.

4.914.2 Member Typedef Documentation

4.914.2.1 metadata_type typedef some_metadata_type __gnu_pbds::sample_update_policy::metadata_type [protected]

Metadata on which this functor operates.

Definition at line 61 of file sample_update_policy.hpp.

4.914.3 Constructor & Destructor Documentation

4.914.3.1 sample_update_policy() [1/2] __gnu_pbds::sample_update_policy::sample_update_policy ( )

Default constructor.

4.914.3.2 sample_update_policy() [2/2] __gnu_pbds::sample_update_policy::sample_update_policy (const sample_update_policy &)

Copy constructor.

4.914.4 Member Function Documentation

4.914.4.1 operator()() [1/2] metadata_type __gnu_pbds::sample_update_policy::operator() ( ) const [protected]

Creates a metadata object.

4.914.4.2 operator()() [2/2] bool __gnu_pbds::sample_update_policy::operator() (metadata_reference) const [protected]

Decides whether a metadata object should be moved to the front of the list. A list-update based containers object will call this method to decide whether to move a node to the front of the list. The method shoule return true if the node should be moved to the front of the list.

4.914.4.3 swap() void __gnu_pbds::sample_update_policy::swap (sample_update_policy & *other*) [inline]

Swaps content.
The documentation for this struct was generated from the following file:

- sample_update_policy.hpp

4.915 __gnu_parallel::sampling_tag Struct Reference

Inheritance diagram for __gnu_parallel::sampling_tag:

Public Member Functions

- **sampling_tag** (_ThreadIndex __num_threads)
- _ThreadIndex __get_num_threads ()
- void set_num_threads (_ThreadIndex __num_threads)

4.915.1 Detailed Description

Forces parallel merging with exact splitting, at compile time.
Definition at line 118 of file tags.h.

4.915.2 Member Function Documentation

4.915.2.1 __get_num_threads() _ThreadIndex __gnu_parallel::parallel_tag::__get_num_threads ( ) [inline], [inherited]

Find out desired number of threads.

Returns

Desired number of threads.

Definition at line 63 of file tags.h.
Referenced by __gnu_parallel::__parallel_sort().

4.915.2.2 set_num_threads() void __gnu_parallel::parallel_tag::set_num_threads (_ThreadIndex *__num_threads*) [inline], [inherited]

Set the desired number of threads.

Parameters

__num_threads	Desired number of threads.

Definition at line 73 of file tags.h.
The documentation for this struct was generated from the following file:

- tags.h

4.916 std::scoped_allocator_adaptor< _OuterAlloc, _InnerAllocs > Class Template Reference

Inherits _OuterAlloc.

4.922 std::basic_istream< _CharT, _Traits >::sentry Class Reference

Public Types

- typedef __istream_type::__ctype_type **__ctype_type**
- typedef _Traits::int_type **__int_type**
- typedef basic_istream< _CharT, _Traits > **__istream_type**
- typedef basic_streambuf< _CharT, _Traits > **__streambuf_type**
- typedef _Traits traits_type

Public Member Functions

- sentry (basic_istream< _CharT, _Traits > &__is, bool __noskipws=false)
- operator bool () const

4.922.1 Detailed Description

template<typename _CharT, typename _Traits>
class std::basic_istream< _CharT, _Traits >::sentry

Performs setup work for input streams.
Objects of this class are created before all of the standard extractors are run. It is responsible for *exception-safe prefix and suffix operations,* although only prefix actions are currently required by the standard.
Definition at line 686 of file istream.

4.922.2 Member Typedef Documentation

4.922.2.1 traits_type

```
template<typename _CharT , typename _Traits >
typedef _Traits std::basic_istream< _CharT, _Traits >::sentry::traits_type
```

Easy access to dependent types.
Definition at line 693 of file istream.

4.922.3 Constructor & Destructor Documentation

4.922.3.1 sentry()

```
template<typename _CharT , typename _Traits >
std::basic_istream< _CharT, _Traits >::sentry::sentry (
            basic_istream< _CharT, _Traits > & __is,
            bool __noskipws = false )  [explicit]
```

The constructor performs all the work.

Parameters

__is	The input stream to guard.
__noskipws	Whether to consume whitespace or not.

If the stream state is good (*__is.good()* is true), then the following actions are performed, otherwise the sentry state is false (*not okay*) and failbit is set in the stream state.
The sentry's preparatory actions are:

1. if the stream is tied to an output stream, `is.tie()->flush()` is called to synchronize the output sequence
2. if *__noskipws* is false, and `ios_base::skipws` is set in `is.flags()`, the sentry extracts and discards whitespace characters from the stream. The currently imbued locale is used to determine whether each character is whitespace.

If the stream state is still good, then the sentry state becomes true (*okay*).
Definition at line 46 of file istream.tcc.
References std::basic_ios< _CharT, _Traits >::good(), and std::ios_base::goodbit.

4.922.4 Member Function Documentation

4.922.4.1 operator bool() `template<typename _CharT , typename _Traits >` `std::basic_istream< _CharT, _Traits >::sentry::operator bool ( ) const [inline], [explicit]`

Quick status checking.

Returns

The sentry state.

For ease of use, sentries may be converted to booleans. The return value is that of the sentry state (true == okay).
Definition at line 734 of file istream.
The documentation for this class was generated from the following files:

- istream
- istream.tcc

4.923 std::basic_ostream< _CharT, _Traits >::sentry Class Reference

Public Member Functions

- sentry (basic_ostream< _CharT, _Traits > &__os)
- ~sentry ()
- operator bool () const

4.923.1 Detailed Description

template<typename _CharT, typename _Traits>
class std::basic_ostream< _CharT, _Traits >::sentry

Performs setup work for output streams.
Objects of this class are created before all of the standard inserters are run. It is responsible for *exception-safe prefix and suffix operations*.
Definition at line 432 of file ostream.

4.923.2 Constructor & Destructor Documentation

4.923.2.1 sentry() template<typename _CharT , typename _Traits > std::basic_ostream< _CharT, _Traits >::sentry::sentry (basic_ostream< _CharT, _Traits > & __os) [explicit]

The constructor performs preparatory work.

Parameters

__os	The output stream to guard.

If the stream state is good (*__os.good()* is true), then if the stream is tied to another output stream, `is.tie()->flush()` is called to synchronize the output sequences.
If the stream state is still good, then the sentry state becomes true (*okay*).
Definition at line 46 of file ostream.tcc.
References std::ios_base::failbit, std::basic_ios< _CharT, _Traits >::good(), std::basic_ios< _CharT, _Traits >::setstate(), and std::basic_ios< _CharT, _Traits >::tie().

4.923.2.2 ~sentry() template<typename _CharT , typename _Traits > std::basic_ostream< _CharT, _Traits >::sentry::~sentry ( ) [inline]

Possibly flushes the stream.
If `ios_base::unitbuf` is set in `os.flags()`, and `std::uncaught_exception()` is true, the sentry destructor calls `flush()` on the output stream.
Definition at line 462 of file ostream.

4.923.3 Member Function Documentation

4.923.3.1 operator bool() template<typename _CharT , typename _Traits > std::basic_ostream< _CharT, _Traits >::sentry::operator bool ( ) const [inline], [explicit]

Quick status checking.

Returns

The sentry state.

For ease of use, sentries may be converted to booleans. The return value is that of the sentry state (true == okay).
Definition at line 484 of file ostream.
The documentation for this class was generated from the following files:

- ostream
- ostream.tcc

4.924 __gnu_pbds::sequence_tag Struct Reference

Inheritance diagram for __gnu_pbds::sequence_tag:

4.924.1 Detailed Description

Basic sequence.
Definition at line 129 of file tag_and_trait.hpp.
The documentation for this struct was generated from the following file:

- tag_and_trait.hpp

4.925 __gnu_parallel::sequential_tag Struct Reference

4.925.1 Detailed Description

Forces sequential execution at compile time.
Definition at line 42 of file tags.h.
The documentation for this struct was generated from the following file:

- tags.h

4.926.1 Detailed Description

template<typename _Key, typename _Compare = std::less<_Key>, typename _Allocator = std::allocator<_Key>>
class std::__debug::set< _Key, _Compare, _Allocator >

Class std::set with safety/checking/debug instrumentation.
Definition at line 44 of file set.h.

4.926.2 Member Function Documentation

4.926.2.1 _M_detach_all() `void __gnu_debug::_Safe_sequence_base::_M_detach_all ( ) [protected], [inherited]`

Detach all iterators, leaving them singular.
Referenced by __gnu_debug::_Safe_sequence_base::~_Safe_sequence_base().

4.926.2.2 _M_detach_singular() void __gnu_debug::_Safe_sequence_base::_M_detach_singular ( ) [protected], [inherited]

Detach all singular iterators.

Postcondition

for all iterators i attached to this sequence, i->_M_version == _M_version.

4.926.2.3 _M_get_mutex() __gnu_cxx::__mutex& __gnu_debug::_Safe_sequence_base::_M_get_mutex ( ) throw ( ) [protected], [inherited]

For use in _Safe_sequence.
Referenced by __gnu_debug::_Safe_sequence< _Sequence >::_M_transfer_from_if().

4.926.2.4 _M_invalidate_all() void __gnu_debug::_Safe_sequence_base::_M_invalidate_all ( ) const [inline], [protected], [inherited]

Invalidates all iterators.
Definition at line 256 of file safe_base.h.
References __gnu_debug::_Safe_sequence_base::_M_version.

4.926.2.5 _M_invalidate_if() template<typename _Sequence > template<typename _Predicate > void __gnu_debug::_Safe_sequence< _Sequence >::_M_invalidate_if (_Predicate __pred) [inherited]

Invalidates all iterators `x` that reference this sequence, are not singular, and for which `__pred(x)` returns `true`. `__pred` will be invoked with the normal iterators nested in the safe ones.
Definition at line 37 of file safe_sequence.tcc.

4.926.2.6 _M_revalidate_singular() void __gnu_debug::_Safe_sequence_base::_M_revalidate_singular ( ) [protected], [inherited]

Revalidates all attached singular iterators. This method may be used to validate iterators that were invalidated before (but for some reason, such as an exception, need to become valid again).

4.926.2.7 _M_swap() void __gnu_debug::_Safe_sequence_base::_M_swap (_Safe_sequence_base & __x) [protected], [noexcept], [inherited]

Swap this sequence with the given sequence. This operation also swaps ownership of the iterators, so that when the operation is complete all iterators that originally referenced one container now reference the other container.

4.926.2.8 _M_transfer_from_if() template<typename _Sequence > template<typename _Predicate > void __gnu_debug::_Safe_sequence< _Sequence >::_M_transfer_from_if (_Safe_sequence< _Sequence > & __from, _Predicate __pred) [inherited]

Transfers all iterators `x` that reference `from` sequence, are not singular, and for which `__pred(x)` returns `true`. `__pred` will be invoked with the normal iterators nested in the safe ones.
Definition at line 68 of file safe_sequence.tcc.
References std::__addressof(), __gnu_debug::_Safe_sequence_base::_M_const_iterators, __gnu_debug::_Safe_iterator_base::_M_detach_single(), __gnu_debug::_Safe_sequence_base::_M_get_mutex(), __gnu_debug::_Safe_sequence_base::_M_iterators, __gnu_debug::_Safe_iterator_base::_M_next, __gnu_debug::_Safe_iterator_base::_M_prior, __gnu_debug::_Safe_iterator_base::_M_sequence, and __gnu_debug::_Safe_iterator_base::_M_version.

4.926.3 Member Data Documentation

4.926.3.1 _M_const_iterators `_Safe_iterator_base* __gnu_debug::_Safe_sequence_base::_M_const_iterators [inherited]`

The list of constant iterators that reference this container.
Definition at line 197 of file safe_base.h.
Referenced by __gnu_debug::_Safe_sequence< _Sequence >::_M_transfer_from_if().

4.926.3.2 _M_iterators `_Safe_iterator_base* __gnu_debug::_Safe_sequence_base::_M_iterators [inherited]`

The list of mutable iterators that reference this container.
Definition at line 194 of file safe_base.h.
Referenced by __gnu_debug::_Safe_sequence< _Sequence >::_M_transfer_from_if().

4.926.3.3 _M_version `unsigned int __gnu_debug::_Safe_sequence_base::_M_version [mutable], [inherited]`

The container version number. This number may never be 0.
Definition at line 200 of file safe_base.h.
Referenced by __gnu_debug::_Safe_sequence_base::_M_invalidate_all().
The documentation for this class was generated from the following file:

4.927.1 Detailed Description

template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
class std::set< _Key, _Compare, _Alloc >

A standard container made up of unique keys, which can be retrieved in logarithmic time.

Template Parameters

_Key	Type of key objects.
_Compare	Comparison function object type, defaults to less<_Key>.
_Alloc	Allocator type, defaults to allocator<_Key>.

Meets the requirements of a container, a reversible container, and an associative container (using unique keys).
Sets support bidirectional iterators.
The private tree data is declared exactly the same way for set and multiset; the distinction is made entirely in how the tree functions are called (*_unique versus *_equal, same as the standard).
Definition at line 94 of file stl_set.h.

4.927.2 Member Typedef Documentation

4.927.2.1 allocator_type

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
typedef _Alloc std::set< _Key, _Compare, _Alloc >::allocator_type
```

Public typedefs.
Definition at line 124 of file stl_set.h.

4.927.2.2 const_iterator

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
typedef _Rep_type::const_iterator std::set< _Key, _Compare, _Alloc >::const_iterator
```

Iterator-related typedefs.
Definition at line 148 of file stl_set.h.

4.927.2.3 const_pointer

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
typedef _Alloc_traits::const_pointer std::set< _Key, _Compare, _Alloc >::const_pointer
```

Iterator-related typedefs.

Definition at line 121 of file stl_set.h.

4.927.3 Constructor & Destructor Documentation

4.927.3.1 set() [1/12]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _↩
Alloc = std::allocator<_Key>>
std::set< _Key, _Compare, _Alloc >::set ( )  [default]
```

Default constructor creates no elements.

4.927.3.2 set() [2/12]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _↩
Alloc = std::allocator<_Key>>
std::set< _Key, _Compare, _Alloc >::set (
            const _Compare & __comp,
            const allocator_type & __a = allocator_type() )  [inline], [explicit]
```

Creates a set with no elements.

Parameters

__comp	Comparator to use.
__a	An allocator object.

Definition at line 176 of file stl_set.h.

4.927.3.3 set() [3/12]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _↩
Alloc = std::allocator<_Key>>
template<typename _InputIterator >
std::set< _Key, _Compare, _Alloc >::set (
            _InputIterator __first,
            _InputIterator __last )  [inline]
```

Builds a set from a range.

Parameters

__first	An input iterator.

Parameters

__last	An input iterator.

Create a set consisting of copies of the elements from [__first,__last). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(__first,__last)).
Definition at line 191 of file stl_set.h.

4.927.3.4 set() [4/12]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _↩
Alloc = std::allocator<_Key>>
template<typename _InputIterator >
std::set< _Key, _Compare, _Alloc >::set (
            _InputIterator __first,
            _InputIterator __last,
            const _Compare & __comp,
            const allocator_type & __a = allocator_type() )  [inline]
```

Builds a set from a range.

Parameters

__first	An input iterator.
__last	An input iterator.
__comp	A comparison functor.
__a	An allocator object.

Create a set consisting of copies of the elements from [__first,__last). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(__first,__last)).
Definition at line 208 of file stl_set.h.

4.927.3.5 set() [5/12]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _↩
Alloc = std::allocator<_Key>>
std::set< _Key, _Compare, _Alloc >::set (
            const set< _Key, _Compare, _Alloc > &  )  [default]
```

Set copy constructor.
Whether the allocator is copied depends on the allocator traits.

4.927.3.6 set() [6/12]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _↩
Alloc = std::allocator<_Key>>
std::set< _Key, _Compare, _Alloc >::set (
            set< _Key, _Compare, _Alloc > &&  )  [default]
```

Set move constructor
The newly-created set contains the exact contents of the moved instance. The moved instance is a valid, but unspecified, set.

4.927.3.7 set() [7/12]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _↩
Alloc = std::allocator<_Key>>
std::set< _Key, _Compare, _Alloc >::set (
            initializer_list< value_type > __l,
            const _Compare & __comp = _Compare(),
            const allocator_type & __a = allocator_type() )  [inline]
```

Builds a set from an initializer_list.

Parameters

__l	An initializer_list.
__comp	A comparison functor.
__a	An allocator object.

Create a set consisting of copies of the elements in the list. This is linear in N if the list is already sorted, and NlogN otherwise (where N is *__l.size()*).
Definition at line 243 of file stl_set.h.

4.927.3.8 set() [8/12]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set< _Key, _Compare, _Alloc >::set (
            const allocator_type & __a )  [inline], [explicit]
```

Allocator-extended default constructor.
Definition at line 251 of file stl_set.h.

4.927.3.9 set() [9/12]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set< _Key, _Compare, _Alloc >::set (
            const set< _Key, _Compare, _Alloc > & __x,
            const allocator_type & __a )  [inline]
```

Allocator-extended copy constructor.
Definition at line 255 of file stl_set.h.

4.927.3.10 set() [10/12]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set< _Key, _Compare, _Alloc >::set (
            set< _Key, _Compare, _Alloc > && __x,
            const allocator_type & __a )  [inline], [noexcept]
```

Allocator-extended move constructor.
Definition at line 259 of file stl_set.h.

4.927.3.11 set() [11/12]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set< _Key, _Compare, _Alloc >::set (
            initializer_list< value_type > __l,
            const allocator_type & __a )  [inline]
```

Allocator-extended initialier-list constructor.
Definition at line 265 of file stl_set.h.

4.927.3.12 set() [12/12]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename _InputIterator >
std::set< _Key, _Compare, _Alloc >::set (
```

```
            _InputIterator __first,
            _InputIterator __last,
            const allocator_type & __a )  [inline]
```

Allocator-extended range constructor.
Definition at line 271 of file stl_set.h.

4.927.3.13 ~set()

`template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>`
`std::set< _Key, _Compare, _Alloc >::~set ( )  [default]`
The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

4.927.4 Member Function Documentation

4.927.4.1 begin()

`template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>`
`iterator std::set< _Key, _Compare, _Alloc >::begin ( ) const  [inline], [noexcept]`
Returns a read-only (constant) iterator that points to the first element in the set. Iteration is done in ascending order according to the keys.
Definition at line 344 of file stl_set.h.

4.927.4.2 cbegin()

`template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>`
`iterator std::set< _Key, _Compare, _Alloc >::cbegin ( ) const  [inline], [noexcept]`
Returns a read-only (constant) iterator that points to the first element in the set. Iteration is done in ascending order according to the keys.
Definition at line 381 of file stl_set.h.

4.927.4.3 cend()

`template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>`
`iterator std::set< _Key, _Compare, _Alloc >::cend ( ) const  [inline], [noexcept]`
Returns a read-only (constant) iterator that points one past the last element in the set. Iteration is done in ascending order according to the keys.
Definition at line 390 of file stl_set.h.

4.927.4.4 clear()

`template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>`
`void std::set< _Key, _Compare, _Alloc >::clear ( )  [inline], [noexcept]`
Erases all elements in a set. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
Definition at line 733 of file stl_set.h.

4.927.4.5 count() [1/2]

`template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>`
`template<typename _Kt >`

```
auto std::set< _Key, _Compare, _Alloc >::count (
            const _Kt & __x ) const -> decltype(_M_t._M_count_tr(__x))   [inline]
```

Finds the number of elements.

Parameters

_↩ _x	Element to located.

Returns

Number of elements with specified key.

This function only makes sense for multisets; for set the result will either be 0 (not present) or 1 (present).
Definition at line 754 of file stl_set.h.

4.927.4.6 count() [2/2]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _↩
Alloc = std::allocator<_Key>>
size_type std::set< _Key, _Compare, _Alloc >::count (
            const key_type & __x ) const  [inline]
```

Finds the number of elements.

Parameters

_↩ _x	Element to located.

Returns

Number of elements with specified key.

This function only makes sense for multisets; for set the result will either be 0 (not present) or 1 (present).
Definition at line 748 of file stl_set.h.

4.927.4.7 crbegin()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc
= std::allocator<_Key>>
reverse_iterator std::set< _Key, _Compare, _Alloc >::crbegin ( ) const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the last element in the set. Iteration is done in descending order according to the keys.
Definition at line 399 of file stl_set.h.

4.927.4.8 crend()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<_Key>>
reverse_iterator std::set< _Key, _Compare, _Alloc >::crend ( ) const  [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last pair in the set. Iteration is done in descending order according to the keys.
Definition at line 408 of file stl_set.h.

4.927.4.9 emplace()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc
= std::allocator<_Key>>
```

```
template<typename... _Args>
std::pair<iterator, bool> std::set< _Key, _Compare, _Alloc >::emplace (
            _Args &&... __args ) [inline]
```

Attempts to build and insert an element into the set.

Parameters

__args	Arguments used to generate an element.

Returns

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to build and insert an element into the set. A set relies on unique keys and thus an element is only inserted if it is not already present in the set.
Insertion requires logarithmic time.
Definition at line 462 of file stl_set.h.

4.927.4.10 emplace_hint()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename
_Alloc = std::allocator<_Key>>
template<typename... _Args>
iterator std::set< _Key, _Compare, _Alloc >::emplace_hint (
            const_iterator __pos,
            _Args &&... __args ) [inline]
```

Attempts to insert an element into the set.

Parameters

__pos	An iterator that serves as a hint as to where the element should be inserted.
__args	Arguments used to generate the element to be inserted.

Returns

An iterator that points to the element with key equivalent to the one generated from *__args* (may or may not be the element itself).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument emplace() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.
For more on *hinting*, see: https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints
Insertion requires logarithmic time (if the hint is not taken).
Definition at line 488 of file stl_set.h.

4.927.4.11 empty()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc
= std::allocator<_Key>>
bool std::set< _Key, _Compare, _Alloc >::empty ( ) const [inline], [noexcept]
```

Returns true if the set is empty.
Definition at line 414 of file stl_set.h.

4.927.4.12 end() template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>

```
iterator std::set< _Key, _Compare, _Alloc >::end ( ) const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the set. Iteration is done in ascending order according to the keys.
Definition at line 353 of file stl_set.h.

4.927.4.13 equal_range() [1/4] template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>

```
template<typename _Kt >
auto std::set< _Key, _Compare, _Alloc >::equal_range (
            const _Kt & __x ) -> decltype(pair<iterator, iterator>(_M_t._M_equal_range_tr(__x)))
[inline]
```

Finds a subsequence matching given key.

Parameters

_↩ _x	Key to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
               c.upper_bound(val))
```

(but is faster than making the calls separately).
This function probably only makes sense for multisets.
Definition at line 908 of file stl_set.h.

4.927.4.14 equal_range() [2/4] template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>

```
template<typename _Kt >
auto std::set< _Key, _Compare, _Alloc >::equal_range (
            const _Kt & __x ) const -> decltype(pair<iterator, iterator>(_M_t._M_equal_range_↩
tr(__x)))   [inline]
```

Finds a subsequence matching given key.

Parameters

_↩ _x	Key to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
               c.upper_bound(val))
```

(but is faster than making the calls separately).
This function probably only makes sense for multisets.

Definition at line 914 of file stl_set.h.

4.927.4.15 equal_range() [3/4]

```
template<typename _Key , typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>>
std::pair<iterator, iterator> std::set< _Key, _Compare, _Alloc >::equal_range (
            const key_type & __x )  [inline]
```

Finds a subsequence matching given key.

Parameters

_↩ _x	Key to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
               c.upper_bound(val))
```

(but is faster than making the calls separately).
This function probably only makes sense for multisets.
Definition at line 898 of file stl_set.h.

4.927.4.16 equal_range() [4/4]

```
template<typename _Key , typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>>
std::pair<const_iterator, const_iterator> std::set< _Key, _Compare, _Alloc >::equal_range (
            const key_type & __x ) const  [inline]
```

Finds a subsequence matching given key.

Parameters

_↩ _x	Key to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
               c.upper_bound(val))
```

(but is faster than making the calls separately).
This function probably only makes sense for multisets.
Definition at line 902 of file stl_set.h.

4.927.4.17 erase() [1/3]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename ↩
_Alloc = std::allocator<_Key>>
size_type std::set< _Key, _Compare, _Alloc >::erase (
            const key_type & __x )  [inline]
```

Erases elements according to the provided key.

Parameters

_↩ _x	Key of element to be erased.

Returns

The number of elements erased.

This function erases all the elements located by the given key from a set. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
Definition at line 684 of file stl_set.h.

4.927.4.18 erase() [2/3]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename ↩
_Alloc = std::allocator<_Key>>
_GLIBCXX_ABI_TAG_CXX11 iterator std::set< _Key, _Compare, _Alloc >::erase (
            const_iterator __first,
            const_iterator __last )  [inline]
```

Erases a [__first,__last) range of elements from a set.

Parameters

__first	Iterator pointing to the start of the range to be erased.
__last	Iterator pointing to the end of the range to be erased.

Returns

The iterator *__last*.

This function erases a sequence of elements from a set. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
Definition at line 706 of file stl_set.h.

4.927.4.19 erase() [3/3]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename ↩
_Alloc = std::allocator<_Key>>
_GLIBCXX_ABI_TAG_CXX11 iterator std::set< _Key, _Compare, _Alloc >::erase (
            const_iterator __position )  [inline]
```

Erases an element from a set.

Parameters

__position	An iterator pointing to the element to be erased.

Returns

An iterator pointing to the element immediately following *__position* prior to the element being erased. If no such element exists, end() is returned.

This function erases an element, pointed to by the given iterator, from a set. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the

pointer is the user's responsibility.
Definition at line 654 of file stl_set.h.

4.927.4.20 find() [1/4]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _↩
Alloc = std::allocator<_Key>>
template<typename _Kt >
auto std::set< _Key, _Compare, _Alloc >::find (
            const _Kt & __x ) -> decltype(iterator{_M_t._M_find_tr(__x)})   [inline]
```

Tries to locate an element in a set.

Parameters

_↩ _x	Element to be located.

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.
Definition at line 804 of file stl_set.h.

4.927.4.21 find() [2/4]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _↩
Alloc = std::allocator<_Key>>
template<typename _Kt >
auto std::set< _Key, _Compare, _Alloc >::find (
            const _Kt & __x ) const -> decltype(const_iterator{_M_t._M_find_tr(__x)})   [inline]
```

Tries to locate an element in a set.

Parameters

_↩ _x	Element to be located.

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.
Definition at line 810 of file stl_set.h.

4.927.4.22 find() [3/4]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _↩
Alloc = std::allocator<_Key>>
iterator std::set< _Key, _Compare, _Alloc >::find (
            const key_type & __x )  [inline]
```

Tries to locate an element in a set.

Parameters

_↩ _x	Element to be located.

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.
Definition at line 794 of file stl_set.h.

4.927.4.23 find() [4/4]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _↩
Alloc = std::allocator<_Key>>
const_iterator std::set< _Key, _Compare, _Alloc >::find (
            const key_type & __x ) const  [inline]
```

Tries to locate an element in a set.

Parameters

_↩ _x	Element to be located.

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.
Definition at line 798 of file stl_set.h.

4.927.4.24 get_allocator()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename
_Alloc = std::allocator<_Key>>
allocator_type std::set< _Key, _Compare, _Alloc >::get_allocator ( ) const  [inline], [noexcept]
```

Returns the allocator object with which the set was constructed.
Definition at line 335 of file stl_set.h.

4.927.4.25 insert() [1/4]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename
_Alloc = std::allocator<_Key>>
template<typename _InputIterator >
void std::set< _Key, _Compare, _Alloc >::insert (
            _InputIterator __first,
            _InputIterator __last )  [inline]
```

A template function that attempts to insert a range of elements.

Parameters

__first	Iterator pointing to the start of the range to be inserted.
__last	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.
Definition at line 566 of file stl_set.h.

4.927.4.26 insert() [2/4] template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>

```
std::pair<iterator, bool> std::set< _Key, _Compare, _Alloc >::insert (
            const value_type & __x )  [inline]
```

Attempts to insert an element into the set.

Parameters

_↩ _x	Element to be inserted.

Returns

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to insert an element into the set. A set relies on unique keys and thus an element is only inserted if it is not already present in the set.
Insertion requires logarithmic time.
Definition at line 509 of file stl_set.h.
References std::pair< _T1, _T2 >::first, and std::pair< _T1, _T2 >::second.
Referenced by std::set< _Key, _Compare, _Alloc >::insert().

4.927.4.27 insert() [3/4] template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>

```
iterator std::set< _Key, _Compare, _Alloc >::insert (
            const_iterator __position,
            const value_type & __x )  [inline]
```

Attempts to insert an element into the set.

Parameters

__position	An iterator that serves as a hint as to where the element should be inserted.
__x	Element to be inserted.

Returns

An iterator that points to the element with key of *__x* (may or may not be the element passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument insert() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.
For more on *hinting*, see: https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.↩ html#containers.associative.insert_hints
Insertion requires logarithmic time (if the hint is not taken).
Definition at line 546 of file stl_set.h.

4.927.4.28 insert() [4/4] template<typename _Key , typename _Compare = std::less<_Key>, typename

```
_Alloc = std::allocator<_Key>>
void std::set< _Key, _Compare, _Alloc >::insert (
            initializer_list< value_type > __l )  [inline]
```

Attempts to insert a list of elements into the set.

Parameters

↩ _↩ ↩ _↩ *l*	A std::initializer_list<value_type> of elements to be inserted.

Complexity similar to that of the range constructor.
Definition at line 578 of file stl_set.h.
References std::set< _Key, _Compare, _Alloc >::insert().

4.927.4.29 key_comp()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _↩
Alloc = std::allocator<_Key>>
key_compare std::set< _Key, _Compare, _Alloc >::key_comp ( ) const  [inline]
```

Returns the comparison object with which the set was constructed.
Definition at line 327 of file stl_set.h.

4.927.4.30 lower_bound() [1/4]

```
template<typename _Key , typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>>
template<typename _Kt >
auto std::set< _Key, _Compare, _Alloc >::lower_bound (
            const _Kt & __x ) -> decltype(iterator(_M_t._M_lower_bound_tr(__x)))  [inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

_↩ *_x*	Key to be located.

Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.
Definition at line 839 of file stl_set.h.

4.927.4.31 lower_bound() [2/4]

```
template<typename _Key , typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>>
template<typename _Kt >
auto std::set< _Key, _Compare, _Alloc >::lower_bound (
            const _Kt & __x ) const -> decltype(const_iterator(_M_t._M_lower_bound_tr(__x)))
[inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

_↩ _x	Key to be located.

Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists. Definition at line 845 of file stl_set.h.

4.927.4.32 lower_bound() [3/4]

```
template<typename _Key , typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>>
iterator std::set< _Key, _Compare, _Alloc >::lower_bound (
            const key_type & __x )  [inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

_↩ _x	Key to be located.

Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists. Definition at line 829 of file stl_set.h.

4.927.4.33 lower_bound() [4/4]

```
template<typename _Key , typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>>
const_iterator std::set< _Key, _Compare, _Alloc >::lower_bound (
            const key_type & __x ) const  [inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

_↩ _x	Key to be located.

Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists. Definition at line 833 of file stl_set.h.

4.927.4.34 max_size() template<typename _Key , typename _Compare = std::less<_Key>, typename _↩ Alloc = std::allocator<_Key>>

size_type std::set< _Key, _Compare, _Alloc >::max_size ( ) const [inline], [noexcept]

Returns the maximum size of the set.

Definition at line 424 of file stl_set.h.

4.927.4.35 operator=() [1/3] template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>

set& std::set< _Key, _Compare, _Alloc >::operator= (
const set< _Key, _Compare, _Alloc > &) [default]

Set assignment operator.

Whether the allocator is copied depends on the allocator traits.

4.927.4.36 operator=() [2/3] template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>

set& std::set< _Key, _Compare, _Alloc >::operator= (
initializer_list< value_type > __*l*) [inline]

Set list assignment operator.

Parameters

↩ _↩ ↩ _↩ *l*	An initializer_list.

This function fills a set with copies of the elements in the initializer list __*l*.

Note that the assignment completely changes the set and that the resulting set's size is the same as the number of elements assigned.

Definition at line 316 of file stl_set.h.

4.927.4.37 operator=() [3/3] template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>

set& std::set< _Key, _Compare, _Alloc >::operator= (
set< _Key, _Compare, _Alloc > &&) [default]

Move assignment operator.

4.927.4.38 rbegin() template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>

reverse_iterator std::set< _Key, _Compare, _Alloc >::rbegin ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points to the last element in the set. Iteration is done in descending order according to the keys.

Definition at line 362 of file stl_set.h.

4.927.4.39 rend() template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>

reverse_iterator std::set< _Key, _Compare, _Alloc >::rend ( ) const [inline], [noexcept]

Returns a read-only (constant) reverse iterator that points to the last pair in the set. Iteration is done in descending order according to the keys.
Definition at line 371 of file stl_set.h.

4.927.4.40 size() `template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>`

```
size_type std::set< _Key, _Compare, _Alloc >::size ( ) const  [inline], [noexcept]
```

Returns the size of the set.
Definition at line 419 of file stl_set.h.

4.927.4.41 swap() `template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>`

```
void std::set< _Key, _Compare, _Alloc >::swap (
            set< _Key, _Compare, _Alloc > & __x )  [inline], [noexcept]
```

Swaps data with another set.

Parameters

_↩ _x	A set of the same element and allocator types.

This exchanges the elements between two sets in constant time. (It is only swapping a pointer, an integer, and an instance of the `Compare` type (which itself is often stateless and empty), so it should be quite fast.) Note that the global std::swap() function is specialized such that std::swap(s1,s2) will feed to this function.
Whether the allocators are swapped depends on the allocator traits.
Definition at line 441 of file stl_set.h.

4.927.4.42 upper_bound() [1/4] `template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>`

```
template<typename _Kt >
auto std::set< _Key, _Compare, _Alloc >::upper_bound (
            const _Kt & __x ) -> decltype(iterator(_M_t._M_upper_bound_tr(__x)))  [inline]
```

Finds the end of a subsequence matching given key.

Parameters

_↩ _x	Key to be located.

Returns

Iterator pointing to the first element greater than key, or end().

Definition at line 869 of file stl_set.h.

4.927.4.43 upper_bound() [2/4] `template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>`

```
template<typename _Kt >
auto std::set< _Key, _Compare, _Alloc >::upper_bound (
            const _Kt & __x ) const -> decltype(iterator(_M_t._M_upper_bound_tr(__x)))  [inline]
```

Finds the end of a subsequence matching given key.

Parameters

_↩ _x	Key to be located.

Returns

Iterator pointing to the first element greater than key, or end().

Definition at line 875 of file stl_set.h.

4.927.4.44 upper_bound() [3/4]

```
template<typename _Key , typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>>
iterator std::set< _Key, _Compare, _Alloc >::upper_bound (
            const key_type & __x )  [inline]
```

Finds the end of a subsequence matching given key.

Parameters

_↩ _x	Key to be located.

Returns

Iterator pointing to the first element greater than key, or end().

Definition at line 859 of file stl_set.h.

4.927.4.45 upper_bound() [4/4]

```
template<typename _Key , typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>>
const_iterator std::set< _Key, _Compare, _Alloc >::upper_bound (
            const key_type & __x ) const  [inline]
```

Finds the end of a subsequence matching given key.

Parameters

_↩ _x	Key to be located.

Returns

Iterator pointing to the first element greater than key, or end().

Definition at line 863 of file stl_set.h.

4.927.4.46 value_comp()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename
_Alloc = std::allocator<_Key>>
value_compare std::set< _Key, _Compare, _Alloc >::value_comp ( ) const  [inline]
```

Returns the comparison object with which the set was constructed.
Definition at line 331 of file stl_set.h.

4.932.1 Detailed Description

template<typename _Tp>
class std::shared_ptr< _Tp >

A smart pointer with reference-counted copy semantics.
A `shared_ptr` object is either empty or *owns* a pointer passed to the constructor. Copies of a `shared_ptr` share ownership of the same pointer. When the last `shared_ptr` that owns the pointer is destroyed or reset, the owned pointer is freed (either by `delete` or by invoking a custom deleter that was passed to the constructor).
A `shared_ptr` also stores another pointer, which is usually (but not always) the same pointer as it owns. The stored pointer can be retrieved by calling the `get()` member function.
The equality and relational operators for `shared_ptr` only compare the stored pointer returned by `get()`, not the owned pointer. To test whether two `shared_ptr` objects share ownership of the same pointer see `std::shared_ptr::owner_before` and `std::owner_less`.
Definition at line 121 of file bits/shared_ptr.h.

4.932.2 Member Typedef Documentation

4.932.2.1 element_type `template<typename _Tp >`

```
using std::shared_ptr< _Tp >::element_type = typename __shared_ptr<_Tp>::element_type
```

The type pointed to by the stored pointer, remove_extent_t<_Tp>
Definition at line 136 of file bits/shared_ptr.h.

4.932.3 Constructor & Destructor Documentation

4.932.3.1 shared_ptr() [1/13] `template<typename _Tp >`

```
constexpr std::shared_ptr< _Tp >::shared_ptr ( )  [inline], [constexpr], [noexcept]
```

Construct an empty shared_ptr.

Postcondition

use_count()==0 && get()==0

Definition at line 147 of file bits/shared_ptr.h.

4.932.3.2 shared_ptr() [2/13] `template<typename _Tp >`

```
std::shared_ptr< _Tp >::shared_ptr (
            const shared_ptr< _Tp > &  )  [default], [noexcept]
```

Copy constructor.

4.932.3.3 shared_ptr() [3/13] `template<typename _Tp >`

```
template<typename _Yp , typename = _Constructible<_Yp*>>
std::shared_ptr< _Tp >::shared_ptr (
            _Yp * __p )  [inline], [explicit]
```

Construct a shared_ptr that owns the pointer *__p*.

Parameters

_↩ _p	A pointer that is convertible to element_type*.

Postcondition

use_count() == 1 && get() == __p

Exceptions

std::bad_alloc,in	which case `delete` *__p* is called.

Definition at line 159 of file bits/shared_ptr.h.

4.932.3.4 shared_ptr() [4/13] `template<typename _Tp >`

```
template<typename _Yp , typename _Deleter , typename = _Constructible<_Yp*, _Deleter>>
std::shared_ptr< _Tp >::shared_ptr (
            _Yp * __p,
            _Deleter __d ) [inline]
```

Construct a shared_ptr that owns the pointer *__p* and the deleter *__d*.

Parameters

_↩ _p	A pointer.
_↩ _d	A deleter.

Postcondition

use_count() == 1 && get() == __p

Exceptions

std::bad_alloc,in	which case *__d(__p)* is called.

Requirements: _Deleter's copy constructor and destructor must not throw
__shared_ptr will release __p by calling __d(__p)
Definition at line 176 of file bits/shared_ptr.h.

4.932.3.5 shared_ptr() [5/13]

```
template<typename _Tp >
template<typename _Deleter >
std::shared_ptr< _Tp >::shared_ptr (
            nullptr_t __p,
            _Deleter __d ) [inline]
```

Construct a shared_ptr that owns a null pointer and the deleter *__d*.

Parameters

_↩ _p	A null pointer constant.
_↩ _d	A deleter.

Postcondition

use_count() == 1 && get() == __p

Exceptions

std::bad_alloc,in	which case *__d(__p)* is called.

Requirements: _Deleter's copy constructor and destructor must not throw
The last owner will call __d(__p)
Definition at line 193 of file bits/shared_ptr.h.

4.932.3.6 shared_ptr() [6/13] template<typename _Tp >

```
template<typename _Yp , typename _Deleter , typename _Alloc , typename = _Constructible<_Yp*, _↩
Deleter, _Alloc>>
std::shared_ptr< _Tp >::shared_ptr (
            _Yp * __p,
            _Deleter __d,
            _Alloc __a )  [inline]
```

Construct a shared_ptr that owns the pointer *__p* and the deleter *__d*.

Parameters

_↩ _*p*	A pointer.
_↩ _*d*	A deleter.
_↩ _*a*	An allocator.

Postcondition

use_count() == 1 && get() == __p

Exceptions

std::bad_alloc,in	which case *__d(__p)* is called.

Requirements: _Deleter's copy constructor and destructor must not throw _Alloc's copy constructor and destructor must not throw.
__shared_ptr will release __p by calling __d(__p)
Definition at line 213 of file bits/shared_ptr.h.

4.932.3.7 shared_ptr() [7/13] template<typename _Tp >

```
template<typename _Deleter , typename _Alloc >
std::shared_ptr< _Tp >::shared_ptr (
            nullptr_t __p,
            _Deleter __d,
            _Alloc __a )  [inline]
```

Construct a shared_ptr that owns a null pointer and the deleter *__d*.

Parameters

_↩ _*p*	A null pointer constant.
_↩ _*d*	A deleter.
_↩ _*a*	An allocator.

Postcondition

use_count() == 1 && get() == __p

Exceptions

std::bad_alloc,in	which case *__d(__p)* is called.

Requirements: _Deleter's copy constructor and destructor must not throw _Alloc's copy constructor and destructor must not throw.
The last owner will call __d(__p)
Definition at line 232 of file bits/shared_ptr.h.

4.932.3.8 shared_ptr() [8/13] template<typename _Tp >

```
template<typename _Yp >
std::shared_ptr< _Tp >::shared_ptr (
            const shared_ptr< _Yp > & __r,
            element_type * __p )  [inline], [noexcept]
```

Constructs a `shared_ptr` instance that stores `__p` and shares ownership with `__r`.

Parameters

_↩ _*r*	A `shared_ptr`.
_↩ _*p*	A pointer that will remain valid while `*__r` is valid.

Postcondition

`get() == __p && use_count() == __r.use_count()`

This can be used to construct a `shared_ptr` to a sub-object of an object managed by an existing `shared_ptr`. The complete object will remain valid while any `shared_ptr` owns it, even if they don't store a pointer to the complete object.

```
shared_ptr<pair<int,int>> pii(new pair<int,int>());
shared_ptr<int> pi(pii, &pii->first);
assert(pii.use_count() == 2);
```

Definition at line 256 of file bits/shared_ptr.h.

4.932.3.9 shared_ptr() [9/13] template<typename _Tp >

```
template<typename _Yp , typename = _Constructible<const shared_ptr<_Yp>&>>
std::shared_ptr< _Tp >::shared_ptr (
            const shared_ptr< _Yp > & __r )  [inline], [noexcept]
```

If *__r* is empty, constructs an empty shared_ptr; otherwise construct a shared_ptr that shares ownership with *__r*.

Parameters

↩ _↩ ↩ _↩ *r*	A shared_ptr.

Postcondition

get() == __r.get() && use_count() == __r.use_count()

Definition at line 295 of file bits/shared_ptr.h.

4.932.3.10 shared_ptr() [10/13] template<typename _Tp >

```
std::shared_ptr< _Tp >::shared_ptr (
            shared_ptr< _Tp > && __r )  [inline], [noexcept]
```

Move-constructs a shared_ptr instance from *__r*.

Parameters

↩ _↩ ↩ _↩ *r*	A shared_ptr rvalue.

Postcondition

∗this contains the old value of *__r*, *__r* is empty.

Definition at line 303 of file bits/shared_ptr.h.

4.932.3.11 shared_ptr() [11/13] template<typename _Tp >

```
template<typename _Yp , typename = _Constructible<shared_ptr<_Yp>>>
std::shared_ptr< _Tp >::shared_ptr (
            shared_ptr< _Yp > && __r )  [inline], [noexcept]
```

Move-constructs a shared_ptr instance from *__r*.

Parameters

↩ _↩ ↩ _↩ *r*	A shared_ptr rvalue.

Postcondition

∗this contains the old value of *__r*, *__r* is empty.

Definition at line 312 of file bits/shared_ptr.h.

4.932.3.12 shared_ptr() [12/13] template<typename _Tp >

```
template<typename _Yp , typename = _Constructible<const weak_ptr<_Yp>&>>
std::shared_ptr< _Tp >::shared_ptr (
            const weak_ptr< _Yp > & __r )  [inline], [explicit]
```

Constructs a shared_ptr that shares ownership with *__r* and stores a copy of the pointer stored in *__r*.

Parameters

↩ _↩ ↩ _↩ *r*	A weak_ptr.

Postcondition

use_count() == __r.use_count()

Exceptions

bad_weak_ptr	when __r.expired(), in which case the constructor has no effect.

Definition at line 324 of file bits/shared_ptr.h.

4.932.3.13 shared_ptr() [13/13]

```
template<typename _Tp >
constexpr std::shared_ptr< _Tp >::shared_ptr (
            nullptr_t ) [inline], [constexpr], [noexcept]
```

Construct an empty shared_ptr.

Postcondition

use_count() == 0 && get() == nullptr

Definition at line 356 of file bits/shared_ptr.h.

4.932.4 Member Function Documentation

4.932.4.1 get()

```
template<typename _Tp , _Lock_policy _Lp>
element_type* std::__shared_ptr< _Tp, _Lp >::get (
            void ) const [inline], [noexcept], [inherited]
```

Return the stored pointer.
Definition at line 1329 of file shared_ptr_base.h.

4.932.4.2 operator bool()

```
template<typename _Tp , _Lock_policy _Lp>
std::__shared_ptr< _Tp, _Lp >::operator bool ( ) const [inline], [explicit], [inherited]
```

Return true if the stored pointer is not null.
Definition at line 1333 of file shared_ptr_base.h.

4.932.4.3 owner_before() [1/2]

```
template<typename _Tp , _Lock_policy _Lp>
template<typename _Tp1 >
bool std::__shared_ptr< _Tp, _Lp >::owner_before (
            __shared_ptr< _Tp1, _Lp > const & __rhs ) const [inline], [noexcept], [inherited]
```

Define an ordering based on ownership.

This function defines a strict weak ordering between two shared_ptr or weak_ptr objects, such that one object is less than the other unless they share ownership of the same pointer, or are both empty.
Definition at line 1363 of file shared_ptr_base.h.

4.932.4.4 owner_before() [2/2] template<typename _Tp , _Lock_policy _Lp>

```
template<typename _Tp1 >
bool std::__shared_ptr< _Tp, _Lp >::owner_before (
            __weak_ptr< _Tp1, _Lp > const & __rhs ) const  [inline], [noexcept], [inherited]
```

Define an ordering based on ownership.
This function defines a strict weak ordering between two shared_ptr or weak_ptr objects, such that one object is less than the other unless they share ownership of the same pointer, or are both empty.
Definition at line 1368 of file shared_ptr_base.h.

4.932.4.5 swap() template<typename _Tp , _Lock_policy _Lp>

```
void std::__shared_ptr< _Tp, _Lp >::swap (
            __shared_ptr< _Tp, _Lp > & __other )  [inline], [noexcept], [inherited]
```

Exchange both the owned pointer and the stored pointer.
Definition at line 1348 of file shared_ptr_base.h.

4.932.4.6 unique() template<typename _Tp , _Lock_policy _Lp>

```
bool std::__shared_ptr< _Tp, _Lp >::unique ( ) const  [inline], [noexcept], [inherited]
```

Return true if use_count() == 1.
Definition at line 1338 of file shared_ptr_base.h.

4.932.4.7 use_count() template<typename _Tp , _Lock_policy _Lp>

```
long std::__shared_ptr< _Tp, _Lp >::use_count ( ) const  [inline], [noexcept], [inherited]
```

If ∗this owns a pointer, return the number of owners, otherwise zero.
Definition at line 1343 of file shared_ptr_base.h.

4.934.1 Detailed Description

template<typename _RandomNumberEngine, size_t __k>
class std::shuffle_order_engine< _RandomNumberEngine, __k >

Produces random numbers by combining random numbers from some base engine to produce random numbers with a specifies number of bits __k.
Definition at line 1324 of file random.h.

4.934.2 Member Typedef Documentation

4.934.2.1 result_type `template<typename _RandomNumberEngine , size_t __k>`

`typedef _RandomNumberEngine::result_type std::shuffle_order_engine< _RandomNumberEngine, __k >::result_type`

The type of the generated random value.
Definition at line 1331 of file random.h.

4.934.3 Constructor & Destructor Documentation

4.934.3.1 shuffle_order_engine() [1/5] `template<typename _RandomNumberEngine , size_t __k>`

`std::shuffle_order_engine< _RandomNumberEngine, __k >::shuffle_order_engine ( ) [inline]`

Constructs a default shuffle_order_engine engine.
The underlying engine is default constructed as well.
Definition at line 1344 of file random.h.

4.934.3.2 shuffle_order_engine() [2/5] `template<typename _RandomNumberEngine , size_t __k>`

```
std::shuffle_order_engine< _RandomNumberEngine, __k >::shuffle_order_engine (
            const _RandomNumberEngine & __rng ) [inline], [explicit]
```

Copy constructs a shuffle_order_engine engine.
Copies an existing base class random number generator.

Parameters

__rng	An existing (base class) engine object.

Definition at line 1355 of file random.h.

4.934.3.3 shuffle_order_engine() [3/5] `template<typename _RandomNumberEngine , size_t __k>`

std::shuffle_order_engine< _RandomNumberEngine, __k >::shuffle_order_engine (_RandomNumberEngine && __rng) [inline], [explicit]

Move constructs a shuffle_order_engine engine.
Copies an existing base class random number generator.

Parameters

__rng	An existing (base class) engine object.

Definition at line 1366 of file random.h.

4.934.3.4 shuffle_order_engine() [4/5] template<typename _RandomNumberEngine , size_t __k>

std::shuffle_order_engine< _RandomNumberEngine, __k >::shuffle_order_engine (result_type __s) [inline], [explicit]

Seed constructs a shuffle_order_engine engine.
Constructs the underlying generator engine seeded with __s.

Parameters

_↩ _s	A seed value for the base class engine.

Definition at line 1377 of file random.h.

4.934.3.5 shuffle_order_engine() [5/5] template<typename _RandomNumberEngine , size_t __k>

template<typename _Sseq , typename = _If_seed_seq<_Sseq>>
std::shuffle_order_engine< _RandomNumberEngine, __k >::shuffle_order_engine (_Sseq & __q) [inline], [explicit]

Generator construct a shuffle_order_engine engine.

Parameters

_↩ _q	A seed sequence.

Definition at line 1388 of file random.h.

4.934.4 Member Function Documentation

4.934.4.1 base() template<typename _RandomNumberEngine , size_t __k>

const _RandomNumberEngine& std::shuffle_order_engine< _RandomNumberEngine, __k >::base ( ) const [inline], [noexcept]

Gets a const reference to the underlying generator engine object.
Definition at line 1431 of file random.h.

4.934.4.2 discard() template<typename _RandomNumberEngine , size_t __k>

void std::shuffle_order_engine< _RandomNumberEngine, __k >::discard (unsigned long long __z) [inline]

Discard a sequence of random numbers.
Definition at line 1452 of file random.h.

4.934.4.3 max() template<typename _RandomNumberEngine , size_t __k>

static constexpr result_type std::shuffle_order_engine< _RandomNumberEngine, __k >::max ( ) [inline], [static], [constexpr]

Gets the maximum value in the generated random number range.
Definition at line 1445 of file random.h.
References std::max().

4.934.4.4 min() template<typename _RandomNumberEngine , size_t __k>

static constexpr result_type std::shuffle_order_engine< _RandomNumberEngine, __k >::min ( ) [inline], [static], [constexpr]

Gets the minimum value in the generated random number range.
Definition at line 1438 of file random.h.
References std::min().

4.934.4.5 operator()() template<typename _RandomNumberEngine , size_t __k>

shuffle_order_engine< _RandomNumberEngine, __k >::result_type std::shuffle_order_engine< _↩ RandomNumberEngine, __k >::operator()

Gets the next value in the generated random number sequence.
Definition at line 809 of file bits/random.tcc.

4.934.4.6 seed() [1/3] template<typename _RandomNumberEngine , size_t __k>

void std::shuffle_order_engine< _RandomNumberEngine, __k >::seed ( ) [inline]

Reseeds the shuffle_order_engine object with the default seed for the underlying base class generator engine.
Definition at line 1397 of file random.h.

4.934.4.7 seed() [2/3] template<typename _RandomNumberEngine , size_t __k>

template<typename _Sseq >
_If_seed_seq<_Sseq> std::shuffle_order_engine< _RandomNumberEngine, __k >::seed (_Sseq & __q) [inline]

Reseeds the shuffle_order_engine object with the given seed sequence.

Parameters

_↩ _q	A seed generator function.

Definition at line 1421 of file random.h.

4.934.4.8 seed() [3/3] template<typename _RandomNumberEngine , size_t __k>

void std::shuffle_order_engine< _RandomNumberEngine, __k >::seed (result_type __s) [inline]

Reseeds the shuffle_order_engine object with the default seed for the underlying base class generator engine.
Definition at line 1408 of file random.h.

4.934.5 Friends And Related Function Documentation

4.934.5.1 operator<< template<typename _RandomNumberEngine , size_t __k>

```
template<typename _RandomNumberEngine1 , size_t __k1, typename _CharT , typename _Traits >
std::basic_ostream<_CharT, _Traits>& operator<< (
            std::basic_ostream< _CharT, _Traits > & __os,
            const std::shuffle_order_engine< _RandomNumberEngine1, __k1 > & __x )  [friend]
```

Inserts the current state of a shuffle_order_engine random number generator engine __x into the output stream __os.

Parameters

__os	An output stream.
__x	A shuffle_order_engine random number generator engine.

Returns

The output stream with the state of __x inserted or in an error state.

4.934.5.2 operator== template<typename _RandomNumberEngine , size_t __k>

```
bool operator== (
            const shuffle_order_engine< _RandomNumberEngine, __k > & __lhs,
            const shuffle_order_engine< _RandomNumberEngine, __k > & __rhs )  [friend]
```

Compares two shuffle_order_engine random number generator objects of the same type for equality.

Parameters

__lhs	A shuffle_order_engine random number generator object.
__rhs	Another shuffle_order_engine random number generator object.

Returns

true if the infinite sequences of generated values would be equal, false otherwise.

Definition at line 1476 of file random.h.

4.934.5.3 operator>> template<typename _RandomNumberEngine , size_t __k>

```
template<typename _RandomNumberEngine1 , size_t __k1, typename _CharT , typename _Traits >
std::basic_istream<_CharT, _Traits>& operator>> (
            std::basic_istream< _CharT, _Traits > & __is,
            std::shuffle_order_engine< _RandomNumberEngine1, __k1 > & __x )  [friend]
```

Extracts the current state of a % subtract_with_carry_engine random number generator engine __x from the input stream __is.

Parameters

_↩ _is	An input stream.
_↩ _x	A shuffle_order_engine random number generator engine.

Returns

The input stream with the state of __x extracted or in an error state.

4.935 std::slice Class Reference

Public Member Functions

- slice ()
- slice (size_t __o, size_t __d, size_t __s)
- size_t size () const
- size_t start () const
- size_t stride () const

4.935.1 Detailed Description

Class defining one-dimensional subset of an array.
The slice class represents a one-dimensional subset of an array, specified by three parameters: start offset, size, and stride. The start offset is the index of the first element of the array that is part of the subset. The size is the total number of elements in the subset. Stride is the distance between each successive array element to include in the subset.
For example, with an array of size 10, and a slice with offset 1, size 3 and stride 2, the subset consists of array elements 1, 3, and 5.
Definition at line 59 of file slice_array.h.
The documentation for this class was generated from the following file:

- slice_array.h

Friends

- class **valarray< _Tp >**

4.936.1 Detailed Description

template<typename _Tp>
class std::slice_array< _Tp >

Reference to one-dimensional subset of an array.
A slice_array is a reference to the actual elements of an array specified by a slice. The way to get a slice_array is to call operator[](slice) on a valarray. The returned slice_array then permits carrying operations out on the referenced subset of elements in the original valarray. For example, operator+=(valarray) will add values to the subset of elements in the underlying valarray this slice_array refers to.

Parameters

Tp	Element type.

Definition at line 128 of file slice_array.h.
The documentation for this class was generated from the following files:

- valarray
- slice_array.h

4.938.1 Detailed Description

template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _Alloc>
class __gnu_pbds::detail::splay_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >

Splay tree.
Definition at line 107 of file splay_tree_.hpp.

4.938.2 Member Function Documentation

4.938.2.1 node_begin() [1/2]

```
template<typename Key , typename Mapped , typename Cmp_Fn , typename
Node_And_It_Traits , typename _Alloc >
node_iterator __gnu_pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, ↩
_Alloc >::node_begin ( ) [inline], [inherited]
```

Returns a node_iterator corresponding to the node at the root of the tree.

4.938.2.2 node_begin() [2/2]

```
template<typename Key , typename Mapped , typename Cmp_Fn , typename
Node_And_It_Traits , typename _Alloc >
node_const_iterator __gnu_pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_↩
Traits, _Alloc >::node_begin ( ) const [inline], [inherited]
```

Returns a const node_iterator corresponding to the node at the root of the tree.

4.938.2.3 node_end() [1/2]

```
template<typename Key , typename Mapped , typename Cmp_Fn , typename
Node_And_It_Traits , typename _Alloc >
node_iterator __gnu_pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, ↩
_Alloc >::node_end ( )  [inline], [inherited]
```

Returns a node_iterator corresponding to a node just after a leaf of the tree.

4.938.2.4 node_end() [2/2]

```
template<typename Key , typename Mapped , typename Cmp_Fn , typename
Node_And_It_Traits , typename _Alloc >
node_const_iterator __gnu_pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_↩
Traits, _Alloc >::node_end ( ) const  [inline], [inherited]
```

Returns a const node_iterator corresponding to a node just after a leaf of the tree.
The documentation for this class was generated from the following file:

4.941.1 Detailed Description

template<typename _Tp, typename _Sequence = deque<_Tp>>
class std::stack< _Tp, _Sequence >

A standard container giving FILO behavior.

Template Parameters

_Tp	Type of element.
_Sequence	Type of underlying sequence, defaults to deque<_Tp>.

Meets many of the requirements of a `container`, but does not define anything to do with iterators. Very few of the other standard container interfaces are defined.
This is not a true container, but an *adaptor*. It holds another container, and provides a wrapper interface to that container. The wrapper is what enforces strict first-in-last-out stack behavior.
The second template parameter defines the type of the underlying sequence/container. It defaults to std::deque, but it can be any type that supports `back`, `push_back`, and `pop_back`, such as std::list, std::vector, or an appropriate user-defined type.
Members not found in *normal* containers are `container_type`, which is a typedef for the second Sequence parameter, and `push`, `pop`, and `top`, which are standard stack/FILO operations.
Definition at line 99 of file stl_stack.h.

4.941.2 Constructor & Destructor Documentation

4.941.2.1 stack() `template<typename _Tp , typename _Sequence = deque<_Tp>>`

```
template<typename _Seq = _Sequence, typename _Requires = typename enable_if<is_default_constructible<↩
_Seq>::value>::type>
std::stack< _Tp, _Sequence >::stack ( )  [inline]
```

Default constructor creates no elements.
Definition at line 162 of file stl_stack.h.

4.941.3 Member Function Documentation

4.941.3.1 empty() `template<typename _Tp , typename _Sequence = deque<_Tp>>`

```
bool std::stack< _Tp, _Sequence >::empty ( ) const  [inline]
```

Returns true if the stack is empty.
Definition at line 199 of file stl_stack.h.

4.941.3.2 pop() `template<typename _Tp , typename _Sequence = deque<_Tp>>`

```
void std::stack< _Tp, _Sequence >::pop ( )  [inline]
```

Removes first element.
This is a typical stack operation. It shrinks the stack by one. The time complexity of the operation depends on the underlying sequence.
Note that no data is returned, and if the first element's data is needed, it should be retrieved before pop() is called.
Definition at line 272 of file stl_stack.h.

4.941.3.3 push() template<typename _Tp , typename _Sequence = deque<_Tp>>

```
void std::stack< _Tp, _Sequence >::push (
            const value_type & __x )  [inline]
```

Add data to the top of the stack.

Parameters

_↩ _x	Data to be added.

This is a typical stack operation. The function creates an element at the top of the stack and assigns the given data to it. The time complexity of the operation depends on the underlying sequence.
Definition at line 239 of file stl_stack.h.

4.941.3.4 size() template<typename _Tp , typename _Sequence = deque<_Tp>>

```
size_type std::stack< _Tp, _Sequence >::size ( ) const  [inline]
```

Returns the number of elements in the stack.

Definition at line 204 of file stl_stack.h.

4.941.3.5 top() [1/2] template<typename _Tp , typename _Sequence = deque<_Tp>>

```
reference std::stack< _Tp, _Sequence >::top ( )  [inline]
```

Returns a read/write reference to the data at the first element of the stack.
Definition at line 212 of file stl_stack.h.

4.941.3.6 top() [2/2] template<typename _Tp , typename _Sequence = deque<_Tp>>

```
const_reference std::stack< _Tp, _Sequence >::top ( ) const  [inline]
```

Returns a read-only (constant) reference to the data at the first element of the stack.
Definition at line 223 of file stl_stack.h.
The documentation for this class was generated from the following file:

- stl_stack.h

4.942.1 Detailed Description

template<typename _CharT, typename _Traits = std::char_traits<_CharT>>
class __gnu_cxx::stdio_filebuf< _CharT, _Traits >

Provides a layer of compatibility for C/POSIX.
This GNU extension provides extensions for working with standard C FILE*'s and POSIX file descriptors. It must be instantiated by the user with the type of character used in the file stream, e.g., stdio_filebuf<char>.
Definition at line 50 of file stdio_filebuf.h.

4.942.2 Constructor & Destructor Documentation

4.942.2.1 stdio_filebuf() [1/3]

```
template<typename _CharT , typename _Traits = std::char_traits<_CharT>>
__gnu_cxx::stdio_filebuf< _CharT, _Traits >::stdio_filebuf ( ) [inline]
```

deferred initialization
Definition at line 65 of file stdio_filebuf.h.

4.942.2.2 stdio_filebuf() [2/3]

```
template<typename _CharT , typename _Traits >
__gnu_cxx::stdio_filebuf< _CharT, _Traits >::stdio_filebuf (
            int __fd,
            std::ios_base::openmode __mode,
            size_t __size = static_cast<size_t>(BUFSIZ) )
```

Parameters

__fd	An open file descriptor.
__mode	Same meaning as in a standard filebuf.
__size	Optimal or preferred size of internal buffer, in chars.

This constructor associates a file stream buffer with an open POSIX file descriptor. The file descriptor will be automatically closed when the stdio_filebuf is closed/destroyed.
Definition at line 136 of file stdio_filebuf.h.

4.942.2.3 stdio_filebuf() [3/3]

```
template<typename _CharT , typename _Traits >
__gnu_cxx::stdio_filebuf< _CharT, _Traits >::stdio_filebuf (
```

```
std::__c_file * __f,
std::ios_base::openmode __mode,
size_t __size = static_cast<size_t>(BUFSIZ) )
```

Parameters

__f	An open FILE*.
__mode	Same meaning as in a standard filebuf.
__size	Optimal or preferred size of internal buffer, in chars. Defaults to system's BUFSIZ.

This constructor associates a file stream buffer with an open C FILE*. The FILE* will not be automatically closed when the stdio_filebuf is closed/destroyed.
Definition at line 152 of file stdio_filebuf.h.

4.942.2.4 ~stdio_filebuf() template<typename _CharT , typename _Traits > __gnu_cxx::stdio_filebuf< _CharT, _Traits >::~stdio_filebuf [virtual]

Closes the external data stream if the file descriptor constructor was used.
Definition at line 132 of file stdio_filebuf.h.

4.942.3 Member Function Documentation

4.942.3.1 _M_create_pback() void std::basic_filebuf< _CharT, std::char_traits< _CharT > >::_M_create_pback ( ) [inline], [protected], [inherited]

Initializes pback buffers, and moves normal buffers to safety. Assumptions: _M_in_cur has already been moved back
Definition at line 199 of file fstream.

4.942.3.2 _M_destroy_pback() void std::basic_filebuf< _CharT, std::char_traits< _CharT > >::_M_destroy_pback ( ) throw ( ) [inline], [protected], [inherited]

Deactivates pback buffer contents, and restores normal buffer. Assumptions: The pback buffer has only moved forward.
Definition at line 216 of file fstream.

4.942.3.3 _M_set_buffer() void std::basic_filebuf< _CharT, std::char_traits< _CharT > >::_M_set_buffer (streamsize __off) [inline], [protected], [inherited]

This function sets the pointers of the internal buffer, both get and put areas. Typically:
__off == egptr() - eback() upon underflow/uflow (**read** mode); __off == 0 upon overflow (**write** mode); __off == -1 upon open, setbuf, seekoff/pos (**uncommitted** mode).
NB: epptr() - pbase() == _M_buf_size - 1, since _M_buf_size reflects the actual allocated memory and the last cell is reserved for the overflow char of a full put area.
Definition at line 459 of file fstream.

4.942.3.4 close() basic_filebuf< _CharT, std::char_traits< _CharT > >::__filebuf_type * std::basic_filebuf< _CharT, std::char_traits< _CharT > >::close [inherited]

Closes the currently associated file.

Returns

this on success, NULL on failure

If no file is currently open, this function immediately fails.
If a *put buffer area* exists, overflow(eof) is called to flush all the characters. The file is then closed.
If any operations fail, this function also fails.
Definition at line 361 of file fstream.tcc.

4.942.3.5 eback() char_type* std::basic_streambuf< _CharT, std::char_traits< _CharT > >::eback ( ) const [inline], [protected], [inherited]

Access to the get area.
These functions are only available to other protected functions, including derived classes.

- eback() returns the beginning pointer for the input sequence
- gptr() returns the next pointer for the input sequence
- egptr() returns the end pointer for the input sequence

Definition at line 489 of file streambuf.

4.942.3.6 egptr() char_type* std::basic_streambuf< _CharT, std::char_traits< _CharT > >::egptr ( ) const [inline], [protected], [inherited]

Access to the get area.
These functions are only available to other protected functions, including derived classes.

- eback() returns the beginning pointer for the input sequence
- gptr() returns the next pointer for the input sequence
- egptr() returns the end pointer for the input sequence

Definition at line 495 of file streambuf.

4.942.3.7 epptr() char_type* std::basic_streambuf< _CharT, std::char_traits< _CharT > >::epptr ( ) const [inline], [protected], [inherited]

Access to the put area.
These functions are only available to other protected functions, including derived classes.

- pbase() returns the beginning pointer for the output sequence
- pptr() returns the next pointer for the output sequence
- epptr() returns the end pointer for the output sequence

Definition at line 542 of file streambuf.

4.942.3.8 fd() template<typename _CharT , typename _Traits = std::char_traits<_CharT>> int __gnu_cxx::stdio_filebuf< _CharT, _Traits >::fd ( ) [inline]

Returns

The underlying file descriptor.

Once associated with an external data stream, this function can be used to access the underlying POSIX file descriptor.
Note that there is no way for the library to track what you do with the descriptor, so be careful.
Definition at line 118 of file stdio_filebuf.h.

4.942.3.9 file() template<typename _CharT , typename _Traits = std::char_traits<_CharT>> std::__c_file* __gnu_cxx::stdio_filebuf< _CharT, _Traits >::file ( ) [inline]

Returns

The underlying FILE*.

This function can be used to access the underlying "C" file pointer. Note that there is no way for the library to track what you do with the file, so be careful.
Definition at line 128 of file stdio_filebuf.h.

4.942.3.10 gbump() void std::basic_streambuf< _CharT, std::char_traits< _CharT > >::gbump (int __n) [inline], [protected], [inherited]

Moving the read position.

Parameters

_↩ _n	The delta by which to move.

This just advances the read position without returning any data.
Definition at line 505 of file streambuf.

4.942.3.11 getloc() locale std::basic_streambuf< _CharT, std::char_traits< _CharT > >::getloc ( ) const [inline], [inherited]

Locale access.

Returns

The current locale in effect.

If pubimbue(loc) has been called, then the most recent `loc` is returned. Otherwise the global locale in effect at the time of construction is returned.
Definition at line 233 of file streambuf.

4.942.3.12 gptr() char_type* std::basic_streambuf< _CharT, std::char_traits< _CharT > >::gptr ( ) const [inline], [protected], [inherited]

Access to the get area.
These functions are only available to other protected functions, including derived classes.

- eback() returns the beginning pointer for the input sequence
- gptr() returns the next pointer for the input sequence
- egptr() returns the end pointer for the input sequence

Definition at line 492 of file streambuf.

4.942.3.13 imbue() void std::basic_filebuf< _CharT, std::char_traits< _CharT > >::imbue (const locale & __loc) [protected], [virtual], [inherited]

Changes translations.

Parameters

__loc	A new locale.

Translations done during I/O which depend on the current locale are changed by this call. The standard adds, *Between invocations of this function a class derived from streambuf can safely cache results of calls to locale functions and to members of facets so obtained.*

Note

Base class version does nothing.

Reimplemented from std::basic_streambuf< _CharT, std::char_traits< _CharT > >.
Definition at line 434 of file fstream.tcc.

4.942.3.14 in_avail()

```
streamsize std::basic_streambuf< _CharT, std::char_traits< _CharT > >::in_avail ( ) [inline], [inherited]
```

Looking ahead into the stream.

Returns

The number of characters available.

If a read position is available, returns the number of characters available for reading before the buffer must be refilled. Otherwise returns the derived `showmanyc()`.
Definition at line 291 of file streambuf.

4.942.3.15 is_open()

```
bool std::basic_filebuf< _CharT, std::char_traits< _CharT > >::is_open ( ) const throw ( ) [inline], [inherited]
```

Returns true if the external file is open.
Definition at line 265 of file fstream.

4.942.3.16 open() [1/2]

```
basic_filebuf< _CharT, std::char_traits< _CharT > >::__filebuf_type * std::basic_filebuf< _CharT, std::char_traits< _CharT > >::open (
            const char * __s,
            ios_base::openmode __mode ) [inherited]
```

Opens an external file.

Parameters

__s	The name of the file.
__mode	The open mode flags.

Returns

`this` on success, NULL on failure

If a file is already open, this function immediately fails. Otherwise it tries to open the file named *__s* using the flags given in *__mode*.
Table 92, adapted here, gives the relation between openmode combinations and the equivalent `fopen()` flags. (NB: lines app, in|out|app, in|app, binary|app, binary|in|out|app, and binary|in|app per DR 596)

```
+-------------------------------------------------------+
```

ios_base Flag combination				stdio equivalent
binary	in	out	trunc	app	
		+			w
		+		+	a
				+	a
		+	+		w
	+				r
	+	+			r+
	+	+	+		w+
	+	+		+	a+
	+			+	a+
		+			wb
		+		+	ab
				+	ab
		+	+		wb
	+				rb
	+	+			r+b
	+	+	+		w+b
	+	+		+	a+b
	+			+	a+b

Definition at line 310 of file fstream.tcc.

4.942.3.17 open() [2/2]

```
__filebuf_type* std::basic_filebuf< _CharT, std::char_traits< _CharT >
>::open (
            const std::string & __s,
            ios_base::openmode __mode )  [inline], [inherited]
```

Opens an external file.

Parameters

__s	The name of the file.
__mode	The open mode flags.

Returns

`this` on success, NULL on failure

Definition at line 331 of file fstream.

4.942.3.18 overflow() [1/2]

```
basic_filebuf< _CharT, std::char_traits< _CharT > >::int_type std::basic_filebuf<
_CharT, std::char_traits< _CharT > >::overflow (
            int_type __c = _Traits::eof() )  [protected], [virtual], [inherited]
```

Consumes data from the buffer; writes to the controlled sequence.

Parameters

__c	An additional character to consume.

Returns

eof() to indicate failure, something else (usually __*c*, or not_eof())

Informally, this function is called when the output buffer is full (or does not exist, as buffering need not actually be done). If a buffer exists, it is *consumed*, with *some effect* on the controlled sequence. (Typically, the buffer is written out to the sequence verbatim.) In either case, the character *c* is also written out, if __*c* is not `eof()`.
For a formal definition of this function, see a good text such as Langer & Kreft, or [27.5.2.4.5]/3-7.
A functioning output streambuf can be created by overriding only this function (no buffer area will be used).

Note

Base class version does nothing, returns eof().

Definition at line 393 of file fstream.tcc.

4.942.3.19 overflow() [2/2]

```
virtual int_type std::basic_streambuf< _CharT, std::char_traits< _CharT > >::overflow (
            int_type __c = traits_type::eof() )  [inline], [protected], [virtual], [inherited]
```

Consumes data from the buffer; writes to the controlled sequence.

Parameters

_*c*	An additional character to consume.

Returns

eof() to indicate failure, something else (usually __*c*, or not_eof())

Informally, this function is called when the output buffer is full (or does not exist, as buffering need not actually be done). If a buffer exists, it is *consumed*, with *some effect* on the controlled sequence. (Typically, the buffer is written out to the sequence verbatim.) In either case, the character *c* is also written out, if __*c* is not `eof()`.
For a formal definition of this function, see a good text such as Langer & Kreft, or [27.5.2.4.5]/3-7.
A functioning output streambuf can be created by overriding only this function (no buffer area will be used).

Note

Base class version does nothing, returns eof().

Definition at line 775 of file streambuf.

4.942.3.20 pbackfail() [1/2]

```
basic_filebuf< _CharT, std::char_traits< _CharT > >::int_type std::basic_filebuf< _CharT, std::char_traits< _CharT > >::pbackfail (
            int_type __c = _Traits::eof() )  [protected], [virtual], [inherited]
```

Tries to back up the input sequence.

Parameters

_*c*	The character to be inserted back into the sequence.

Returns

eof() on failure, *some other value* on success

Postcondition

The constraints of `gptr()`, `eback()`, and `pptr()` are the same as for `underflow()`.

Note

Base class version does nothing, returns eof().

Definition at line 383 of file fstream.tcc.

4.942.3.21 pbackfail() [2/2]

`virtual int_type std::basic_streambuf< _CharT, std::char_traits< _CharT > >::pbackfail ( int_type __c = traits_type::eof() ) [inline], [protected], [virtual], [inherited]`

Tries to back up the input sequence.

Parameters

__c	The character to be inserted back into the sequence.

Returns

eof() on failure, *some other value* on success

Postcondition

The constraints of `gptr()`, `eback()`, and `pptr()` are the same as for `underflow()`.

Note

Base class version does nothing, returns eof().

Definition at line 731 of file streambuf.

4.942.3.22 pbase()

`char_type* std::basic_streambuf< _CharT, std::char_traits< _CharT > >::pbase ( ) const [inline], [protected], [inherited]`

Access to the put area.
These functions are only available to other protected functions, including derived classes.

- pbase() returns the beginning pointer for the output sequence
- pptr() returns the next pointer for the output sequence
- epptr() returns the end pointer for the output sequence

Definition at line 536 of file streambuf.

4.942.3.23 pbump()

`void std::basic_streambuf< _CharT, std::char_traits< _CharT > >::pbump ( int __n ) [inline], [protected], [inherited]`

Moving the write position.

Parameters

_↩ _n	The delta by which to move.

This just advances the write position without returning any data.
Definition at line 552 of file streambuf.

4.942.3.24 pptr() char_type* std::basic_streambuf< _CharT, std::char_traits< _CharT > >::pptr ( ) const [inline], [protected], [inherited]

Access to the put area.
These functions are only available to other protected functions, including derived classes.

- pbase() returns the beginning pointer for the output sequence
- pptr() returns the next pointer for the output sequence
- epptr() returns the end pointer for the output sequence

Definition at line 539 of file streambuf.

4.942.3.25 pubimbue() locale std::basic_streambuf< _CharT, std::char_traits< _CharT > >::pubimbue (const locale & __loc) [inline], [inherited]

Entry point for imbue().

Parameters

__loc	The new locale.

Returns

The previous locale.

Calls the derived imbue(__loc).
Definition at line 216 of file streambuf.

4.942.3.26 pubseekoff() pos_type std::basic_streambuf< _CharT, std::char_traits< _CharT > >↩ ::pubseekoff (off_type __off, ios_base::seekdir __way, ios_base::openmode __mode = ios_base::in | ios_base::out) [inline], [inherited]

Alters the stream position.

Parameters

__off	Offset.
__way	Value for ios_base::seekdir.
__mode	Value for ios_base::openmode.

Calls virtual seekoff function.
Definition at line 258 of file streambuf.

4.942.3.27 pubseekpos()

```
pos_type std::basic_streambuf< _CharT, std::char_traits< _CharT > >::pubseekpos (
            pos_type __sp,
            ios_base::openmode __mode = ios_base::in | ios_base::out )  [inline], [inherited]
```

Alters the stream position.

Parameters

__sp	Position
__mode	Value for ios_base::openmode.

Calls virtual seekpos function.
Definition at line 270 of file streambuf.

4.942.3.28 pubsetbuf()

```
basic_streambuf* std::basic_streambuf< _CharT, std::char_traits< _CharT > >::pubsetbuf (
            char_type * __s,
            streamsize __n )  [inline], [inherited]
```

Entry points for derived buffer functions.
The public versions of `pubfoo` dispatch to the protected derived `foo` member functions, passing the arguments (if any) and returning the result unchanged.
Definition at line 246 of file streambuf.

4.942.3.29 pubsync()

```
int std::basic_streambuf< _CharT, std::char_traits< _CharT > >::pubsync ( )  [inline], [inherited]
```

Calls virtual sync function.
Definition at line 278 of file streambuf.

4.942.3.30 sbumpc()

```
int_type std::basic_streambuf< _CharT, std::char_traits< _CharT > >::sbumpc ( )  [inline], [inherited]
```

Getting the next character.

Returns

The next character, or eof.

If the input read position is available, returns that character and increments the read pointer, otherwise calls and returns `uflow()`.
Definition at line 323 of file streambuf.

4.942.3.31 seekoff() [1/2]

```
basic_filebuf< _CharT, std::char_traits< _CharT > >::pos_type std::basic_filebuf< _CharT, std::char_traits< _CharT > >::seekoff (
            off_type __off,
            ios_base::seekdir __way,
            ios_base::openmode __mode = ios_base::in | ios_base::out )  [protected], [virtual], [inherited]
```

Alters the stream positions.
Each derived class provides its own appropriate behavior.

Note

Base class version does nothing, returns a `pos_type` that represents an invalid stream position.

Definition at line 416 of file fstream.tcc.

4.942.3.32 seekoff() [2/2]

```
virtual pos_type std::basic_streambuf< _CharT, std::char_traits< _CharT
> >::seekoff (
            off_type ,
            ios_base::seekdir ,
            ios_base::openmode  = ios_base::in | ios_base::out )  [inline], [protected], [virtual],
[inherited]
```

Alters the stream positions.
Each derived class provides its own appropriate behavior.

Note

Base class version does nothing, returns a `pos_type` that represents an invalid stream position.

Definition at line 609 of file streambuf.

4.942.3.33 seekpos() [1/2]

```
basic_filebuf< _CharT, std::char_traits< _CharT > >::pos_type std::basic_filebuf<
_CharT, std::char_traits< _CharT > >::seekpos (
            pos_type __pos,
            ios_base::openmode __mode = ios_base::in | ios_base::out )  [protected], [virtual],
[inherited]
```

Alters the stream positions.
Each derived class provides its own appropriate behavior.

Note

Base class version does nothing, returns a `pos_type` that represents an invalid stream position.

Definition at line 420 of file fstream.tcc.

4.942.3.34 seekpos() [2/2]

```
virtual pos_type std::basic_streambuf< _CharT, std::char_traits< _↩
CharT > >::seekpos (
            pos_type ,
            ios_base::openmode  = ios_base::in | ios_base::out )  [inline], [protected], [virtual],
[inherited]
```

Alters the stream positions.
Each derived class provides its own appropriate behavior.

Note

Base class version does nothing, returns a `pos_type` that represents an invalid stream position.

Reimplemented in __gnu_cxx::stdio_sync_filebuf< _CharT, _Traits >.
Definition at line 621 of file streambuf.

4.942.3.35 setbuf() basic_filebuf< _CharT, std::char_traits< _CharT > >::__streambuf_type * std::basic_filebuf< _CharT, std::char_traits< _CharT > >::setbuf (

```
            char_type * __s,
            streamsize __n )  [protected], [virtual], [inherited]
```

Manipulates the buffer.

Parameters

_↩ _s	Pointer to a buffer area.
_↩ _n	Size of __s.

Returns

`this`

If no file has been opened, and both __s and __n are zero, then the stream becomes unbuffered. Otherwise, __s is used as a buffer; see https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.↩ html#io.streambuf.buffering for more.
Reimplemented from std::basic_streambuf< _CharT, std::char_traits< _CharT > >.
Definition at line 413 of file fstream.tcc.

4.942.3.36 setg() void std::basic_streambuf< _CharT, std::char_traits< _CharT > >::setg (

```
            char_type * __gbeg,
            char_type * __gnext,
            char_type * __gend )  [inline], [protected], [inherited]
```

Setting the three read area pointers.

Parameters

__gbeg	A pointer.
__gnext	A pointer.
__gend	A pointer.

Postcondition

__gbeg == `eback()`, *__gnext* == `gptr()`, and *__gend* == `egptr()`

Definition at line 516 of file streambuf.

4.942.3.37 setp() void std::basic_streambuf< _CharT, std::char_traits< _CharT > >::setp (

```
            char_type * __pbeg,
            char_type * __pend )  [inline], [protected], [inherited]
```

Setting the three write area pointers.

Parameters

__pbeg	A pointer.
__pend	A pointer.

Postcondition

__pbeg == `pbase()`, *__pbeg* == `pptr()`, and *__pend* == `epptr()`

Definition at line 562 of file streambuf.

4.942.3.38 sgetc() `int_type std::basic_streambuf< _CharT, std::char_traits< _CharT > >::sgetc ( ) [inline], [inherited]`

Getting the next character.

Returns

The next character, or eof.

If the input read position is available, returns that character, otherwise calls and returns `underflow()`. Does not move the read position after fetching the character.
Definition at line 345 of file streambuf.

4.942.3.39 sgetn() `streamsize std::basic_streambuf< _CharT, std::char_traits< _CharT > >::sgetn ( char_type * __s, streamsize __n ) [inline], [inherited]`

Entry point for xsgetn.

Parameters

__s	A buffer area.
__n	A count.

Returns xsgetn(__s,__n). The effect is to fill *__s*[0] through *__s*[__n-1] with characters from the input sequence, if possible.
Definition at line 364 of file streambuf.

4.942.3.40 showmanyc() `streamsize std::basic_filebuf< _CharT, std::char_traits< _CharT > >::showmanyc [protected], [virtual], [inherited]`

Investigating the data available.

Returns

An estimate of the number of characters available in the input sequence, or -1.

If it returns a positive value, then successive calls to `underflow()` *will not return* `traits::eof()` *until at least that number of characters have been supplied. If* `showmanyc()` *returns -1, then calls to* `underflow()` *or* `uflow()` *will fail.* [27.5.2.4.3]/1

Note

Base class version does nothing, returns zero.

The standard adds that *the intention is not only that the calls [to underflow or uflow] will not return* `eof()` *but that they will return immediately.*

The standard adds that *the morphemes of* `showmanyc` *are* ***es-how-many-see****, not* ***show-manic****.*

Reimplemented from std::basic_streambuf< _CharT, std::char_traits< _CharT > >.

Definition at line 372 of file fstream.tcc.

4.942.3.41 snextc() int_type std::basic_streambuf< _CharT, std::char_traits< _CharT > >::snextc ( ) [inline], [inherited]

Getting the next character.

Returns

The next character, or eof.

Calls sbumpc(), and if that function returns traits::eof(), so does this function. Otherwise, sgetc().
Definition at line 305 of file streambuf.

4.942.3.42 sputbackc() int_type std::basic_streambuf< _CharT, std::char_traits< _CharT > >::sputbackc (char_type __c) [inline], [inherited]

Pushing characters back into the input stream.

Parameters

__c	The character to push back.

Returns

The previous character, if possible.

Similar to sungetc(), but __c is pushed onto the stream instead of *the previous character.* If successful, the next character fetched from the input stream will be __c.
Definition at line 379 of file streambuf.

4.942.3.43 sputc() int_type std::basic_streambuf< _CharT, std::char_traits< _CharT > >::sputc (char_type __c) [inline], [inherited]

Entry point for all single-character output functions.

Parameters

__c	A character to output.

Returns

__c, if possible.

One of two public output functions.
If a write position is available for the output sequence (i.e., the buffer is not full), stores __c in that position, increments the position, and returns traits::to_int_type(__c). If a write position is not available, returns overflow(__c).
Definition at line 431 of file streambuf.

4.942.3.44 sputn() streamsize std::basic_streambuf< _CharT, std::char_traits< _CharT > >::sputn (

```
const char_type * __s,
streamsize __n )  [inline], [inherited]
```

Entry point for all single-character output functions.

Parameters

_↩ _s	A buffer read area.
_↩ _n	A count.

One of two public output functions.
Returns xsputn(__s,__n). The effect is to write __s[0] through __s[__n-1] to the output sequence, if possible.
Definition at line 457 of file streambuf.

4.942.3.45 sungetc() int_type std::basic_streambuf< _CharT, std::char_traits< _CharT > >::sungetc ( ) [inline], [inherited]

Moving backwards in the input stream.

Returns

The previous character, if possible.

If a putback position is available, this function decrements the input pointer and returns that character. Otherwise, calls and returns pbackfail(). The effect is to *unget* the last character *gotten*.
Definition at line 404 of file streambuf.

4.942.3.46 sync() int std::basic_filebuf< _CharT, std::char_traits< _CharT > >::sync (void) [protected], [virtual], [inherited]

Synchronizes the buffer arrays with the controlled sequences.

Returns

-1 on failure.

Each derived class provides its own appropriate behavior, including the definition of *failure*.

Note

Base class version does nothing, returns zero.

Reimplemented from std::basic_streambuf< _CharT, std::char_traits< _CharT > >.
Definition at line 431 of file fstream.tcc.

4.942.3.47 uflow() virtual int_type std::basic_streambuf< _CharT, std::char_traits< _CharT > >↩ ::uflow ( ) [inline], [protected], [virtual], [inherited]

Fetches more data from the controlled sequence.

Returns

The first character from the *pending sequence*.

Informally, this function does the same thing as `underflow()`, and in fact is required to call that function. It also returns the new character, like `underflow()` does. However, this function also moves the read position forward by one.
Reimplemented in __gnu_cxx::stdio_sync_filebuf< _CharT, _Traits >.
Definition at line 707 of file streambuf.

4.942.3.48 underflow() basic_filebuf< _CharT, std::char_traits< _CharT > >::int_type std::basic_filebuf< _CharT, std::char_traits< _CharT > >::underflow [protected], [virtual], [inherited]

Fetches more data from the controlled sequence.

Returns

The first character from the *pending sequence*.

Informally, this function is called when the input buffer is exhausted (or does not exist, as buffering need not actually be done). If a buffer exists, it is *refilled*. In either case, the next available character is returned, or `traits::eof()` to indicate a null pending sequence.
For a formal definition of the pending sequence, see a good text such as Langer & Kreft, or [27.5.2.4.3]/7-14.
A functioning input streambuf can be created by overriding only this function (no buffer area will be used). For an example, see https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.html

Note

Base class version does nothing, returns eof().

Reimplemented from std::basic_streambuf< _CharT, std::char_traits< _CharT > >.
Definition at line 380 of file fstream.tcc.

4.942.3.49 xsgetn() streamsize std::basic_filebuf< _CharT, std::char_traits< _CharT > >::xsgetn (char_type * __s, streamsize __n) [protected], [virtual], [inherited]

Multiple character extraction.

Parameters

_↩ _s	A buffer area.
_↩ _n	Maximum number of characters to assign.

Returns

The number of characters assigned.

Fills __s[0] through __s[__n-1] with characters from the input sequence, as if by `sbumpc()`. Stops when either __n characters have been copied, or when `traits::eof()` would be copied.
It is expected that derived classes provide a more efficient implementation by overriding this definition.
Reimplemented from std::basic_streambuf< _CharT, std::char_traits< _CharT > >.
Definition at line 437 of file fstream.tcc.

4.942.3.50 xsputn() streamsize std::basic_filebuf< _CharT, std::char_traits< _CharT > >::xsputn (const char_type * __s, streamsize __n) [protected], [virtual], [inherited]

Multiple character insertion.

Parameters

_↩ _s	A buffer area.
_↩ _n	Maximum number of characters to write.

Returns

The number of characters written.

Writes __s[0] through __s[__n-1] to the output sequence, as if by `sputc()`. Stops when either *n* characters have been copied, or when `sputc()` would return `traits::eof()`.
It is expected that derived classes provide a more efficient implementation by overriding this definition.
Reimplemented from std::basic_streambuf< _CharT, std::char_traits< _CharT > >.
Definition at line 440 of file fstream.tcc.

4.942.4 Member Data Documentation

4.942.4.1 _M_buf

`char_type* std::basic_filebuf< _CharT, std::char_traits< _CharT > >::_M_buf [protected], [inherited]`

Pointer to the beginning of internal buffer.
Definition at line 136 of file fstream.

4.942.4.2 _M_buf_locale

`locale std::basic_streambuf< _CharT, std::char_traits< _CharT > >::_M_buf_locale [protected], [inherited]`

Current locale setting.
Definition at line 199 of file streambuf.

4.942.4.3 _M_buf_size

`size_t std::basic_filebuf< _CharT, std::char_traits< _CharT > >::_M_buf_size [protected], [inherited]`

Actual size of internal buffer. This number is equal to the size of the put area + 1 position, reserved for the overflow char of a full area.
Definition at line 143 of file fstream.

4.942.4.4 _M_ext_buf

`char* std::basic_filebuf< _CharT, std::char_traits< _CharT > >::_M_ext_buf [protected], [inherited]`

Buffer for external characters. Used for input when codecvt::always_noconv() == false. When valid, this corresponds to eback().
Definition at line 178 of file fstream.

4.942.4.5 _M_ext_buf_size

`streamsize std::basic_filebuf< _CharT, std::char_traits< _CharT > >::_M_ext_buf_size [protected], [inherited]`

Size of buffer held by _M_ext_buf.
Definition at line 183 of file fstream.

4.942.4.6 _M_ext_next

`const char* std::basic_filebuf< _CharT, std::char_traits< _CharT > >::_M_ext_next [protected], [inherited]`

Pointers into the buffer held by _M_ext_buf that delimit a subsequence of bytes that have been read but not yet converted. When valid, _M_ext_next corresponds to egptr().
Definition at line 190 of file fstream.

4.942.4.7 _M_in_beg

`char_type* std::basic_streambuf< _CharT, std::char_traits< _CharT > >::_M_in_beg [protected], [inherited]`

Start of get area.

Definition at line 191 of file streambuf.

4.942.4.8 _M_in_cur

`char_type* std::basic_streambuf< _CharT, std::char_traits< _CharT > >::_M_in_cur [protected], [inherited]`

Current read area.

Definition at line 192 of file streambuf.

4.942.4.9 _M_in_end

`char_type* std::basic_streambuf< _CharT, std::char_traits< _CharT > >::_M_in_end [protected], [inherited]`

End of get area.

Definition at line 193 of file streambuf.

4.942.4.10 _M_mode

`ios_base::openmode std::basic_filebuf< _CharT, std::char_traits< _CharT > >::_M_mode [protected], [inherited]`

Place to stash in || out || in | out settings for current filebuf.

Definition at line 121 of file fstream.

4.942.4.11 _M_out_beg

`char_type* std::basic_streambuf< _CharT, std::char_traits< _CharT > >::_M_out_beg [protected], [inherited]`

Start of put area.

Definition at line 194 of file streambuf.

4.942.4.12 _M_out_cur

`char_type* std::basic_streambuf< _CharT, std::char_traits< _CharT > >::_M_out_cur [protected], [inherited]`

Current put area.

Definition at line 195 of file streambuf.

4.942.4.13 _M_out_end

`char_type* std::basic_streambuf< _CharT, std::char_traits< _CharT > >::_M_out_end [protected], [inherited]`

End of put area.

Definition at line 196 of file streambuf.

4.942.4.14 _M_pback

`char_type std::basic_filebuf< _CharT, std::char_traits< _CharT > >::_M_pback [protected], [inherited]`

Necessary bits for putback buffer management.

Note

pbacks of over one character are not currently supported.

Definition at line 164 of file fstream.

4.942.4.15 _M_pback_cur_save

`char_type* std::basic_filebuf< _CharT, std::char_traits< _CharT > >::_M_pback_cur_save [protected], [inherited]`

Necessary bits for putback buffer management.

Note

pbacks of over one character are not currently supported.

Definition at line 165 of file fstream.

4.942.4.16 _M_pback_end_save

`char_type* std::basic_filebuf< _CharT, std::char_traits< _CharT > >::_M_pback_end_save [protected], [inherited]`

Necessary bits for putback buffer management.

Note

pbacks of over one character are not currently supported.

Definition at line 166 of file fstream.

4.942.4.17 _M_pback_init

`bool std::basic_filebuf< _CharT, std::char_traits< _CharT > >::_M_pback_init [protected], [inherited]`

Necessary bits for putback buffer management.

Note

pbacks of over one character are not currently supported.

Definition at line 167 of file fstream.

4.942.4.18 _M_reading

`bool std::basic_filebuf< _CharT, std::char_traits< _CharT > >::_M_reading [protected], [inherited]`

_M_reading == false && _M_writing == false for **uncommitted** mode; _M_reading == true for **read** mode; _M_writing == true for **write** mode;
NB: _M_reading == true && _M_writing == true is unused.
Definition at line 155 of file fstream.

4.943.1 Detailed Description

template<typename _CharT, typename _Traits = std::char_traits<_CharT>>
class __gnu_cxx::stdio_sync_filebuf< _CharT, _Traits >

Provides a layer of compatibility for C.
This GNU extension provides extensions for working with standard C FILE*'s. It must be instantiated by the user with the type of character used in the file stream, e.g., stdio_filebuf<char>.
Definition at line 57 of file stdio_sync_filebuf.h.

4.943.2 Member Function Documentation

4.943.2.1 eback() char_type* std::basic_streambuf< _CharT, std::char_traits< _CharT > >::eback ( ) const [inline], [protected], [inherited]

Access to the get area.
These functions are only available to other protected functions, including derived classes.

- eback() returns the beginning pointer for the input sequence
- gptr() returns the next pointer for the input sequence
- egptr() returns the end pointer for the input sequence

Definition at line 489 of file streambuf.

4.943.2.2 egptr() char_type* std::basic_streambuf< _CharT, std::char_traits< _CharT > >::egptr ( ) const [inline], [protected], [inherited]

Access to the get area.
These functions are only available to other protected functions, including derived classes.

- eback() returns the beginning pointer for the input sequence
- gptr() returns the next pointer for the input sequence
- egptr() returns the end pointer for the input sequence

Definition at line 495 of file streambuf.

4.943.2.3 epptr() char_type* std::basic_streambuf< _CharT, std::char_traits< _CharT > >::epptr ( ) const [inline], [protected], [inherited]

Access to the put area.
These functions are only available to other protected functions, including derived classes.

- pbase() returns the beginning pointer for the output sequence
- pptr() returns the next pointer for the output sequence
- epptr() returns the end pointer for the output sequence

Definition at line 542 of file streambuf.

4.943.2.4 file() template<typename _CharT , typename _Traits = std::char_traits<_CharT>> std::__c_file* __gnu_cxx::stdio_sync_filebuf< _CharT, _Traits >::file ( ) [inline]

Returns

The underlying FILE*.

This function can be used to access the underlying C file pointer. Note that there is no way for the library to track what you do with the file, so be careful.
Definition at line 118 of file stdio_sync_filebuf.h.

4.943.2.5 gbump() void std::basic_streambuf< _CharT, std::char_traits< _CharT > >::gbump (int __n) [inline], [protected], [inherited]

Moving the read position.

Parameters

_↩ _n	The delta by which to move.

This just advances the read position without returning any data.
Definition at line 505 of file streambuf.

4.943.2.6 getloc() `locale std::basic_streambuf< _CharT, std::char_traits< _CharT > >::getloc ( ) const [inline], [inherited]`

Locale access.

Returns

The current locale in effect.

If pubimbue(loc) has been called, then the most recent `loc` is returned. Otherwise the global locale in effect at the time of construction is returned.
Definition at line 233 of file streambuf.

4.943.2.7 gptr() `char_type* std::basic_streambuf< _CharT, std::char_traits< _CharT > >::gptr ( ) const [inline], [protected], [inherited]`

Access to the get area.
These functions are only available to other protected functions, including derived classes.

- eback() returns the beginning pointer for the input sequence
- gptr() returns the next pointer for the input sequence
- egptr() returns the end pointer for the input sequence

Definition at line 492 of file streambuf.

4.943.2.8 imbue() `virtual void std::basic_streambuf< _CharT, std::char_traits< _CharT > >::imbue ( const locale & __loc ) [inline], [protected], [virtual], [inherited]`

Changes translations.

Parameters

__loc	A new locale.

Translations done during I/O which depend on the current locale are changed by this call. The standard adds, *Between invocations of this function a class derived from streambuf can safely cache results of calls to locale functions and to members of facets so obtained.*

Note

Base class version does nothing.

Reimplemented in std::basic_filebuf< _CharT, std::char_traits< _CharT > >.
Definition at line 583 of file streambuf.

4.943.2.9 in_avail()

`streamsize std::basic_streambuf< _CharT, std::char_traits< _CharT > >::in_avail ( ) [inline], [inherited]`

Looking ahead into the stream.

Returns

The number of characters available.

If a read position is available, returns the number of characters available for reading before the buffer must be refilled. Otherwise returns the derived `showmanyc()`.
Definition at line 291 of file streambuf.

4.943.2.10 overflow()

`virtual int_type std::basic_streambuf< _CharT, std::char_traits< _CharT > >::overflow ( int_type __c = traits_type::eof() ) [inline], [protected], [virtual], [inherited]`

Consumes data from the buffer; writes to the controlled sequence.

Parameters

__c	An additional character to consume.

Returns

eof() to indicate failure, something else (usually *__c*, or not_eof())

Informally, this function is called when the output buffer is full (or does not exist, as buffering need not actually be done). If a buffer exists, it is *consumed*, with *some effect* on the controlled sequence. (Typically, the buffer is written out to the sequence verbatim.) In either case, the character *c* is also written out, if *__c* is not `eof()`.
For a formal definition of this function, see a good text such as Langer & Kreft, or [27.5.2.4.5]/3-7.
A functioning output streambuf can be created by overriding only this function (no buffer area will be used).

Note

Base class version does nothing, returns eof().

Definition at line 775 of file streambuf.

4.943.2.11 pbackfail()

`virtual int_type std::basic_streambuf< _CharT, std::char_traits< _CharT > >::pbackfail ( int_type __c = traits_type::eof() ) [inline], [protected], [virtual], [inherited]`

Tries to back up the input sequence.

Parameters

__c	The character to be inserted back into the sequence.

Returns

eof() on failure, *some other value* on success

Postcondition

The constraints of `gptr()`, `eback()`, and `pptr()` are the same as for `underflow()`.

Note

Base class version does nothing, returns eof().

Definition at line 731 of file streambuf.

4.943.2.12 pbase() `char_type* std::basic_streambuf< _CharT, std::char_traits< _CharT > >::pbase ( ) const [inline], [protected], [inherited]`

Access to the put area.
These functions are only available to other protected functions, including derived classes.

- pbase() returns the beginning pointer for the output sequence
- pptr() returns the next pointer for the output sequence
- epptr() returns the end pointer for the output sequence

Definition at line 536 of file streambuf.

4.943.2.13 pbump() `void std::basic_streambuf< _CharT, std::char_traits< _CharT > >::pbump ( int __n ) [inline], [protected], [inherited]`

Moving the write position.

Parameters

__n	The delta by which to move.

This just advances the write position without returning any data.
Definition at line 552 of file streambuf.

4.943.2.14 pptr() `char_type* std::basic_streambuf< _CharT, std::char_traits< _CharT > >::pptr ( ) const [inline], [protected], [inherited]`

Access to the put area.
These functions are only available to other protected functions, including derived classes.

- pbase() returns the beginning pointer for the output sequence
- pptr() returns the next pointer for the output sequence
- epptr() returns the end pointer for the output sequence

Definition at line 539 of file streambuf.

4.943.2.15 pubimbue() `locale std::basic_streambuf< _CharT, std::char_traits< _CharT > >::pubimbue ( const locale & __loc ) [inline], [inherited]`

Entry point for imbue().

Parameters

__loc	The new locale.

Returns

The previous locale.

Calls the derived imbue(__loc).
Definition at line 216 of file streambuf.

4.943.2.16 pubseekoff()

```
pos_type std::basic_streambuf< _CharT, std::char_traits< _CharT > >::pubseekoff (
            off_type __off,
            ios_base::seekdir __way,
            ios_base::openmode __mode = ios_base::in | ios_base::out )  [inline], [inherited]
```

Alters the stream position.

Parameters

__off	Offset.
__way	Value for ios_base::seekdir.
__mode	Value for ios_base::openmode.

Calls virtual seekoff function.
Definition at line 258 of file streambuf.

4.943.2.17 pubseekpos()

```
pos_type std::basic_streambuf< _CharT, std::char_traits< _CharT > >::pubseekpos (
            pos_type __sp,
            ios_base::openmode __mode = ios_base::in | ios_base::out )  [inline], [inherited]
```

Alters the stream position.

Parameters

__sp	Position
__mode	Value for ios_base::openmode.

Calls virtual seekpos function.
Definition at line 270 of file streambuf.

4.943.2.18 pubsetbuf()

```
basic_streambuf* std::basic_streambuf< _CharT, std::char_traits< _CharT > >::pubsetbuf (
            char_type * __s,
            streamsize __n )  [inline], [inherited]
```

Entry points for derived buffer functions.
The public versions of `pubfoo` dispatch to the protected derived `foo` member functions, passing the arguments (if any) and returning the result unchanged.
Definition at line 246 of file streambuf.

4.943.2.19 pubsync() int std::basic_streambuf< _CharT, std::char_traits< _CharT > >::pubsync ( ) [inline], [inherited]

Calls virtual sync function.
Definition at line 278 of file streambuf.

4.943.2.20 sbumpc() int_type std::basic_streambuf< _CharT, std::char_traits< _CharT > >::sbumpc ( ) [inline], [inherited]

Getting the next character.

Returns

The next character, or eof.

If the input read position is available, returns that character and increments the read pointer, otherwise calls and returns `uflow()`.
Definition at line 323 of file streambuf.

4.943.2.21 seekoff() virtual pos_type std::basic_streambuf< _CharT, std::char_traits< _CharT > >::seekoff (off_type , ios_base::seekdir , ios_base::openmode = *ios_base::in* | *ios_base::out*) [inline], [protected], [virtual], [inherited]

Alters the stream positions.
Each derived class provides its own appropriate behavior.

Note

Base class version does nothing, returns a `pos_type` that represents an invalid stream position.

Definition at line 609 of file streambuf.

4.943.2.22 seekpos() template<typename _CharT , typename _Traits = std::char_traits<_CharT>> virtual std::streampos __gnu_cxx::stdio_sync_filebuf< _CharT, _Traits >::seekpos (std::streampos , std::ios_base::openmode = *std::ios_base::in* | *std::ios_base::out*) [inline], [protected], [virtual]

Alters the stream positions.
Each derived class provides its own appropriate behavior.

Note

Base class version does nothing, returns a `pos_type` that represents an invalid stream position.

Reimplemented from std::basic_streambuf< _CharT, std::char_traits< _CharT > >.
Definition at line 216 of file stdio_sync_filebuf.h.
References std::ios_base::beg.

4.943.2.23 setbuf()

```
virtual basic_streambuf<char_type,std::char_traits< _CharT > >* std::basic_streambuf<
_CharT, std::char_traits< _CharT > >::setbuf (
            char_type * ,
            streamsize  )  [inline], [protected], [virtual], [inherited]
```

Manipulates the buffer.
Each derived class provides its own appropriate behavior. See the next-to-last paragraph of https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.html#io.streambuf.buffering for more on this function.

Note

Base class version does nothing, returns `this`.

Reimplemented in std::basic_filebuf< _CharT, std::char_traits< _CharT > >.
Definition at line 598 of file streambuf.

4.943.2.24 setg()

```
void std::basic_streambuf< _CharT, std::char_traits< _CharT > >::setg (
            char_type * __gbeg,
            char_type * __gnext,
            char_type * __gend )  [inline], [protected], [inherited]
```

Setting the three read area pointers.

Parameters

__gbeg	A pointer.
__gnext	A pointer.
__gend	A pointer.

Postcondition

__gbeg == `eback()`, *__gnext* == `gptr()`, and *__gend* == `egptr()`

Definition at line 516 of file streambuf.

4.943.2.25 setp()

```
void std::basic_streambuf< _CharT, std::char_traits< _CharT > >::setp (
            char_type * __pbeg,
            char_type * __pend )  [inline], [protected], [inherited]
```

Setting the three write area pointers.

Parameters

__pbeg	A pointer.
__pend	A pointer.

Postcondition

__pbeg == `pbase()`, *__pbeg* == `pptr()`, and *__pend* == `epptr()`

Definition at line 562 of file streambuf.

4.943.2.26 sgetc()

```
int_type std::basic_streambuf< _CharT, std::char_traits< _CharT > >::sgetc ( )
[inline], [inherited]
```

Getting the next character.

Returns

The next character, or eof.

If the input read position is available, returns that character, otherwise calls and returns `underflow()`. Does not move the read position after fetching the character.
Definition at line 345 of file streambuf.

4.943.2.27 sgetn()

`streamsize std::basic_streambuf< _CharT, std::char_traits< _CharT > >::sgetn ( char_type * __s, streamsize __n ) [inline], [inherited]`

Entry point for xsgetn.

Parameters

_↩ _s	A buffer area.
_↩ _n	A count.

Returns xsgetn(__s,__n). The effect is to fill __*s*[0] through __*s*[__n-1] with characters from the input sequence, if possible.
Definition at line 364 of file streambuf.

4.943.2.28 showmanyc()

`virtual streamsize std::basic_streambuf< _CharT, std::char_traits< _CharT > >::showmanyc ( ) [inline], [protected], [virtual], [inherited]`

Investigating the data available.

Returns

An estimate of the number of characters available in the input sequence, or -1.

If it returns a positive value, then successive calls to `underflow()` *will not return* `traits::eof()` *until at least that number of characters have been supplied. If* `showmanyc()` *returns -1, then calls to* `underflow()` *or* `uflow()` *will fail.* [27.5.2.4.3]/1

Note

Base class version does nothing, returns zero.

The standard adds that *the intention is not only that the calls [to underflow or uflow] will not return* `eof()` *but that they will return immediately.*

The standard adds that *the morphemes of* `showmanyc` *are* ***es-how-many-see****, not* ***show-manic****.*

Reimplemented in std::basic_filebuf< _CharT, std::char_traits< _CharT > >.
Definition at line 656 of file streambuf.

4.943.2.29 snextc()

`int_type std::basic_streambuf< _CharT, std::char_traits< _CharT > >::snextc ( ) [inline], [inherited]`

Getting the next character.

Returns

The next character, or eof.

Calls `sbumpc()`, and if that function returns `traits::eof()`, so does this function. Otherwise, `sgetc()`.
Definition at line 305 of file streambuf.

4.943.2.30 sputbackc()

`int_type std::basic_streambuf< _CharT, std::char_traits< _CharT > >::sputbackc ( char_type __c ) [inline], [inherited]`

Pushing characters back into the input stream.

Parameters

__c	The character to push back.

Returns

The previous character, if possible.

Similar to sungetc(), but *__c* is pushed onto the stream instead of *the previous character.* If successful, the next character fetched from the input stream will be *__c*.
Definition at line 379 of file streambuf.

4.943.2.31 sputc()

`int_type std::basic_streambuf< _CharT, std::char_traits< _CharT > >::sputc ( char_type __c ) [inline], [inherited]`

Entry point for all single-character output functions.

Parameters

__c	A character to output.

Returns

__c, if possible.

One of two public output functions.
If a write position is available for the output sequence (i.e., the buffer is not full), stores *__c* in that position, increments the position, and returns `traits::to_int_type(__c)`. If a write position is not available, returns `overflow(__c)`.
Definition at line 431 of file streambuf.

4.943.2.32 sputn()

`streamsize std::basic_streambuf< _CharT, std::char_traits< _CharT > >::sputn ( const char_type * __s, streamsize __n ) [inline], [inherited]`

Entry point for all single-character output functions.

Parameters

_↩ _s	A buffer read area.
_↩ _n	A count.

One of two public output functions.
Returns xsputn(__s,__n). The effect is to write __*s*[0] through __*s*[__n-1] to the output sequence, if possible.
Definition at line 457 of file streambuf.

4.943.2.33 sungetc() `int_type std::basic_streambuf< _CharT, std::char_traits< _CharT > >::sungetc ( ) [inline], [inherited]`

Moving backwards in the input stream.

Returns

The previous character, if possible.

If a putback position is available, this function decrements the input pointer and returns that character. Otherwise, calls and returns pbackfail(). The effect is to *unget* the last character *gotten*.
Definition at line 404 of file streambuf.

4.943.2.34 sync() `template<typename _CharT , typename _Traits = std::char_traits<_CharT>> virtual int __gnu_cxx::stdio_sync_filebuf< _CharT, _Traits >::sync ( void ) [inline], [protected], [virtual]`

Synchronizes the buffer arrays with the controlled sequences.

Returns

-1 on failure.

Each derived class provides its own appropriate behavior, including the definition of *failure*.

Note

Base class version does nothing, returns zero.

Reimplemented from std::basic_streambuf< _CharT, std::char_traits< _CharT > >.
Definition at line 190 of file stdio_sync_filebuf.h.

4.943.2.35 uflow() `template<typename _CharT , typename _Traits = std::char_traits<_CharT>> virtual int_type __gnu_cxx::stdio_sync_filebuf< _CharT, _Traits >::uflow ( ) [inline], [protected], [virtual]`

Fetches more data from the controlled sequence.

Returns

The first character from the *pending sequence*.

Informally, this function does the same thing as `underflow()`, and in fact is required to call that function. It also returns the new character, like `underflow()` does. However, this function also moves the read position forward by one.
Reimplemented from std::basic_streambuf< _CharT, std::char_traits< _CharT > >.
Definition at line 138 of file stdio_sync_filebuf.h.

4.943.2.36 underflow() template<typename _CharT , typename _Traits = std::char_traits<_CharT>> virtual int_type __gnu_cxx::stdio_sync_filebuf< _CharT, _Traits >::underflow ( ) [inline], [protected], [virtual]

Fetches more data from the controlled sequence.

Returns

The first character from the *pending sequence*.

Informally, this function is called when the input buffer is exhausted (or does not exist, as buffering need not actually be done). If a buffer exists, it is *refilled*. In either case, the next available character is returned, or `traits::eof()` to indicate a null pending sequence.
For a formal definition of the pending sequence, see a good text such as Langer & Kreft, or [27.5.2.4.3]/7-14.
A functioning input streambuf can be created by overriding only this function (no buffer area will be used). For an example, see https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.html

Note

Base class version does nothing, returns eof().

Reimplemented from std::basic_streambuf< _CharT, std::char_traits< _CharT > >.
Definition at line 131 of file stdio_sync_filebuf.h.

4.943.2.37 xsgetn() streamsize std::basic_streambuf< _CharT, std::char_traits< _CharT > >::xsgetn (char_type * __s, streamsize __n) [protected], [virtual], [inherited]

Multiple character extraction.

Parameters

_↩ _s	A buffer area.
_↩ _n	Maximum number of characters to assign.

Returns

The number of characters assigned.

Fills __s[0] through __s[__n-1] with characters from the input sequence, as if by `sbumpc()`. Stops when either __n characters have been copied, or when `traits::eof()` would be copied.
It is expected that derived classes provide a more efficient implementation by overriding this definition.
Reimplemented in std::basic_filebuf< _CharT, std::char_traits< _CharT > >.
Definition at line 672 of file streambuf.tcc.

4.943.2.38 xsputn() streamsize std::basic_streambuf< _CharT, std::char_traits< _CharT > >::xsputn (const char_type * __s, streamsize __n) [protected], [virtual], [inherited]

Multiple character insertion.

Parameters

_↩ _s	A buffer area.
_↩ _n	Maximum number of characters to write.

Returns

The number of characters written.

Writes __s[0] through __s[__n-1] to the output sequence, as if by `sputc()`. Stops when either *n* characters have been copied, or when `sputc()` would return `traits::eof()`.
It is expected that derived classes provide a more efficient implementation by overriding this definition.
Reimplemented in std::basic_filebuf< _CharT, std::char_traits< _CharT > >.
Definition at line 749 of file streambuf.tcc.

4.950.1 Detailed Description

template<typename _RealType = double>
class std::student_t_distribution< _RealType >

A student_t_distribution random number distribution.
The formula for the normal probability mass function is:

$$p(x|n) = \frac{1}{\sqrt{(n\pi)}} \frac{\Gamma((n+1)/2)}{\Gamma(n/2)} (1 + \frac{x^2}{n})^{-(n+1)/2}$$

Definition at line 3294 of file random.h.

4.950.2 Member Typedef Documentation

4.950.2.1 result_type `template<typename _RealType = double>`

```
typedef _RealType std::student_t_distribution< _RealType >::result_type
```

The type of the range of the distribution.
Definition at line 3301 of file random.h.

4.950.3 Member Function Documentation

4.950.3.1 max() `template<typename _RealType = double>`

```
result_type std::student_t_distribution< _RealType >::max ( ) const  [inline]
```

Returns the least upper bound value of the distribution.
Definition at line 3386 of file random.h.
References std::numeric_limits< _Tp >::max().

4.950.3.2 min() template<typename _RealType = double>

result_type std::student_t_distribution< _RealType >::min ( ) const [inline]

Returns the greatest lower bound value of the distribution.

Definition at line 3379 of file random.h.

References std::numeric_limits< _Tp >::lowest().

4.950.3.3 operator()() template<typename _RealType = double>

template<typename _UniformRandomNumberGenerator >
result_type std::student_t_distribution< _RealType >::operator() (
_UniformRandomNumberGenerator & __urng) [inline]

Generating functions.

Definition at line 3394 of file random.h.

References std::sqrt().

4.950.3.4 param() [1/2] template<typename _RealType = double>

param_type std::student_t_distribution< _RealType >::param ( ) const [inline]

Returns the parameter set of the distribution.

Definition at line 3364 of file random.h.

4.950.3.5 param() [2/2] template<typename _RealType = double>

void std::student_t_distribution< _RealType >::param (
const param_type & __param) [inline]

Sets the parameter set of the distribution.

Parameters

__param	The new parameter set of the distribution.

Definition at line 3372 of file random.h.

4.950.3.6 reset() template<typename _RealType = double>

void std::student_t_distribution< _RealType >::reset ( ) [inline]

Resets the distribution state.

Definition at line 3347 of file random.h.

References std::normal_distribution< _RealType >::reset(), and std::gamma_distribution< _RealType >::reset().

4.950.4 Friends And Related Function Documentation

4.950.4.1 operator<< template<typename _RealType = double>

template<typename _RealType1 , typename _CharT , typename _Traits >
std::basic_ostream<_CharT, _Traits>& operator<< (
std::basic_ostream< _CharT, _Traits > & __os,
const std::student_t_distribution< _RealType1 > & __x) [friend]

Inserts a student_t_distribution random number distribution __x into the output stream __os.

Parameters

__os	An output stream.
__x	A student_t_distribution random number distribution.

Returns

The output stream with the state of __x inserted or in an error state.

4.950.4.2 operator== template<typename _RealType = double>

```
bool operator== (
            const student_t_distribution< _RealType > & __d1,
            const student_t_distribution< _RealType > & __d2 )  [friend]
```

Return true if two Student t distributions have the same parameters and the sequences that would be generated are equal.
Definition at line 3443 of file random.h.

4.950.4.3 operator>> template<typename _RealType = double>

```
template<typename _RealType1 , typename _CharT , typename _Traits >
std::basic_istream<_CharT, _Traits>& operator>> (
            std::basic_istream< _CharT, _Traits > & __is,
            std::student_t_distribution< _RealType1 > & __x )  [friend]
```

Extracts a student_t_distribution random number distribution __x from the input stream __is.

Parameters

_↩ _is	An input stream.
_↩ _x	A student_t_distribution random number generator engine.

Returns

The input stream with __x extracted or in an error state.

The documentation for this class was generated from the following files:

- random.h
- bits/random.tcc

4.951.1 Detailed Description

template<typename _BiIter>
class std::sub_match< _BiIter >

A sequence of characters matched by a particular marked sub-expression.
An object of this class is essentially a pair of iterators marking a matched subexpression within a regular expression pattern match. Such objects can be converted to and compared with std::basic_string objects of a similar base character type as the pattern matched by the regular expression.
The iterators that make up the pair are the usual half-open interval referencing the actual original pattern matched.
Definition at line 868 of file regex.h.

4.951.2 Member Typedef Documentation

4.951.2.1 first_type `typedef _BiIter std::pair< _BiIter , _BiIter >::first_type [inherited]`

The type of the `first` member.
Definition at line 214 of file stl_pair.h.

4.951.2.2 second_type `typedef _BiIter std::pair< _BiIter , _BiIter >::second_type [inherited]`

The type of the `second` member.
Definition at line 215 of file stl_pair.h.

4.951.3 Member Function Documentation

4.951.3.1 compare() [1/3] `template<typename _BiIter >`

```
int std::sub_match< _BiIter >::compare (
            const string_type & __s ) const  [inline]
```

Compares this `sub_match` to a string.

Parameters

__s	A string to compare to this `sub_match`.

Return values

negative	This matched sequence will collate before `__s`.
zero	This matched sequence is equivalent to `__s`.
positive	This matched sequence will collate after `__s`.

Definition at line 937 of file regex.h.

4.951.3.2 compare() [2/3] `template<typename _BiIter >`

```
int std::sub_match< _BiIter >::compare (
            const sub_match< _BiIter > & __s ) const  [inline]
```

Compares this and another matched sequence.

Parameters

_↩ _s	Another matched sequence to compare to this one.

Return values

negative	This matched sequence will collate before __s.
zero	This matched sequence is equivalent to __s.
positive	This matched sequence will collate after __s.

Definition at line 923 of file regex.h.
Referenced by std::sub_match< _BiIter >::operator!=(), std::sub_match< _BiIter >::operator<(), std::sub_match< ↩ _BiIter >::operator<=(), std::sub_match< _BiIter >::operator==(), std::sub_match< _BiIter >::operator>(), and std↩ ::sub_match< _BiIter >::operator>=().

4.951.3.3 compare() [3/3] template<typename _BiIter >

```
int std::sub_match< _BiIter >::compare (
            const value_type * __s ) const  [inline]
```

Compares this sub_match to a string.

Parameters

_↩ _s	A string to compare to this sub_match.

Return values

negative	This matched sequence will collate before __s.
zero	This matched sequence is equivalent to __s.
positive	This matched sequence will collate after __s.

Definition at line 941 of file regex.h.

4.951.3.4 length() template<typename _BiIter >

```
difference_type std::sub_match< _BiIter >::length ( ) const  [inline], [noexcept]
```

Gets the length of the matching sequence.
Definition at line 884 of file regex.h.
References std::distance(), std::pair< _BiIter, _BiIter >::first, and std::pair< _BiIter, _BiIter >::second.

4.951.3.5 operator string_type() template<typename _BiIter >

```
std::sub_match< _BiIter >::operator string_type ( ) const  [inline]
```

Gets the matching sequence as a string.

Returns

the matching sequence as a string.

This is the implicit conversion operator. It is identical to the str() member function except that it will want to pop up in unexpected places and cause a great deal of confusion and cursing from the unwary.
Definition at line 897 of file regex.h.
References std::sub_match< _BiIter >::str().

4.951.3.6 str() template<typename _BiIter > string_type std::sub_match< _BiIter >::str ( ) const [inline]

Gets the matching sequence as a string.

Returns

the matching sequence as a string.

Definition at line 906 of file regex.h.
References std::pair< _BiIter, _BiIter >::first, and std::pair< _BiIter, _BiIter >::second.
Referenced by std::sub_match< _BiIter >::operator string_type().

4.951.3.7 swap() constexpr void std::pair< _BiIter , _BiIter >::swap (pair< _BiIter, _BiIter > & __p) [inline], [constexpr], [noexcept], [inherited]

Swap the first members and then the second members.
Definition at line 439 of file stl_pair.h.

4.951.4 Friends And Related Function Documentation

4.951.4.1 make_pair() constexpr pair< typename __decay_and_strip< _BiIter >::__type, typename _↩ _decay_and_strip< _BiIter >::__type > make_pair (_BiIter && __x, _BiIter && __y) [related]

A convenience wrapper for creating a pair from two objects.

Parameters

_↩ _x	The first object.
_↩ _y	The second object.

Returns

A newly-constructed pair<> object of the appropriate type.

The C++98 standard says the objects are passed by reference-to-const, but C++03 says they are passed by value (this was LWG issue #181).
Since C++11 they have been passed by forwarding reference and then forwarded to the new members of the pair. To create a pair with a member of reference type, pass a `reference_wrapper` to this function.
Definition at line 567 of file stl_pair.h.

4.951.4.2 operator"!=() constexpr bool operator!= (

```
const pair< _BiIter , _BiIter > & __x,
const pair< _BiIter , _BiIter > & __y )  [related]
```

Uses operator== to find the result.
Definition at line 496 of file stl_pair.h.

4.951.4.3 operator<() constexpr bool operator< (

```
const pair< _BiIter , _BiIter > & __x,
const pair< _BiIter , _BiIter > & __y )  [related]
```

Defines a lexicographical order for pairs.
For two pairs of the same type, P is ordered before Q if P.first is less than Q.first, or if P.first and Q.first are equivalent (neither is less than the other) and P.second is less than Q.second.
Definition at line 488 of file stl_pair.h.

4.951.4.4 operator<=() constexpr bool operator<= (

```
const pair< _BiIter , _BiIter > & __x,
const pair< _BiIter , _BiIter > & __y )  [related]
```

Uses operator< to find the result.
Definition at line 507 of file stl_pair.h.

4.951.4.5 operator==() constexpr bool operator== (

```
const pair< _BiIter , _BiIter > & __x,
const pair< _BiIter , _BiIter > & __y )  [related]
```

Two pairs of the same type are equal iff their members are equal.
Definition at line 466 of file stl_pair.h.

4.951.4.6 operator>() constexpr bool operator> (

```
const pair< _BiIter , _BiIter > & __x,
const pair< _BiIter , _BiIter > & __y )  [related]
```

Uses operator< to find the result.
Definition at line 502 of file stl_pair.h.

4.951.4.7 operator>=() constexpr bool operator>= (

```
const pair< _BiIter , _BiIter > & __x,
const pair< _BiIter , _BiIter > & __y )  [related]
```

Uses operator< to find the result.
Definition at line 514 of file stl_pair.h.

4.951.4.8 swap() constexpr enable_if< __and_< __is_swappable< _BiIter >, __is_swappable< _BiIter > >::value >::type swap (

```
pair< _BiIter , _BiIter > & __x,
pair< _BiIter , _BiIter > & __y )  [related]
```

Swap overload for pairs. Calls std::pair::swap().

Note

This std::swap overload is not declared in C++03 mode, which has performance implications, e.g. see https://gcc.gnu.org/PR38466

Definition at line 533 of file stl_pair.h.

4.951.5 Member Data Documentation

4.951.5.1 first _BiIter std::pair< _BiIter , _BiIter >::first [inherited]

The first member.
Definition at line 217 of file stl_pair.h.

4.951.5.2 second _BiIter std::pair< _BiIter , _BiIter >::second [inherited]

The second member.
Definition at line 218 of file stl_pair.h.

4.952.1 Detailed Description

template<typename _UIntType, size_t __w, size_t __s, size_t __r>
class std::subtract_with_carry_engine< _UIntType, __w, __s, __r >

The Marsaglia-Zaman generator.
This is a model of a Generalized Fibonacci discrete random number generator, sometimes referred to as the SWC generator.
A discrete random number generator that produces pseudorandom numbers using:

$$x_i \leftarrow (x_{i-s} - x_{i-r} - carry_{i-1}) \bmod m$$

The size of the state is r and the maximum period of the generator is $(m^r - m^s - 1)$.
Definition at line 692 of file random.h.

```
typedef _UIntType std::subtract_with_carry_engine< _UIntType, __w, __s, __r >::result_type
```

The type of the generated random value.
Definition at line 707 of file random.h.

4.952.3 Constructor & Destructor Documentation

4.952.3.1 subtract_with_carry_engine() [1/2] `template<typename _UIntType , size_t __w, size_t __s, size_t __r>`

```
std::subtract_with_carry_engine< _UIntType, __w, __s, __r >::subtract_with_carry_engine (
            result_type __sd )  [inline], [explicit]
```

Constructs an explicitly seeded subtract_with_carry_engine random number generator.
Definition at line 723 of file random.h.
References std::subtract_with_carry_engine< _UIntType, __w, __s, __r >::seed().

4.952.3.2 subtract_with_carry_engine() [2/2] `template<typename _UIntType , size_t __w, size_t __s, size_t __r>`

```
template<typename _Sseq , typename = _If_seed_seq<_Sseq>>
std::subtract_with_carry_engine< _UIntType, __w, __s, __r >::subtract_with_carry_engine (
            _Sseq & __q )  [inline], [explicit]
```

Constructs a subtract_with_carry_engine random number engine seeded from the seed sequence __q.

Parameters

_↩ _q	the seed sequence.

Definition at line 734 of file random.h.
References std::subtract_with_carry_engine< _UIntType, __w, __s, __r >::seed().

4.952.4 Member Function Documentation

4.952.4.1 discard()

```
template<typename _UIntType , size_t __w, size_t __s, size_t __r>
void std::subtract_with_carry_engine< _UIntType, __w, __s, __r >::discard (
            unsigned long long __z )  [inline]
```

Discard a sequence of random numbers.
Definition at line 780 of file random.h.

4.952.4.2 max()

```
template<typename _UIntType , size_t __w, size_t __s, size_t __r>
static constexpr result_type std::subtract_with_carry_engine< _UIntType, __w, __s, __r >::max ( )
[inline], [static], [constexpr]
```

Gets the inclusive maximum value of the range of random integers returned by this generator.
Definition at line 773 of file random.h.

4.952.4.3 min()

```
template<typename _UIntType , size_t __w, size_t __s, size_t __r>
static constexpr result_type std::subtract_with_carry_engine< _UIntType, __w, __s, __r >::min ( )
[inline], [static], [constexpr]
```

Gets the inclusive minimum value of the range of random integers returned by this generator.
Definition at line 765 of file random.h.

4.952.4.4 operator()()

```
template<typename _UIntType , size_t __w, size_t __s, size_t __r>
subtract_with_carry_engine< _UIntType, __w, __s, __r >::result_type std::subtract_with_carry_engine<
_UIntType, __w, __s, __r >::operator()
```

Gets the next random number in the sequence.
Definition at line 593 of file bits/random.tcc.

4.952.4.5 seed() [1/2]

```
template<typename _UIntType , size_t __w, size_t __s, size_t __r>
template<typename _Sseq >
_If_seed_seq<_Sseq> std::subtract_with_carry_engine< _UIntType, __w, __s, __r >::seed (
            _Sseq & __q )
```

Seeds the initial state x_0 of the % subtract_with_carry_engine random number generator.

4.952.4.6 seed() [2/2]

```
template<typename _UIntType , size_t __w, size_t __s, size_t __r>
void std::subtract_with_carry_engine< _UIntType, __w, __s, __r >::seed (
            result_type __sd = default_seed )
```

Seeds the initial state x_0 of the random number generator.

N1688[4.19] modifies this as follows. If __value == 0, sets value to 19780503. In any case, with a linear congruential generator lcg(i) having parameters $m_{lcg} = 2147483563, a_{lcg} = 40014, c_{lcg} = 0, and lcg(0) = value$, sets $x_{-r} \dots x_{-1}$ to $lcg(1) \bmod m \dots lcg(r) \bmod m$ respectively. If $x_{-1} = 0$ set carry to 1, otherwise sets carry to 0.
Definition at line 537 of file bits/random.tcc.
Referenced by std::subtract_with_carry_engine< _UIntType, __w, __s, __r >::subtract_with_carry_engine().

4.952.5 Friends And Related Function Documentation

4.952.5.1 operator<< template<typename _UIntType , size_t __w, size_t __s, size_t __r> template<typename _UIntType1 , size_t __w1, size_t __s1, size_t __r1, typename _CharT , typename _Traits > std::basic_ostream<_CharT, _Traits>& operator<< (std::basic_ostream< _CharT, _Traits > & __os, const std::subtract_with_carry_engine< _UIntType1, __w1, __s1, __r1 > & __x) [friend]

Inserts the current state of a % subtract_with_carry_engine random number generator engine __x into the output stream __os.

Parameters

__os	An output stream.
__x	A % subtract_with_carry_engine random number generator engine.

Returns

The output stream with the state of __x inserted or in an error state.

4.952.5.2 operator== template<typename _UIntType , size_t __w, size_t __s, size_t __r> bool operator== (const subtract_with_carry_engine< _UIntType, __w, __s, __r > & *__lhs*, const subtract_with_carry_engine< _UIntType, __w, __s, __r > & *__rhs*) [friend]

Compares two % subtract_with_carry_engine random number generator objects of the same type for equality.

Parameters

__lhs	A % subtract_with_carry_engine random number generator object.
__rhs	Another % subtract_with_carry_engine random number generator object.

Returns

true if the infinite sequences of generated values would be equal, false otherwise.

Definition at line 805 of file random.h.

4.952.5.3 operator>> template<typename _UIntType , size_t __w, size_t __s, size_t __r> template<typename _UIntType1 , size_t __w1, size_t __s1, size_t __r1, typename _CharT , typename _Traits > std::basic_istream<_CharT, _Traits>& operator>> (std::basic_istream< _CharT, _Traits > & *__is*, std::subtract_with_carry_engine< _UIntType1, __w1, __s1, __r1 > & __x) [friend]

Extracts the current state of a % subtract_with_carry_engine random number generator engine __x from the input stream __is.

Parameters

_↩ _is	An input stream.
_↩ _x	A % subtract_with_carry_engine random number generator engine.

Returns

The input stream with the state of __x extracted or in an error state.

- size_type **_M_original_len**

4.957.1 Detailed Description

template<class _ForwardIterator, class _Tp = typename std::iterator_traits<_ForwardIterator>::value_type>
struct __gnu_cxx::temporary_buffer< _ForwardIterator, _Tp >

This class provides similar behavior and semantics of the standard functions get_temporary_buffer() and return_↩ temporary_buffer(), but encapsulated in a type vaguely resembling a standard container.
By default, a temporary_buffer<Iter> stores space for objects of whatever type the Iter iterator points to. It is constructed from a typical [first,last) range, and provides the begin(), end(), size() functions, as well as requested_size(). For non-trivial types, copies of *first will be used to initialize the storage.

malloc is used to obtain underlying storage.
Like get_temporary_buffer(), not all the requested memory may be available. Ideally, the created buffer will be large enough to hold a copy of [first,last), but if size() is less than requested_size(), then this didn't happen.
Definition at line 184 of file ext/memory.

4.957.2 Constructor & Destructor Documentation

4.957.2.1 temporary_buffer() template<class _ForwardIterator , class _Tp = typename std::iterator_traits<_ForwardIterator>::value_type>

```
__gnu_cxx::temporary_buffer< _ForwardIterator, _Tp >::temporary_buffer (
            _ForwardIterator __first,
            _ForwardIterator __last )  [inline]
```

Requests storage large enough to hold a copy of [first,last).
Definition at line 187 of file ext/memory.

4.957.2.2 ~temporary_buffer() template<class _ForwardIterator , class _Tp = typename std::iterator_traits<_ForwardIterator>::value_type>

```
__gnu_cxx::temporary_buffer< _ForwardIterator, _Tp >::~temporary_buffer ( )  [inline]
```

Destroys objects and frees storage.
Definition at line 193 of file ext/memory.

4.957.3 Member Function Documentation

4.957.3.1 begin() template<typename _ForwardIterator , typename _Tp >

```
iterator std::_Temporary_buffer< _ForwardIterator, _Tp >::begin ( )  [inline], [inherited]
```

As per Table mumble.
Definition at line 165 of file stl_tempbuf.h.

4.957.3.2 end() template<typename _ForwardIterator , typename _Tp >

```
iterator std::_Temporary_buffer< _ForwardIterator, _Tp >::end ( )  [inline], [inherited]
```

As per Table mumble.
Definition at line 170 of file stl_tempbuf.h.

4.957.3.3 requested_size() template<typename _ForwardIterator , typename _Tp >

```
size_type std::_Temporary_buffer< _ForwardIterator, _Tp >::requested_size ( ) const  [inline],
[inherited]
```

Returns the size requested by the constructor; may be >size().
Definition at line 160 of file stl_tempbuf.h.

4.957.3.4 size() template<typename _ForwardIterator , typename _Tp >

```
size_type std::_Temporary_buffer< _ForwardIterator, _Tp >::size ( ) const  [inline], [inherited]
```

As per Table mumble.
Definition at line 155 of file stl_tempbuf.h.
The documentation for this struct was generated from the following file:

4.968.1 Detailed Description

template<typename _CharT, typename _InIter>
class std::time_get< _CharT, _InIter >

Primary class template time_get.
This facet encapsulates the code to parse and return a date or time from a string. It is used by the istream numeric extraction operators.
The time_get template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the time_get facet.
Definition at line 368 of file locale_facets_nonio.h.

4.968.2 Member Typedef Documentation

4.968.2.1 char_type

`template<typename _CharT , typename _InIter >`
`typedef _CharT std::time_get< _CharT, _InIter >::char_type`
Public typedefs.
Definition at line 374 of file locale_facets_nonio.h.

4.968.2.2 iter_type

`template<typename _CharT , typename _InIter >`
`typedef _InIter std::time_get< _CharT, _InIter >::iter_type`
Public typedefs.
Definition at line 375 of file locale_facets_nonio.h.

4.968.3 Constructor & Destructor Documentation

4.968.3.1 time_get()

`template<typename _CharT , typename _InIter >`
`std::time_get< _CharT, _InIter >::time_get ( size_t __refs = 0 ) [inline], [explicit]`
Constructor performs initialization.
This is the constructor provided by the standard.

Parameters

__refs	Passed to the base facet class.

Definition at line 389 of file locale_facets_nonio.h.

4.968.3.2 ~time_get()

`template<typename _CharT , typename _InIter >`
`virtual std::time_get< _CharT, _InIter >::~time_get ( ) [inline], [protected], [virtual]`
Destructor.
Definition at line 593 of file locale_facets_nonio.h.

4.968.4 Member Function Documentation

4.968.4.1 date_order()

`template<typename _CharT , typename _InIter >`
`dateorder std::time_get< _CharT, _InIter >::date_order ( ) const [inline]`
Return preferred order of month, day, and year.
This function returns an enum from time_base::dateorder giving the preferred ordering if the format *x* given to time_↩put::put() only uses month, day, and year. If the format *x* for the associated locale uses other fields, this function returns time_base::dateorder::noorder.
NOTE: The library always returns noorder at the moment.

Returns

A member of time_base::dateorder.

Definition at line 406 of file locale_facets_nonio.h.
References std::time_get< _CharT, _InIter >::do_date_order().

4.968.4.2 do_date_order()

```
template<typename _CharT , typename _InIter >
_GLIBCXX_END_NAMESPACE_LDBL_OR_CXX11 time_base::dateorder std::time_get< _CharT, _InIter >::do_↩
date_order [protected], [virtual]
```

Return preferred order of month, day, and year.

This function returns an enum from time_base::dateorder giving the preferred ordering if the format *x* given to time_↩ put::put() only uses month, day, and year. This function is a hook for derived classes to change the value returned.

Returns

A member of time_base::dateorder.

Definition at line 627 of file locale_facets_nonio.tcc.

Referenced by std::time_get< _CharT, _InIter >::date_order().

4.968.4.3 do_get()

```
template<typename _CharT , typename _InIter >
_InIter std::time_get< _CharT, _InIter >::do_get (
            iter_type __s,
            iter_type __end,
            ios_base & __f,
            ios_base::iostate & __err,
            tm * __tm,
            char __format,
            char __modifier ) const [inline], [protected]
```

Parse input string according to format.

This function parses the string according to the provided format and optional modifier. This function is a hook for derived classes to change the value returned.

See also

get() for more details.

Parameters

__s	Start of string to parse.
__end	End of string to parse.
__f	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.
__format	Format specifier.
__modifier	Format modifier.

Returns

Iterator to first char not parsed.

Definition at line 1240 of file locale_facets_nonio.tcc.

References std::ios_base::_M_getloc(), std::ios_base::eofbit, std::ios_base::goodbit, and std::__ctype_abstract_base< _CharT >::widen().

Referenced by std::time_get< _CharT, _InIter >::get().

4.968.4.4 do_get_date()

```
template<typename _CharT , typename _InIter >
_InIter std::time_get< _CharT, _InIter >::do_get_date (
```

```
            iter_type __beg,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            tm * __tm ) const  [protected], [virtual]
```

Parse input date string.
This function parses a date according to the format *X* and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

get_date() for details.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond date string.

Definition at line 1076 of file locale_facets_nonio.tcc.
References std::ios_base::_M_getloc(), and std::ios_base::eofbit.
Referenced by std::time_get< _CharT, _InIter >::get_date().

4.968.4.5 do_get_monthname()

```
template<typename _CharT , typename _InIter >
_InIter std::time_get< _CharT, _InIter >::do_get_monthname (
            iter_type __beg,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            tm * __tm ) const  [protected], [virtual]
```

Parse input month string.
This function parses a month name and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

get_monthname() for details.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond month name.

Definition at line 1119 of file locale_facets_nonio.tcc.
References std::ios_base::_M_getloc(), std::ios_base::eofbit, std::ios_base::failbit, and std::ios_base::goodbit.
Referenced by std::time_get< _CharT, _InIter >::get_monthname().

4.968.4.6 do_get_time()

```
template<typename _CharT , typename _InIter >
_InIter std::time_get< _CharT, _InIter >::do_get_time (
            iter_type __beg,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            tm * __tm ) const  [protected], [virtual]
```

Parse input time string.
This function parses a time according to the format *x* and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

get_time() for details.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond time string.

Definition at line 1059 of file locale_facets_nonio.tcc.
References std::ios_base::_M_getloc(), and std::ios_base::eofbit.
Referenced by std::time_get< _CharT, _InIter >::get_time().

4.968.4.7 do_get_weekday()

```
template<typename _CharT , typename _InIter >
_InIter std::time_get< _CharT, _InIter >::do_get_weekday (
            iter_type __beg,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            tm * __tm ) const  [protected], [virtual]
```

Parse input weekday string.
This function parses a weekday name and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

get_weekday() for details.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond weekday name.

Definition at line 1093 of file locale_facets_nonio.tcc.
References std::ios_base::_M_getloc(), std::ios_base::eofbit, std::ios_base::failbit, and std::ios_base::goodbit.
Referenced by std::time_get< _CharT, _InIter >::get_weekday().

4.968.4.8 do_get_year()

```
template<typename _CharT , typename _InIter >
_InIter std::time_get< _CharT, _InIter >::do_get_year (
            iter_type __beg,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            tm * __tm ) const  [protected], [virtual]
```

Parse input year string.
This function reads up to 4 characters to parse a year string and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

get_year() for details.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond year.

Definition at line 1145 of file locale_facets_nonio.tcc.
References std::ios_base::eofbit, std::ios_base::failbit, and std::ios_base::goodbit.
Referenced by std::time_get< _CharT, _InIter >::get_year().

4.968.4.9 get() [1/2]

```
template<typename _CharT , typename _InIter >
iter_type std::time_get< _CharT, _InIter >::get (
            iter_type __s,
```

```
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            tm * __tm,
            char __format,
            char __modifier = 0 ) const  [inline]
```

Parse input string according to format.
This function calls time_get::do_get with the provided parameters.

See also

do_get() and get().

Parameters

__s	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.
__format	Format specifier.
__modifier	Format modifier.

Returns

Iterator to first char not parsed.

Definition at line 559 of file locale_facets_nonio.h.
References std::time_get< _CharT, _InIter >::do_get().

4.968.4.10 get() [2/2] template<typename _CharT , typename _InIter >

```
_InIter std::time_get< _CharT, _InIter >::get (
            iter_type __s,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            tm * __tm,
            const char_type * __fmt,
            const char_type * __fmtend ) const  [inline]
```

Parse input string according to format.
This function parses the input string according to a provided format string. It does the inverse of time_put::put. The format string follows the format specified for strftime(3)/strptime(3). The actual parsing is done by time_get::do_get.

Parameters

__s	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.
__fmt	Start of the format string.
__fmtend	End of the format string.

Returns

Iterator to first char not parsed.

Definition at line 1168 of file locale_facets_nonio.tcc.
References std::ios_base::_M_getloc(), std::ios_base::eofbit, std::ios_base::failbit, std::ios_base::goodbit, std::__ctype_abstract_base< _CharT >::is(), std::__ctype_abstract_base< _CharT >::narrow(), std::__ctype_abstract_base< _CharT >::tolower(), and std::__ctype_abstract_base< _CharT >::toupper().

4.968.4.11 get_date()

```
template<typename _CharT , typename _InIter >
iter_type std::time_get< _CharT, _InIter >::get_date (
            iter_type __beg,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            tm * __tm ) const  [inline]
```

Parse input date string.
This function parses a date according to the format *x* and puts the results into a user-supplied struct tm. The result is returned by calling time_get::do_get_date().
If there is a valid date string according to format *x*, *tm* will be filled in accordingly and the returned iterator will point to the first character beyond the date string. If an error occurs before the end, err |= ios_base::failbit. If parsing reads all the characters, err |= ios_base::eofbit.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond date string.

Definition at line 455 of file locale_facets_nonio.h.
References std::time_get< _CharT, _InIter >::do_get_date().

4.968.4.12 get_monthname()

```
template<typename _CharT , typename _InIter >
iter_type std::time_get< _CharT, _InIter >::get_monthname (
            iter_type __beg,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            tm * __tm ) const  [inline]
```

Parse input month string.
This function parses a month name and puts the results into a user-supplied struct tm. The result is returned by calling time_get::do_get_monthname().
Parsing starts by parsing an abbreviated month name. If a valid abbreviation is followed by a character that would lead to the full month name, parsing continues until the full name is found or an error occurs. Otherwise parsing finishes at the end of the abbreviated name.
If an error occurs before the end, err |= ios_base::failbit. If parsing reads all the characters, err |= ios_base::eofbit.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond month name.

Definition at line 512 of file locale_facets_nonio.h.
References std::time_get< _CharT, _InIter >::do_get_monthname().

4.968.4.13 get_time() template<typename _CharT , typename _InIter >

```
iter_type std::time_get< _CharT, _InIter >::get_time (
            iter_type __beg,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            tm * __tm ) const  [inline]
```

Parse input time string.
This function parses a time according to the format *X* and puts the results into a user-supplied struct tm. The result is returned by calling time_get::do_get_time().
If there is a valid time string according to format *X*, *tm* will be filled in accordingly and the returned iterator will point to the first character beyond the time string. If an error occurs before the end, err |= ios_base::failbit. If parsing reads all the characters, err |= ios_base::eofbit.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond time string.

Definition at line 430 of file locale_facets_nonio.h.
References std::time_get< _CharT, _InIter >::do_get_time().

4.968.4.14 get_weekday() template<typename _CharT , typename _InIter >

```
iter_type std::time_get< _CharT, _InIter >::get_weekday (
            iter_type __beg,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            tm * __tm ) const  [inline]
```

Parse input weekday string.
This function parses a weekday name and puts the results into a user-supplied struct tm. The result is returned by calling time_get::do_get_weekday().
Parsing starts by parsing an abbreviated weekday name. If a valid abbreviation is followed by a character that would lead to the full weekday name, parsing continues until the full name is found or an error occurs. Otherwise parsing finishes at the end of the abbreviated name.
If an error occurs before the end, err |= ios_base::failbit. If parsing reads all the characters, err |= ios_base::eofbit.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond weekday name.

Definition at line 483 of file locale_facets_nonio.h.
References std::time_get< _CharT, _InIter >::do_get_weekday().

4.968.4.15 get_year()

```
template<typename _CharT , typename _InIter >
iter_type std::time_get< _CharT, _InIter >::get_year (
            iter_type __beg,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            tm * __tm ) const  [inline]
```

Parse input year string.
This function reads up to 4 characters to parse a year string and puts the results into a user-supplied struct tm. The result is returned by calling time_get::do_get_year().
4 consecutive digits are interpreted as a full year. If there are exactly 2 consecutive digits, the library interprets this as the number of years since 1900.
If an error occurs before the end, err |= ios_base::failbit. If parsing reads all the characters, err |= ios_base::eofbit.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond year.

Definition at line 538 of file locale_facets_nonio.h.
References std::time_get< _CharT, _InIter >::do_get_year().

4.969.1 Detailed Description

template<typename _CharT, typename _InIter>
class std::time_get_byname< _CharT, _InIter >

class time_get_byname [22.2.5.2].
Definition at line 760 of file locale_facets_nonio.h.

4.969.2 Member Function Documentation

4.969.2.1 date_order() `template<typename _CharT , typename _InIter >`

`dateorder std::time_get< _CharT, _InIter >::date_order ( ) const [inline], [inherited]`

Return preferred order of month, day, and year.
This function returns an enum from time_base::dateorder giving the preferred ordering if the format *x* given to time_↩ put::put() only uses month, day, and year. If the format *x* for the associated locale uses other fields, this function returns time_base::dateorder::noorder.
NOTE: The library always returns noorder at the moment.

Returns

A member of time_base::dateorder.

Definition at line 406 of file locale_facets_nonio.h.
References std::time_get< _CharT, _InIter >::do_date_order().

4.969.2.2 do_date_order()

```
template<typename _CharT , typename _InIter >
_GLIBCXX_END_NAMESPACE_LDBL_OR_CXX11 time_base::dateorder std::time_get< _CharT, _InIter >::do_↩
date_order  [protected], [virtual], [inherited]
```

Return preferred order of month, day, and year.

This function returns an enum from time_base::dateorder giving the preferred ordering if the format *x* given to time_↩ put::put() only uses month, day, and year. This function is a hook for derived classes to change the value returned.

Returns

A member of time_base::dateorder.

Definition at line 627 of file locale_facets_nonio.tcc.

Referenced by std::time_get< _CharT, _InIter >::date_order().

4.969.2.3 do_get()

```
template<typename _CharT , typename _InIter >
_InIter std::time_get< _CharT, _InIter >::do_get (
            iter_type __s,
            iter_type __end,
            ios_base & __f,
            ios_base::iostate & __err,
            tm * __tm,
            char __format,
            char __modifier ) const  [inline], [protected], [inherited]
```

Parse input string according to format.

This function parses the string according to the provided format and optional modifier. This function is a hook for derived classes to change the value returned.

See also

get() for more details.

Parameters

__s	Start of string to parse.
__end	End of string to parse.
__f	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.
__format	Format specifier.
__modifier	Format modifier.

Returns

Iterator to first char not parsed.

Definition at line 1240 of file locale_facets_nonio.tcc.

References std::ios_base::_M_getloc(), std::ios_base::eofbit, std::ios_base::goodbit, and std::__ctype_abstract_base< _CharT >::widen().

Referenced by std::time_get< _CharT, _InIter >::get().

4.969.2.4 do_get_date()

```
template<typename _CharT , typename _InIter >
_InIter std::time_get< _CharT, _InIter >::do_get_date (
```

```
            iter_type __beg,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            tm * __tm ) const  [protected], [virtual], [inherited]
```

Parse input date string.
This function parses a date according to the format *X* and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

get_date() for details.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond date string.

Definition at line 1076 of file locale_facets_nonio.tcc.
References std::ios_base::_M_getloc(), and std::ios_base::eofbit.
Referenced by std::time_get< _CharT, _InIter >::get_date().

4.969.2.5 do_get_monthname()

```
template<typename _CharT , typename _InIter >
_InIter std::time_get< _CharT, _InIter >::do_get_monthname (
            iter_type __beg,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            tm * __tm ) const  [protected], [virtual], [inherited]
```

Parse input month string.
This function parses a month name and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

get_monthname() for details.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond month name.

Definition at line 1119 of file locale_facets_nonio.tcc.
References std::ios_base::_M_getloc(), std::ios_base::eofbit, std::ios_base::failbit, and std::ios_base::goodbit.
Referenced by std::time_get< _CharT, _InIter >::get_monthname().

4.969.2.6 do_get_time() template<typename _CharT , typename _InIter >

```
_InIter std::time_get< _CharT, _InIter >::do_get_time (
             iter_type __beg,
             iter_type __end,
             ios_base & __io,
             ios_base::iostate & __err,
             tm * __tm ) const  [protected], [virtual], [inherited]
```

Parse input time string.
This function parses a time according to the format *x* and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

get_time() for details.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond time string.

Definition at line 1059 of file locale_facets_nonio.tcc.
References std::ios_base::_M_getloc(), and std::ios_base::eofbit.
Referenced by std::time_get< _CharT, _InIter >::get_time().

4.969.2.7 do_get_weekday() template<typename _CharT , typename _InIter >

```
_InIter std::time_get< _CharT, _InIter >::do_get_weekday (
             iter_type __beg,
             iter_type __end,
             ios_base & __io,
             ios_base::iostate & __err,
             tm * __tm ) const  [protected], [virtual], [inherited]
```

Parse input weekday string.
This function parses a weekday name and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

get_weekday() for details.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond weekday name.

Definition at line 1093 of file locale_facets_nonio.tcc.
References std::ios_base::_M_getloc(), std::ios_base::eofbit, std::ios_base::failbit, and std::ios_base::goodbit.
Referenced by std::time_get< _CharT, _InIter >::get_weekday().

4.969.2.8 do_get_year() template<typename _CharT , typename _InIter >

```
_InIter std::time_get< _CharT, _InIter >::do_get_year (
            iter_type __beg,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            tm * __tm ) const  [protected], [virtual], [inherited]
```

Parse input year string.
This function reads up to 4 characters to parse a year string and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

get_year() for details.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond year.

Definition at line 1145 of file locale_facets_nonio.tcc.
References std::ios_base::eofbit, std::ios_base::failbit, and std::ios_base::goodbit.
Referenced by std::time_get< _CharT, _InIter >::get_year().

4.969.2.9 get() [1/2] template<typename _CharT , typename _InIter >

```
iter_type std::time_get< _CharT, _InIter >::get (
            iter_type __s,
```

```
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            tm * __tm,
            char __format,
            char __modifier = 0 ) const  [inline], [inherited]
```

Parse input string according to format.
This function calls time_get::do_get with the provided parameters.

See also

do_get() and get().

Parameters

__s	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.
__format	Format specifier.
__modifier	Format modifier.

Returns

Iterator to first char not parsed.

Definition at line 559 of file locale_facets_nonio.h.
References std::time_get< _CharT, _InIter >::do_get().

4.969.2.10 get() [2/2] template<typename _CharT , typename _InIter >

```
_InIter std::time_get< _CharT, _InIter >::get (
            iter_type __s,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            tm * __tm,
            const char_type * __fmt,
            const char_type * __fmtend ) const  [inline], [inherited]
```

Parse input string according to format.
This function parses the input string according to a provided format string. It does the inverse of time_put::put. The format string follows the format specified for strftime(3)/strptime(3). The actual parsing is done by time_get::do_get.

Parameters

__s	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.
__fmt	Start of the format string.
__fmtend	End of the format string.

Returns

Iterator to first char not parsed.

Definition at line 1168 of file locale_facets_nonio.tcc.
References std::ios_base::_M_getloc(), std::ios_base::eofbit, std::ios_base::failbit, std::ios_base::goodbit, std::__ctype_abstract_base< _CharT >::is(), std::__ctype_abstract_base< _CharT >::narrow(), std::__ctype_abstract_base< _CharT >::tolower(), and std::__ctype_abstract_base< _CharT >::toupper().

4.969.2.11 get_date()

```
template<typename _CharT , typename _InIter >
iter_type std::time_get< _CharT, _InIter >::get_date (
            iter_type __beg,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            tm * __tm ) const  [inline], [inherited]
```

Parse input date string.
This function parses a date according to the format *x* and puts the results into a user-supplied struct tm. The result is returned by calling time_get::do_get_date().
If there is a valid date string according to format *x*, *tm* will be filled in accordingly and the returned iterator will point to the first character beyond the date string. If an error occurs before the end, err |= ios_base::failbit. If parsing reads all the characters, err |= ios_base::eofbit.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond date string.

Definition at line 455 of file locale_facets_nonio.h.
References std::time_get< _CharT, _InIter >::do_get_date().

4.969.2.12 get_monthname()

```
template<typename _CharT , typename _InIter >
iter_type std::time_get< _CharT, _InIter >::get_monthname (
            iter_type __beg,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            tm * __tm ) const  [inline], [inherited]
```

Parse input month string.
This function parses a month name and puts the results into a user-supplied struct tm. The result is returned by calling time_get::do_get_monthname().
Parsing starts by parsing an abbreviated month name. If a valid abbreviation is followed by a character that would lead to the full month name, parsing continues until the full name is found or an error occurs. Otherwise parsing finishes at the end of the abbreviated name.
If an error occurs before the end, err |= ios_base::failbit. If parsing reads all the characters, err |= ios_base::eofbit.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond month name.

Definition at line 512 of file locale_facets_nonio.h.
References std::time_get< _CharT, _InIter >::do_get_monthname().

4.969.2.13 get_time()

```
template<typename _CharT , typename _InIter >

            ios_base & __io,
            ios_base::iostate & __err,
            tm * __tm ) const  [inline], [inherited]
```

Parse input weekday string.
This function parses a weekday name and puts the results into a user-supplied struct tm. The result is returned by calling time_get::do_get_weekday().
Parsing starts by parsing an abbreviated weekday name. If a valid abbreviation is followed by a character that would lead to the full weekday name, parsing continues until the full name is found or an error occurs. Otherwise parsing finishes at the end of the abbreviated name.
If an error occurs before the end, err |= ios_base::failbit. If parsing reads all the characters, err |= ios_base::eofbit.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond weekday name.

Definition at line 483 of file locale_facets_nonio.h.
References std::time_get< _CharT, _InIter >::do_get_weekday().

4.969.2.15 get_year()

```
template<typename _CharT , typename _InIter >
iter_type std::time_get< _CharT, _InIter >::get_year (
            iter_type __beg,
            iter_type __end,
            ios_base & __io,
            ios_base::iostate & __err,
            tm * __tm ) const  [inline], [inherited]
```

Parse input year string.
This function reads up to 4 characters to parse a year string and puts the results into a user-supplied struct tm. The result is returned by calling time_get::do_get_year().
4 consecutive digits are interpreted as a full year. If there are exactly 2 consecutive digits, the library interprets this as the number of years since 1900.
If an error occurs before the end, err |= ios_base::failbit. If parsing reads all the characters, err |= ios_base::eofbit.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond year.

Definition at line 538 of file locale_facets_nonio.h.
References std::time_get< _CharT, _InIter >::do_get_year().

4.971.1 Detailed Description

template<typename _CharT, typename _OutIter>
class std::time_put< _CharT, _OutIter >

Primary class template time_put.
This facet encapsulates the code to format and output dates and times according to formats used by strftime().

The time_put template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the time_put facet.
Definition at line 797 of file locale_facets_nonio.h.

4.971.2 Member Typedef Documentation

4.971.2.1 char_type

4.971.3 Constructor & Destructor Documentation

4.971.3.1 time_put()

```
template<typename _CharT , typename _OutIter >
std::time_put< _CharT, _OutIter >::time_put (
            size_t __refs = 0 ) [inline], [explicit]
```

Constructor performs initialization.
This is the constructor provided by the standard.

Parameters

__refs	Passed to the base facet class.

Definition at line 818 of file locale_facets_nonio.h.

4.971.3.2 ~time_put()

```
template<typename _CharT , typename _OutIter >
virtual std::time_put< _CharT, _OutIter >::~time_put ( ) [inline], [protected], [virtual]
```

Destructor.
Definition at line 864 of file locale_facets_nonio.h.

4.971.4 Member Function Documentation

4.971.4.1 do_put()

```
template<typename _CharT , typename _OutIter >
_OutIter std::time_put< _CharT, _OutIter >::do_put (
            iter_type __s,
            ios_base & __io,
            char_type __fill,
            const tm * __tm,
```

```
            char __format,
            char __mod ) const  [protected], [virtual]
```

Format and output a time or date.
This function formats the data in struct tm according to the provided format char and optional modifier. This function is a hook for derived classes to change the value returned.

See also

put() for more details.

Parameters

__s	The stream to write to.
__io	Source of locale.
__fill	char_type to use for padding.
__tm	Struct tm with date and time info to format.
__format	Format char.
__mod	Optional modifier char.

Returns

Iterator after writing.

Definition at line 1308 of file locale_facets_nonio.tcc.
References std::ios_base::_M_getloc(), and std::__ctype_abstract_base< _CharT >::widen().
Referenced by std::time_put< _CharT, _OutIter >::put().

4.971.4.2 put() [1/2]

```
template<typename _CharT , typename _OutIter >
iter_type std::time_put< _CharT, _OutIter >::put (
            iter_type __s,
            ios_base & __io,
            char_type __fill,
            const tm * __tm,
            char __format,
            char __mod = 0 ) const  [inline]
```

Format and output a time or date.
This function formats the data in struct tm according to the provided format char and optional modifier. The format and modifier are interpreted as by strftime(). It does so by returning time_put::do_put().

Parameters

__s	The stream to write to.
__io	Source of locale.
__fill	char_type to use for padding.
__tm	Struct tm with date and time info to format.
__format	Format char.
__mod	Optional modifier char.

Returns

Iterator after writing.

Definition at line 857 of file locale_facets_nonio.h.
References std::time_put< _CharT, _OutIter >::do_put().

4.971.4.3 put() [2/2]

```
template<typename _CharT , typename _OutIter >
_OutIter std::time_put< _CharT, _OutIter >::put (
            iter_type __s,
            ios_base & __io,
            char_type __fill,
            const tm * __tm,
            const _CharT * __beg,
            const _CharT * __end ) const
```

Format and output a time or date.
This function formats the data in struct tm according to the provided format string. The format string is interpreted as by strftime().

Parameters

__s	The stream to write to.
__io	Source of locale.
__fill	char_type to use for padding.
__tm	Struct tm with date and time info to format.
__beg	Start of format string.
__end	End of format string.

Returns

Iterator after writing.

4.981.1 Detailed Description

template<typename Node_CItr, typename Node_Itr, typename Cmp_Fn, typename _Alloc>
class __gnu_pbds::tree_order_statistics_node_update< Node_CItr, Node_Itr, Cmp_Fn, _Alloc >

Functor updating ranks of entrees.
Definition at line 64 of file tree_policy.hpp.

4.981.2 Member Function Documentation

4.981.2.1 find_by_order() [1/2]

```
template<typename Node_CItr , typename Node_Itr , typename Cmp_Fn , typename _Alloc >
iterator __gnu_pbds::tree_order_statistics_node_update< Node_CItr, Node_Itr, Cmp_Fn, _Alloc >::find_by_order (
            size_type  )  [inline]
```

Finds an entry by __order. Returns an iterator to the entry with the __order order, or an iterator to the container object's end if order is at least the size of the container object.

4.981.2.2 find_by_order() [2/2]

```
template<typename Node_CItr , typename Node_Itr , typename Cmp_Fn , typename _Alloc >
const_iterator __gnu_pbds::tree_order_statistics_node_update< Node_CItr, Node_Itr, Cmp_Fn, _Alloc >::find_by_order (
            size_type  ) const  [inline]
```

Finds an entry by __order. Returns a const_iterator to the entry with the __order order, or a const_iterator to the container object's end if order is at least the size of the container object.

4.981.2.3 operator()()

```
template<typename Node_CItr , typename Node_Itr , typename Cmp_Fn , typename _Alloc >
void __gnu_pbds::tree_order_statistics_node_update< Node_CItr, Node_Itr, Cmp_Fn, _Alloc >::operator() (
            node_iterator ,
            node_const_iterator  ) const  [inline], [protected]
```

Updates the rank of a node through a node_iterator node_it; end_nd_it is the end node iterator.

4.981.2.4 order_of_key()

```
template<typename Node_CItr , typename Node_Itr , typename Cmp_Fn , typename _Alloc >
size_type __gnu_pbds::tree_order_statistics_node_update< Node_CItr, Node_Itr, Cmp_Fn, _Alloc >::order_of_key (
            key_const_reference  ) const  [inline]
```

Returns the order of a key within a sequence. For exapmle, if r_key is the smallest key, this method will return 0; if r_key is a key between the smallest and next key, this method will return 1; if r_key is a key larger than the largest key, this method will return the size of r_c.

4.990.1 Detailed Description

template<typename Key, typename Mapped, typename _ATraits = typename detail::default_trie_access_traits<Key>::type, typename Tag = pat_trie_tag, template< typename Node_CItr, typename Node_Itr, typename _ATraits_, typename _Alloc_ > class Node_Update = null_node_update, typename _Alloc = std::allocator<char>>
class __gnu_pbds::trie< Key, Mapped, _ATraits, Tag, Node_Update, _Alloc >

A trie-based container.

Template Parameters

Key	Key type.
Mapped	Map type.
_ATraits	Element access traits.
Tag	Instantiating data structure type, see container_tag.
Node_Update	Updates trie internal-nodes, restores invariants when invalidated. XXX See design::tree-based-containersnode invariants.
_Alloc	Allocator type.

Base tag choice is pat_trie_tag.
Base is basic_branch.
Definition at line 731 of file assoc_container.hpp.

4.990.2 Member Typedef Documentation

4.990.2.1 access_traits `template<typename Key , typename Mapped , typename _ATraits = typename detail::default_trie_access_traits<Key>::type, typename Tag = pat_trie_tag, template< typename Node_CItr, typename Node_Itr, typename _ATraits_, typename _Alloc_ > class Node_Update = null_node_update, typename _Alloc = std::allocator<char>>`

`typedef _ATraits __gnu_pbds::trie< Key, Mapped, _ATraits, Tag, Node_Update, _Alloc >::access_traits`

Element access traits type.
Definition at line 738 of file assoc_container.hpp.

4.990.3 Constructor & Destructor Documentation

4.990.3.1 trie() [1/3]

```
template<typename Key , typename Mapped , typename _ATraits = typename detail↩
::default_trie_access_traits<Key>::type, typename Tag = pat_trie_tag, template< typename Node_↩
CItr, typename Node_Itr, typename _ATraits_, typename _Alloc_ > class Node_Update = null_node_↩
update, typename _Alloc = std::allocator<char>>
__gnu_pbds::trie< Key, Mapped, _ATraits, Tag, Node_Update, _Alloc >::trie (
            const access_traits & t )  [inline]
```

Constructor taking some policy objects. r_access_traits will be copied by the _ATraits object of the container object.
Definition at line 744 of file assoc_container.hpp.

4.990.3.2 trie() [2/3]

```
template<typename Key , typename Mapped , typename _ATraits = typename detail↩
::default_trie_access_traits<Key>::type, typename Tag = pat_trie_tag, template< typename Node_↩
CItr, typename Node_Itr, typename _ATraits_, typename _Alloc_ > class Node_Update = null_node_↩
update, typename _Alloc = std::allocator<char>>
template<typename It >
__gnu_pbds::trie< Key, Mapped, _ATraits, Tag, Node_Update, _Alloc >::trie (
            It first,
            It last )  [inline]
```

Constructor taking __iterators to a range of value_types. The value_types between first_it and last_it will be inserted into the container object.
Definition at line 751 of file assoc_container.hpp.

4.990.3.3 trie() [3/3]

```
template<typename Key , typename Mapped , typename _ATraits = typename detail↩

4.995.1 Detailed Description

template<typename Node_CItr, typename Node_Itr, typename _ATraits, typename _Alloc>
class __gnu_pbds::trie_order_statistics_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >

Functor updating ranks of entrees.
Definition at line 253 of file trie_policy.hpp.

4.995.2 Member Function Documentation

4.995.2.1 find_by_order() [1/2]

```
template<typename Node_CItr , typename Node_Itr , typename _ATraits
, typename _Alloc >
iterator __gnu_pbds::trie_order_statistics_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >↩
::find_by_order (
            size_type  )  [inline]
```

Finds an entry by __order. Returns an iterator to the entry with the __order order, or an iterator to the container object's end if order is at least the size of the container object.

4.995.2.2 find_by_order() [2/2]

```
template<typename Node_CItr , typename Node_Itr , typename _ATraits
, typename _Alloc >
const_iterator __gnu_pbds::trie_order_statistics_node_update< Node_CItr, Node_Itr, _ATraits, _↩
Alloc >::find_by_order (
            size_type  ) const  [inline]
```

Finds an entry by __order. Returns a const_iterator to the entry with the __order order, or a const_iterator to the container object's end if order is at least the size of the container object.

4.995.2.3 operator()()

```
template<typename Node_CItr , typename Node_Itr , typename _ATraits , typename
_Alloc >
void __gnu_pbds::trie_order_statistics_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >↩
::operator() (
            node_iterator ,
            node_const_iterator  ) const  [inline], [protected]
```

Updates the rank of a node through a node_iterator node_it; end_nd_it is the end node iterator.

4.995.2.4 order_of_key()

```
template<typename Node_CItr , typename Node_Itr , typename _ATraits ,
typename _Alloc >
size_type __gnu_pbds::trie_order_statistics_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc
>::order_of_key (
            key_const_reference  ) const  [inline]
```

Returns the order of a key within a sequence. For exapmle, if r_key is the smallest key, this method will return 0; if r_key is a key between the smallest and next key, this method will return 1; if r_key is a key larger than the largest key, this method will return the size of r_c.

4.995.2.5 order_of_prefix()

```
template<typename Node_CItr , typename Node_Itr , typename _ATraits ,
typename _Alloc >
size_type __gnu_pbds::trie_order_statistics_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc
>::order_of_prefix (
            a_const_iterator ,
            a_const_iterator  ) const  [inline]
```

Returns the order of a prefix within a sequence. For exapmle, if [b, e] is the smallest prefix, this method will return 0; if r_key is a key between the smallest and next key, this method will return 1; if r_key is a key larger than the largest key, this method will return the size of r_c.

4.997.1 Detailed Description

template<typename Node_CItr, typename Node_Itr, typename _ATraits, typename _Alloc>
class __gnu_pbds::trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >

A node updator that allows tries to be searched for the range of values that match a certain prefix.
Definition at line 155 of file trie_policy.hpp.

4.997.2 Member Typedef Documentation

4.997.2.1 a_const_iterator

```
template<typename Node_CItr , typename Node_Itr , typename _ATraits ,
typename _Alloc >
typedef access_traits::const_iterator __gnu_pbds::trie_prefix_search_node_update< Node_CItr,
Node_Itr, _ATraits, _Alloc >::a_const_iterator
```

Const element iterator.
Definition at line 168 of file trie_policy.hpp.

4.997.2.2 access_traits

```
template<typename Node_CItr , typename Node_Itr , typename _ATraits ,
typename _Alloc >
typedef _ATraits __gnu_pbds::trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _↩
Alloc >::access_traits
```

Element access traits.
Definition at line 165 of file trie_policy.hpp.

4.997.2.3 allocator_type

```
template<typename Node_CItr , typename Node_Itr , typename _ATraits , typename _Alloc >
typedef _Alloc __gnu_pbds::trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >::allocator_type
```

_Alloc type.
Definition at line 171 of file trie_policy.hpp.

4.997.2.4 size_type

```
template<typename Node_CItr , typename Node_Itr , typename _ATraits , typename _Alloc >
typedef allocator_type::size_type __gnu_pbds::trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >::size_type
```

Size type.
Definition at line 174 of file trie_policy.hpp.

4.997.3 Member Function Documentation

4.997.3.1 operator()()

```
template<typename Node_CItr , typename Node_Itr , typename _ATraits , typename _Alloc >
void __gnu_pbds::trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >::operator()
(
            node_iterator node_it,
            node_const_iterator end_nd_it ) const  [inline], [protected]
```

Called to update a node's metadata.

4.997.3.2 prefix_range() [1/4]

```
template<typename Node_CItr , typename Node_Itr , typename _ATraits , typename _Alloc >
std::pair<iterator, iterator> __gnu_pbds::trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >::prefix_range (
            a_const_iterator ,
            a_const_iterator  )
```

Finds the iterator range corresponding to all values whose prefixes match [b, e).

4.997.3.3 prefix_range() [2/4]

```
template<typename Node_CItr , typename Node_Itr , typename _ATraits , typename _Alloc >
std::pair<const_iterator, const_iterator> __gnu_pbds::trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >::prefix_range (
            a_const_iterator ,
            a_const_iterator  ) const
```

Finds the const iterator range corresponding to all values whose prefixes match [b, e).

4.997.3.4 prefix_range() [3/4]

```
template<typename Node_CItr , typename Node_Itr , typename _ATraits , typename _Alloc >
std::pair<iterator, iterator> __gnu_pbds::trie_prefix_search_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc >::prefix_range (
            key_const_reference  )
```

Finds the iterator range corresponding to all values whose prefixes match r_key.

4.997.3.5 prefix_range() [4/4] template<typename Node_CItr , typename Node_Itr , typename _ATraits , typename _Alloc >

```
std::pair<const_iterator, const_iterator> __gnu_pbds::trie_prefix_search_node_update< Node_CItr,
Node_Itr, _ATraits, _Alloc >::prefix_range (
            key_const_reference  ) const
```

Finds the const iterator range corresponding to all values whose prefixes match r_key.
The documentation for this class was generated from the following file:

- trie_policy.hpp

4.998 __gnu_pbds::trie_string_access_traits< String, Min_E_Val, Max_E_Val, Reverse, _Alloc > Struct Template Reference

Public Types

4.998.1 Detailed Description

template<typename String = std::string, typename String::value_type Min_E_Val = detail::__numeric_traits<typename String::value_type>::__min, typename String::value_type Max_E_Val = detail::__numeric_traits<typename String::value_type>::__max, bool Reverse = false, typename _Alloc = std::allocator<char>>
struct __gnu_pbds::trie_string_access_traits< String, Min_E_Val, Max_E_Val, Reverse, _Alloc >

Element access traits for string types.

Template Parameters

String	String type.
Min_E_Val	Minimal element value.
Max_E_Val	Maximum element value.
Reverse	Reverse iteration should be used. Default: false.
_Alloc	Allocator type.

Definition at line 74 of file trie_policy.hpp.

4.998.2 Member Typedef Documentation

4.998.2.1 const_iterator

```
template<typename String = std::string, typename String::value_type Min_↩
E_Val = detail::__numeric_traits<typename String::value_type>::__min, typename String::value_type
Max_E_Val = detail::__numeric_traits<typename String::value_type>::__max, bool Reverse = false,
typename _Alloc = std::allocator<char>>
typedef detail::__conditional_type<Reverse, typename String::const_reverse_iterator, typename
String::const_iterator>::__type __gnu_pbds::trie_string_access_traits< String, Min_E_Val, Max_↩
E_Val, Reverse, _Alloc >::const_iterator
```

Element const iterator type.
Definition at line 90 of file trie_policy.hpp.

4.998.2.2 e_type

```
template<typename String = std::string, typename String::value_type Min_E_↩
Val = detail::__numeric_traits<typename String::value_type>::__min, typename String::value_type
Max_E_Val = detail::__numeric_traits<typename String::value_type>::__max, bool Reverse = false,
typename _Alloc = std::allocator<char>>
typedef std::iterator_traits<const_iterator>::value_type __gnu_pbds::trie_string_access_traits<
String, Min_E_Val, Max_E_Val, Reverse, _Alloc >::e_type
```

Element type.
Definition at line 93 of file trie_policy.hpp.

4.998.3 Member Function Documentation

4.998.3.1 begin()

```
template<typename String = std::string, typename String::value_type Min_E_↩
Val = detail::__numeric_traits<typename String::value_type>::__min, typename String::value_type
Max_E_Val = detail::__numeric_traits<typename String::value_type>::__max, bool Reverse = false,
typename _Alloc = std::allocator<char>>
static const_iterator __gnu_pbds::trie_string_access_traits< String, Min_E_Val, Max_E_Val, Reverse,
_Alloc >::begin (
            key_const_reference  )  [inline], [static]
```

Returns a const_iterator to the first element of key_const_reference agumnet.

4.998.3.2 e_pos()

```
template<typename String = std::string, typename String::value_type Min_E_↩
Val = detail::__numeric_traits<typename String::value_type>::__min, typename String::value_type
Max_E_Val = detail::__numeric_traits<typename String::value_type>::__max, bool Reverse = false,
typename _Alloc = std::allocator<char>>
static size_type __gnu_pbds::trie_string_access_traits< String, Min_E_Val, Max_E_Val, Reverse, _↩
Alloc >::e_pos (
            e_type e )  [inline], [static]
```

Maps an element to a position.

4.998.3.3 end()

```
template<typename String = std::string, typename String::value_type Min_E_Val =
detail::__numeric_traits<typename String::value_type>::__min, typename String::value_type Max↩
_E_Val = detail::__numeric_traits<typename String::value_type>::__max, bool Reverse = false,
typename _Alloc = std::allocator<char>>
static const_iterator __gnu_pbds::trie_string_access_traits< String, Min_E_Val, Max_E_Val, Reverse,
_Alloc >::end (
            key_const_reference  )  [inline], [static]
```

Returns a const_iterator to the after-last element of key_const_reference argument.

4.1006.1 Detailed Description

template<typename _T1, typename _T2>
class std::tuple< _T1, _T2 >

Partial specialization, 2-element tuple. Includes construction and assignment from a pair.
Definition at line 904 of file tuple.
The documentation for this class was generated from the following file:

- tuple

4.1007 std::tuple_element< _Int, _Tp > Struct Template Reference

4.1007.1 Detailed Description

template<std::size_t _Int, typename _Tp>
struct std::tuple_element< _Int, _Tp >

tuple_element
Gives the type of the ith element of a given tuple type.
Definition at line 428 of file array.
The documentation for this struct was generated from the following file:

- array

4.1008 std::tuple_element< 0, std::pair< _Tp1, _Tp2 > > Struct Template Reference

Public Types

- typedef _Tp1 **type**

4.1008.1 Detailed Description

template<class _Tp1, class _Tp2>
struct std::tuple_element< 0, std::pair< _Tp1, _Tp2 > >

Partial specialization for std::pair.
Definition at line 162 of file utility.
The documentation for this struct was generated from the following file:

- utility

4.1009 std::tuple_element< 0, tuple< _Head, _Tail... > > Struct Template Reference

Public Types

- typedef _Head **type**

4.1009.1 Detailed Description

template<typename _Head, typename... _Tail>
struct std::tuple_element< 0, tuple< _Head, _Tail... > >

Basis case for tuple_element: The first element is the one we're seeking.
Definition at line 1283 of file tuple.
The documentation for this struct was generated from the following file:

- tuple

4.1010 std::tuple_element< 1, std::pair< _Tp1, _Tp2 > > Struct Template Reference

Public Types

- typedef _Tp2 **type**

4.1010.1 Detailed Description

template<class _Tp1, class _Tp2>
struct std::tuple_element< 1, std::pair< _Tp1, _Tp2 > >

Partial specialization for std::pair.
Definition at line 167 of file utility.
The documentation for this struct was generated from the following file:

- utility

4.1011 std::tuple_element< __i, tuple< _Head, _Tail... > > Struct Template Reference

Inheritance diagram for std::tuple_element< __i, tuple< _Head, _Tail... > >:

4.1011.1 Detailed Description

template<std::size_t __i, typename _Head, typename... _Tail>
struct std::tuple_element< __i, tuple< _Head, _Tail... > >

Recursive case for tuple_element: strip off the first element in the tuple and retrieve the (i-1)th element of the remaining tuple.
Definition at line 1276 of file tuple.
The documentation for this struct was generated from the following file:

- tuple

4.1012 std::tuple_element< __i, tuple<> > Struct Template Reference

4.1012.1 Detailed Description

template<size_t __i>
struct std::tuple_element< __i, tuple<> >

Error case for tuple_element: invalid index.
Definition at line 1292 of file tuple.
The documentation for this struct was generated from the following file:

- tuple

4.1013 std::tuple_element< _Int, ::array< _Tp, _Nm > > Struct Template Reference

Public Types

- typedef _Tp **type**

4.1013.1 Detailed Description

template<std::size_t _Int, typename _Tp, std::size_t _Nm>
struct std::tuple_element< _Int, ::array< _Tp, _Nm > >

Partial specialization for std::array.
Definition at line 432 of file array.
The documentation for this struct was generated from the following file:

- array

4.1014 std::tuple_element< _Int, std::__debug::array< _Tp, _Nm > > Struct Template Reference

Public Types

- typedef _Tp **type**

4.1014.1 Detailed Description

template<std::size_t _Int, typename _Tp, std::size_t _Nm>
struct std::tuple_element< _Int, std::__debug::array< _Tp, _Nm > >

tuple_element
Definition at line 395 of file debug/array.
The documentation for this struct was generated from the following file:

- debug/array

4.1015 std::tuple_size< _Tp > Struct Template Reference

Inherited by std::tuple_size< const __enable_if_has_tuple_size< _Tp > >, std::tuple_size< const volatile __enable↩ _if_has_tuple_size< _Tp > >, and std::tuple_size< volatile __enable_if_has_tuple_size< _Tp > >.

4.1015.1 Detailed Description

template<typename _Tp>
struct std::tuple_size< _Tp >

tuple_size
Finds the size of a given tuple type.
Definition at line 419 of file array.
The documentation for this struct was generated from the following file:

- array

4.1016 std::tuple_size< std::__debug::array< _Tp, _Nm > > Struct Template Reference

Protected Member Functions

- **type_info** (const char *__n)

Protected Attributes

- const char * **__name**

4.1022.1 Detailed Description

Part of RTTI.
The `type_info` class describes type information generated by an implementation.
Definition at line 88 of file typeinfo.

4.1022.2 Constructor & Destructor Documentation

4.1022.2.1 ~type_info() `virtual std::type_info::~type_info ( ) [virtual]`

Destructor first. Being the first non-inline virtual function, this controls in which translation unit the vtable is emitted. The compiler makes use of that information to know where to emit the runtime-mandated type_info structures in the new-abi.

4.1022.3 Member Function Documentation

4.1022.3.1 name() const char* std::type_info::name ( ) const [inline], [noexcept]

Returns an *implementation-defined* byte string; this is not portable between compilers!

Definition at line 99 of file typeinfo.
The documentation for this class was generated from the following file:

- typeinfo

4.1023 __gnu_pbds::detail::types_traits< Key, Mapped, _Alloc, Store_Hash > Struct Template Reference

Inheritance diagram for __gnu_pbds::detail::types_traits< Key, Mapped, _Alloc, Store_Hash >:

Public Types

- typedef std::pair< size_type, size_type > **comp_hash**
- typedef __rebind_va::const_pointer **const_pointer**
- typedef __rebind_va::const_reference **const_reference**
- typedef __rebind_ka::const_pointer **key_const_pointer**
- typedef __rebind_ka::const_reference **key_const_reference**
- typedef __rebind_ka::pointer **key_pointer**
- typedef __rebind_ka::reference **key_reference**
- typedef Key **key_type**
- typedef __rebind_ma::const_pointer **mapped_const_pointer**
- typedef __rebind_ma::const_reference **mapped_const_reference**
- typedef __rebind_ma::pointer **mapped_pointer**
- typedef __rebind_ma::reference **mapped_reference**
- typedef Mapped **mapped_type**
- typedef __nothrowcopy::indicator **no_throw_indicator**
- typedef __rebind_va::pointer **pointer**
- typedef __rebind_va::reference **reference**
- typedef _Alloc::size_type **size_type**
- typedef integral_constant< int, Store_Hash > **store_extra**
- typedef stored_data< value_type, size_type, Store_Hash > **stored_data_type**
- typedef select_value_type< Key, Mapped >::type **value_type**

Public Attributes

- no_throw_indicator **m_no_throw_copies_indicator**
- store_extra **m_store_extra_indicator**

4.1023.1 Detailed Description

template<typename Key, typename Mapped, typename _Alloc, bool Store_Hash>
struct __gnu_pbds::detail::types_traits< Key, Mapped, _Alloc, Store_Hash >

Traits for abstract types.
Definition at line 154 of file types_traits.hpp.
The documentation for this struct was generated from the following file:

- types_traits.hpp

4.1024 __gnu_cxx::unary_compose< _Operation1, _Operation2 > Class Template Reference

Inheritance diagram for __gnu_cxx::unary_compose< _Operation1, _Operation2 >:

Public Types

- typedef _Operation2::argument_type argument_type
- typedef _Operation1::result_type result_type

Public Member Functions

- **unary_compose** (const _Operation1 &__x, const _Operation2 &__y)
- _Operation1::result_type **operator()** (const typename _Operation2::argument_type &__x) const

Protected Attributes

- _Operation1 **_M_fn1**
- _Operation2 **_M_fn2**

4.1024.1 Detailed Description

template<class _Operation1, class _Operation2>
class __gnu_cxx::unary_compose< _Operation1, _Operation2 >

An SGI extension .
Definition at line 117 of file ext/functional.

4.1024.2 Member Typedef Documentation

4.1024.2.1 argument_type

`typedef _Operation2::argument_type std::unary_function< _Operation2::argument_type , _Operation1::result_type >::argument_type [inherited]`

`argument_type` is the type of the argument
Definition at line 108 of file stl_function.h.

4.1024.2.2 result_type

`typedef _Operation1::result_type std::unary_function< _Operation2::argument_type , _Operation1::result_type >::result_type [inherited]`

`result_type` is the return type
Definition at line 111 of file stl_function.h.
The documentation for this class was generated from the following file:

- ext/functional

4.1025 std::unary_function< _Arg, _Result > Struct Template Reference

Inheritance diagram for std::unary_function< _Arg, _Result >:

Public Types

- typedef _Arg argument_type
- typedef _Result result_type

4.1025.1 Detailed Description

template<typename _Arg, typename _Result>
struct std::unary_function< _Arg, _Result >

This is one of the functor base classes.
Definition at line 105 of file stl_function.h.

4.1025.2 Member Typedef Documentation

4.1025.2.1 argument_type `template<typename _Arg , typename _Result >`

`typedef _Arg std::unary_function< _Arg, _Result >::argument_type`

`argument_type` is the type of the argument
Definition at line 108 of file stl_function.h.

4.1025.2.2 result_type `template<typename _Arg , typename _Result >`

`typedef _Result std::unary_function< _Arg, _Result >::result_type`

`result_type` is the return type
Definition at line 111 of file stl_function.h.
The documentation for this struct was generated from the following file:

- stl_function.h

4.1026 std::unary_negate< _Predicate > Class Template Reference

Inheritance diagram for std::unary_negate< _Predicate >:

Public Types

- typedef _Predicate::argument_type argument_type
- typedef bool result_type

Public Member Functions

- constexpr **unary_negate** (const _Predicate &__x)
- constexpr bool **operator()** (const typename _Predicate::argument_type &__x) const

Protected Attributes

- _Predicate **_M_pred**

4.1026.1 Detailed Description

template<typename _Predicate>
class std::unary_negate< _Predicate >

One of the negation functors.
Definition at line 1003 of file stl_function.h.

4.1026.2 Member Typedef Documentation

4.1026.2.1 argument_type

`typedef _Predicate::argument_type std::unary_function< _Predicate::argument_type , bool >::argument_type [inherited]`

`argument_type` is the type of the argument
Definition at line 108 of file stl_function.h.

4.1026.2.2 result_type

`typedef bool std::unary_function< _Predicate::argument_type , bool >::result_type [inherited]`

`result_type` is the return type
Definition at line 111 of file stl_function.h.
The documentation for this class was generated from the following file:

- stl_function.h

4.1027 __gnu_parallel::unbalanced_tag Struct Reference

Inheritance diagram for __gnu_parallel::unbalanced_tag:

Public Member Functions

- _ThreadIndex __get_num_threads ()
- void set_num_threads (_ThreadIndex __num_threads)

4.1027.1 Detailed Description

Recommends parallel execution using static load-balancing at compile time.
Definition at line 92 of file tags.h.

4.1027.2 Member Function Documentation

4.1027.2.1 __get_num_threads()

`_ThreadIndex __gnu_parallel::parallel_tag::__get_num_threads ( ) [inline], [inherited]`

Find out desired number of threads.

Returns

Desired number of threads.

Definition at line 63 of file tags.h.
Referenced by __gnu_parallel::__parallel_sort().

4.1027.2.2 set_num_threads()

`void __gnu_parallel::parallel_tag::set_num_threads ( _ThreadIndex __num_threads ) [inline], [inherited]`

Set the desired number of threads.

Parameters

__num_threads	Desired number of threads.

Definition at line 73 of file tags.h.
The documentation for this struct was generated from the following file:

- tags.h

4.1028 std::underflow_error Class Reference

Inheritance diagram for std::underflow_error:

Public Member Functions

- **underflow_error** (const char *) _GLIBCXX_TXN_SAFE
- **underflow_error** (const string &__arg) _GLIBCXX_TXN_SAFE
- **underflow_error** (const underflow_error &)=default
- **underflow_error** (underflow_error &&)=default
- underflow_error & **operator=** (const underflow_error &)=default
- underflow_error & **operator=** (underflow_error &&)=default
- virtual const char * what () const noexcept

4.1028.1 Detailed Description

Thrown to indicate arithmetic underflow.

Definition at line 288 of file stdexcept.

4.1028.2 Member Function Documentation

4.1028.2.1 what() `virtual const char* std::runtime_error::what ( ) const [virtual], [noexcept], [inherited]`

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from std::exception.
Reimplemented in std::experimental::filesystem::v1::filesystem_error.
The documentation for this class was generated from the following file:

- stdexcept

4.1029 std::underlying_type< _Tp > Struct Template Reference

Inherits std::__underlying_type_impl< _Tp, bool >.

Public Types

- using **type** = __underlying_type(_Tp)

4.1029.1 Detailed Description

template<typename _Tp>
struct std::underlying_type< _Tp >

The underlying type of an enum.
Definition at line 2324 of file type_traits.
The documentation for this struct was generated from the following file:

- type_traits

4.1030 std::uniform_int_distribution< _IntType > Class Template Reference

Classes

- struct param_type

Public Types

- typedef _IntType result_type

Public Member Functions

- uniform_int_distribution ()
- uniform_int_distribution (_IntType __a, _IntType __b=numeric_limits< _IntType >::max())
- **uniform_int_distribution** (const param_type &__p)
- template<typename _ForwardIterator , typename _UniformRandomNumberGenerator > void **__generate** (_ForwardIterator __f, _ForwardIterator __t, _UniformRandomNumberGenerator &__urng)
- template<typename _ForwardIterator , typename _UniformRandomNumberGenerator > void **__generate** (_ForwardIterator __f, _ForwardIterator __t, _UniformRandomNumberGenerator &__urng, const param_type &__p)
- template<typename _UniformRandomNumberGenerator > void **__generate** (result_type *__f, result_type *__t, _UniformRandomNumberGenerator &__urng, const param_type &__p)
- result_type **a** () const
- result_type **b** () const
- result_type max () const
- result_type min () const
- template<typename _UniformRandomNumberGenerator > result_type operator() (_UniformRandomNumberGenerator &__urng)
- template<typename _UniformRandomNumberGenerator > result_type **operator()** (_UniformRandomNumberGenerator &__urng, const param_type &__p)
- param_type param () const
- void param (const param_type &__param)
- void reset ()

Friends

- bool operator== (const uniform_int_distribution &__d1, const uniform_int_distribution &__d2)

4.1030.1 Detailed Description

template<typename _IntType = int>
class std::uniform_int_distribution< _IntType >

Uniform discrete distribution for random numbers. A discrete random distribution on the range $[min, max]$ with equal probability throughout the range.
Definition at line 74 of file uniform_int_dist.h.

4.1030.2 Member Typedef Documentation

4.1030.2.1 result_type `template<typename _IntType = int>`

`typedef _IntType std::uniform_int_distribution< _IntType >::result_type`

The type of the range of the distribution.
Definition at line 81 of file uniform_int_dist.h.

4.1030.3 Constructor & Destructor Documentation

4.1030.3.1 uniform_int_distribution() [1/2] template<typename _IntType = int>

std::uniform_int_distribution< _IntType >::uniform_int_distribution ( ) [inline]

Constructs a uniform distribution object.

Definition at line 122 of file uniform_int_dist.h.

4.1030.3.2 uniform_int_distribution() [2/2] template<typename _IntType = int>

```
std::uniform_int_distribution< _IntType >::uniform_int_distribution (
            _IntType __a,
            _IntType __b = numeric_limits<_IntType>::max() ) [inline], [explicit]
```

Constructs a uniform distribution object.

Definition at line 128 of file uniform_int_dist.h.

4.1030.4 Member Function Documentation

4.1030.4.1 max() template<typename _IntType = int>

result_type std::uniform_int_distribution< _IntType >::max ( ) const [inline]

Returns the inclusive upper bound of the distribution range.

Definition at line 180 of file uniform_int_dist.h.

4.1030.4.2 min() template<typename _IntType = int>

result_type std::uniform_int_distribution< _IntType >::min ( ) const [inline]

Returns the inclusive lower bound of the distribution range.

Definition at line 173 of file uniform_int_dist.h.

4.1030.4.3 operator()() template<typename _IntType = int>

```
template<typename _UniformRandomNumberGenerator >
result_type std::uniform_int_distribution< _IntType >::operator() (
            _UniformRandomNumberGenerator & __urng ) [inline]
```

Generating functions.

Definition at line 188 of file uniform_int_dist.h.

4.1030.4.4 param() [1/2] template<typename _IntType = int>

param_type std::uniform_int_distribution< _IntType >::param ( ) const [inline]

Returns the parameter set of the distribution.

Definition at line 158 of file uniform_int_dist.h.

Referenced by std::operator>>().

4.1030.4.5 param() [2/2] template<typename _IntType = int>

```
void std::uniform_int_distribution< _IntType >::param (
            const param_type & __param ) [inline]
```

Sets the parameter set of the distribution.

Parameters

__param	The new parameter set of the distribution.

Definition at line 166 of file uniform_int_dist.h.

4.1030.4.6 reset() `template<typename _IntType = int>`

`void std::uniform_int_distribution< _IntType >::reset ( ) [inline]`

Resets the distribution state.
Does nothing for the uniform integer distribution.
Definition at line 144 of file uniform_int_dist.h.

4.1030.5 Friends And Related Function Documentation

4.1030.5.1 operator== `template<typename _IntType = int>`

```
bool operator== (
            const uniform_int_distribution< _IntType > & __d1,
            const uniform_int_distribution< _IntType > & __d2 ) [friend]
```

Return true if two uniform integer distributions have the same parameters.
Definition at line 223 of file uniform_int_dist.h.
The documentation for this class was generated from the following file:

- uniform_int_dist.h

4.1031 std::uniform_real_distribution< _RealType > Class Template Reference

Classes

- struct param_type

Public Types

4.1031.1 Detailed Description

template<typename _RealType = double>
class std::uniform_real_distribution< _RealType >

Uniform continuous distribution for random numbers.
A continuous random distribution on the range [min, max) with equal probability throughout the range. The URNG should be real-valued and deliver number in the range [0, 1).
Definition at line 1740 of file random.h.

4.1031.2 Member Typedef Documentation

4.1031.2.1 result_type `template<typename _RealType = double>`

```
typedef _RealType std::uniform_real_distribution< _RealType >::result_type
```

The type of the range of the distribution.
Definition at line 1747 of file random.h.

4.1031.3 Constructor & Destructor Documentation

4.1031.3.1 uniform_real_distribution() [1/2] `template<typename _RealType = double>`

```
std::uniform_real_distribution< _RealType >::uniform_real_distribution ( )  [inline]
```

Constructs a uniform_real_distribution object.
The lower bound is set to 0.0 and the upper bound to 1.0
Definition at line 1790 of file random.h.

4.1031.3.2 uniform_real_distribution() [2/2] `template<typename _RealType = double>`

```
std::uniform_real_distribution< _RealType >::uniform_real_distribution (
            _RealType __a,
            _RealType __b = _RealType(1) )  [inline], [explicit]
```

Constructs a uniform_real_distribution object.

Parameters

_↩ _a	[IN] The lower bound of the distribution.
_↩ _b	[IN] The upper bound of the distribution.

Definition at line 1799 of file random.h.

4.1031.4 Member Function Documentation

4.1031.4.1 max() template<typename _RealType = double>

```
result_type std::uniform_real_distribution< _RealType >::max ( ) const  [inline]
```

Returns the inclusive upper bound of the distribution range.
Definition at line 1850 of file random.h.

4.1031.4.2 min() template<typename _RealType = double>

```
result_type std::uniform_real_distribution< _RealType >::min ( ) const  [inline]
```

Returns the inclusive lower bound of the distribution range.
Definition at line 1843 of file random.h.

4.1031.4.3 operator()() template<typename _RealType = double>

```
template<typename _UniformRandomNumberGenerator >
result_type std::uniform_real_distribution< _RealType >::operator() (
            _UniformRandomNumberGenerator & __urng )  [inline]
```

Generating functions.
Definition at line 1858 of file random.h.

4.1031.4.4 param() [1/2] template<typename _RealType = double>

```
param_type std::uniform_real_distribution< _RealType >::param ( ) const  [inline]
```

Returns the parameter set of the distribution.
Definition at line 1828 of file random.h.
Referenced by std::operator>>().

4.1031.4.5 param() [2/2] template<typename _RealType = double>

```
void std::uniform_real_distribution< _RealType >::param (
            const param_type & __param )  [inline]
```

Sets the parameter set of the distribution.

Parameters

__param	The new parameter set of the distribution.

Definition at line 1836 of file random.h.

4.1031.4.6 reset() template<typename _RealType = double>

```
void std::uniform_real_distribution< _RealType >::reset ( )  [inline]
```

Resets the distribution state.
Does nothing for the uniform real distribution.
Definition at line 1814 of file random.h.

4.1031.5 Friends And Related Function Documentation

4.1031.5.1 operator== template<typename _RealType = double>

```
bool operator== (
            const uniform_real_distribution< _RealType > & __d1,
            const uniform_real_distribution< _RealType > & __d2 )  [friend]
```

Return true if two uniform real distributions have the same parameters.
Definition at line 1898 of file random.h.
The documentation for this class was generated from the following files:

- random.h
- bits/random.tcc

4.1032 std::unique_lock< _Mutex > Class Template Reference

Related Functions

(Note that these are not member functions.)

- template<typename _Mutex >
  void swap (unique_lock< _Mutex > &__x, unique_lock< _Mutex > &__y) noexcept

4.1032.1 Detailed Description

template<typename _Mutex>
class std::unique_lock< _Mutex >

A movable scoped lock type.
A unique_lock controls mutex ownership within a scope. Ownership of the mutex can be delayed until after construction and can be transferred to another unique_lock by move construction or move assignment. If a mutex lock is owned when the destructor runs ownership will be released.
Definition at line 56 of file unique_lock.h.

4.1032.2 Friends And Related Function Documentation

4.1032.2.1 swap() `template<typename _Mutex >`

```
void swap (
            unique_lock< _Mutex > & __x,
            unique_lock< _Mutex > & __y )  [related]
```

Swap overload for unique_lock objects.
Definition at line 235 of file unique_lock.h.

4.1033.1 Detailed Description

template<typename _Tp, typename _Dp = default_delete<_Tp>>
class std::unique_ptr< _Tp, _Dp >

20.7.1.2 unique_ptr for single objects.
Definition at line 242 of file unique_ptr.h.

4.1033.2 Constructor & Destructor Documentation

4.1033.2.1 unique_ptr() [1/7]

```
template<typename _Tp , typename _Dp = default_delete<_Tp>>
template<typename _Del = _Dp, typename = _DeleterConstraint<_Del>>
constexpr std::unique_ptr< _Tp, _Dp >::unique_ptr ( )  [inline], [constexpr], [noexcept]
```

Default constructor, creates a unique_ptr that owns nothing.
Definition at line 269 of file unique_ptr.h.

4.1033.2.2 unique_ptr() [2/7]

```
template<typename _Tp , typename _Dp = default_delete<_Tp>>
template<typename _Del = _Dp, typename = _DeleterConstraint<_Del>>
std::unique_ptr< _Tp, _Dp >::unique_ptr (
            pointer __p )  [inline], [explicit], [noexcept]
```

Takes ownership of a pointer.

Parameters

_↩ _p	A pointer to an object of `element_type`

The deleter will be value-initialized.
Definition at line 281 of file unique_ptr.h.

4.1033.2.3 unique_ptr() [3/7]

```
template<typename _Tp , typename _Dp = default_delete<_Tp>>
template<typename _Del = deleter_type, typename = _Require<is_copy_constructible<_Del>>>
std::unique_ptr< _Tp, _Dp >::unique_ptr (
            pointer __p,
```

```
            const deleter_type & __d )  [inline], [noexcept]
```

Takes ownership of a pointer.

Parameters

_↩ _p	A pointer to an object of element_type
_↩ _d	A reference to a deleter.

The deleter will be initialized with __d
Definition at line 294 of file unique_ptr.h.

4.1033.2.4 unique_ptr() [4/7]

```
template<typename _Tp , typename _Dp = default_delete<_Tp>>
template<typename _Del = deleter_type, typename = _Require<is_move_constructible<_Del>>>
std::unique_ptr< _Tp, _Dp >::unique_ptr (
            pointer __p,
            __enable_if_t<!is_lvalue_reference< _Del >::value, _Del && > __d )  [inline], [noexcept]
```

Takes ownership of a pointer.

Parameters

_↩ _p	A pointer to an object of element_type
_↩ _d	An rvalue reference to a (non-reference) deleter.

The deleter will be initialized with std::move(__d)
Definition at line 306 of file unique_ptr.h.

4.1033.2.5 unique_ptr() [5/7]

```
template<typename _Tp , typename _Dp = default_delete<_Tp>>
template<typename _Del = _Dp, typename = _DeleterConstraint<_Del>>
constexpr std::unique_ptr< _Tp, _Dp >::unique_ptr (
            nullptr_t  )  [inline], [constexpr], [noexcept]
```

Creates a unique_ptr that owns nothing.
Definition at line 320 of file unique_ptr.h.

4.1033.2.6 unique_ptr() [6/7]

```
template<typename _Tp , typename _Dp = default_delete<_Tp>>
std::unique_ptr< _Tp, _Dp >::unique_ptr (
            unique_ptr< _Tp, _Dp > &&  )  [default]
```

Move constructor.

4.1033.2.7 unique_ptr() [7/7]

```
template<typename _Tp , typename _Dp = default_delete<_Tp>>
template<typename _Up , typename _Ep , typename = _Require< __safe_conversion_up<_Up, _Ep>,
typename conditional<is_reference<_Dp>::value, is_same<_Ep, _Dp>, is_convertible<_Ep, _Dp>>↩
::type>>
std::unique_ptr< _Tp, _Dp >::unique_ptr (
            unique_ptr< _Up, _Ep > && __u )  [inline], [noexcept]
```

Converting constructor from another type.
Requires that the pointer owned by __u is convertible to the type of pointer owned by this object, __u does not own an array, and __u has a compatible deleter type.
Definition at line 340 of file unique_ptr.h.

4.1033.2.8 ~unique_ptr() template<typename _Tp , typename _Dp = default_delete<_Tp>> std::unique_ptr< _Tp, _Dp >::~unique_ptr ( ) [inline], [noexcept]

Destructor, invokes the deleter if the stored pointer is not null.
Definition at line 355 of file unique_ptr.h.
References std::unique_ptr< _Tp, _Dp >::get_deleter(), and std::move().

4.1033.3 Member Function Documentation

4.1033.3.1 get() template<typename _Tp , typename _Dp = default_delete<_Tp>> pointer std::unique_ptr< _Tp, _Dp >::get (void) const [inline], [noexcept]

Return the stored pointer.
Definition at line 421 of file unique_ptr.h.
Referenced by std::unique_ptr< _Tp, _Dp >::operator bool(), std::unique_ptr< _Tp[], _Dp >::operator bool(), std::unique_ptr< _Tp, _Dp >::operator!=(), std::unique_ptr< _Tp, _Dp >::operator==(), and std::unique_ptr< _Tp, _Dp >::operator>().

4.1033.3.2 get_deleter() [1/2] template<typename _Tp , typename _Dp = default_delete<_Tp>> const deleter_type& std::unique_ptr< _Tp, _Dp >::get_deleter ( ) const [inline], [noexcept]

Return a reference to the stored deleter.
Definition at line 431 of file unique_ptr.h.

4.1033.3.3 get_deleter() [2/2] template<typename _Tp , typename _Dp = default_delete<_Tp>> deleter_type& std::unique_ptr< _Tp, _Dp >::get_deleter ( ) [inline], [noexcept]

Return a reference to the stored deleter.
Definition at line 426 of file unique_ptr.h.
Referenced by std::unique_ptr< _Tp[], _Dp >::~unique_ptr(), std::unique_ptr< _Tp, _Dp >::~unique_ptr(), std::unique_ptr< _Tp, _Dp >::operator=(), and std::unique_ptr< _Tp[], _Dp >::operator=().

4.1033.3.4 operator bool() template<typename _Tp , typename _Dp = default_delete<_Tp>> std::unique_ptr< _Tp, _Dp >::operator bool ( ) const [inline], [explicit], [noexcept]

Return `true` if the stored pointer is not null.
Definition at line 435 of file unique_ptr.h.
References std::unique_ptr< _Tp, _Dp >::get().

4.1033.3.5 operator*() template<typename _Tp , typename _Dp = default_delete<_Tp>> add_lvalue_reference<element_type>::type std::unique_ptr< _Tp, _Dp >::operator* ( ) const [inline]

Dereference the stored pointer.
Definition at line 405 of file unique_ptr.h.

4.1033.3.6 operator->() template<typename _Tp , typename _Dp = default_delete<_Tp>>

pointer std::unique_ptr< _Tp, _Dp >::operator-> ( ) const [inline], [noexcept]

Return the stored pointer.

Definition at line 413 of file unique_ptr.h.

4.1033.3.7 operator=() [1/3] template<typename _Tp , typename _Dp = default_delete<_Tp>>

unique_ptr& std::unique_ptr< _Tp, _Dp >::operator= (
nullptr_t) [inline], [noexcept]

Reset the unique_ptr to empty, invoking the deleter if necessary.

Definition at line 395 of file unique_ptr.h.

References std::unique_ptr< _Tp, _Dp >::reset().

4.1033.3.8 operator=() [2/3] template<typename _Tp , typename _Dp = default_delete<_Tp>>

unique_ptr& std::unique_ptr< _Tp, _Dp >::operator= (
unique_ptr< _Tp, _Dp > &&) [default]

Move assignment operator.

Invokes the deleter if this object owns a pointer.

4.1033.3.9 operator=() [3/3] template<typename _Tp , typename _Dp = default_delete<_Tp>>

template<typename _Up , typename _Ep >
enable_if< __and_< __safe_conversion_up<_Up, _Ep>, is_assignable<deleter_type&, _Ep&&> >::value, unique_ptr&>::type std::unique_ptr< _Tp, _Dp >::operator= (
unique_ptr< _Up, _Ep > && __u) [inline], [noexcept]

Assignment from another type.

Parameters

_u	The object to transfer ownership from, which owns a convertible pointer to a non-array object.

Invokes the deleter if this object owns a pointer.

Definition at line 386 of file unique_ptr.h.

References std::unique_ptr< _Tp, _Dp >::get_deleter(), and std::unique_ptr< _Tp, _Dp >::reset().

4.1033.3.10 release() template<typename _Tp , typename _Dp = default_delete<_Tp>>

pointer std::unique_ptr< _Tp, _Dp >::release ( ) [inline], [noexcept]

Release ownership of any stored pointer.

Definition at line 442 of file unique_ptr.h.

4.1033.3.11 reset() template<typename _Tp , typename _Dp = default_delete<_Tp>>

void std::unique_ptr< _Tp, _Dp >::reset (
pointer __p = *pointer()*) [inline], [noexcept]

Replace the stored pointer.

Parameters

_p	The new pointer to store.

The deleter will be invoked if a pointer is already owned.
Definition at line 452 of file unique_ptr.h.
References std::move().
Referenced by std::unique_ptr< _Tp, _Dp >::operator=(), and std::unique_ptr< _Tp[], _Dp >::operator=().

4.1033.3.12 swap() template<typename _Tp , typename _Dp = default_delete<_Tp>> void std::unique_ptr< _Tp, _Dp >::swap (unique_ptr< _Tp, _Dp > & __u) [inline], [noexcept]

Exchange the pointer and deleter with another object.
Definition at line 461 of file unique_ptr.h.
The documentation for this class was generated from the following files:

- unique_ptr.h
- auto_ptr.h

4.1034.1 Detailed Description

template<typename _Tp, typename _Dp>
class std::unique_ptr< _Tp[ ], _Dp >

20.7.1.3 unique_ptr for array objects with a runtime length
Definition at line 477 of file unique_ptr.h.

4.1034.2 Constructor & Destructor Documentation

4.1034.2.1 unique_ptr() [1/6]

```
template<typename _Tp , typename _Dp >
template<typename _Del = _Dp, typename = _DeleterConstraint<_Del>>
constexpr std::unique_ptr< _Tp[ ], _Dp >::unique_ptr ( )  [inline], [constexpr], [noexcept]
```

Default constructor, creates a unique_ptr that owns nothing.
Definition at line 530 of file unique_ptr.h.

4.1034.2.2 unique_ptr() [2/6]

```
template<typename _Tp , typename _Dp >
template<typename _Up , typename _Vp = _Dp, typename = _DeleterConstraint<_Vp>, typename = typename
enable_if< __safe_conversion_raw<_Up>::value, bool>::type>
std::unique_ptr< _Tp[ ], _Dp >::unique_ptr (
            _Up __p )  [inline], [explicit], [noexcept]
```

Takes ownership of a pointer.

Parameters

_↩ _p	A pointer to an array of a type safely convertible to an array of `element_type`

The deleter will be value-initialized.
Definition at line 547 of file unique_ptr.h.

4.1034.2.3 unique_ptr() [3/6]

```
template<typename _Tp , typename _Dp >
template<typename _Up , typename _Del = deleter_type, typename = _Require<__safe_conversion_↩
raw<_Up>, is_copy_constructible<_Del>>>
std::unique_ptr< _Tp[], _Dp >::unique_ptr (
            _Up __p,
            const deleter_type & __d )  [inline], [noexcept]
```

Takes ownership of a pointer.

Parameters

_↩ _p	A pointer to an array of a type safely convertible to an array of element_type
_↩ _d	A reference to a deleter.

The deleter will be initialized with __d
Definition at line 562 of file unique_ptr.h.

4.1034.2.4 unique_ptr() [4/6]

```
template<typename _Tp , typename _Dp >
template<typename _Up , typename _Del = deleter_type, typename = _Require<__safe_conversion_↩
raw<_Up>, is_move_constructible<_Del>>>
std::unique_ptr< _Tp[], _Dp >::unique_ptr (
            _Up __p,
            __enable_if_t<!is_lvalue_reference< _Del >::value, _Del && > __d )  [inline], [noexcept]
```

Takes ownership of a pointer.

Parameters

_↩ _p	A pointer to an array of a type safely convertible to an array of element_type
_↩ _d	A reference to a deleter.

The deleter will be initialized with std::move(__d)
Definition at line 576 of file unique_ptr.h.

4.1034.2.5 unique_ptr() [5/6]

```
template<typename _Tp , typename _Dp >
std::unique_ptr< _Tp[], _Dp >::unique_ptr (
            unique_ptr< _Tp[], _Dp > &&  )  [default]
```

Move constructor.

4.1034.2.6 unique_ptr() [6/6]

```
template<typename _Tp , typename _Dp >
template<typename _Del = _Dp, typename = _DeleterConstraint<_Del>>
constexpr std::unique_ptr< _Tp[], _Dp >::unique_ptr (
            nullptr_t  )  [inline], [constexpr], [noexcept]
```

Creates a unique_ptr that owns nothing.
Definition at line 594 of file unique_ptr.h.

4.1034.2.7 ~unique_ptr() template<typename _Tp , typename _Dp >

std::unique_ptr< _Tp[], _Dp >::~unique_ptr ( ) [inline]

Destructor, invokes the deleter if the stored pointer is not null.
Definition at line 608 of file unique_ptr.h.
References std::unique_ptr< _Tp, _Dp >::get_deleter().

4.1034.3 Member Function Documentation

4.1034.3.1 get() template<typename _Tp , typename _Dp >

pointer std::unique_ptr< _Tp[], _Dp >::get (
void) const [inline], [noexcept]

Return the stored pointer.
Definition at line 665 of file unique_ptr.h.

4.1034.3.2 get_deleter() [1/2] template<typename _Tp , typename _Dp >

const deleter_type& std::unique_ptr< _Tp[], _Dp >::get_deleter ( ) const [inline], [noexcept]

Return a reference to the stored deleter.
Definition at line 675 of file unique_ptr.h.

4.1034.3.3 get_deleter() [2/2] template<typename _Tp , typename _Dp >

deleter_type& std::unique_ptr< _Tp[], _Dp >::get_deleter ( ) [inline], [noexcept]

Return a reference to the stored deleter.
Definition at line 670 of file unique_ptr.h.

4.1034.3.4 operator bool() template<typename _Tp , typename _Dp >

std::unique_ptr< _Tp[], _Dp >::operator bool ( ) const [inline], [explicit], [noexcept]

Return `true` if the stored pointer is not null.
Definition at line 679 of file unique_ptr.h.
References std::unique_ptr< _Tp, _Dp >::get().

4.1034.3.5 operator=() [1/3] template<typename _Tp , typename _Dp >

unique_ptr& std::unique_ptr< _Tp[], _Dp >::operator= (
nullptr_t) [inline], [noexcept]

Reset the unique_ptr to empty, invoking the deleter if necessary.
Definition at line 647 of file unique_ptr.h.
References std::unique_ptr< _Tp, _Dp >::reset().

4.1034.3.6 operator=() [2/3] template<typename _Tp , typename _Dp >

unique_ptr& std::unique_ptr< _Tp[], _Dp >::operator= (
unique_ptr< _Tp[], _Dp > &&) [default]

Move assignment operator.
Invokes the deleter if this object owns a pointer.

4.1034.3.7 operator=() [3/3]

```
template<typename _Tp , typename _Dp >
template<typename _Up , typename _Ep >
enable_if<__and_<__safe_conversion_up<_Up, _Ep>, is_assignable<deleter_type&, _Ep&&> >::value,
unique_ptr&>::type std::unique_ptr< _Tp[], _Dp >::operator= (
            unique_ptr< _Up, _Ep > && __u )  [inline], [noexcept]
```

Assignment from another type.

Parameters

_↩ _u	The object to transfer ownership from, which owns a convertible pointer to an array object.

Invokes the deleter if this object owns a pointer.
Definition at line 638 of file unique_ptr.h.
References std::unique_ptr< _Tp, _Dp >::get_deleter(), and std::unique_ptr< _Tp, _Dp >::reset().

4.1034.3.8 operator[]()

```
template<typename _Tp , typename _Dp >
std::add_lvalue_reference<element_type>::type std::unique_ptr< _Tp[], _Dp >::operator[] (
            size_t __i ) const  [inline]
```

Access an element of owned array.
Definition at line 657 of file unique_ptr.h.

4.1034.3.9 release()

```
template<typename _Tp , typename _Dp >
pointer std::unique_ptr< _Tp[], _Dp >::release ( )  [inline], [noexcept]
```

Release ownership of any stored pointer.
Definition at line 686 of file unique_ptr.h.

4.1034.3.10 reset()

```
template<typename _Tp , typename _Dp >
template<typename _Up , typename = _Require< __or_<is_same<_Up, pointer>, __and_<is_same<pointer,
element_type*>, is_pointer<_Up>, is_convertible< typename remove_pointer<_Up>::type(*)[], element↩
_type(*)[] > > > >>
void std::unique_ptr< _Tp[], _Dp >::reset (
            _Up __p )  [inline], [noexcept]
```

Replace the stored pointer.

Parameters

_↩ _p	The new pointer to store.

The deleter will be invoked if a pointer is already owned.
Definition at line 708 of file unique_ptr.h.
References std::move().

4.1034.3.11 swap()

```
template<typename _Tp , typename _Dp >
void std::unique_ptr< _Tp[], _Dp >::swap (
            unique_ptr< _Tp[], _Dp > & __u )  [inline], [noexcept]
```

Exchange the pointer and deleter with another object.
Definition at line 716 of file unique_ptr.h.

4.1035.1 Detailed Description

template<typename _Key, typename _Tp, typename _Hash = std::hash<_Key>, typename _Pred = std::equal_to<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
class std::__debug::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >

Class std::unordered_map with safety/checking/debug instrumentation.
Definition at line 63 of file debug/unordered_map.

4.1035.2 Member Function Documentation

4.1035.2.1 _M_detach_all() `void __gnu_debug::_Safe_unordered_container_base::_M_detach_all ( ) [protected], [inherited]`

Detach all iterators, leaving them singular.

4.1035.2.2 _M_detach_singular() `void __gnu_debug::_Safe_sequence_base::_M_detach_singular ( ) [protected], [inherited]`

Detach all singular iterators.

Postcondition

for all iterators i attached to this sequence, i->_M_version == _M_version.

4.1035.2.3 _M_get_mutex() `__gnu_cxx::__mutex& __gnu_debug::_Safe_sequence_base::_M_get_mutex ( ) throw ( ) [protected], [inherited]`

For use in _Safe_sequence.
Referenced by __gnu_debug::_Safe_sequence< _Sequence >::_M_transfer_from_if().

4.1035.2.4 _M_invalidate_all() `void __gnu_debug::_Safe_sequence_base::_M_invalidate_all ( ) const [inline], [protected], [inherited]`

Invalidates all iterators.
Definition at line 256 of file safe_base.h.
References __gnu_debug::_Safe_sequence_base::_M_version.

4.1035.2.5 _M_invalidate_if() `template<typename _Container >`

```
template<typename _Predicate >
void __gnu_debug::_Safe_unordered_container< _Container >::_M_invalidate_if (
            _Predicate __pred ) [protected], [inherited]
```

Invalidates all iterators `x` that reference this container, are not singular, and for which `__pred(x)` returns `true`. `__pred` will be invoked with the normal iterators nested in the safe ones.
Definition at line 37 of file safe_unordered_container.tcc.

4.1035.2.6 _M_invalidate_local_if() `template<typename _Container >`

```
template<typename _Predicate >
void __gnu_debug::_Safe_unordered_container< _Container >::_M_invalidate_local_if (
            _Predicate __pred ) [protected], [inherited]
```

Invalidates all local iterators `x` that reference this container, are not singular, and for which `__pred(x)` returns `true`. `__pred` will be invoked with the normal local iterators nested in the safe ones.
Definition at line 69 of file safe_unordered_container.tcc.

4.1035.2.7 _M_revalidate_singular() `void __gnu_debug::_Safe_sequence_base::_M_revalidate_singular ( ) [protected], [inherited]`

Revalidates all attached singular iterators. This method may be used to validate iterators that were invalidated before (but for some reason, such as an exception, need to become valid again).

4.1035.2.8 _M_swap() [1/2] `void __gnu_debug::_Safe_sequence_base::_M_swap (`

```
            _Safe_sequence_base & __x ) [protected], [noexcept], [inherited]
```

Swap this sequence with the given sequence. This operation also swaps ownership of the iterators, so that when the operation is complete all iterators that originally referenced one container now reference the other container.

4.1035.2.9 _M_swap() [2/2] `void __gnu_debug::_Safe_unordered_container_base::_M_swap (`

```
            _Safe_unordered_container_base & __x ) [protected], [noexcept], [inherited]
```

Swap this container with the given container. This operation also swaps ownership of the iterators, so that when the operation is complete all iterators that originally referenced one container now reference the other container.

4.1035.3 Member Data Documentation

4.1035.3.1 _M_const_iterators `_Safe_iterator_base* __gnu_debug::_Safe_sequence_base::_M_const_↩ iterators [inherited]`

The list of constant iterators that reference this container.
Definition at line 197 of file safe_base.h.
Referenced by __gnu_debug::_Safe_sequence< _Sequence >::_M_transfer_from_if().

4.1035.3.2 _M_const_local_iterators

`_Safe_iterator_base* __gnu_debug::_Safe_unordered_container_base::_M_const_local_iterators [inherited]`

The list of constant local iterators that reference this container.
Definition at line 130 of file safe_unordered_base.h.

4.1035.3.3 _M_iterators

`_Safe_iterator_base* __gnu_debug::_Safe_sequence_base::_M_iterators [inherited]`

The list of mutable iterators that reference this container.
Definition at line 194 of file safe_base.h.
Referenced by __gnu_debug::_Safe_sequence< _Sequence >::_M_transfer_from_if().

4.1035.3.4 _M_local_iterators

`_Safe_iterator_base* __gnu_debug::_Safe_unordered_container_base::_M_local_iterators [inherited]`

The list of mutable local iterators that reference this container.
Definition at line 127 of file safe_unordered_base.h.

4.1035.3.5 _M_version

`unsigned int __gnu_debug::_Safe_sequence_base::_M_version [mutable], [inherited]`

The container version number. This number may never be 0.
Definition at line 200 of file safe_base.h.
Referenced by __gnu_debug::_Safe_sequence_base::_M_invalidate_all().

4.1036.1 Detailed Description

template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
class std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >

A standard container composed of unique keys (containing at most one of each key value) that associates values of another type with the keys.

Template Parameters

_Key	Type of key objects.
_Tp	Type of mapped objects.
_Hash	Hashing function object type, defaults to hash<_Value>.
_Pred	Predicate function object type, defaults to equal_to<_Value>.
_Alloc	Allocator type, defaults to std::allocator<std::pair<const _Key, _Tp>>.

Meets the requirements of a container, and unordered associative container
The resulting value type of the container is std::pair<const _Key, _Tp>.
Base is _Hashtable, dispatched at compile time via template alias __umap_hashtable.
Definition at line 102 of file unordered_map.h.

4.1036.2 Member Typedef Documentation

4.1036.2.1 allocator_type

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,

4.1036.3 Constructor & Destructor Documentation

4.1036.3.1 unordered_map() [1/7]

```
template<typename _Key , typename _Tp , typename _Hash = hash<↩
_Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _↩
Tp>>>
std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map ( )  [default]
```

Default constructor.

4.1036.3.2 unordered_map() [2/7]

```
template<typename _Key , typename _Tp , typename _Hash = hash<↩
_Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _↩
Tp>>>
std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map (
            size_type __n,
            const hasher & __hf = hasher(),
            const key_equal & __eql = key_equal(),
            const allocator_type & __a = allocator_type() )  [inline], [explicit]
```

Default constructor creates no elements.

Parameters

__n	Minimal initial number of buckets.
__hf	A hash functor.
__eql	A key equality functor.
__a	An allocator object.

Definition at line 151 of file unordered_map.h.

4.1036.3.3 unordered_map() [3/7]

```
template<typename _Key , typename _Tp , typename _Hash = hash<↩
_Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _↩
Tp>>>
template<typename _InputIterator >
std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map (
            _InputIterator __first,
            _InputIterator __last,
            size_type __n = 0,
            const hasher & __hf = hasher(),
            const key_equal & __eql = key_equal(),
            const allocator_type & __a = allocator_type() )  [inline]
```

Builds an unordered_map from a range.

Parameters

__first	An input iterator.
__last	An input iterator.
__n	Minimal initial number of buckets.
__hf	A hash functor.
__eql	A key equality functor.
__a	An allocator object.

Create an unordered_map consisting of copies of the elements from [__first,__last). This is linear in N (where N is distance(__first,__last)).
Definition at line 172 of file unordered_map.h.

4.1036.3.4 unordered_map() [4/7] template<typename _Key , typename _Tp , typename _Hash = hash<↩ _Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _↩ Tp>>>

```
std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map (
            const unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc > &  )  [default]
```

Copy constructor.

4.1036.3.5 unordered_map() [5/7] template<typename _Key , typename _Tp , typename _Hash = hash<↩ _Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _↩ Tp>>>

```
std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map (
            unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc > &&  )  [default]
```

Move constructor.

4.1036.3.6 unordered_map() [6/7] template<typename _Key , typename _Tp , typename _Hash = hash<↩ _Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _↩ Tp>>>

```
std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map (
            const allocator_type & __a )  [inline], [explicit]
```

Creates an unordered_map with no elements.

Parameters

_↩ _a	An allocator object.

Definition at line 191 of file unordered_map.h.

4.1036.3.7 unordered_map() [7/7] template<typename _Key , typename _Tp , typename _Hash = hash<↩ _Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _↩ Tp>>>

```
std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map (
            initializer_list< value_type > __l,
            size_type __n = 0,
            const hasher & __hf = hasher(),
            const key_equal & __eql = key_equal(),
            const allocator_type & __a = allocator_type() )  [inline]
```

Builds an unordered_map from an initializer_list.

Parameters

__l	An initializer_list.
__n	Minimal initial number of buckets.
__hf	A hash functor.
__eql	A key equality functor.
__a	An allocator object.

Create an unordered_map consisting of copies of the elements in the list. This is linear in N (where N is *__l.size()*).
Definition at line 227 of file unordered_map.h.

4.1036.4 Member Function Documentation

4.1036.4.1 at() [1/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename
_Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
mapped_type& std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::at (
            const key_type & __k )  [inline]
```

Access to unordered_map data.

Parameters

__k	The key for which data should be retrieved.

Returns

A reference to the data whose key is equal to *__k*, if such a data is present in the unordered_map.

Exceptions

std::out_of_range	If no such data is present.

Definition at line 1001 of file unordered_map.h.

4.1036.4.2 at() [2/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename
_Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const mapped_type& std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::at (
            const key_type & __k ) const  [inline]
```

Access to unordered_map data.

Parameters

__k	The key for which data should be retrieved.

Returns

A reference to the data whose key is equal to *__k*, if such a data is present in the unordered_map.

Exceptions

std::out_of_range	If no such data is present.

Definition at line 1005 of file unordered_map.h.

Returns a read-only (constant) iterator that points one past the last element in the unordered_map.
Definition at line 360 of file unordered_map.h.

4.1036.4.11 cend() [2/2]

template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_local_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::cend (
size_type __n) const [inline]
Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

_↩ _n	The bucket index.

Returns

A read-only local iterator.

Definition at line 1087 of file unordered_map.h.

4.1036.4.12 clear()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename
_Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
void std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::clear ( )  [inline], [noexcept]
```

Erases all elements in an unordered_map. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
Definition at line 842 of file unordered_map.h.

4.1036.4.13 count()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename
_Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
size_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::count (
            const key_type & __x ) const  [inline]
```

Finds the number of elements.

Parameters

_↩ _x	Key to count.

Returns

Number of elements with specified key.

This function only makes sense for unordered_multimap; for unordered_map the result will either be 0 (not present) or 1 (present).
Definition at line 938 of file unordered_map.h.

4.1036.4.14 emplace()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename
_Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename... _Args>
std::pair<iterator, bool> std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::emplace (
            _Args &&... __args )  [inline]
```

Attempts to build and insert a std::pair into the unordered_map.

Parameters

__args	Arguments used to generate a new pair instance (see std::piecewise_contruct for passing arguments to each part of the pair constructor).

Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to build and insert a (key, value) pair into the unordered_map. An unordered_map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the unordered_map.

Insertion requires amortized constant time.
Definition at line 388 of file unordered_map.h.

4.1036.4.15 emplace_hint()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename... _Args>
iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::emplace_hint (
            const_iterator __pos,
            _Args &&... __args ) [inline]
```

Attempts to build and insert a std::pair into the unordered_map.

Parameters

__pos	An iterator that serves as a hint as to where the pair should be inserted.
__args	Arguments used to generate a new pair instance (see std::piecewise_contruct for passing arguments to each part of the pair constructor).

Returns

An iterator that points to the element with key of the std::pair built from *__args* (may or may not be that std::pair).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument emplace() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.
See https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints for more on *hinting*.
Insertion requires amortized constant time.
Definition at line 419 of file unordered_map.h.

4.1036.4.16 empty()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename
_Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
bool std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::empty ( ) const [inline], [noexcept]
```

Returns true if the unordered_map is empty.
Definition at line 305 of file unordered_map.h.

4.1036.4.17 end() [1/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::end ( ) const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered_map.
Definition at line 356 of file unordered_map.h.

4.1036.4.18 end() [2/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::end ( ) [inline], [noexcept]
```

Returns a read/write iterator that points one past the last element in the unordered_map.
Definition at line 347 of file unordered_map.h.

4.1036.4.19 end() [3/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
local_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::end (
            size_type __n )  [inline]
```

Returns a read/write iterator pointing to one past the last bucket elements.

Parameters

_↩ _n	The bucket index.

Returns

A read/write local iterator.

Definition at line 1072 of file unordered_map.h.

4.1036.4.20 end() [4/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_local_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::end (
            size_type __n ) const  [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

_↩ _n	The bucket index.

Returns

A read-only local iterator.

Definition at line 1083 of file unordered_map.h.

4.1036.4.21 equal_range() [1/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_↩
Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::pair<iterator, iterator> std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::equal_range
(
            const key_type & __x )  [inline]
```

Finds a subsequence matching given key.

Parameters

_↩ _x	Key to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for unordered_multimap.
Definition at line 962 of file unordered_map.h.

4.1036.4.22 equal_range() [2/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::pair<const_iterator, const_iterator> std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::equal_range (
            const key_type & __x ) const  [inline]
```

Finds a subsequence matching given key.

Parameters

_x	Key to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for unordered_multimap.
Definition at line 966 of file unordered_map.h.

4.1036.4.23 erase() [1/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
size_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (
            const key_type & __x )  [inline]
```

Erases elements according to the provided key.

Parameters

_x	Key of element to be erased.

Returns

The number of elements erased.

This function erases all the elements located by the given key from an unordered_map. For an unordered_map the result of this function can only be 0 (not present) or 1 (present). Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
Definition at line 814 of file unordered_map.h.

4.1036.4.24 erase() [2/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (
            const_iterator __first,
            const_iterator __last )  [inline]
```

Erases a [__first,__last) range of elements from an unordered_map.

Parameters

__first	Iterator pointing to the start of the range to be erased.
__last	Iterator pointing to the end of the range to be erased.

Returns

The iterator *__last*.

This function erases a sequence of elements from an unordered_map. Note that this function only erases the elements, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
Definition at line 832 of file unordered_map.h.

4.1036.4.25 erase() [3/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (
            const_iterator __position )  [inline]
```

Erases an element from an unordered_map.

Parameters

__position	An iterator pointing to the element to be erased.

Returns

An iterator pointing to the element immediately following *__position* prior to the element being erased. If no such element exists, end() is returned.

This function erases an element, pointed to by the given iterator, from an unordered_map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
Definition at line 792 of file unordered_map.h.

4.1036.4.26 erase() [4/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (
            iterator __position )  [inline]
```

Erases an element from an unordered_map.

Parameters

__position	An iterator pointing to the element to be erased.

Returns

An iterator pointing to the element immediately following *__position* prior to the element being erased. If no such element exists, end() is returned.

This function erases an element, pointed to by the given iterator, from an unordered_map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
Definition at line 797 of file unordered_map.h.

4.1036.4.27 find() [1/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
```

```
iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::find (
            const key_type & __x )  [inline]
```

Tries to locate an element in an unordered_map.

Parameters

_↩ _x	Key to be located.

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.
Definition at line 920 of file unordered_map.h.

4.1036.4.28 find() [2/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::find (
            const key_type & __x ) const  [inline]
```

Tries to locate an element in an unordered_map.

Parameters

_↩ _x	Key to be located.

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.
Definition at line 924 of file unordered_map.h.

4.1036.4.29 get_allocator()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
allocator_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::get_allocator ( ) const
[inline], [noexcept]
```

Returns the allocator object used by the unordered_map.
Definition at line 298 of file unordered_map.h.

4.1036.4.30 hash_function()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
hasher std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::hash_function ( ) const  [inline]
```

Returns the hash functor object with which the unordered_map was constructed.
Definition at line 896 of file unordered_map.h.

4.1036.4.31 insert() [1/8]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename _InputIterator >
void std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
            _InputIterator __first,
            _InputIterator __last )  [inline]
```

A template function that attempts to insert a range of elements.

Parameters

__first	Iterator pointing to the start of the range to be inserted.
__last	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.
Definition at line 645 of file unordered_map.h.

4.1036.4.32 insert() [2/8]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename _Pair >
__enable_if_t<is_constructible<value_type, _Pair&&>::value, pair<iterator, bool> > std::unordered_map<
_Key, _Tp, _Hash, _Pred, _Alloc >::insert (
            _Pair && __x )  [inline]
```

Attempts to insert a std::pair into the unordered_map.

Parameters

_↩ _x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the unordered_map. An unordered_map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the unordered_map.
Insertion requires amortized constant time.
Definition at line 592 of file unordered_map.h.

4.1036.4.33 insert() [3/8]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::pair<iterator, bool> std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
            const value_type & __x )  [inline]
```

Attempts to insert a std::pair into the unordered_map.

Parameters

_↩ _x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the unordered_map. An unordered_map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the unordered_map.
Insertion requires amortized constant time.
Definition at line 580 of file unordered_map.h.

4.1036.4.34 insert() [4/8]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename _Pair >
__enable_if_t<is_constructible<value_type, _Pair&&>::value, iterator> std::unordered_map< _Key,
_Tp, _Hash, _Pred, _Alloc >::insert (
            const_iterator __hint,
            _Pair && __x )  [inline]
```

Attempts to insert a std::pair into the unordered_map.

Parameters

__hint	An iterator that serves as a hint as to where the pair should be inserted.
__x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the element with key of *__x* (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument insert() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.
See https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints for more on *hinting*.
Insertion requires amortized constant time.
Definition at line 630 of file unordered_map.h.

4.1036.4.35 insert() [5/8]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
            const_iterator __hint,
            const value_type & __x )  [inline]
```

Attempts to insert a std::pair into the unordered_map.

Parameters

__hint	An iterator that serves as a hint as to where the pair should be inserted.
__x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the element with key of *__x* (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument insert() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.
See https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints for more on *hinting*.
Insertion requires amortized constant time.
Definition at line 619 of file unordered_map.h.

4.1036.4.36 insert() [6/8]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
            const_iterator __hint,
            value_type && __x )  [inline]
```

Attempts to insert a std::pair into the unordered_map.

Parameters

__hint	An iterator that serves as a hint as to where the pair should be inserted.
__x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the element with key of *__x* (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument insert() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.
See https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints for more on *hinting*.
Insertion requires amortized constant time.

References std::move().

4.1036.4.37 insert() [7/8]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
void std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
            initializer_list< value_type > __l )  [inline]
```

Attempts to insert a list of elements into the unordered_map.

Parameters

__l	A std::initializer_list<value_type> of elements to be inserted.

Complexity similar to that of the range constructor.

Definition at line 656 of file unordered_map.h.

4.1036.4.38 insert() [8/8]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::pair<iterator, bool> std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
            value_type && __x )  [inline]
```

Attempts to insert a std::pair into the unordered_map.

Parameters

_↩ _x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the unordered_map. An unordered_map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the unordered_map.
Insertion requires amortized constant time.
Definition at line 586 of file unordered_map.h.
References std::move().

4.1036.4.39 key_eq()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename
_Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
key_equal std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::key_eq ( ) const  [inline]
```

Returns the key comparison object with which the unordered_map was constructed.
Definition at line 902 of file unordered_map.h.

4.1036.4.40 load_factor()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
float std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::load_factor ( ) const  [inline],
[noexcept]
```

Returns the average number of elements per bucket.
Definition at line 1095 of file unordered_map.h.

4.1036.4.41 max_bucket_count()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_↩
Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
size_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::max_bucket_count ( ) const  [inline],
[noexcept]
```

Returns the maximum number of buckets of the unordered_map.
Definition at line 1018 of file unordered_map.h.

4.1036.4.42 max_load_factor() [1/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<↩
_Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _↩
Tp>>>
```

float std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::max_load_factor ( ) const [inline], [noexcept]
Returns a positive number that the unordered_map tries to keep the load factor less than or equal to.
Definition at line 1101 of file unordered_map.h.

4.1036.4.43 max_load_factor() [2/2]

template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
void std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::max_load_factor (float __z) [inline]
Change the unordered_map maximum load factor.

Parameters

_z	The new maximum load factor.

Definition at line 1109 of file unordered_map.h.

4.1036.4.44 max_size()

template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
size_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::max_size ( ) const [inline], [noexcept]
Returns the maximum size of the unordered_map.
Definition at line 315 of file unordered_map.h.

4.1036.4.45 operator=() [1/3]

template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
unordered_map& std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::operator= (const unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc > &) [default]
Copy assignment operator.

4.1036.4.46 operator=() [2/3]

template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
unordered_map& std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::operator= (initializer_list< value_type > __l) [inline]
Unordered_map list assignment operator.

Parameters

↩ _↩ ↩ _↩ l	An initializer_list.

This function fills an unordered_map with copies of the elements in the initializer list __l.
Note that the assignment completely changes the unordered_map and that the resulting unordered_map's size is the same as the number of elements assigned.

Definition at line 290 of file unordered_map.h.

4.1036.4.47 operator=() [3/3]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
unordered_map& std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::operator= (
            unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc > &&  )  [default]
```

Move assignment operator.

4.1036.4.48 operator[]() [1/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
mapped_type& std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::operator[] (
            const key_type & __k )  [inline]
```

Subscript ([]) access to unordered_map data.

Parameters

_↩ _k	The key for which data should be retrieved.

Returns

A reference to the data of the (key,data) pair.

Allows for easy lookup with the subscript ([])operator. Returns data associated with the key specified in subscript. If the key does not exist, a pair with that key is created using default values, which is then returned.
Lookup requires constant time.
Definition at line 984 of file unordered_map.h.

4.1036.4.49 operator[]() [2/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
mapped_type& std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::operator[] (
            key_type && __k )  [inline]
```

Subscript ([]) access to unordered_map data.

Parameters

_↩ _k	The key for which data should be retrieved.

Returns

A reference to the data of the (key,data) pair.

Allows for easy lookup with the subscript ([])operator. Returns data associated with the key specified in subscript. If the key does not exist, a pair with that key is created using default values, which is then returned.
Lookup requires constant time.
Definition at line 988 of file unordered_map.h.
References std::move().

4.1036.4.50 rehash()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename
```

```
_Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
void std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::rehash (
            size_type __n )  [inline]
```

May rehash the unordered_map.

Parameters

_↩ _n	The new number of buckets.

Rehash will occur only if the new number of buckets respect the unordered_map maximum load factor.
Definition at line 1120 of file unordered_map.h.

4.1036.4.51 reserve()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename
_Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
void std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::reserve (
            size_type __n )  [inline]
```

Prepare the unordered_map for a specified number of elements.

Parameters

_↩ _n	Number of elements required.

Same as rehash(ceil(n / max_load_factor())).
Definition at line 1131 of file unordered_map.h.

4.1036.4.52 size()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename
_Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
size_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::size ( ) const  [inline], [noexcept]
```

Returns the size of the unordered_map.
Definition at line 310 of file unordered_map.h.

4.1036.4.53 swap()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename
_Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
void std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::swap (
            unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc > & __x )  [inline], [noexcept]
```

Swaps data with another unordered_map.

Parameters

_↩ _x	An unordered_map of the same element and allocator types.

This exchanges the elements between two unordered_map in constant time. Note that the global std::swap() function is specialized such that std::swap(m1,m2) will feed to this function.
Definition at line 856 of file unordered_map.h.
The documentation for this class was generated from the following file:

4.1037.1 Detailed Description

template<typename _Key, typename _Tp, typename _Hash = std::hash<_Key>, typename _Pred = std::equal_to<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >>
class std::__debug::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >

Class std::unordered_multimap with safety/checking/debug instrumentation.
Definition at line 759 of file debug/unordered_map.

4.1037.2 Member Function Documentation

4.1037.2.1 _M_detach_all() `void __gnu_debug::_Safe_unordered_container_base::_M_detach_all ( ) [protected], [inherited]`

Detach all iterators, leaving them singular.

4.1037.2.2 _M_detach_singular() `void __gnu_debug::_Safe_sequence_base::_M_detach_singular ( ) [protected], [inherited]`

Detach all singular iterators.

Postcondition

for all iterators i attached to this sequence, i->_M_version == _M_version.

4.1037.2.3 _M_get_mutex() `__gnu_cxx::__mutex& __gnu_debug::_Safe_sequence_base::_M_get_mutex ( ) throw ( ) [protected], [inherited]`

For use in _Safe_sequence.
Referenced by __gnu_debug::_Safe_sequence< _Sequence >::_M_transfer_from_if().

4.1037.2.4 _M_invalidate_all() `void __gnu_debug::_Safe_sequence_base::_M_invalidate_all ( ) const [inline], [protected], [inherited]`

Invalidates all iterators.
Definition at line 256 of file safe_base.h.
References __gnu_debug::_Safe_sequence_base::_M_version.

4.1037.2.5 _M_invalidate_if() `template<typename _Container >`

```
template<typename _Predicate >
void __gnu_debug::_Safe_unordered_container< _Container >::_M_invalidate_if (
            _Predicate __pred ) [protected], [inherited]
```

Invalidates all iterators `x` that reference this container, are not singular, and for which `__pred(x)` returns `true`. `__pred` will be invoked with the normal iterators nested in the safe ones.
Definition at line 37 of file safe_unordered_container.tcc.

4.1037.2.6 _M_invalidate_local_if() `template<typename _Container >`

```
template<typename _Predicate >
void __gnu_debug::_Safe_unordered_container< _Container >::_M_invalidate_local_if (
            _Predicate __pred ) [protected], [inherited]
```

Invalidates all local iterators `x` that reference this container, are not singular, and for which `__pred(x)` returns `true`. `__pred` will be invoked with the normal local iterators nested in the safe ones.
Definition at line 69 of file safe_unordered_container.tcc.

4.1037.2.7 _M_revalidate_singular() `void __gnu_debug::_Safe_sequence_base::_M_revalidate_singular ( ) [protected], [inherited]`

Revalidates all attached singular iterators. This method may be used to validate iterators that were invalidated before (but for some reason, such as an exception, need to become valid again).

4.1037.2.8 _M_swap() [1/2] `void __gnu_debug::_Safe_sequence_base::_M_swap (`

```
            _Safe_sequence_base & __x ) [protected], [noexcept], [inherited]
```

Swap this sequence with the given sequence. This operation also swaps ownership of the iterators, so that when the operation is complete all iterators that originally referenced one container now reference the other container.

4.1037.2.9 _M_swap() [2/2] `void __gnu_debug::_Safe_unordered_container_base::_M_swap (`

```
            _Safe_unordered_container_base & __x ) [protected], [noexcept], [inherited]
```

Swap this container with the given container. This operation also swaps ownership of the iterators, so that when the operation is complete all iterators that originally referenced one container now reference the other container.

4.1037.3 Member Data Documentation

4.1037.3.1 _M_const_iterators `_Safe_iterator_base* __gnu_debug::_Safe_sequence_base::_M_const_↩ iterators [inherited]`

The list of constant iterators that reference this container.
Definition at line 197 of file safe_base.h.
Referenced by __gnu_debug::_Safe_sequence< _Sequence >::_M_transfer_from_if().

4.1037.3.2 _M_const_local_iterators

`_Safe_iterator_base* __gnu_debug::_Safe_unordered_container_base::_M_const_local_iterators [inherited]`

The list of constant local iterators that reference this container.
Definition at line 130 of file safe_unordered_base.h.

4.1037.3.3 _M_iterators

`_Safe_iterator_base* __gnu_debug::_Safe_sequence_base::_M_iterators [inherited]`

The list of mutable iterators that reference this container.
Definition at line 194 of file safe_base.h.
Referenced by __gnu_debug::_Safe_sequence< _Sequence >::_M_transfer_from_if().

4.1037.3.4 _M_local_iterators

`_Safe_iterator_base* __gnu_debug::_Safe_unordered_container_base::_M_local_iterators [inherited]`

The list of mutable local iterators that reference this container.
Definition at line 127 of file safe_unordered_base.h.

4.1037.3.5 _M_version

`unsigned int __gnu_debug::_Safe_sequence_base::_M_version [mutable], [inherited]`

The container version number. This number may never be 0.
Definition at line 200 of file safe_base.h.
Referenced by __gnu_debug::_Safe_sequence_base::_M_invalidate_all().

4.1038.1 Detailed Description

template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
class std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >

A standard container composed of equivalent keys (possibly containing multiple of each key value) that associates values of another type with the keys.

Template Parameters

_Key	Type of key objects.
_Tp	Type of mapped objects.
_Hash	Hashing function object type, defaults to hash<_Value>.
_Pred	Predicate function object type, defaults to equal_to<_Value>.
_Alloc	Allocator type, defaults to std::allocator<std::pair<const _Key, _Tp>>.

Meets the requirements of a container, and unordered associative container
The resulting value type of the container is std::pair<const _Key, _Tp>.
Base is _Hashtable, dispatched at compile time via template alias __ummap_hashtable.
Definition at line 1250 of file unordered_map.h.

4.1038.2 Member Typedef Documentation

4.1038.2.1 allocator_type

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,

4.1038.3 Constructor & Destructor Documentation

4.1038.3.1 unordered_multimap() [1/7]

```
template<typename _Key , typename _Tp , typename _Hash =
hash<_Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key,
_Tp>>>
std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap ( )  [default]
```

Default constructor.

4.1038.3.2 unordered_multimap() [2/7]

```
template<typename _Key , typename _Tp , typename _Hash =
hash<_Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key,
_Tp>>>
std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap (
            size_type __n,
            const hasher & __hf = hasher(),
            const key_equal & __eql = key_equal(),
            const allocator_type & __a = allocator_type() )  [inline], [explicit]
```

Default constructor creates no elements.

Parameters

__n	Mnimal initial number of buckets.
__hf	A hash functor.
__eql	A key equality functor.
__a	An allocator object.

Definition at line 1298 of file unordered_map.h.

4.1038.3.3 unordered_multimap() [3/7]

```
template<typename _Key , typename _Tp , typename _Hash =
hash<_Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key,
_Tp>>>
template<typename _InputIterator >
std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap (
            _InputIterator __first,
            _InputIterator __last,
            size_type __n = 0,
            const hasher & __hf = hasher(),
            const key_equal & __eql = key_equal(),
            const allocator_type & __a = allocator_type() )  [inline]
```

Builds an unordered_multimap from a range.

Parameters

__first	An input iterator.
__last	An input iterator.
__n	Minimal initial number of buckets.
__hf	A hash functor.
__eql	A key equality functor.
__a	An allocator object.

Create an unordered_multimap consisting of copies of the elements from [__first,__last). This is linear in N (where N is distance(__first,__last)).
Definition at line 1319 of file unordered_map.h.

4.1038.3.4 unordered_multimap() [4/7]

```
template<typename _Key , typename _Tp , typename _Hash =
hash<_Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key,
_Tp>>>
std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap (
            const unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc > &  )  [default]
```

Copy constructor.

4.1038.3.5 unordered_multimap() [5/7]

```
template<typename _Key , typename _Tp , typename _Hash =
hash<_Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key,
_Tp>>>
std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap (
            unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc > &&  )  [default]
```

Move constructor.

4.1038.3.6 unordered_multimap() [6/7]

```
template<typename _Key , typename _Tp , typename _Hash =
hash<_Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key,
_Tp>>>
std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap (
            const allocator_type & __a )  [inline], [explicit]
```

Creates an unordered_multimap with no elements.

Parameters

__a	An allocator object.

Definition at line 1338 of file unordered_map.h.

4.1038.3.7 unordered_multimap() [7/7]

```
template<typename _Key , typename _Tp , typename _Hash =
hash<_Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key,
_Tp>>>
std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap (
            initializer_list< value_type > __l,
            size_type __n = 0,
            const hasher & __hf = hasher(),
            const key_equal & __eql = key_equal(),
            const allocator_type & __a = allocator_type() )  [inline]
```

Builds an unordered_multimap from an initializer_list.

Parameters

__l	An initializer_list.
__n	Minimal initial number of buckets.
__hf	A hash functor.
__eql	A key equality functor.
__a	An allocator object.

Create an unordered_multimap consisting of copies of the elements in the list. This is linear in N (where N is *__l.size()*).
Definition at line 1374 of file unordered_map.h.

4.1038.4 Member Function Documentation

4.1038.4.1 begin() [1/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::begin ( ) const  [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered_multimap.
Definition at line 1481 of file unordered_map.h.

4.1038.4.2 begin() [2/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::begin ( )  [inline], [noexcept]
```

Returns a read/write iterator that points to the first element in the unordered_multimap.
Definition at line 1472 of file unordered_map.h.

4.1038.4.3 begin() [3/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
local_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::begin (
            size_type __n )  [inline]
```

Returns a read/write iterator pointing to the first bucket element.

Parameters

_↩ _n	The bucket index.

Returns

A read/write local iterator.

Definition at line 1897 of file unordered_map.h.

4.1038.4.4 begin() [4/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_local_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::begin (
            size_type __n ) const  [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

_↩ _n	The bucket index.

Returns

A read-only local iterator.

Definition at line 1908 of file unordered_map.h.

4.1038.4.5 bucket_count()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
size_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::bucket_count ( ) const
[inline], [noexcept]
```

Returns the number of buckets of the unordered_multimap.
Definition at line 1864 of file unordered_map.h.

4.1038.4.6 cbegin() [1/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::cbegin ( ) const  [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered_multimap.
Definition at line 1485 of file unordered_map.h.

4.1038.4.7 cbegin() [2/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_local_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::cbegin (
            size_type __n ) const  [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

_↩ _n	The bucket index.

Returns

A read-only local iterator.

Definition at line 1912 of file unordered_map.h.

4.1038.4.8 cend() [1/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::cend ( ) const  [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered_multimap.
Definition at line 1507 of file unordered_map.h.

4.1038.4.9 cend() [2/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_local_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::cend (
            size_type __n ) const  [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

_↩ _n	The bucket index.

Returns

A read-only local iterator.

Definition at line 1938 of file unordered_map.h.

4.1038.4.10 clear()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename
_Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::clear ( )  [inline], [noexcept]
```

Erases all elements in an unordered_multimap. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1736 of file unordered_map.h.

4.1038.4.11 count()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename
_Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
size_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::count (
            const key_type & __x ) const  [inline]
```

Finds the number of elements.

Parameters

_↩ _x	Key to count.

Returns

Number of elements with specified key.

Definition at line 1830 of file unordered_map.h.

4.1038.4.12 emplace()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename
_Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename...  _Args>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::emplace (
            _Args &&...  __args )  [inline]
```

Attempts to build and insert a std::pair into the unordered_multimap.

Parameters

__args	Arguments used to generate a new pair instance (see std::piecewise_contruct for passing arguments to each part of the pair constructor).

Returns

An iterator that points to the inserted pair.

This function attempts to build and insert a (key, value) pair into the unordered_multimap.
Insertion requires amortized constant time.
Definition at line 1530 of file unordered_map.h.

4.1038.4.13 emplace_hint()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename... _Args>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::emplace_hint (
            const_iterator __pos,
            _Args &&... __args )  [inline]
```

Attempts to build and insert a std::pair into the unordered_multimap.

Parameters

__pos	An iterator that serves as a hint as to where the pair should be inserted.
__args	Arguments used to generate a new pair instance (see std::piecewise_contruct for passing arguments to each part of the pair constructor).

Returns

An iterator that points to the element with key of the std::pair built from *__args*.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.
See https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints for more on *hinting*.
Insertion requires amortized constant time.
Definition at line 1557 of file unordered_map.h.

4.1038.4.14 empty()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename
_Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
bool std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::empty ( ) const  [inline], [noexcept]
```

Returns true if the unordered_multimap is empty.
Definition at line 1452 of file unordered_map.h.

4.1038.4.15 end() [1/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::end ( ) const  [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered_multimap.
Definition at line 1503 of file unordered_map.h.

4.1038.4.16 end() [2/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::end ( )  [inline], [noexcept]
```

Returns a read/write iterator that points one past the last element in the unordered_multimap.

Definition at line 1494 of file unordered_map.h.

4.1038.4.17 end() [3/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
local_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::end (
            size_type __n ) [inline]
```

Returns a read/write iterator pointing to one past the last bucket elements.

Parameters

_↩ _n	The bucket index.

Returns

A read/write local iterator.

Definition at line 1923 of file unordered_map.h.

4.1038.4.18 end() [4/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_local_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::end (
            size_type __n ) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

_↩ _n	The bucket index.

Returns

A read-only local iterator.

Definition at line 1934 of file unordered_map.h.

4.1038.4.19 equal_range() [1/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_↩
Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::pair<iterator, iterator> std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::equal↩
_range (
            const key_type & __x ) [inline]
```

Finds a subsequence matching given key.

Parameters

_↩ _x	Key to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

Definition at line 1852 of file unordered_map.h.

4.1038.4.20 equal_range() [2/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_↩
Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::pair<const_iterator, const_iterator> std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _↩
Alloc >::equal_range (
            const key_type & __x ) const  [inline]
```

Finds a subsequence matching given key.

Parameters

_↩ _x	Key to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

Definition at line 1856 of file unordered_map.h.

4.1038.4.21 erase() [1/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
size_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (
            const key_type & __x )  [inline]
```

Erases elements according to the provided key.

Parameters

_↩ _x	Key of elements to be erased.

Returns

The number of elements erased.

This function erases all the elements located by the given key from an unordered_multimap. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
Definition at line 1707 of file unordered_map.h.

4.1038.4.22 erase() [2/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (
            const_iterator __first,
            const_iterator __last )  [inline]
```

Erases a [__first,__last) range of elements from an unordered_multimap.

Parameters

__first	Iterator pointing to the start of the range to be erased.
__last	Iterator pointing to the end of the range to be erased.

Returns

The iterator *__last*.

This function erases a sequence of elements from an unordered_multimap. Note that this function only erases the elements, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
Definition at line 1726 of file unordered_map.h.

4.1038.4.23 erase() [3/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (
            const_iterator __position )  [inline]
```

Erases an element from an unordered_multimap.

Parameters

__position	An iterator pointing to the element to be erased.

Returns

An iterator pointing to the element immediately following *__position* prior to the element being erased. If no such element exists, end() is returned.

This function erases an element, pointed to by the given iterator, from an unordered_multimap. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
Definition at line 1686 of file unordered_map.h.

4.1038.4.24 erase() [4/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (
            iterator __position )  [inline]
```

Erases an element from an unordered_multimap.

Parameters

__position	An iterator pointing to the element to be erased.

Returns

An iterator pointing to the element immediately following *__position* prior to the element being erased. If no such element exists, end() is returned.

This function erases an element, pointed to by the given iterator, from an unordered_multimap. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1691 of file unordered_map.h.

4.1038.4.25 find() [1/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::find (
            const key_type & __x )  [inline]
```

Tries to locate an element in an unordered_multimap.

Parameters

_↩ _x	Key to be located.

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.
Definition at line 1816 of file unordered_map.h.

4.1038.4.26 find() [2/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::find (
            const key_type & __x ) const  [inline]
```

Tries to locate an element in an unordered_multimap.

Parameters

_↩ _x	Key to be located.

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.
Definition at line 1820 of file unordered_map.h.

4.1038.4.27 get_allocator()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
allocator_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::get_allocator ( )
const  [inline], [noexcept]
```

Returns the allocator object used by the unordered_multimap.
Definition at line 1445 of file unordered_map.h.

4.1038.4.28 hash_function()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
hasher std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::hash_function ( ) const  [inline]
```

Returns the hash functor object with which the unordered_multimap was constructed.
Definition at line 1792 of file unordered_map.h.

4.1038.4.29 insert() [1/8]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename _InputIterator >
void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
            _InputIterator __first,
            _InputIterator __last )  [inline]
```

A template function that attempts to insert a range of elements.

Parameters

__first	Iterator pointing to the start of the range to be inserted.
__last	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.
Definition at line 1631 of file unordered_map.h.

4.1038.4.30 insert() [2/8]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename _Pair >
__enable_if_t<is_constructible<value_type, _Pair&&>::value, iterator> std::unordered_multimap<
_Key, _Tp, _Hash, _Pred, _Alloc >::insert (
            _Pair && __x )  [inline]
```

Inserts a std::pair into the unordered_multimap.

Parameters

_↩ _x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the inserted pair.

Insertion requires amortized constant time.
Definition at line 1580 of file unordered_map.h.

4.1038.4.31 insert() [3/8]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
            const value_type & __x )  [inline]
```

Inserts a std::pair into the unordered_multimap.

Parameters

_↩ _x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the inserted pair.

Insertion requires amortized constant time.
Definition at line 1571 of file unordered_map.h.

4.1038.4.32 insert() [4/8]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename _Pair >
__enable_if_t<is_constructible<value_type, _Pair&&>::value, iterator> std::unordered_multimap<
_Key, _Tp, _Hash, _Pred, _Alloc >::insert (
            const_iterator __hint,
            _Pair && __x )  [inline]
```

Inserts a std::pair into the unordered_multimap.

Parameters

__hint	An iterator that serves as a hint as to where the pair should be inserted.
__x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the element with key of *__x* (may or may not be the pair passed in).

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.
See https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints for more on *hinting*.
Insertion requires amortized constant time.
Definition at line 1616 of file unordered_map.h.

4.1038.4.33 insert() [5/8]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
            const_iterator __hint,
            const value_type & __x )  [inline]
```

Inserts a std::pair into the unordered_multimap.

Parameters

__hint	An iterator that serves as a hint as to where the pair should be inserted.
__x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the element with key of *__x* (may or may not be the pair passed in).

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.
See https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints for more on *hinting*.

Insertion requires amortized constant time.
Definition at line 1605 of file unordered_map.h.

4.1038.4.34 insert() [6/8]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
            const_iterator __hint,
            value_type && __x )  [inline]
```

Inserts a std::pair into the unordered_multimap.

Parameters

__hint	An iterator that serves as a hint as to where the pair should be inserted.
__x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the element with key of *__x* (may or may not be the pair passed in).

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.
See https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints for more on *hinting*.
Insertion requires amortized constant time.
Definition at line 1611 of file unordered_map.h.
References std::move().

4.1038.4.35 insert() [7/8]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
            initializer_list< value_type > __l )  [inline]
```

Attempts to insert a list of elements into the unordered_multimap.

Parameters

__l	A std::initializer_list<value_type> of elements to be inserted.

Complexity similar to that of the range constructor.
Definition at line 1643 of file unordered_map.h.

4.1038.4.36 insert() [8/8]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
            value_type && __x )  [inline]
```

Inserts a std::pair into the unordered_multimap.

Parameters

_↩ _x	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the inserted pair.

Insertion requires amortized constant time.
Definition at line 1575 of file unordered_map.h.
References std::move().

4.1038.4.37 key_eq()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename
_Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
key_equal std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::key_eq ( ) const  [inline]
```

Returns the key comparison object with which the unordered_multimap was constructed.
Definition at line 1798 of file unordered_map.h.

4.1038.4.38 load_factor()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
float std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::load_factor ( ) const  [inline],
[noexcept]
```

Returns the average number of elements per bucket.
Definition at line 1946 of file unordered_map.h.

4.1038.4.39 max_bucket_count()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_↩
Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
size_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::max_bucket_count ( ) const
[inline], [noexcept]
```

Returns the maximum number of buckets of the unordered_multimap.
Definition at line 1869 of file unordered_map.h.

4.1038.4.40 max_load_factor() [1/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<↩
_Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _↩
Tp>>>
float std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::max_load_factor ( ) const  [inline],
[noexcept]
```

Returns a positive number that the unordered_multimap tries to keep the load factor less than or equal to.
Definition at line 1952 of file unordered_map.h.

4.1038.4.41 max_load_factor() [2/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<↩
_Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _↩
Tp>>>
void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::max_load_factor (
            float __z )  [inline]
```

Change the unordered_multimap maximum load factor.

Parameters

_↩ _z	The new maximum load factor.

Definition at line 1960 of file unordered_map.h.

4.1038.4.42 max_size()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename
_Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
size_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::max_size ( ) const  [inline],
[noexcept]
```

Returns the maximum size of the unordered_multimap.
Definition at line 1462 of file unordered_map.h.

4.1038.4.43 operator=() [1/3]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
unordered_multimap& std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::operator= (
            const unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc > &  )  [default]
```

Copy assignment operator.

4.1038.4.44 operator=() [2/3]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
unordered_multimap& std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::operator= (
            initializer_list< value_type > __l )  [inline]
```

Unordered_multimap list assignment operator.

Parameters

↩ _↩ ↩ _↩ *l*	An initializer_list.

This function fills an unordered_multimap with copies of the elements in the initializer list *__l*.
Note that the assignment completely changes the unordered_multimap and that the resulting unordered_multimap's size is the same as the number of elements assigned.
Definition at line 1437 of file unordered_map.h.

4.1038.4.45 operator=() [3/3]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>,
typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
unordered_multimap& std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::operator= (
            unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc > &&  )  [default]
```

Move assignment operator.

4.1038.4.46 rehash()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename
_Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
```

```
void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::rehash (
            size_type __n ) [inline]
```

May rehash the unordered_multimap.

Parameters

_↩ _n	The new number of buckets.

Rehash will occur only if the new number of buckets respect the unordered_multimap maximum load factor.
Definition at line 1971 of file unordered_map.h.

4.1038.4.47 reserve()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename
_Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::reserve (
            size_type __n ) [inline]
```

Prepare the unordered_multimap for a specified number of elements.

Parameters

_↩ _n	Number of elements required.

Same as rehash(ceil(n / max_load_factor())).
Definition at line 1982 of file unordered_map.h.

4.1038.4.48 size()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename
_Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
size_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::size ( ) const [inline],
[noexcept]
```

Returns the size of the unordered_multimap.
Definition at line 1457 of file unordered_map.h.

4.1038.4.49 swap()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename
_Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::swap (
            unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc > & __x ) [inline], [noexcept]
```

Swaps data with another unordered_multimap.

Parameters

_↩ _x	An unordered_multimap of the same element and allocator types.

This exchanges the elements between two unordered_multimap in constant time. Note that the global std::swap() function is specialized such that std::swap(m1,m2) will feed to this function.
Definition at line 1750 of file unordered_map.h.

4.1039.1 Detailed Description

template<typename _Value, typename _Hash = std::hash<_Value>, typename _Pred = std::equal_to<_Value>, typename _Alloc = std::allocator<_Value>>
class std::__debug::unordered_multiset< _Value, _Hash, _Pred, _Alloc >

Class std::unordered_multiset with safety/checking/debug instrumentation.
Definition at line 629 of file debug/unordered_set.

4.1039.2 Member Function Documentation

4.1039.2.1 _M_detach_all() `void __gnu_debug::_Safe_unordered_container_base::_M_detach_all ( ) [protected], [inherited]`

Detach all iterators, leaving them singular.

4.1039.2.2 _M_detach_singular() `void __gnu_debug::_Safe_sequence_base::_M_detach_singular ( ) [protected], [inherited]`

Detach all singular iterators.

Postcondition

for all iterators i attached to this sequence, i->_M_version == _M_version.

4.1039.2.3 _M_get_mutex() `__gnu_cxx::__mutex& __gnu_debug::_Safe_sequence_base::_M_get_mutex ( ) throw ( ) [protected], [inherited]`

For use in _Safe_sequence.
Referenced by __gnu_debug::_Safe_sequence< _Sequence >::_M_transfer_from_if().

4.1039.2.4 _M_invalidate_all() `void __gnu_debug::_Safe_sequence_base::_M_invalidate_all ( ) const [inline], [protected], [inherited]`

Invalidates all iterators.
Definition at line 256 of file safe_base.h.
References __gnu_debug::_Safe_sequence_base::_M_version.

4.1039.2.5 _M_invalidate_if() template<typename _Container >
template<typename _Predicate >
void __gnu_debug::_Safe_unordered_container< _Container >::_M_invalidate_if (
_Predicate __pred) [protected], [inherited]

Invalidates all iterators x that reference this container, are not singular, and for which __pred(x) returns true. __pred will be invoked with the normal iterators nested in the safe ones.
Definition at line 37 of file safe_unordered_container.tcc.

4.1039.2.6 _M_invalidate_local_if() template<typename _Container >
template<typename _Predicate >
void __gnu_debug::_Safe_unordered_container< _Container >::_M_invalidate_local_if (
_Predicate __pred) [protected], [inherited]

Invalidates all local iterators x that reference this container, are not singular, and for which __pred(x) returns true. __pred will be invoked with the normal local iterators nested in the safe ones.
Definition at line 69 of file safe_unordered_container.tcc.

4.1039.2.7 _M_revalidate_singular() void __gnu_debug::_Safe_sequence_base::_M_revalidate_singular (
) [protected], [inherited]

Revalidates all attached singular iterators. This method may be used to validate iterators that were invalidated before (but for some reason, such as an exception, need to become valid again).

4.1039.2.8 _M_swap() [1/2] void __gnu_debug::_Safe_sequence_base::_M_swap (
_Safe_sequence_base & __x) [protected], [noexcept], [inherited]

Swap this sequence with the given sequence. This operation also swaps ownership of the iterators, so that when the operation is complete all iterators that originally referenced one container now reference the other container.

4.1039.2.9 _M_swap() [2/2] void __gnu_debug::_Safe_unordered_container_base::_M_swap (
_Safe_unordered_container_base & __x) [protected], [noexcept], [inherited]

Swap this container with the given container. This operation also swaps ownership of the iterators, so that when the operation is complete all iterators that originally referenced one container now reference the other container.

4.1039.3 Member Data Documentation

4.1039.3.1 _M_const_iterators _Safe_iterator_base* __gnu_debug::_Safe_sequence_base::_M_const_↩
iterators [inherited]

The list of constant iterators that reference this container.

4.1040.1 Detailed Description

template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
class std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >

A standard container composed of equivalent keys (possibly containing multiple of each key value) in which the elements' keys are the elements themselves.

Template Parameters

_Value	Type of key objects.
_Hash	Hashing function object type, defaults to hash<_Value>.
_Pred	Predicate function object type, defaults to equal_to<_Value>.
_Alloc	Allocator type, defaults to allocator<_Key>.

Meets the requirements of a container, and unordered associative container
Base is _Hashtable, dispatched at compile time via template alias __umset_hashtable.
Definition at line 913 of file unordered_set.h.

4.1040.3 Constructor & Destructor Documentation

4.1040.3.1 unordered_multiset() [1/7]

```
template<typename _Value , typename _Hash = hash<_Value>,
typename _Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset ( )  [default]
```

Default constructor.

4.1040.3.2 unordered_multiset() [2/7]

```
template<typename _Value , typename _Hash = hash<_Value>,
typename _Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
            size_type __n,
            const hasher & __hf = hasher(),
            const key_equal & __eql = key_equal(),
            const allocator_type & __a = allocator_type() )  [inline], [explicit]
```

Default constructor creates no elements.

Parameters

__n	Minimal initial number of buckets.
__hf	A hash functor.
__eql	A key equality functor.
__a	An allocator object.

Definition at line 960 of file unordered_set.h.

4.1040.3.3 unordered_multiset() [3/7]

```
template<typename _Value , typename _Hash = hash<_Value>,
typename _Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
template<typename _InputIterator >
```

```
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
            _InputIterator __first,
            _InputIterator __last,
            size_type __n = 0,
            const hasher & __hf = hasher(),
            const key_equal & __eql = key_equal(),
            const allocator_type & __a = allocator_type() )  [inline]
```

Builds an unordered_multiset from a range.

Parameters

__first	An input iterator.
__last	An input iterator.
__n	Minimal initial number of buckets.
__hf	A hash functor.
__eql	A key equality functor.
__a	An allocator object.

Create an unordered_multiset consisting of copies of the elements from [__first,__last). This is linear in N (where N is distance(__first,__last)).
Definition at line 981 of file unordered_set.h.

4.1040.3.4 unordered_multiset() [4/7]

```
template<typename _Value , typename _Hash = hash<_Value>,
typename _Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
            const unordered_multiset< _Value, _Hash, _Pred, _Alloc > &  )  [default]
```

Copy constructor.

4.1040.3.5 unordered_multiset() [5/7]

```
template<typename _Value , typename _Hash = hash<_Value>,
typename _Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
            unordered_multiset< _Value, _Hash, _Pred, _Alloc > &&  )  [default]
```

Move constructor.

4.1040.3.6 unordered_multiset() [6/7]

```
template<typename _Value , typename _Hash = hash<_Value>,
typename _Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
            initializer_list< value_type > __l,
            size_type __n = 0,
            const hasher & __hf = hasher(),
            const key_equal & __eql = key_equal(),
            const allocator_type & __a = allocator_type() )  [inline]
```

Builds an unordered_multiset from an initializer_list.

Parameters

__l	An initializer_list.
__n	Minimal initial number of buckets.
__hf	A hash functor.

Parameters

__eql	A key equality functor.
__a	An allocator object.

Create an unordered_multiset consisting of copies of the elements in the list. This is linear in N (where N is *__l.size()*).
Definition at line 1006 of file unordered_set.h.

4.1040.3.7 unordered_multiset() [7/7]

```
template<typename _Value , typename _Hash = hash<_Value>,
typename _Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
            const allocator_type & __a )  [inline], [explicit]
```

Creates an unordered_multiset with no elements.

Parameters

_↩ _a	An allocator object.

Definition at line 1027 of file unordered_set.h.

4.1040.4 Member Function Documentation

4.1040.4.1 begin() [1/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred
= equal_to<_Value>, typename _Alloc = allocator<_Value>>
const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::begin ( ) const  [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered_multiset.
Definition at line 1139 of file unordered_set.h.

4.1040.4.2 begin() [2/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred
= equal_to<_Value>, typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::begin ( )  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered_multiset.
Definition at line 1135 of file unordered_set.h.

4.1040.4.3 begin() [3/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred
= equal_to<_Value>, typename _Alloc = allocator<_Value>>
local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::begin (
            size_type __n )  [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

_↩ _n	The bucket index.

Returns

A read-only local iterator.

Definition at line 1532 of file unordered_set.h.

4.1040.4.4 begin() [4/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred
= equal_to<_Value>, typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::begin (
            size_type __n ) const  [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

_↩ _n	The bucket index.

Returns

A read-only local iterator.

Definition at line 1536 of file unordered_set.h.

4.1040.4.5 bucket_count()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _↩
Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::bucket_count ( ) const  [inline],
[noexcept]
```

Returns the number of buckets of the unordered_multiset.
Definition at line 1498 of file unordered_set.h.

4.1040.4.6 cbegin() [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _↩
Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::cbegin ( ) const  [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered_multiset.
Definition at line 1162 of file unordered_set.h.

4.1040.4.7 cbegin() [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _↩
Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::cbegin (
            size_type __n ) const  [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

_↩ _n	The bucket index.

Returns

A read-only local iterator.

Definition at line 1540 of file unordered_set.h.

4.1040.4.8 cend() [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred
= equal_to<_Value>, typename _Alloc = allocator<_Value>>
const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::cend ( ) const  [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered_multiset.
Definition at line 1170 of file unordered_set.h.

4.1040.4.9 cend() [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred
= equal_to<_Value>, typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::cend (
            size_type __n ) const  [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

_↩ _n	The bucket index.

Returns

A read-only local iterator.

Definition at line 1560 of file unordered_set.h.

4.1040.4.10 clear()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred =
equal_to<_Value>, typename _Alloc = allocator<_Value>>
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::clear ( )  [inline], [noexcept]
```

Erases all elements in an unordered_multiset.
Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
Definition at line 1371 of file unordered_set.h.

4.1040.4.11 count()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred =
equal_to<_Value>, typename _Alloc = allocator<_Value>>
size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::count (
            const key_type & __x ) const  [inline]
```

Finds the number of elements.

Parameters

_↩ _x	Element to located.

Returns

Number of elements with specified key.

Definition at line 1464 of file unordered_set.h.

4.1040.4.12 emplace()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred =
equal_to<_Value>, typename _Alloc = allocator<_Value>>
template<typename... _Args>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::emplace (
            _Args &&... __args ) [inline]
```

Builds and insert an element into the unordered_multiset.

Parameters

__args	Arguments used to generate an element.

Returns

An iterator that points to the inserted element.

Insertion requires amortized constant time.
Definition at line 1184 of file unordered_set.h.

4.1040.4.13 emplace_hint()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _↩
Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
template<typename... _Args>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::emplace_hint (
            const_iterator __pos,
            _Args &&... __args ) [inline]
```

Inserts an element into the unordered_multiset.

Parameters

__pos	An iterator that serves as a hint as to where the element should be inserted.
__args	Arguments used to generate the element to be inserted.

Returns

An iterator that points to the inserted element.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.
For more on *hinting*, see: https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.↩html#containers.associative.insert_hints
Insertion requires amortized constant time.
Definition at line 1206 of file unordered_set.h.

4.1040.4.14 empty()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred =
equal_to<_Value>, typename _Alloc = allocator<_Value>>
bool std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::empty ( ) const [inline], [noexcept]
```

Returns true if the unordered_multiset is empty.
Definition at line 1114 of file unordered_set.h.

4.1040.4.15 end() [1/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred
= equal_to<_Value>, typename _Alloc = allocator<_Value>>
const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::end ( ) const  [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered_multiset.
Definition at line 1153 of file unordered_set.h.

4.1040.4.16 end() [2/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred
= equal_to<_Value>, typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::end ( )  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered_multiset.
Definition at line 1149 of file unordered_set.h.

4.1040.4.17 end() [3/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred
= equal_to<_Value>, typename _Alloc = allocator<_Value>>
local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::end (
            size_type __n )  [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

_↩ _n	The bucket index.

Returns

A read-only local iterator.

Definition at line 1552 of file unordered_set.h.

4.1040.4.18 end() [4/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred
= equal_to<_Value>, typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::end (
            size_type __n ) const  [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

_↩ _n	The bucket index.

Returns

A read-only local iterator.

Definition at line 1556 of file unordered_set.h.

4.1040.4.19 equal_range() [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename
_Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
std::pair<iterator, iterator> std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::equal_↩
range (
            const key_type & __x )  [inline]
```

Finds a subsequence matching given key.

Parameters

_↩ _x	Key to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

Definition at line 1486 of file unordered_set.h.

4.1040.4.20 equal_range() [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename
_Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
std::pair<const_iterator, const_iterator> std::unordered_multiset< _Value, _Hash, _Pred, _Alloc
>::equal_range (
            const key_type & __x ) const  [inline]
```

Finds a subsequence matching given key.

Parameters

_↩ _x	Key to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

Definition at line 1490 of file unordered_set.h.

4.1040.4.21 erase() [1/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred
= equal_to<_Value>, typename _Alloc = allocator<_Value>>
size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::erase (
            const key_type & __x )  [inline]
```

Erases elements according to the provided key.

Parameters

_↩ _x	Key of element to be erased.

Returns

The number of elements erased.

This function erases all the elements located by the given key from an unordered_multiset.

Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
Definition at line 1340 of file unordered_set.h.

4.1040.4.22 erase() [2/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred
= equal_to<_Value>, typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::erase (
            const_iterator __first,
            const_iterator __last )  [inline]
```

Erases a [__first,__last) range of elements from an unordered_multiset.

Parameters

__first	Iterator pointing to the start of the range to be erased.
__last	Iterator pointing to the end of the range to be erased.

Returns

The iterator *__last*.

This function erases a sequence of elements from an unordered_multiset.
Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
Definition at line 1360 of file unordered_set.h.

4.1040.4.23 erase() [3/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred
= equal_to<_Value>, typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::erase (
            const_iterator __position )  [inline]
```

Erases an element from an unordered_multiset.

Parameters

__position	An iterator pointing to the element to be erased.

Returns

An iterator pointing to the element immediately following *__position* prior to the element being erased. If no such element exists, end() is returned.

This function erases an element, pointed to by the given iterator, from an unordered_multiset.
Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
Definition at line 1317 of file unordered_set.h.

4.1040.4.24 erase() [4/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred
= equal_to<_Value>, typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::erase (
            iterator __position )  [inline]
```

Erases an element from an unordered_multiset.

Parameters

__position	An iterator pointing to the element to be erased.

Returns

An iterator pointing to the element immediately following *__position* prior to the element being erased. If no such element exists, end() is returned.

This function erases an element, pointed to by the given iterator, from an unordered_multiset.
Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
Definition at line 1322 of file unordered_set.h.

4.1040.4.25 find() [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred
= equal_to<_Value>, typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::find (
            const key_type & __x )  [inline]
```

Tries to locate an element in an unordered_multiset.

Parameters

_↩ _x	Element to be located.

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.
Definition at line 1450 of file unordered_set.h.

4.1040.4.26 find() [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred
= equal_to<_Value>, typename _Alloc = allocator<_Value>>
const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::find (
            const key_type & __x ) const  [inline]
```

Tries to locate an element in an unordered_multiset.

Parameters

_↩ _x	Element to be located.

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.
Definition at line 1454 of file unordered_set.h.

4.1040.4.27 get_allocator() template<typename _Value , typename _Hash = hash<_Value>, typename _↩ Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>

allocator_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::get_allocator ( ) const [inline], [noexcept]

Returns the allocator object used by the unordered_multiset.
Definition at line 1107 of file unordered_set.h.

4.1040.4.28 hash_function() template<typename _Value , typename _Hash = hash<_Value>, typename ↩ _Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>

hasher std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::hash_function ( ) const [inline]

Returns the hash functor object with which the unordered_multiset was constructed.
Definition at line 1426 of file unordered_set.h.

4.1040.4.29 insert() [1/6] template<typename _Value , typename _Hash = hash<_Value>, typename _↩ Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>

```
template<typename _InputIterator >
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
            _InputIterator __first,
            _InputIterator __last ) [inline]
```

A template function that inserts a range of elements.

Parameters

__first	Iterator pointing to the start of the range to be inserted.
__last	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.
Definition at line 1262 of file unordered_set.h.

4.1040.4.30 insert() [2/6] template<typename _Value , typename _Hash = hash<_Value>, typename _↩ Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>

```
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
            const value_type & __x ) [inline]
```

Inserts an element into the unordered_multiset.

Parameters

_↩ _x	Element to be inserted.

Returns

An iterator that points to the inserted element.

Insertion requires amortized constant time.
Definition at line 1218 of file unordered_set.h.

4.1040.4.31 insert() [3/6] template<typename _Value , typename _Hash = hash<_Value>, typename _↩ Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>

```
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
            const_iterator __hint,
            const value_type & __x )  [inline]
```

Inserts an element into the unordered_multiset.

Parameters

__hint	An iterator that serves as a hint as to where the element should be inserted.
__x	Element to be inserted.

Returns

An iterator that points to the inserted element.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.
For more on *hinting*, see: https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints
Insertion requires amortized constant.
Definition at line 1244 of file unordered_set.h.

4.1040.4.32 insert() [4/6]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
            const_iterator __hint,
            value_type && __x )  [inline]
```

Inserts an element into the unordered_multiset.

Parameters

__hint	An iterator that serves as a hint as to where the element should be inserted.
__x	Element to be inserted.

Returns

An iterator that points to the inserted element.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.
For more on *hinting*, see: https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints
Insertion requires amortized constant.
Definition at line 1248 of file unordered_set.h.
References std::move().

4.1040.4.33 insert() [5/6]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
            initializer_list< value_type > __l )  [inline]
```

Inserts a list of elements into the unordered_multiset.

Parameters

↩ _↩ ↩ _↩ *l*	A std::initializer_list<value_type> of elements to be inserted.

Complexity similar to that of the range constructor.
Definition at line 1273 of file unordered_set.h.

4.1040.4.34 insert() [6/6]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _↩
Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
            value_type && __x )  [inline]
```

Inserts an element into the unordered_multiset.

Parameters

_↩ *_x*	Element to be inserted.

Returns

An iterator that points to the inserted element.

Insertion requires amortized constant time.
Definition at line 1222 of file unordered_set.h.
References std::move().

4.1040.4.35 key_eq()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred =
equal_to<_Value>, typename _Alloc = allocator<_Value>>
key_equal std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::key_eq ( ) const  [inline]
```

Returns the key comparison object with which the unordered_multiset was constructed.
Definition at line 1432 of file unordered_set.h.

4.1040.4.36 load_factor()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred
= equal_to<_Value>, typename _Alloc = allocator<_Value>>
float std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::load_factor ( ) const  [inline],
[noexcept]
```

Returns the average number of elements per bucket.
Definition at line 1568 of file unordered_set.h.

4.1040.4.37 max_bucket_count()

```
template<typename _Value , typename _Hash = hash<_Value>, typename
_Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::max_bucket_count ( ) const
[inline], [noexcept]
```

Returns the maximum number of buckets of the unordered_multiset.
Definition at line 1503 of file unordered_set.h.

4.1040.4.38 max_load_factor() [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>,
typename _Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
float std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::max_load_factor ( ) const  [inline],
[noexcept]
```

Returns a positive number that the unordered_multiset tries to keep the load factor less than or equal to.
Definition at line 1574 of file unordered_set.h.

4.1040.4.39 max_load_factor() [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>,
typename _Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::max_load_factor (
            float __z )  [inline]
```

Change the unordered_multiset maximum load factor.

Parameters

_↩ _z	The new maximum load factor.

Definition at line 1582 of file unordered_set.h.

4.1040.4.40 max_size()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred =
equal_to<_Value>, typename _Alloc = allocator<_Value>>
size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::max_size ( ) const  [inline],
[noexcept]
```

Returns the maximum size of the unordered_multiset.
Definition at line 1124 of file unordered_set.h.

4.1040.4.41 operator=() [1/3]

```
template<typename _Value , typename _Hash = hash<_Value>, typename
_Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
unordered_multiset& std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::operator= (
            const unordered_multiset< _Value, _Hash, _Pred, _Alloc > &  )  [default]
```

Copy assignment operator.

4.1040.4.42 operator=() [2/3]

```
template<typename _Value , typename _Hash = hash<_Value>, typename
_Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
unordered_multiset& std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::operator= (
            initializer_list< value_type > __l )  [inline]
```

Unordered_multiset list assignment operator.

Parameters

↩ _↩ ↩ _↩ l	An initializer_list.

This function fills an unordered_multiset with copies of the elements in the initializer list *__l*.
Note that the assignment completely changes the unordered_multiset and that the resulting unordered_multiset's size

is the same as the number of elements assigned.
Definition at line 1099 of file unordered_set.h.

4.1040.4.43 operator=() [3/3]

```
template<typename _Value , typename _Hash = hash<_Value>, typename
_Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
unordered_multiset& std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::operator= (
            unordered_multiset< _Value, _Hash, _Pred, _Alloc > &&  )  [default]
```

Move assignment operator.

4.1040.4.44 rehash()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred =
equal_to<_Value>, typename _Alloc = allocator<_Value>>
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::rehash (
            size_type __n )  [inline]
```

May rehash the unordered_multiset.

Parameters

_↩ _n	The new number of buckets.

Rehash will occur only if the new number of buckets respect the unordered_multiset maximum load factor.
Definition at line 1593 of file unordered_set.h.

4.1040.4.45 reserve()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred =
equal_to<_Value>, typename _Alloc = allocator<_Value>>
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::reserve (
            size_type __n )  [inline]
```

Prepare the unordered_multiset for a specified number of elements.

Parameters

_↩ _n	Number of elements required.

Same as rehash(ceil(n / max_load_factor())).
Definition at line 1604 of file unordered_set.h.

4.1040.4.46 size()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred =
equal_to<_Value>, typename _Alloc = allocator<_Value>>
size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::size ( ) const  [inline],
[noexcept]
```

Returns the size of the unordered_multiset.
Definition at line 1119 of file unordered_set.h.

4.1040.4.47 swap()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred =
equal_to<_Value>, typename _Alloc = allocator<_Value>>
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::swap (
            unordered_multiset< _Value, _Hash, _Pred, _Alloc > & __x )  [inline], [noexcept]
```

Swaps data with another unordered_multiset.

Parameters

_↩ _x	An unordered_multiset of the same element and allocator types.

This exchanges the elements between two sets in constant time. Note that the global std::swap() function is specialized such that std::swap(s1,s2) will feed to this function.
Definition at line 1384 of file unordered_set.h.
The documentation for this class was generated from the following file:

4.1041.1 Detailed Description

template<typename _Value, typename _Hash = std::hash<_Value>, typename _Pred = std::equal_to<_Value>, typename _Alloc = std::allocator<_Value>>
class std::__debug::unordered_set< _Value, _Hash, _Pred, _Alloc >

Class std::unordered_set with safety/checking/debug instrumentation.
Definition at line 60 of file debug/unordered_set.

4.1041.2 Member Function Documentation

4.1041.2.1 _M_detach_all() `void __gnu_debug::_Safe_unordered_container_base::_M_detach_all ( ) [protected], [inherited]`

Detach all iterators, leaving them singular.

4.1041.2.2 _M_detach_singular() `void __gnu_debug::_Safe_sequence_base::_M_detach_singular ( ) [protected], [inherited]`

Detach all singular iterators.

Postcondition

for all iterators i attached to this sequence, i->_M_version == _M_version.

4.1041.2.3 _M_get_mutex() `__gnu_cxx::__mutex& __gnu_debug::_Safe_sequence_base::_M_get_mutex ( ) throw ( ) [protected], [inherited]`

For use in _Safe_sequence.

Referenced by __gnu_debug::_Safe_sequence< _Sequence >::_M_transfer_from_if().

4.1041.2.4 _M_invalidate_all() `void __gnu_debug::_Safe_sequence_base::_M_invalidate_all ( ) const [inline], [protected], [inherited]`

Invalidates all iterators.

Definition at line 256 of file safe_base.h.

References __gnu_debug::_Safe_sequence_base::_M_version.

4.1041.2.5 _M_invalidate_if() `template<typename _Container >`

`template<typename _Predicate >`

`void __gnu_debug::_Safe_unordered_container< _Container >::_M_invalidate_if ( _Predicate __pred ) [protected], [inherited]`

Invalidates all iterators `x` that reference this container, are not singular, and for which `__pred(x)` returns `true`. `__pred` will be invoked with the normal iterators nested in the safe ones.

Definition at line 37 of file safe_unordered_container.tcc.

4.1041.2.6 _M_invalidate_local_if() `template<typename _Container >`

`template<typename _Predicate >`

`void __gnu_debug::_Safe_unordered_container< _Container >::_M_invalidate_local_if ( _Predicate __pred ) [protected], [inherited]`

Invalidates all local iterators `x` that reference this container, are not singular, and for which `__pred(x)` returns `true`. `__pred` will be invoked with the normal local iterators nested in the safe ones.

Definition at line 69 of file safe_unordered_container.tcc.

4.1041.2.7 _M_revalidate_singular() `void __gnu_debug::_Safe_sequence_base::_M_revalidate_singular ( ) [protected], [inherited]`

Revalidates all attached singular iterators. This method may be used to validate iterators that were invalidated before (but for some reason, such as an exception, need to become valid again).

4.1041.2.8 _M_swap() [1/2] `void __gnu_debug::_Safe_sequence_base::_M_swap ( _Safe_sequence_base & __x ) [protected], [noexcept], [inherited]`

Swap this sequence with the given sequence. This operation also swaps ownership of the iterators, so that when the operation is complete all iterators that originally referenced one container now reference the other container.

4.1041.2.9 _M_swap() [2/2] `void __gnu_debug::_Safe_unordered_container_base::_M_swap ( _Safe_unordered_container_base & __x ) [protected], [noexcept], [inherited]`

Swap this container with the given container. This operation also swaps ownership of the iterators, so that when the operation is complete all iterators that originally referenced one container now reference the other container.

4.1041.3 Member Data Documentation

4.1041.3.1 _M_const_iterators

`_Safe_iterator_base* __gnu_debug::_Safe_sequence_base::_M_const_iterators [inherited]`

The list of constant iterators that reference this container.
Definition at line 197 of file safe_base.h.
Referenced by __gnu_debug::_Safe_sequence< _Sequence >::_M_transfer_from_if().

4.1041.3.2 _M_const_local_iterators

`_Safe_iterator_base* __gnu_debug::_Safe_unordered_container_base::_M_const_local_iterators [inherited]`

The list of constant local iterators that reference this container.
Definition at line 130 of file safe_unordered_base.h.

4.1041.3.3 _M_iterators

`_Safe_iterator_base* __gnu_debug::_Safe_sequence_base::_M_iterators [inherited]`

The list of mutable iterators that reference this container.
Definition at line 194 of file safe_base.h.
Referenced by __gnu_debug::_Safe_sequence< _Sequence >::_M_transfer_from_if().

4.1041.3.4 _M_local_iterators

`_Safe_iterator_base* __gnu_debug::_Safe_unordered_container_base::_M_local_iterators [inherited]`

The list of mutable local iterators that reference this container.
Definition at line 127 of file safe_unordered_base.h.

4.1041.3.5 _M_version

`unsigned int __gnu_debug::_Safe_sequence_base::_M_version [mutable], [inherited]`

The container version number. This number may never be 0.
Definition at line 200 of file safe_base.h.
Referenced by __gnu_debug::_Safe_sequence_base::_M_invalidate_all().

4.1042.1 Detailed Description

template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
class std::unordered_set< _Value, _Hash, _Pred, _Alloc >

A standard container composed of unique keys (containing at most one of each key value) in which the elements' keys are the elements themselves.

Template Parameters

_Value	Type of key objects.
_Hash	Hashing function object type, defaults to hash<_Value>.
_Pred	Predicate function object type, defaults to equal_to<_Value>.
_Alloc	Allocator type, defaults to allocator<_Key>.

Meets the requirements of a container, and unordered associative container
Base is _Hashtable, dispatched at compile time via template alias __uset_hashtable.
Definition at line 97 of file unordered_set.h.

Public typedefs.
Definition at line 107 of file unordered_set.h.

4.1042.3 Constructor & Destructor Documentation

4.1042.3.1 unordered_set() [1/7]

```
template<typename _Value , typename _Hash = hash<_Value>, typename
_Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set ( )  [default]
```

Default constructor.

4.1042.3.2 unordered_set() [2/7]

```
template<typename _Value , typename _Hash = hash<_Value>, typename
_Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (
            size_type __n,
            const hasher & __hf = hasher(),
            const key_equal & __eql = key_equal(),
            const allocator_type & __a = allocator_type() )  [inline], [explicit]
```

Default constructor creates no elements.

Parameters

__n	Minimal initial number of buckets.

Parameters

__hf	A hash functor.
__eql	A key equality functor.
__a	An allocator object.

Definition at line 145 of file unordered_set.h.

4.1042.3.3 unordered_set() [3/7]

```
template<typename _Value , typename _Hash = hash<_Value>, typename
_Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
template<typename _InputIterator >
std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (
            _InputIterator __first,
            _InputIterator __last,
            size_type __n = 0,
            const hasher & __hf = hasher(),
            const key_equal & __eql = key_equal(),
            const allocator_type & __a = allocator_type() )  [inline]
```

Builds an unordered_set from a range.

Parameters

__first	An input iterator.
__last	An input iterator.
__n	Minimal initial number of buckets.
__hf	A hash functor.
__eql	A key equality functor.
__a	An allocator object.

Create an unordered_set consisting of copies of the elements from [__first,__last). This is linear in N (where N is distance(__first,__last)).
Definition at line 166 of file unordered_set.h.

4.1042.3.4 unordered_set() [4/7]

```
template<typename _Value , typename _Hash = hash<_Value>, typename
_Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (
            const unordered_set< _Value, _Hash, _Pred, _Alloc > &  )  [default]
```

Copy constructor.

4.1042.3.5 unordered_set() [5/7]

```
template<typename _Value , typename _Hash = hash<_Value>, typename
_Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (
            unordered_set< _Value, _Hash, _Pred, _Alloc > &&  )  [default]
```

Move constructor.

4.1042.3.6 unordered_set() [6/7]

```
template<typename _Value , typename _Hash = hash<_Value>, typename
_Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
```

```
std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (
            const allocator_type & __a )  [inline], [explicit]
```

Creates an unordered_set with no elements.

Parameters

_↩ _a	An allocator object.

Definition at line 185 of file unordered_set.h.

4.1042.3.7 unordered_set() [7/7]

```
template<typename _Value , typename _Hash = hash<_Value>, typename
_Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (
            initializer_list< value_type > __l,
            size_type __n = 0,
            const hasher & __hf = hasher(),
            const key_equal & __eql = key_equal(),
            const allocator_type & __a = allocator_type() )  [inline]
```

Builds an unordered_set from an initializer_list.

Parameters

__l	An initializer_list.
__n	Minimal initial number of buckets.
__hf	A hash functor.
__eql	A key equality functor.
__a	An allocator object.

Create an unordered_set consisting of copies of the elements in the list. This is linear in N (where N is *__l.size()*).
Definition at line 221 of file unordered_set.h.

4.1042.4 Member Function Documentation

4.1042.4.1 begin() [1/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred
= equal_to<_Value>, typename _Alloc = allocator<_Value>>
const_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::begin ( ) const  [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered_set.
Definition at line 324 of file unordered_set.h.

4.1042.4.2 begin() [2/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred
= equal_to<_Value>, typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::begin ( )  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered_set.
Definition at line 320 of file unordered_set.h.

4.1042.4.3 begin() [3/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred
= equal_to<_Value>, typename _Alloc = allocator<_Value>>
local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::begin (
            size_type __n )  [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

_↩ _n	The bucket index.

Returns

A read-only local iterator.

Definition at line 738 of file unordered_set.h.

4.1042.4.4 begin() [4/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred
= equal_to<_Value>, typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::begin (
            size_type __n ) const  [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

_↩ _n	The bucket index.

Returns

A read-only local iterator.

Definition at line 742 of file unordered_set.h.

4.1042.4.5 bucket_count()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _↩
Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::bucket_count ( ) const  [inline],
[noexcept]
```

Returns the number of buckets of the unordered_set.
Definition at line 704 of file unordered_set.h.

4.1042.4.6 cbegin() [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _↩
Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
const_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::cbegin ( ) const  [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered_set.
Definition at line 347 of file unordered_set.h.

4.1042.4.7 cbegin() [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _↩
Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
```

```
const_local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::cbegin (
            size_type __n ) const  [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

_↩ _n	The bucket index.

Returns

A read-only local iterator.

Definition at line 746 of file unordered_set.h.

4.1042.4.8 cend() [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred
= equal_to<_Value>, typename _Alloc = allocator<_Value>>
const_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::cend ( ) const  [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered_set.
Definition at line 355 of file unordered_set.h.

4.1042.4.9 cend() [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred
= equal_to<_Value>, typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::cend (
            size_type __n ) const  [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

_↩ _n	The bucket index.

Returns

A read-only local iterator.

Definition at line 766 of file unordered_set.h.

4.1042.4.10 clear()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred =
equal_to<_Value>, typename _Alloc = allocator<_Value>>
void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::clear ( )  [inline], [noexcept]
```

Erases all elements in an unordered_set. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
Definition at line 573 of file unordered_set.h.

4.1042.4.11 count()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred =
equal_to<_Value>, typename _Alloc = allocator<_Value>>
```

```
size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::count (
            const key_type & __x ) const  [inline]
```

Finds the number of elements.

Parameters

_↩ _x	Element to located.

Returns

Number of elements with specified key.

This function only makes sense for unordered_multisets; for unordered_set the result will either be 0 (not present) or 1 (present).
Definition at line 668 of file unordered_set.h.

4.1042.4.12 emplace()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred =
equal_to<_Value>, typename _Alloc = allocator<_Value>>
template<typename... _Args>
std::pair<iterator, bool> std::unordered_set< _Value, _Hash, _Pred, _Alloc >::emplace (
            _Args &&... __args )  [inline]
```

Attempts to build and insert an element into the unordered_set.

Parameters

__args	Arguments used to generate an element.

Returns

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to build and insert an element into the unordered_set. An unordered_set relies on unique keys and thus an element is only inserted if it is not already present in the unordered_set.
Insertion requires amortized constant time.
Definition at line 377 of file unordered_set.h.

4.1042.4.13 emplace_hint()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _↩
Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
template<typename... _Args>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::emplace_hint (
            const_iterator __pos,
            _Args &&... __args )  [inline]
```

Attempts to insert an element into the unordered_set.

Parameters

__pos	An iterator that serves as a hint as to where the element should be inserted.
__args	Arguments used to generate the element to be inserted.

Returns

An iterator that points to the element with key equivalent to the one generated from *__args* (may or may not be the element itself).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument emplace() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.
For more on *hinting*, see: https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints
Insertion requires amortized constant time.
Definition at line 403 of file unordered_set.h.

4.1042.4.14 empty()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred =
equal_to<_Value>, typename _Alloc = allocator<_Value>>
bool std::unordered_set< _Value, _Hash, _Pred, _Alloc >::empty ( ) const  [inline], [noexcept]
```

Returns true if the unordered_set is empty.
Definition at line 299 of file unordered_set.h.

4.1042.4.15 end() [1/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred
= equal_to<_Value>, typename _Alloc = allocator<_Value>>
const_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::end ( ) const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered_set.
Definition at line 338 of file unordered_set.h.

4.1042.4.16 end() [2/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred
= equal_to<_Value>, typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::end ( )  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered_set.
Definition at line 334 of file unordered_set.h.

4.1042.4.17 end() [3/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred
= equal_to<_Value>, typename _Alloc = allocator<_Value>>
local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::end (
            size_type __n )  [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

__n	The bucket index.

Returns

A read-only local iterator.

Definition at line 758 of file unordered_set.h.

4.1042.4.18 end() [4/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred
= equal_to<_Value>, typename _Alloc = allocator<_Value>>
```

```
const_local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::end (
            size_type __n ) const  [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

_↩ _n	The bucket index.

Returns

A read-only local iterator.

Definition at line 762 of file unordered_set.h.

4.1042.4.19 equal_range() [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename
_Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
std::pair<iterator, iterator> std::unordered_set< _Value, _Hash, _Pred, _Alloc >::equal_range (
            const key_type & __x )  [inline]
```

Finds a subsequence matching given key.

Parameters

_↩ _x	Key to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for multisets.
Definition at line 692 of file unordered_set.h.

4.1042.4.20 equal_range() [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename
_Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
std::pair<const_iterator, const_iterator> std::unordered_set< _Value, _Hash, _Pred, _Alloc >↩
::equal_range (
            const key_type & __x ) const  [inline]
```

Finds a subsequence matching given key.

Parameters

_↩ _x	Key to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for multisets.
Definition at line 696 of file unordered_set.h.

4.1042.4.21 erase() [1/4] template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>

```
size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::erase (
            const key_type & __x )  [inline]
```

Erases elements according to the provided key.

Parameters

_↩ _x	Key of element to be erased.

Returns

The number of elements erased.

This function erases all the elements located by the given key from an unordered_set. For an unordered_set the result of this function can only be 0 (not present) or 1 (present). Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
Definition at line 545 of file unordered_set.h.

4.1042.4.22 erase() [2/4] template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>

```
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::erase (
            const_iterator __first,
            const_iterator __last )  [inline]
```

Erases a [__first,__last) range of elements from an unordered_set.

Parameters

__first	Iterator pointing to the start of the range to be erased.
__last	Iterator pointing to the end of the range to be erased.

Returns

The iterator *__last*.

This function erases a sequence of elements from an unordered_set. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
Definition at line 563 of file unordered_set.h.

4.1042.4.23 erase() [3/4] template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>

```
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::erase (
            const_iterator __position )  [inline]
```

Erases an element from an unordered_set.

Parameters

__position	An iterator pointing to the element to be erased.

Returns

An iterator pointing to the element immediately following *__position* prior to the element being erased. If no such element exists, end() is returned.

This function erases an element, pointed to by the given iterator, from an unordered_set. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
Definition at line 523 of file unordered_set.h.

4.1042.4.24 erase() [4/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred
= equal_to<_Value>, typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::erase (
            iterator __position )  [inline]
```

Erases an element from an unordered_set.

Parameters

__position	An iterator pointing to the element to be erased.

Returns

An iterator pointing to the element immediately following *__position* prior to the element being erased. If no such element exists, end() is returned.

This function erases an element, pointed to by the given iterator, from an unordered_set. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
Definition at line 528 of file unordered_set.h.

4.1042.4.25 find() [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred
= equal_to<_Value>, typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::find (
            const key_type & __x )  [inline]
```

Tries to locate an element in an unordered_set.

Parameters

_↩ _x	Element to be located.

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.
Definition at line 650 of file unordered_set.h.

4.1042.4.26 find() [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred
= equal_to<_Value>, typename _Alloc = allocator<_Value>>
```

```
const_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::find (
            const key_type & __x ) const  [inline]
```

Tries to locate an element in an unordered_set.

Parameters

_↩ _x	Element to be located.

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.
Definition at line 654 of file unordered_set.h.

4.1042.4.27 get_allocator()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _↩
Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
allocator_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::get_allocator ( ) const  [inline],
[noexcept]
```

Returns the allocator object used by the unordered_set.
Definition at line 292 of file unordered_set.h.

4.1042.4.28 hash_function()

```
template<typename _Value , typename _Hash = hash<_Value>, typename ↩
_Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
hasher std::unordered_set< _Value, _Hash, _Pred, _Alloc >::hash_function ( ) const  [inline]
```

Returns the hash functor object with which the unordered_set was constructed.
Definition at line 626 of file unordered_set.h.

4.1042.4.29 insert() [1/6]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _↩
Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
template<typename _InputIterator >
void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (
            _InputIterator __first,
            _InputIterator __last )  [inline]
```

A template function that attempts to insert a range of elements.

Parameters

__first	Iterator pointing to the start of the range to be inserted.
__last	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.
Definition at line 469 of file unordered_set.h.

4.1042.4.30 insert() [2/6]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _↩
Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
```

```
std::pair<iterator, bool> std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (
            const value_type & __x )  [inline]
```

Attempts to insert an element into the unordered_set.

Parameters

_↩ _x	Element to be inserted.

Returns

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to insert an element into the unordered_set. An unordered_set relies on unique keys and thus an element is only inserted if it is not already present in the unordered_set.
Insertion requires amortized constant time.
Definition at line 421 of file unordered_set.h.

4.1042.4.31 insert() [3/6]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _↩
Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (
            const_iterator __hint,
            const value_type & __x )  [inline]
```

Attempts to insert an element into the unordered_set.

Parameters

__hint	An iterator that serves as a hint as to where the element should be inserted.
__x	Element to be inserted.

Returns

An iterator that points to the element with key of *__x* (may or may not be the element passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument insert() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.
For more on *hinting*, see: https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.↩ html#containers.associative.insert_hints
Insertion requires amortized constant.
Definition at line 450 of file unordered_set.h.

4.1042.4.32 insert() [4/6]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _↩
Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (
            const_iterator __hint,
            value_type && __x )  [inline]
```

Attempts to insert an element into the unordered_set.

Parameters

__hint	An iterator that serves as a hint as to where the element should be inserted.
__x	Element to be inserted.

Returns

An iterator that points to the element with key of *__x* (may or may not be the element passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument insert() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.
For more on *hinting*, see: https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints
Insertion requires amortized constant.
Definition at line 454 of file unordered_set.h.
References std::move().

4.1042.4.33 insert() [5/6]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (
            initializer_list< value_type > __l )  [inline]
```

Attempts to insert a list of elements into the unordered_set.

Parameters

__l	A std::initializer_list<value_type> of elements to be inserted.

Complexity similar to that of the range constructor.
Definition at line 480 of file unordered_set.h.

4.1042.4.34 insert() [6/6]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
std::pair<iterator, bool> std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (
            value_type && __x )  [inline]
```

Attempts to insert an element into the unordered_set.

Parameters

__x	Element to be inserted.

Returns

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to insert an element into the unordered_set. An unordered_set relies on unique keys and thus an element is only inserted if it is not already present in the unordered_set.
Insertion requires amortized constant time.
Definition at line 425 of file unordered_set.h.
References std::move().

4.1042.4.35 key_eq()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred =
equal_to<_Value>, typename _Alloc = allocator<_Value>>
key_equal std::unordered_set< _Value, _Hash, _Pred, _Alloc >::key_eq ( ) const  [inline]
```

Returns the key comparison object with which the unordered_set was constructed.
Definition at line 632 of file unordered_set.h.

4.1042.4.36 load_factor()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred
= equal_to<_Value>, typename _Alloc = allocator<_Value>>
float std::unordered_set< _Value, _Hash, _Pred, _Alloc >::load_factor ( ) const  [inline], [noexcept]
```

Returns the average number of elements per bucket.
Definition at line 774 of file unordered_set.h.

4.1042.4.37 max_bucket_count()

```
template<typename _Value , typename _Hash = hash<_Value>, typename
_Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::max_bucket_count ( ) const  [inline],
[noexcept]
```

Returns the maximum number of buckets of the unordered_set.
Definition at line 709 of file unordered_set.h.

4.1042.4.38 max_load_factor() [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>,
typename _Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
float std::unordered_set< _Value, _Hash, _Pred, _Alloc >::max_load_factor ( ) const  [inline],
[noexcept]
```

Returns a positive number that the unordered_set tries to keep the load factor less than or equal to.
Definition at line 780 of file unordered_set.h.

4.1042.4.39 max_load_factor() [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>,
typename _Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::max_load_factor (
            float __z )  [inline]
```

Change the unordered_set maximum load factor.

Parameters

_↩ _z	The new maximum load factor.

Definition at line 788 of file unordered_set.h.

4.1042.4.40 max_size() template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>

size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::max_size ( ) const [inline], [noexcept]

Returns the maximum size of the unordered_set.

Definition at line 309 of file unordered_set.h.

4.1042.4.41 operator=() [1/3] template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>

unordered_set& std::unordered_set< _Value, _Hash, _Pred, _Alloc >::operator= (
const unordered_set< _Value, _Hash, _Pred, _Alloc > &) [default]

Copy assignment operator.

4.1042.4.42 operator=() [2/3] template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>

unordered_set& std::unordered_set< _Value, _Hash, _Pred, _Alloc >::operator= (
initializer_list< value_type > __*l*) [inline]

Unordered_set list assignment operator.

Parameters

↩ _↩ ↩ _↩ *l*	An initializer_list.

This function fills an unordered_set with copies of the elements in the initializer list __*l*.

Note that the assignment completely changes the unordered_set and that the resulting unordered_set's size is the same as the number of elements assigned.

Definition at line 284 of file unordered_set.h.

4.1042.4.43 operator=() [3/3] template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>

unordered_set& std::unordered_set< _Value, _Hash, _Pred, _Alloc >::operator= (
unordered_set< _Value, _Hash, _Pred, _Alloc > &&) [default]

Move assignment operator.

4.1042.4.44 rehash() template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>

void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::rehash (
size_type __*n*) [inline]

May rehash the unordered_set.

Parameters

_↩ _*n*	The new number of buckets.

Rehash will occur only if the new number of buckets respect the unordered_set maximum load factor.
Definition at line 799 of file unordered_set.h.

4.1042.4.45 reserve()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred =
equal_to<_Value>, typename _Alloc = allocator<_Value>>
void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::reserve (
            size_type __n ) [inline]
```

Prepare the unordered_set for a specified number of elements.

Parameters

_↩ _n	Number of elements required.

Same as rehash(ceil(n / max_load_factor())).
Definition at line 810 of file unordered_set.h.

4.1042.4.46 size()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred =
equal_to<_Value>, typename _Alloc = allocator<_Value>>
size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::size ( ) const [inline], [noexcept]
```

Returns the size of the unordered_set.
Definition at line 304 of file unordered_set.h.

4.1042.4.47 swap()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred =
equal_to<_Value>, typename _Alloc = allocator<_Value>>
void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::swap (
            unordered_set< _Value, _Hash, _Pred, _Alloc > & __x ) [inline], [noexcept]
```

Swaps data with another unordered_set.

Parameters

_↩ _x	An unordered_set of the same element and allocator types.

This exchanges the elements between two sets in constant time. Note that the global std::swap() function is specialized such that std::swap(s1,s2) will feed to this function.
Definition at line 586 of file unordered_set.h.
The documentation for this class was generated from the following file:

Friends

- class **_Array**< **_Tp** >

4.1045.1 Detailed Description

template<**class _Tp**>
class std::valarray< _Tp >

Smart array designed to support numeric processing.
A valarray is an array that provides constraints intended to allow for effective optimization of numeric array processing by reducing the aliasing that can result from pointer representations. It represents a one-dimensional array from which different multidimensional subsets can be accessed and modified.

Template Parameters

_Tp	Type of object in the array.

Definition at line 127 of file valarray.

4.1045.2 Constructor & Destructor Documentation

4.1045.2.1 valarray() `template<class _Tp >`

```
std::valarray< _Tp >::valarray (
            const _Tp * __restrict__,
            size_t  )
```

Construct an array initialized to the first *n* elements of *t*.
The documentation for this class was generated from the following file:

- valarray

4.1046.1 Detailed Description

template<typename _Tp, typename _Allocator = std::allocator<_Tp>>
class std::__debug::vector< _Tp, _Allocator >

Class std::vector with safety/checking/debug instrumentation.
Definition at line 118 of file debug/vector.

4.1046.2 Constructor & Destructor Documentation

4.1046.2.1 vector() `template<typename _Tp , typename _Allocator = std::allocator<_Tp>>`

`std::__debug::vector< _Tp, _Allocator >::vector ( const _Base & __x ) [inline]`

Construction from a normal-mode vector.
Definition at line 224 of file debug/vector.

4.1046.3 Member Function Documentation

4.1046.3.1 _M_detach_all() `void __gnu_debug::_Safe_sequence_base::_M_detach_all ( ) [protected], [inherited]`

Detach all iterators, leaving them singular.
Referenced by __gnu_debug::_Safe_sequence_base::~_Safe_sequence_base().

4.1046.3.2 _M_detach_singular() `void __gnu_debug::_Safe_sequence_base::_M_detach_singular ( ) [protected], [inherited]`

Detach all singular iterators.

Postcondition

for all iterators i attached to this sequence, i->_M_version == _M_version.

4.1046.3.3 _M_get_mutex() `__gnu_cxx::__mutex& __gnu_debug::_Safe_sequence_base::_M_get_mutex ( ) throw ( ) [protected], [inherited]`

For use in _Safe_sequence.
Referenced by __gnu_debug::_Safe_sequence< _Sequence >::_M_transfer_from_if().

4.1046.3.4 _M_invalidate_all() `void __gnu_debug::_Safe_sequence_base::_M_invalidate_all ( ) const [inline], [protected], [inherited]`

Invalidates all iterators.
Definition at line 256 of file safe_base.h.
References __gnu_debug::_Safe_sequence_base::_M_version.

4.1046.3.5 _M_invalidate_if() `template<typename _Sequence >`

```
template<typename _Predicate >
void __gnu_debug::_Safe_sequence< _Sequence >::_M_invalidate_if (
            _Predicate __pred ) [inherited]
```

Invalidates all iterators `x` that reference this sequence, are not singular, and for which `__pred(x)` returns `true`. `__pred` will be invoked with the normal iterators nested in the safe ones.
Definition at line 37 of file safe_sequence.tcc.

4.1046.3.6 _M_revalidate_singular() `void __gnu_debug::_Safe_sequence_base::_M_revalidate_singular ( ) [protected], [inherited]`

Revalidates all attached singular iterators. This method may be used to validate iterators that were invalidated before (but for some reason, such as an exception, need to become valid again).

4.1046.3.7 _M_swap() `void __gnu_debug::_Safe_sequence_base::_M_swap (`

```
            _Safe_sequence_base & __x ) [protected], [noexcept], [inherited]
```

Swap this sequence with the given sequence. This operation also swaps ownership of the iterators, so that when the operation is complete all iterators that originally referenced one container now reference the other container.

4.1046.3.8 _M_transfer_from_if() `template<typename _Sequence >`

```
template<typename _Predicate >
void __gnu_debug::_Safe_sequence< _Sequence >::_M_transfer_from_if (
            _Safe_sequence< _Sequence > & __from,
            _Predicate __pred ) [inherited]
```

Transfers all iterators `x` that reference `from` sequence, are not singular, and for which `__pred(x)` returns `true`. `__pred` will be invoked with the normal iterators nested in the safe ones.
Definition at line 68 of file safe_sequence.tcc.
References std::__addressof(), __gnu_debug::_Safe_sequence_base::_M_const_iterators, __gnu_debug::_Safe_iterator_base::_M_detach_single(), __gnu_debug::_Safe_sequence_base::_M_get_mutex(), __gnu_debug::_Safe_sequence_base::_M_iterators, __gnu_debug::_Safe_iterator_base::_M_next, __gnu_debug::_Safe_iterator_base::_M_prior, __gnu_debug::_Safe_iterator_base::_M_sequence, and __gnu_debug::_Safe_iterator_base::_M_version.

4.1046.4 Member Data Documentation

4.1046.4.1 _M_const_iterators `_Safe_iterator_base* __gnu_debug::_Safe_sequence_base::_M_const_iterators [inherited]`

The list of constant iterators that reference this container.
Definition at line 197 of file safe_base.h.
Referenced by __gnu_debug::_Safe_sequence< _Sequence >::_M_transfer_from_if().

4.1046.4.2 _M_iterators `_Safe_iterator_base* __gnu_debug::_Safe_sequence_base::_M_iterators [inherited]`

The list of mutable iterators that reference this container.
Definition at line 194 of file safe_base.h.
Referenced by __gnu_debug::_Safe_sequence< _Sequence >::_M_transfer_from_if().

4.1046.4.3 _M_version `unsigned int __gnu_debug::_Safe_sequence_base::_M_version [mutable], [inherited]`

The container version number. This number may never be 0.
Definition at line 200 of file safe_base.h.
Referenced by __gnu_debug::_Safe_sequence_base::_M_invalidate_all().
The documentation for this class was generated from the following file:

4.1047.1 Detailed Description

template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
class std::vector< _Tp, _Alloc >

A standard container which offers fixed time access to individual elements in any order.

Template Parameters

_Tp	Type of element.
_Alloc	Allocator type, defaults to allocator<_Tp>.

Meets the requirements of a `container`, a `reversible container`, and a `sequence`, including the `optional sequence requirements` with the exception of `push_front` and `pop_front`.
In some terminology a vector can be described as a dynamic C-style array, it offers fast and efficient access to individual elements in any order and saves the user from worrying about memory and size allocation. Subscripting ([]) access is also provided as with C-style arrays.
Definition at line 389 of file stl_vector.h.

4.1047.2 Constructor & Destructor Documentation

4.1047.2.1 vector() [1/10]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
std::vector< _Tp, _Alloc >::vector ( )  [default]
```

Creates a vector with no elements.

4.1047.2.2 vector() [2/10]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
std::vector< _Tp, _Alloc >::vector (
            const allocator_type & __a )  [inline], [explicit], [noexcept]
```

Creates a vector with no elements.

Parameters

_↩ _a	An allocator object.

Definition at line 497 of file stl_vector.h.

4.1047.2.3 vector() [3/10]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
std::vector< _Tp, _Alloc >::vector (
            size_type __n,
            const allocator_type & __a = allocator_type() )  [inline], [explicit]
```

Creates a vector with default constructed elements.

Parameters

_↩ _n	The number of elements to initially create.
_↩ _a	An allocator.

This constructor fills the vector with *__n* default constructed elements.
Definition at line 510 of file stl_vector.h.

4.1047.2.4 vector() [4/10]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
std::vector< _Tp, _Alloc >::vector (
            size_type __n,
            const value_type & __value,
            const allocator_type & __a = allocator_type() )  [inline]
```

Creates a vector with copies of an exemplar element.

Parameters

__n	The number of elements to initially create.
__value	An element to copy.
__a	An allocator.

This constructor fills the vector with *__n* copies of *__value*.
Definition at line 522 of file stl_vector.h.

4.1047.2.5 vector() [5/10] template<typename _Tp , typename _Alloc = std::allocator<_Tp>>

```
std::vector< _Tp, _Alloc >::vector (
            const vector< _Tp, _Alloc > & __x )  [inline]
```

Vector copy constructor.

Parameters

_↩ _x	A vector of identical element and allocator types.

All the elements of __x are copied, but any unused capacity in __x will not be copied (i.e. capacity() == size() in the new vector).
The newly-created vector uses a copy of the allocator object used by __x (unless the allocator traits dictate a different object).
Definition at line 553 of file stl_vector.h.
References std::vector< _Tp, _Alloc >::begin(), and std::vector< _Tp, _Alloc >::end().

4.1047.2.6 vector() [6/10] template<typename _Tp , typename _Alloc = std::allocator<_Tp>>

```
std::vector< _Tp, _Alloc >::vector (
            vector< _Tp, _Alloc > &&  )  [default], [noexcept]
```

Vector move constructor.
The newly-created vector contains the exact contents of the moved instance. The contents of the moved instance are a valid, but unspecified vector.

4.1047.2.7 vector() [7/10] template<typename _Tp , typename _Alloc = std::allocator<_Tp>>

```
std::vector< _Tp, _Alloc >::vector (
            const vector< _Tp, _Alloc > & __x,
            const allocator_type & __a )  [inline]
```

Copy constructor with alternative allocator.
Definition at line 575 of file stl_vector.h.

4.1047.2.8 vector() [8/10] template<typename _Tp , typename _Alloc = std::allocator<_Tp>>

```
std::vector< _Tp, _Alloc >::vector (
            vector< _Tp, _Alloc > && __rv,
            const allocator_type & __m )  [inline], [noexcept]
```

Move constructor with alternative allocator.
Definition at line 607 of file stl_vector.h.

4.1047.2.9 vector() [9/10] template<typename _Tp , typename _Alloc = std::allocator<_Tp>>

```
std::vector< _Tp, _Alloc >::vector (
            initializer_list< value_type > __l,
            const allocator_type & __a = allocator_type() )  [inline]
```

Builds a vector from an initializer list.

Parameters

_↩ _l	An initializer_list.
_↩ _a	An allocator.

Create a vector consisting of copies of the elements in the initializer_list *__l*.
This will call the element type's copy constructor N times (where N is *__l.size()*) and do no memory reallocation.
Definition at line 625 of file stl_vector.h.

4.1047.2.10 vector() [10/10]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
template<typename _InputIterator , typename = std::_RequireInputIter<_InputIterator>>
std::vector< _Tp, _Alloc >::vector (
            _InputIterator __first,
            _InputIterator __last,
            const allocator_type & __a = allocator_type() )  [inline]
```

Builds a vector from a range.

Parameters

__first	An input iterator.
__last	An input iterator.
__a	An allocator.

Create a vector consisting of copies of the elements from [first,last).
If the iterators are forward, bidirectional, or random-access, then this will call the elements' copy constructor N times (where N is distance(first,last)) and do no memory reallocation. But if only input iterators are used, then this will do at most 2N calls to the copy constructor, and logN memory reallocations.
Definition at line 653 of file stl_vector.h.
References std::__iterator_category().

4.1047.2.11 ~vector()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
std::vector< _Tp, _Alloc >::~vector ( )  [inline], [noexcept]
```

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
Definition at line 678 of file stl_vector.h.
References std::_Destroy().

4.1047.3 Member Function Documentation

4.1047.3.1 _M_allocate_and_copy()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
template<typename _ForwardIterator >
pointer std::vector< _Tp, _Alloc >::_M_allocate_and_copy (
            size_type __n,
            _ForwardIterator __first,
            _ForwardIterator __last )  [inline], [protected]
```

Memory expansion handler. Uses the member allocation function to obtain *n* bytes of memory, and then copies [first,last) into it.
Definition at line 1508 of file stl_vector.h.

4.1047.3.2 _M_range_check()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
void std::vector< _Tp, _Alloc >::_M_range_check (
            size_type __n ) const  [inline], [protected]
```

Safety check used only from at().

Definition at line 1070 of file stl_vector.h.
References std::vector< _Tp, _Alloc >::size().
Referenced by std::vector< _Tp, _Alloc >::at().

4.1047.3.3 assign() [1/3]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
template<typename _InputIterator , typename = std::_RequireInputIter<_InputIterator>>
void std::vector< _Tp, _Alloc >::assign (
            _InputIterator __first,
            _InputIterator __last )  [inline]
```

Assigns a range to a vector.

Parameters

__first	An input iterator.
__last	An input iterator.

This function fills a vector with copies of the elements in the range [__first,__last).
Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned.
Definition at line 768 of file stl_vector.h.

4.1047.3.4 assign() [2/3]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
void std::vector< _Tp, _Alloc >::assign (
            initializer_list< value_type > __l )  [inline]
```

Assigns an initializer list to a vector.

Parameters

__l	An initializer_list.

This function fills a vector with copies of the elements in the initializer list *__l*.
Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned.
Definition at line 794 of file stl_vector.h.

4.1047.3.5 assign() [3/3]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
void std::vector< _Tp, _Alloc >::assign (
            size_type __n,
            const value_type & __val )  [inline]
```

Assigns a given value to a vector.

Parameters

__n	Number of elements to be assigned.
__val	Value to be assigned.

This function fills a vector with __n copies of the given value. Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned.
Definition at line 749 of file stl_vector.h.

4.1047.3.6 at() [1/2] template<typename _Tp , typename _Alloc = std::allocator<_Tp>>

```
reference std::vector< _Tp, _Alloc >::at (
            size_type __n ) [inline]
```

Provides access to the data contained in the vector.

Parameters

_↩ _n	The index of the element for which data should be accessed.

Returns

Read/write reference to data.

Exceptions

std::out_of_range	If __n is an invalid index.

This function provides for safer data access. The parameter is first checked that it is in the range of the vector. The function throws out_of_range if the check fails.
Definition at line 1092 of file stl_vector.h.
References std::vector< _Tp, _Alloc >::_M_range_check().

4.1047.3.7 at() [2/2] template<typename _Tp , typename _Alloc = std::allocator<_Tp>>

```
const_reference std::vector< _Tp, _Alloc >::at (
            size_type __n ) const [inline]
```

Provides access to the data contained in the vector.

Parameters

_↩ _n	The index of the element for which data should be accessed.

Returns

Read-only (constant) reference to data.

Exceptions

std::out_of_range	If __n is an invalid index.

This function provides for safer data access. The parameter is first checked that it is in the range of the vector. The function throws out_of_range if the check fails.
Definition at line 1110 of file stl_vector.h.
References std::vector< _Tp, _Alloc >::_M_range_check().

4.1047.3.8 back() [1/2] template<typename _Tp , typename _Alloc = std::allocator<_Tp>> const_reference std::vector< _Tp, _Alloc >::back ( ) const [inline], [noexcept]

Returns a read-only (constant) reference to the data at the last element of the vector.
Definition at line 1154 of file stl_vector.h.

4.1047.3.9 back() [2/2] template<typename _Tp , typename _Alloc = std::allocator<_Tp>> reference std::vector< _Tp, _Alloc >::back ( ) [inline], [noexcept]

Returns a read/write reference to the data at the last element of the vector.
Definition at line 1143 of file stl_vector.h.
Referenced by std::piecewise_constant_distribution< _RealType >::max(), and std::piecewise_linear_distribution< ↩ _RealType >::max().

4.1047.3.10 begin() [1/2] template<typename _Tp , typename _Alloc = std::allocator<_Tp>> const_iterator std::vector< _Tp, _Alloc >::begin ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points to the first element in the vector. Iteration is done in ordinary element order.
Definition at line 820 of file stl_vector.h.

4.1047.3.11 begin() [2/2] template<typename _Tp , typename _Alloc = std::allocator<_Tp>> iterator std::vector< _Tp, _Alloc >::begin ( ) [inline], [noexcept]

Returns a read/write iterator that points to the first element in the vector. Iteration is done in ordinary element order.
Definition at line 811 of file stl_vector.h.
Referenced by std::vector< _Tp, _Alloc >::vector(), std::match_results< _Bi_iter, _Alloc >::begin(), std::vector< _Tp, _Alloc >::crend(), std::vector< _Tp, _Alloc >::empty(), std::vector< _Tp, _Alloc >::erase(), std::vector< _Tp, _Alloc >::insert(), std::operator<(), std::operator==(), and std::vector< _Tp, _Alloc >::rend().

4.1047.3.12 capacity() template<typename _Tp , typename _Alloc = std::allocator<_Tp>> size_type std::vector< _Tp, _Alloc >::capacity ( ) const [inline], [noexcept]

Returns the total number of elements that the vector can hold before needing to allocate more memory.
Definition at line 998 of file stl_vector.h.

4.1047.3.13 cbegin() template<typename _Tp , typename _Alloc = std::allocator<_Tp>> const_iterator std::vector< _Tp, _Alloc >::cbegin ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points to the first element in the vector. Iteration is done in ordinary element order.
Definition at line 884 of file stl_vector.h.
Referenced by std::vector< _Tp, _Alloc >::erase(), and std::vector< _Tp, _Alloc >::insert().

4.1047.3.14 cend() template<typename _Tp , typename _Alloc = std::allocator<_Tp>> const_iterator std::vector< _Tp, _Alloc >::cend ( ) const [inline], [noexcept]

Returns a read-only (constant) iterator that points one past the last element in the vector. Iteration is done in ordinary element order.
Definition at line 893 of file stl_vector.h.

4.1047.3.15 clear()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
void std::vector< _Tp, _Alloc >::clear ( )  [inline], [noexcept]
```

Erases all the elements. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
Definition at line 1498 of file stl_vector.h.

4.1047.3.16 crbegin()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::vector< _Tp, _Alloc >::crbegin ( ) const  [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the vector. Iteration is done in reverse element order.
Definition at line 902 of file stl_vector.h.
References std::vector< _Tp, _Alloc >::end().

4.1047.3.17 crend()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::vector< _Tp, _Alloc >::crend ( ) const  [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first element in the vector. Iteration is done in reverse element order.
Definition at line 911 of file stl_vector.h.
References std::vector< _Tp, _Alloc >::begin().

4.1047.3.18 data()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
_Tp* std::vector< _Tp, _Alloc >::data ( )  [inline], [noexcept]
```

Returns a pointer such that [data(), data() + size()) is a valid range. For a non-empty vector, data() == &front().
Definition at line 1168 of file stl_vector.h.
Referenced by std::regex_traits< _Ch_type >::transform_primary().

4.1047.3.19 emplace()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
template<typename...  _Args>
iterator std::vector< _Tp, _Alloc >::emplace (
            const_iterator __position,
            _Args &&...  __args )  [inline]
```

Inserts an object in vector before specified iterator.

Parameters

__position	A const_iterator into the vector.
__args	Arguments.

Returns

An iterator that points to the inserted data.

This function will insert an object of type T constructed with T(std::forward<Args>(args)...) before the specified location. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using std::list.
Definition at line 1248 of file stl_vector.h.

4.1047.3.20 empty()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
bool std::vector< _Tp, _Alloc >::empty ( ) const  [inline], [noexcept]
```

Returns true if the vector is empty. (Thus begin() would equal end().)
Definition at line 1007 of file stl_vector.h.
References std::vector< _Tp, _Alloc >::begin(), and std::vector< _Tp, _Alloc >::end().
Referenced by std::piecewise_constant_distribution< _RealType >::densities(), std::piecewise_linear_distribution< _↩
RealType >::densities(), std::match_results< _Bi_iter, _Alloc >::end(), std::piecewise_constant_distribution< _Real↩
Type >::intervals(), std::piecewise_linear_distribution< _RealType >::intervals(), std::discrete_distribution< _IntType
>::max(), std::piecewise_constant_distribution< _RealType >::max(), std::piecewise_linear_distribution< _RealType
>::max(), std::piecewise_constant_distribution< _RealType >::min(), std::piecewise_linear_distribution< _RealType
>::min(), std::discrete_distribution< _IntType >::probabilities(), std::match_results< _Bi_iter, _Alloc >::ready(), and
std::match_results< _Bi_iter, _Alloc >::size().

4.1047.3.21 end() [1/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
const_iterator std::vector< _Tp, _Alloc >::end ( ) const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the vector. Iteration is done in ordinary element order.
Definition at line 838 of file stl_vector.h.

4.1047.3.22 end() [2/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
iterator std::vector< _Tp, _Alloc >::end ( )  [inline], [noexcept]
```

Returns a read/write iterator that points one past the last element in the vector. Iteration is done in ordinary element order.
Definition at line 829 of file stl_vector.h.
Referenced by std::vector< _Tp, _Alloc >::vector(), std::vector< _Tp, _Alloc >::crbegin(), std::vector< _Tp, _Alloc >↩
::empty(), std::match_results< _Bi_iter, _Alloc >::end(), std::operator<(), std::operator==(), std::vector< _Tp, _Alloc
>::rbegin(), and std::vector< _Tp, _Alloc >::resize().

4.1047.3.23 erase() [1/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
iterator std::vector< _Tp, _Alloc >::erase (
            const_iterator __first,
            const_iterator __last )  [inline]
```

Remove a range of elements.

Parameters

__first	Iterator pointing to the first element to be erased.
__last	Iterator pointing to one past the last element to be erased.

Returns

An iterator pointing to the element pointed to by *__last* prior to erasing (or end()).

This function will erase the elements in the range [__first,__last) and shorten the vector accordingly.
Note This operation could be expensive and if it is frequently used the user should consider using std::list. The user is also cautioned that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
Definition at line 1457 of file stl_vector.h.
References std::vector< _Tp, _Alloc >::begin(), and std::vector< _Tp, _Alloc >::cbegin().

4.1047.3.24 erase() [2/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
```

```
iterator std::vector< _Tp, _Alloc >::erase (
            const_iterator __position )  [inline]
```

Remove element at given position.

Parameters

__position	Iterator pointing to element to be erased.

Returns

An iterator pointing to the next element (or end()).

This function will erase the element at the given position and thus shorten the vector by one.
Note This operation could be expensive and if it is frequently used the user should consider using std::list. The user is also cautioned that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.
Definition at line 1430 of file stl_vector.h.
References std::vector< _Tp, _Alloc >::begin(), and std::vector< _Tp, _Alloc >::cbegin().

4.1047.3.25 front() [1/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
const_reference std::vector< _Tp, _Alloc >::front ( ) const  [inline], [noexcept]
```

Returns a read-only (constant) reference to the data at the first element of the vector.
Definition at line 1132 of file stl_vector.h.

4.1047.3.26 front() [2/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
reference std::vector< _Tp, _Alloc >::front ( )  [inline], [noexcept]
```

Returns a read/write reference to the data at the first element of the vector.
Definition at line 1121 of file stl_vector.h.
Referenced by std::piecewise_constant_distribution< _RealType >::min(), and std::piecewise_linear_distribution< _↩ RealType >::min().

4.1047.3.27 get_allocator()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
allocator_type std::_Vector_base< _Tp, _Alloc >::get_allocator  [inline], [noexcept]
```

Get a copy of the memory allocation object.
Definition at line 284 of file stl_vector.h.
Referenced by std::match_results< _Bi_iter, _Alloc >::get_allocator().

4.1047.3.28 insert() [1/5]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
template<typename _InputIterator , typename = std::_RequireInputIter<_InputIterator>>
iterator std::vector< _Tp, _Alloc >::insert (
            const_iterator __position,
            _InputIterator __first,
            _InputIterator __last )  [inline]
```

Inserts a range into the vector.

Parameters

__position	A const_iterator into the vector.
__first	An input iterator.
__last	An input iterator.

Returns

An iterator that points to the inserted data.

This function will insert copies of the data in the range [__first,__last) into the vector before the location specified by *pos*. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using std::list.
Definition at line 1379 of file stl_vector.h.
References std::vector< _Tp, _Alloc >::begin(), and std::vector< _Tp, _Alloc >::cbegin().

4.1047.3.29 insert() [2/5]

```
template<typename _Tp , typename _Alloc >
vector< _Tp, _Alloc >::iterator vector::insert (
            const_iterator __position,
            const value_type & __x )
```

Inserts given value into vector before specified iterator.

Parameters

__position	A const_iterator into the vector.
__x	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a copy of the given value before the specified location. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using std::list.
Definition at line 130 of file vector.tcc.
References std::begin(), and std::end().

4.1047.3.30 insert() [3/5]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
iterator std::vector< _Tp, _Alloc >::insert (
            const_iterator __position,
            initializer_list< value_type > __l )  [inline]
```

Inserts an initializer_list into the vector.

Parameters

__position	An iterator into the vector.
__l	An initializer_list.

This function will insert copies of the data in the initializer_list *l* into the vector before the location specified by *position*. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using std::list.
Definition at line 1310 of file stl_vector.h.
References std::vector< _Tp, _Alloc >::begin(), and std::vector< _Tp, _Alloc >::cbegin().

4.1047.3.31 insert() [4/5]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
iterator std::vector< _Tp, _Alloc >::insert (
            const_iterator __position,
            size_type __n,
```

```
            const value_type & __x )  [inline]
```

Inserts a number of copies of given data into the vector.

Parameters

__position	A const_iterator into the vector.
__n	Number of elements to be inserted.
__x	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a specified number of copies of the given data before the location specified by *position*.
Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using std::list.
Definition at line 1335 of file stl_vector.h.
References std::vector< _Tp, _Alloc >::begin(), and std::vector< _Tp, _Alloc >::cbegin().

4.1047.3.32 insert() [5/5]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
iterator std::vector< _Tp, _Alloc >::insert (
            const_iterator __position,
            value_type && __x )  [inline]
```

Inserts given rvalue into vector before specified iterator.

Parameters

__position	A const_iterator into the vector.
__x	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a copy of the given rvalue before the specified location. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using std::list.
Definition at line 1293 of file stl_vector.h.
References std::move().

4.1047.3.33 max_size()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
size_type std::vector< _Tp, _Alloc >::max_size ( ) const  [inline], [noexcept]
```

Returns the size() of the largest possible vector.

Definition at line 923 of file stl_vector.h.
Referenced by std::match_results< _Bi_iter, _Alloc >::max_size().

4.1047.3.34 operator=() [1/3]

```
template<typename _Tp , typename _Alloc >
vector< _Tp, _Alloc > & vector::operator= (
            const vector< _Tp, _Alloc > & __x )
```

Vector assignment operator.

Parameters

_↩ _x	A vector of identical element and allocator types.

All the elements of __x are copied, but any unused capacity in __x will not be copied.
Whether the allocator is copied depends on the allocator traits.
Definition at line 198 of file vector.tcc.

4.1047.3.35 operator=() [2/3]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
vector& std::vector< _Tp, _Alloc >::operator= (
            initializer_list< value_type > __l )  [inline]
```

Vector list assignment operator.

Parameters

↩ _↩ ↩ _↩ l	An initializer_list.

This function fills a vector with copies of the elements in the initializer list __l.
Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned.
Definition at line 730 of file stl_vector.h.

4.1047.3.36 operator=() [3/3]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
vector& std::vector< _Tp, _Alloc >::operator= (
            vector< _Tp, _Alloc > && __x )  [inline], [noexcept]
```

Vector move assignment operator.

Parameters

_↩ _x	A vector of identical element and allocator types.

The contents of __x are moved into this vector (without copying, if the allocators permit it). Afterwards __x is a valid, but unspecified vector.
Whether the allocator is moved depends on the allocator traits.
Definition at line 709 of file stl_vector.h.
References std::move().

4.1047.3.37 operator[]() [1/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
const_reference std::vector< _Tp, _Alloc >::operator[] (
            size_type __n ) const  [inline], [noexcept]
```

Subscript access to the data contained in the vector.

Parameters

_↩ _n	The index of the element for which data should be accessed.

Returns

Read-only (constant) reference to data.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and out_of_range lookups are not defined. (For checked lookups see at().)
Definition at line 1061 of file stl_vector.h.

4.1047.3.38 operator[]() [2/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
reference std::vector< _Tp, _Alloc >::operator[] (
            size_type __n ) [inline], [noexcept]
```

Subscript access to the data contained in the vector.

Parameters

_↩ _n	The index of the element for which data should be accessed.

Returns

Read/write reference to data.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and out_of_range lookups are not defined. (For checked lookups see at().)
Definition at line 1043 of file stl_vector.h.

4.1047.3.39 pop_back()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
void std::vector< _Tp, _Alloc >::pop_back ( ) [inline], [noexcept]
```

Removes last element.
This is a typical stack operation. It shrinks the vector by one.
Note that no data is returned, and if the last element's data is needed, it should be retrieved before pop_back() is called.
Definition at line 1225 of file stl_vector.h.

4.1047.3.40 push_back()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
void std::vector< _Tp, _Alloc >::push_back (
            const value_type & __x ) [inline]
```

Add data to the end of the vector.

Parameters

_↩ _x	Data to be added.

This is a typical stack operation. The function creates an element at the end of the vector and assigns the given data to it. Due to the nature of a vector this operation can be done in constant time if the vector has preallocated space

available.
Definition at line 1187 of file stl_vector.h.

4.1047.3.41 rbegin() [1/2] template<typename _Tp , typename _Alloc = std::allocator<_Tp>>

```
const_reverse_iterator std::vector< _Tp, _Alloc >::rbegin ( ) const  [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the vector. Iteration is done in reverse element order.
Definition at line 856 of file stl_vector.h.
References std::vector< _Tp, _Alloc >::end().

4.1047.3.42 rbegin() [2/2] template<typename _Tp , typename _Alloc = std::allocator<_Tp>>

```
reverse_iterator std::vector< _Tp, _Alloc >::rbegin ( )  [inline], [noexcept]
```

Returns a read/write reverse iterator that points to the last element in the vector. Iteration is done in reverse element order.
Definition at line 847 of file stl_vector.h.
References std::vector< _Tp, _Alloc >::end().

4.1047.3.43 rend() [1/2] template<typename _Tp , typename _Alloc = std::allocator<_Tp>>

```
const_reverse_iterator std::vector< _Tp, _Alloc >::rend ( ) const  [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first element in the vector. Iteration is done in reverse element order.
Definition at line 874 of file stl_vector.h.
References std::vector< _Tp, _Alloc >::begin().

4.1047.3.44 rend() [2/2] template<typename _Tp , typename _Alloc = std::allocator<_Tp>>

```
reverse_iterator std::vector< _Tp, _Alloc >::rend ( )  [inline], [noexcept]
```

Returns a read/write reverse iterator that points to one before the first element in the vector. Iteration is done in reverse element order.
Definition at line 865 of file stl_vector.h.
References std::vector< _Tp, _Alloc >::begin().

4.1047.3.45 reserve() template<typename _Tp , typename _Alloc >

```
void vector::reserve (
            size_type __n )
```

Attempt to preallocate enough memory for specified number of elements.

Parameters

_↩ _n	Number of elements required.

Exceptions

std::length_error	If *n* exceeds `max_size()`.

This function attempts to reserve enough memory for the vector to hold the specified number of elements. If the number

requested is more than max_size(), length_error is thrown.
The advantage of this function is that if optimal code is a necessity and the user can determine the number of elements that will be required, the user can reserve the memory in advance, and thus prevent a possible reallocation of memory and copying of vector data.
Definition at line 66 of file vector.tcc.

4.1047.3.46 resize() [1/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
void std::vector< _Tp, _Alloc >::resize (
            size_type __new_size )  [inline]
```

Resizes the vector to the specified number of elements.

Parameters

__new_size	Number of elements the vector should contain.

This function will resize the vector to the specified number of elements. If the number is smaller than the vector's current size the vector is truncated, otherwise default constructed elements are appended.
Definition at line 937 of file stl_vector.h.
References std::vector< _Tp, _Alloc >::size().
Referenced by __gnu_parallel::__shrink_and_double().

4.1047.3.47 resize() [2/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
void std::vector< _Tp, _Alloc >::resize (
            size_type __new_size,
            const value_type & __x )  [inline]
```

Resizes the vector to the specified number of elements.

Parameters

__new_size	Number of elements the vector should contain.
__x	Data with which new elements should be populated.

This function will resize the vector to the specified number of elements. If the number is smaller than the vector's current size the vector is truncated, otherwise the vector is extended and new elements are populated with given data.
Definition at line 957 of file stl_vector.h.
References std::vector< _Tp, _Alloc >::end(), and std::vector< _Tp, _Alloc >::size().

4.1047.3.48 shrink_to_fit()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
void std::vector< _Tp, _Alloc >::shrink_to_fit ( )  [inline]
```

A non-binding request to reduce capacity() to size().

Definition at line 989 of file stl_vector.h.

4.1047.3.49 size()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
size_type std::vector< _Tp, _Alloc >::size ( ) const  [inline], [noexcept]
```

Returns the number of elements in the vector.

Definition at line 918 of file stl_vector.h.

Referenced by __gnu_parallel::__shrink(), __gnu_parallel::__shrink_and_double(), std::vector< _Tp, _Alloc >::_↩ M_range_check(), std::match_results< _Bi_iter, _Alloc >::empty(), __gnu_parallel::list_partition(), std::discrete_↩ distribution< _IntType >::max(), std::operator==(), std::vector< _Tp, _Alloc >::resize(), std::match_results< _Bi_iter, _Alloc >::size(), and std::regex_traits< _Ch_type >::transform_primary().

4.1047.3.50 swap() template<typename _Tp , typename _Alloc = std::allocator<_Tp>>

```
void std::vector< _Tp, _Alloc >::swap (
            vector< _Tp, _Alloc > & __x )  [inline], [noexcept]
```

Swaps data with another vector.

Parameters

_↩ _x	A vector of the same element and allocator types.

This exchanges the elements between two vectors in constant time. (Three pointers, so it should be quite fast.) Note that the global std::swap() function is specialized such that std::swap(v1,v2) will feed to this function.
Whether the allocators are swapped depends on the allocator traits.
Definition at line 1480 of file stl_vector.h.
Referenced by std::match_results< _Bi_iter, _Alloc >::swap().

4.1048.1 Detailed Description

template<**typename _Alloc**>
class std::vector< **bool, _Alloc** >

A specialization of vector for booleans which offers fixed time access to individual elements in any order.

Template Parameters

_Alloc	Allocator type.

Note that vector<bool> does not actually meet the requirements for being a container. This is because the reference and pointer types are not really references and pointers to bool. See DR96 for details.

See also

vector for function documentation.

In some terminology a vector can be described as a dynamic C-style array, it offers fast and efficient access to individual elements in any order and saves the user from worrying about memory and size allocation. Subscripting ([]) access is also provided as with C-style arrays.
Definition at line 615 of file stl_bvector.h.

4.1049.1 Detailed Description

template<typename _Codecvt, typename _Elem = wchar_t, typename _Tr = char_traits<_Elem>>
class std::wbuffer_convert< _Codecvt, _Elem, _Tr >

Buffer conversions.
Definition at line 387 of file locale_conv.h.

4.1049.2 Member Typedef Documentation

4.1049.2.1 __streambuf_type

`typedef basic_streambuf<char_type, traits_type> std::basic_streambuf< wchar_t , char_traits< wchar_t > >::__streambuf_type [inherited]`

This is a non-standard type.
Definition at line 140 of file streambuf.

4.1049.2.2 char_type

`typedef wchar_t std::basic_streambuf< wchar_t , char_traits< wchar_t > >::char_type [inherited]`

These are standard types. They permit a standardized way of referring to names of (or names dependent on) the template parameters, which are specific to the implementation.
Definition at line 131 of file streambuf.

4.1049.2.3 int_type

`typedef traits_type::int_type std::basic_streambuf< wchar_t , char_traits< wchar_t > >::int_type [inherited]`

These are standard types. They permit a standardized way of referring to names of (or names dependent on) the template parameters, which are specific to the implementation.
Definition at line 133 of file streambuf.

4.1049.2.4 off_type

`typedef traits_type::off_type std::basic_streambuf< wchar_t , char_traits< wchar_t > >::off_type [inherited]`

These are standard types. They permit a standardized way of referring to names of (or names dependent on) the template parameters, which are specific to the implementation.
Definition at line 135 of file streambuf.

4.1049.2.5 pos_type

`typedef traits_type::pos_type std::basic_streambuf< wchar_t , char_traits< wchar_t > >::pos_type [inherited]`

These are standard types. They permit a standardized way of referring to names of (or names dependent on) the template parameters, which are specific to the implementation.
Definition at line 134 of file streambuf.

4.1049.2.6 traits_type

`typedef char_traits< wchar_t > std::basic_streambuf< wchar_t , char_traits< wchar_t > >::traits_type [inherited]`

These are standard types. They permit a standardized way of referring to names of (or names dependent on) the template parameters, which are specific to the implementation.
Definition at line 132 of file streambuf.

4.1049.3 Constructor & Destructor Documentation

4.1049.3.1 wbuffer_convert() [1/2]

`template<typename _Codecvt , typename _Elem = wchar_t, typename _Tr = char_traits<_Elem>>`
`std::wbuffer_convert< _Codecvt, _Elem, _Tr >::wbuffer_convert ( ) [inline]`

Default constructor.
Definition at line 395 of file locale_conv.h.

4.1049.3.2 wbuffer_convert() [2/2]

`template<typename _Codecvt , typename _Elem = wchar_t, typename _Tr = char_traits<_Elem>>`

```
std::wbuffer_convert< _Codecvt, _Elem, _Tr >::wbuffer_convert (
            streambuf * __bytebuf,
            _Codecvt * __pcvt = new _Codecvt,
            state_type __state = state_type() ) [inline], [explicit]
```

Constructor.

Parameters

__bytebuf	The underlying byte stream buffer.
__pcvt	The facet to use for conversions.
__state	Initial conversion state.

Takes ownership of __pcvt and will delete it in the destructor.
Definition at line 406 of file locale_conv.h.
References std::basic_streambuf< wchar_t, char_traits< wchar_t > >::setg(), and std::basic_streambuf< wchar_t, char_traits< wchar_t > >::setp().

4.1049.4 Member Function Documentation

4.1049.4.1 eback() char_type* std::basic_streambuf< wchar_t , char_traits< wchar_t > >::eback ( ) const [inline], [protected], [inherited]

Access to the get area.
These functions are only available to other protected functions, including derived classes.

- eback() returns the beginning pointer for the input sequence
- gptr() returns the next pointer for the input sequence
- egptr() returns the end pointer for the input sequence

Definition at line 489 of file streambuf.

4.1049.4.2 egptr() char_type* std::basic_streambuf< wchar_t , char_traits< wchar_t > >::egptr ( ) const [inline], [protected], [inherited]

Access to the get area.
These functions are only available to other protected functions, including derived classes.

- eback() returns the beginning pointer for the input sequence
- gptr() returns the next pointer for the input sequence
- egptr() returns the end pointer for the input sequence

Definition at line 495 of file streambuf.

4.1049.4.3 epptr() char_type* std::basic_streambuf< wchar_t , char_traits< wchar_t > >::epptr ( ) const [inline], [protected], [inherited]

Access to the put area.
These functions are only available to other protected functions, including derived classes.

- pbase() returns the beginning pointer for the output sequence
- pptr() returns the next pointer for the output sequence
- epptr() returns the end pointer for the output sequence

Definition at line 542 of file streambuf.

4.1049.4.4 gbump() void std::basic_streambuf< wchar_t , char_traits< wchar_t > >::gbump (int __n) [inline], [protected], [inherited]

Moving the read position.

Parameters

_↩ _n	The delta by which to move.

This just advances the read position without returning any data.
Definition at line 505 of file streambuf.

4.1049.4.5 getloc() locale std::basic_streambuf< wchar_t , char_traits< wchar_t > >::getloc ( )

const [inline], [inherited]
Locale access.

Returns

The current locale in effect.

If pubimbue(loc) has been called, then the most recent `loc` is returned. Otherwise the global locale in effect at the time of construction is returned.
Definition at line 233 of file streambuf.

4.1049.4.6 gptr() char_type* std::basic_streambuf< wchar_t , char_traits< wchar_t > >::gptr ( ) const [inline], [protected], [inherited]

Access to the get area.
These functions are only available to other protected functions, including derived classes.

- eback() returns the beginning pointer for the input sequence
- gptr() returns the next pointer for the input sequence
- egptr() returns the end pointer for the input sequence

Definition at line 492 of file streambuf.

4.1049.4.7 imbue() virtual void std::basic_streambuf< wchar_t , char_traits< wchar_t > >::imbue (const locale & *__loc*) [inline], [protected], [virtual], [inherited]

Changes translations.

Parameters

__loc	A new locale.

Translations done during I/O which depend on the current locale are changed by this call. The standard adds, *Between invocations of this function a class derived from streambuf can safely cache results of calls to locale functions and to members of facets so obtained.*

Note

Base class version does nothing.

Definition at line 583 of file streambuf.

4.1049.4.8 in_avail() streamsize std::basic_streambuf< wchar_t , char_traits< wchar_t > >::in_↩ avail ( ) [inline], [inherited]

Looking ahead into the stream.

Returns

The number of characters available.

If a read position is available, returns the number of characters available for reading before the buffer must be refilled. Otherwise returns the derived `showmanyc()`.
Definition at line 291 of file streambuf.

4.1049.4.9 overflow()

```
template<typename _Codecvt , typename _Elem = wchar_t, typename _Tr = char_traits<_Elem>>
_Wide_streambuf::int_type std::wbuffer_convert< _Codecvt, _Elem, _Tr >::overflow (
            typename _Wide_streambuf::int_type __c )  [inline], [protected], [virtual]
```

Consumes data from the buffer; writes to the controlled sequence.

Parameters

__c	An additional character to consume.

Returns

eof() to indicate failure, something else (usually *__c*, or not_eof())

Informally, this function is called when the output buffer is full (or does not exist, as buffering need not actually be done). If a buffer exists, it is *consumed*, with *some effect* on the controlled sequence. (Typically, the buffer is written out to the sequence verbatim.) In either case, the character *c* is also written out, if *__c* is not `eof()`.
For a formal definition of this function, see a good text such as Langer & Kreft, or [27.5.2.4.5]/3-7.
A functioning output streambuf can be created by overriding only this function (no buffer area will be used).

Note

Base class version does nothing, returns eof().

Reimplemented from std::basic_streambuf< wchar_t, char_traits< wchar_t > >.
Definition at line 450 of file locale_conv.h.
References std::basic_streambuf< wchar_t, char_traits< wchar_t > >::sputc().

4.1049.4.10 pbackfail()

```
virtual int_type std::basic_streambuf< wchar_t , char_traits< wchar_t > >::pbackfail (
            int_type __c = traits_type::eof() )  [inline], [protected], [virtual], [inherited]
```

Tries to back up the input sequence.

Parameters

__c	The character to be inserted back into the sequence.

Returns

eof() on failure, *some other value* on success

Postcondition

The constraints of `gptr()`, `eback()`, and `pptr()` are the same as for `underflow()`.

Note

Base class version does nothing, returns eof().

Definition at line 731 of file streambuf.

4.1049.4.11 pbase() char_type* std::basic_streambuf< wchar_t , char_traits< wchar_t > >::pbase ( ) const [inline], [protected], [inherited]

Access to the put area.
These functions are only available to other protected functions, including derived classes.

- pbase() returns the beginning pointer for the output sequence
- pptr() returns the next pointer for the output sequence
- epptr() returns the end pointer for the output sequence

Definition at line 536 of file streambuf.

4.1049.4.12 pbump() void std::basic_streambuf< wchar_t , char_traits< wchar_t > >::pbump (int __n) [inline], [protected], [inherited]

Moving the write position.

Parameters

_↩ _n	The delta by which to move.

This just advances the write position without returning any data.
Definition at line 552 of file streambuf.

4.1049.4.13 pptr() char_type* std::basic_streambuf< wchar_t , char_traits< wchar_t > >::pptr ( ) const [inline], [protected], [inherited]

Access to the put area.
These functions are only available to other protected functions, including derived classes.

- pbase() returns the beginning pointer for the output sequence
- pptr() returns the next pointer for the output sequence
- epptr() returns the end pointer for the output sequence

Definition at line 539 of file streambuf.

4.1049.4.14 pubimbue() locale std::basic_streambuf< wchar_t , char_traits< wchar_t > >::pubimbue (const locale & __loc) [inline], [inherited]

Entry point for imbue().

Parameters

__loc	The new locale.

Returns

The previous locale.

Calls the derived imbue(__loc).

Definition at line 216 of file streambuf.

4.1049.4.15 pubseekoff()

```
pos_type std::basic_streambuf< wchar_t , char_traits< wchar_t > >::pubseekoff (
            off_type __off,
            ios_base::seekdir __way,
            ios_base::openmode __mode = ios_base::in | ios_base::out )  [inline], [inherited]
```

Alters the stream position.

Parameters

__off	Offset.
__way	Value for ios_base::seekdir.
__mode	Value for ios_base::openmode.

Calls virtual seekoff function.
Definition at line 258 of file streambuf.

4.1049.4.16 pubseekpos()

```
pos_type std::basic_streambuf< wchar_t , char_traits< wchar_t > >::pubseekpos (
            pos_type __sp,
            ios_base::openmode __mode = ios_base::in | ios_base::out )  [inline], [inherited]
```

Alters the stream position.

Parameters

__sp	Position
__mode	Value for ios_base::openmode.

Calls virtual seekpos function.
Definition at line 270 of file streambuf.

4.1049.4.17 pubsetbuf()

```
basic_streambuf* std::basic_streambuf< wchar_t , char_traits< wchar_t > >::pubsetbuf (
            char_type * __s,
            streamsize __n )  [inline], [inherited]
```

Entry points for derived buffer functions.
The public versions of `pubfoo` dispatch to the protected derived `foo` member functions, passing the arguments (if any) and returning the result unchanged.
Definition at line 246 of file streambuf.

4.1049.4.18 pubsync()

```
int std::basic_streambuf< wchar_t , char_traits< wchar_t > >::pubsync ( )  [inline], [inherited]
```

Calls virtual sync function.
Definition at line 278 of file streambuf.

4.1049.4.19 sbumpc()

```
int_type std::basic_streambuf< wchar_t , char_traits< wchar_t > >::sbumpc
```

( ) [inline], [inherited]
Getting the next character.

Returns

The next character, or eof.

If the input read position is available, returns that character and increments the read pointer, otherwise calls and returns uflow().
Definition at line 323 of file streambuf.

4.1049.4.20 seekoff() virtual pos_type std::basic_streambuf< wchar_t , char_traits< wchar_t > >::seekoff (

```
            off_type ,
            ios_base::seekdir ,
            ios_base::openmode  = ios_base::in | ios_base::out )  [inline], [protected], [virtual],
[inherited]
```

Alters the stream positions.
Each derived class provides its own appropriate behavior.

Note

Base class version does nothing, returns a pos_type that represents an invalid stream position.

Definition at line 609 of file streambuf.

4.1049.4.21 seekpos() virtual pos_type std::basic_streambuf< wchar_t , char_traits< wchar_t > >::seekpos (

```
            pos_type ,
            ios_base::openmode  = ios_base::in | ios_base::out )  [inline], [protected], [virtual],
[inherited]
```

Alters the stream positions.
Each derived class provides its own appropriate behavior.

Note

Base class version does nothing, returns a pos_type that represents an invalid stream position.

Definition at line 621 of file streambuf.

4.1049.4.22 setbuf() virtual basic_streambuf<char_type,char_traits< wchar_t > >* std::basic_streambuf< wchar_t , char_traits< wchar_t > >::setbuf (

```
            char_type * ,
            streamsize  )  [inline], [protected], [virtual], [inherited]
```

Manipulates the buffer.
Each derived class provides its own appropriate behavior. See the next-to-last paragraph of https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.html#io.streambuf.buffering for more on this function.

Note

Base class version does nothing, returns this.

Definition at line 598 of file streambuf.

4.1049.4.23 setg()

```
void std::basic_streambuf< wchar_t , char_traits< wchar_t > >::setg (
    char_type * __gbeg,
    char_type * __gnext,
    char_type * __gend )  [inline], [protected], [inherited]
```

Setting the three read area pointers.

Parameters

__gbeg	A pointer.
__gnext	A pointer.
__gend	A pointer.

Postcondition

__gbeg == `eback()`, *__gnext* == `gptr()`, and *__gend* == `egptr()`

Definition at line 516 of file streambuf.

4.1049.4.24 setp()

```
void std::basic_streambuf< wchar_t , char_traits< wchar_t > >::setp (
    char_type * __pbeg,
    char_type * __pend )  [inline], [protected], [inherited]
```

Setting the three write area pointers.

Parameters

__pbeg	A pointer.
__pend	A pointer.

Postcondition

__pbeg == `pbase()`, *__pbeg* == `pptr()`, and *__pend* == `epptr()`

Definition at line 562 of file streambuf.

4.1049.4.25 sgetc()

```
int_type std::basic_streambuf< wchar_t , char_traits< wchar_t > >::sgetc ( )
[inline], [inherited]
```

Getting the next character.

Returns

The next character, or eof.

If the input read position is available, returns that character, otherwise calls and returns `underflow()`. Does not move the read position after fetching the character.
Definition at line 345 of file streambuf.

4.1049.4.26 sgetn()

```
streamsize std::basic_streambuf< wchar_t , char_traits< wchar_t > >::sgetn (
    char_type * __s,
    streamsize __n )  [inline], [inherited]
```

Entry point for xsgetn.

Parameters

_↩ _s	A buffer area.
_↩ _n	A count.

Returns xsgetn(__s,__n). The effect is to fill __s[0] through __s[__n-1] with characters from the input sequence, if possible.
Definition at line 364 of file streambuf.

4.1049.4.27 showmanyc() `virtual streamsize std::basic_streambuf< wchar_t , char_traits< wchar_t > >::showmanyc ( ) [inline], [protected], [virtual], [inherited]`

Investigating the data available.

Returns

An estimate of the number of characters available in the input sequence, or -1.

If it returns a positive value, then successive calls to `underflow()` will not return `traits::eof()` until at least that number of characters have been supplied. If `showmanyc()` returns -1, then calls to `underflow()` or `uflow()` will fail. [27.5.2.4.3]/1

Note

Base class version does nothing, returns zero.

The standard adds that *the intention is not only that the calls [to underflow or uflow] will not return `eof()` but that they will return immediately.*

The standard adds that *the morphemes of `showmanyc` are **es-how-many-see**, not **show-manic**.*

Definition at line 656 of file streambuf.

4.1049.4.28 snextc() `int_type std::basic_streambuf< wchar_t , char_traits< wchar_t > >::snextc ( ) [inline], [inherited]`

Getting the next character.

Returns

The next character, or eof.

Calls `sbumpc()`, and if that function returns `traits::eof()`, so does this function. Otherwise, `sgetc()`.
Definition at line 305 of file streambuf.

4.1049.4.29 sputbackc() `int_type std::basic_streambuf< wchar_t , char_traits< wchar_t > >↩ ::sputbackc ( char_type __c ) [inline], [inherited]`

Pushing characters back into the input stream.

Parameters

_↩ _c	The character to push back.

Returns

The previous character, if possible.

Similar to sungetc(), but __*c* is pushed onto the stream instead of *the previous character.* If successful, the next character fetched from the input stream will be __*c*.
Definition at line 379 of file streambuf.

4.1049.4.30 sputc()

```
int_type std::basic_streambuf< wchar_t , char_traits< wchar_t > >::sputc (
        char_type __c )  [inline], [inherited]
```

Entry point for all single-character output functions.

Parameters

_↩ _*c*	A character to output.

Returns

__*c*, if possible.

One of two public output functions.
If a write position is available for the output sequence (i.e., the buffer is not full), stores __*c* in that position, increments the position, and returns `traits::to_int_type(__c)`. If a write position is not available, returns `overflow(↩ __c)`.
Definition at line 431 of file streambuf.

4.1049.4.31 sputn()

```
streamsize std::basic_streambuf< wchar_t , char_traits< wchar_t > >::sputn (
        const char_type * __s,
        streamsize __n )  [inline], [inherited]
```

Entry point for all single-character output functions.

Parameters

_↩ _*s*	A buffer read area.
_↩ _*n*	A count.

One of two public output functions.
Returns xsputn(__s,__n). The effect is to write __*s*[0] through __*s*[__n-1] to the output sequence, if possible.
Definition at line 457 of file streambuf.

4.1049.4.32 state()

```
template<typename _Codecvt , typename _Elem = wchar_t, typename _Tr = char_↩
traits<_Elem>>
state_type std::wbuffer_convert< _Codecvt, _Elem, _Tr >::state ( ) const  [inline], [noexcept]
```

The conversion state following the last conversion.
Definition at line 442 of file locale_conv.h.

4.1049.4.33 sungetc()

```
int_type std::basic_streambuf< wchar_t , char_traits< wchar_t > >::sungetc
```

( ) [inline], [inherited]
Moving backwards in the input stream.

Returns

The previous character, if possible.

If a putback position is available, this function decrements the input pointer and returns that character. Otherwise, calls and returns pbackfail(). The effect is to *unget* the last character *gotten*.
Definition at line 404 of file streambuf.

4.1049.4.34 sync() template<typename _Codecvt , typename _Elem = wchar_t, typename _Tr = char_↩ traits<_Elem>>

int std::wbuffer_convert< _Codecvt, _Elem, _Tr >::sync (
void) [inline], [protected], [virtual]
Synchronizes the buffer arrays with the controlled sequences.

Returns

-1 on failure.

Each derived class provides its own appropriate behavior, including the definition of *failure*.

Note

Base class version does nothing, returns zero.

Reimplemented from std::basic_streambuf< wchar_t, char_traits< wchar_t > >.
Definition at line 446 of file locale_conv.h.
References std::basic_streambuf< _CharT, _Traits >::pubsync().

4.1049.4.35 uflow() virtual int_type std::basic_streambuf< wchar_t , char_traits< wchar_t > >↩ ::uflow ( ) [inline], [protected], [virtual], [inherited]
Fetches more data from the controlled sequence.

Returns

The first character from the *pending sequence*.

Informally, this function does the same thing as underflow(), and in fact is required to call that function. It also returns the new character, like underflow() does. However, this function also moves the read position forward by one.
Definition at line 707 of file streambuf.

4.1049.4.36 underflow() template<typename _Codecvt , typename _Elem = wchar_t, typename _Tr = char_traits<_Elem>>

_Wide_streambuf::int_type std::wbuffer_convert< _Codecvt, _Elem, _Tr >::underflow ( ) [inline], [protected], [virtual]
Fetches more data from the controlled sequence.

Returns

The first character from the *pending sequence*.

Informally, this function is called when the input buffer is exhausted (or does not exist, as buffering need not actually be done). If a buffer exists, it is *refilled*. In either case, the next available character is returned, or `traits::eof()` to indicate a null pending sequence.
For a formal definition of the pending sequence, see a good text such as Langer & Kreft, or [27.5.2.4.3]/7-14.
A functioning input streambuf can be created by overriding only this function (no buffer area will be used). For an example, see https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.html

Note

Base class version does nothing, returns eof().

Reimplemented from std::basic_streambuf< wchar_t, char_traits< wchar_t > >.
Definition at line 460 of file locale_conv.h.
References std::basic_streambuf< wchar_t, char_traits< wchar_t > >::egptr(), and std::basic_streambuf< wchar_t, char_traits< wchar_t > >::gptr().

4.1049.4.37 xsgetn()

```
streamsize std::basic_streambuf< wchar_t , char_traits< wchar_t > >::xsgetn
(
            char_type * __s,
            streamsize __n )  [protected], [virtual], [inherited]
```

Multiple character extraction.

Parameters

_↩ _s	A buffer area.
_↩ _n	Maximum number of characters to assign.

Returns

The number of characters assigned.

Fills __s[0] through __s[__n-1] with characters from the input sequence, as if by `sbumpc()`. Stops when either __n characters have been copied, or when `traits::eof()` would be copied.
It is expected that derived classes provide a more efficient implementation by overriding this definition.
Definition at line 672 of file streambuf.tcc.

4.1049.4.38 xsputn()

```
streamsize std::basic_streambuf< wchar_t , char_traits< wchar_t > >::xsputn
(
            const char_type * __s,
            streamsize __n )  [protected], [virtual], [inherited]
```

Multiple character insertion.

Parameters

_↩ _s	A buffer area.
_↩ _n	Maximum number of characters to write.

Returns

The number of characters written.

Writes __*s*[0] through __*s*[__n-1] to the output sequence, as if by `sputc()`. Stops when either *n* characters have been copied, or when `sputc()` would return `traits::eof()`.
It is expected that derived classes provide a more efficient implementation by overriding this definition.
Definition at line 749 of file streambuf.tcc.

4.1050.1 Detailed Description

template<typename _Tp>
class std::weak_ptr< _Tp >

A non-owning observer for a pointer owned by a shared_ptr.
A weak_ptr provides a safe alternative to a raw pointer when you want a non-owning reference to an object that is managed by a shared_ptr.

Unlike a raw pointer, a weak_ptr can be converted to a new shared_ptr that shares ownership with every other shared_ptr that already owns the pointer. In other words you can upgrade from a non-owning "weak" reference to an owning shared_ptr, without having access to any of the existing shared_ptr objects.
Also unlike a raw pointer, a weak_ptr does not become "dangling" after the object it points to has been destroyed. Instead, a weak_ptr becomes *expired* and can no longer be converted to a shared_ptr that owns the freed pointer, so you cannot accidentally access the pointed-to object after it has been destroyed.

4.1051.1 Detailed Description

template<typename _RealType = double>
class std::weibull_distribution< _RealType >

A weibull_distribution random number distribution.

The formula for the normal probability density function is:

$$p(x|\alpha,\beta) = \frac{\alpha}{\beta}(\frac{x}{\beta})^{\alpha-1}\exp{(-(\frac{x}{\beta})^{\alpha})}$$

Definition at line 4860 of file random.h.

4.1051.2 Member Typedef Documentation

4.1051.2.1 result_type `template<typename _RealType = double>`

`typedef _RealType std::weibull_distribution< _RealType >::result_type`

The type of the range of the distribution.
Definition at line 4867 of file random.h.

4.1051.3 Member Function Documentation

4.1051.3.1 a() `template<typename _RealType = double>`

`_RealType std::weibull_distribution< _RealType >::a ( ) const [inline]`

Return the a parameter of the distribution.
Definition at line 4925 of file random.h.

4.1051.3.2 b() `template<typename _RealType = double>`

`_RealType std::weibull_distribution< _RealType >::b ( ) const [inline]`

Return the b parameter of the distribution.
Definition at line 4932 of file random.h.

4.1051.3.3 max() `template<typename _RealType = double>`

`result_type std::weibull_distribution< _RealType >::max ( ) const [inline]`

Returns the least upper bound value of the distribution.
Definition at line 4961 of file random.h.
References std::numeric_limits< _Tp >::max().

4.1051.3.4 min() `template<typename _RealType = double>`

`result_type std::weibull_distribution< _RealType >::min ( ) const [inline]`

Returns the greatest lower bound value of the distribution.
Definition at line 4954 of file random.h.

4.1051.3.5 operator()() `template<typename _RealType = double>`

```
template<typename _UniformRandomNumberGenerator >
result_type std::weibull_distribution< _RealType >::operator() (
            _UniformRandomNumberGenerator & __urng ) [inline]
```

Generating functions.
Definition at line 4969 of file random.h.

4.1051.3.6 param() [1/2] template<typename _RealType = double>

param_type std::weibull_distribution< _RealType >::param ( ) const [inline]

Returns the parameter set of the distribution.

Definition at line 4939 of file random.h.

4.1051.3.7 param() [2/2] template<typename _RealType = double>

void std::weibull_distribution< _RealType >::param (
const param_type & __param) [inline]

Sets the parameter set of the distribution.

Parameters

__param	The new parameter set of the distribution.

Definition at line 4947 of file random.h.

4.1051.3.8 reset() template<typename _RealType = double>

void std::weibull_distribution< _RealType >::reset ( ) [inline]

Resets the distribution state.

Definition at line 4918 of file random.h.

4.1051.4 Friends And Related Function Documentation

4.1051.4.1 operator== template<typename _RealType = double>

bool operator== (
const weibull_distribution< _RealType > & *__d1*,
const weibull_distribution< _RealType > & *__d2*) [friend]

Return true if two Weibull distributions have the same parameters.

Definition at line 5004 of file random.h.

4.1052.1 Detailed Description

template<typename _Codecvt, typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>, typename _Byte_alloc = allocator<char>>
class std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >

String conversions.
Definition at line 232 of file locale_conv.h.

4.1052.2 Constructor & Destructor Documentation

4.1052.2.1 wstring_convert() [1/4]

```
template<typename _Codecvt , typename _Elem = wchar_t, typename
_Wide_alloc = allocator<_Elem>, typename _Byte_alloc = allocator<char>>
std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::wstring_convert ( )  [inline]
```

Default constructor.
Definition at line 241 of file locale_conv.h.

4.1052.2.2 wstring_convert() [2/4]

```
template<typename _Codecvt , typename _Elem = wchar_t, typename
_Wide_alloc = allocator<_Elem>, typename _Byte_alloc = allocator<char>>
std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::wstring_convert (
            _Codecvt * __pcvt )  [inline], [explicit]
```

Constructor.

Parameters

__pcvt	The facet to use for conversions.

Takes ownership of __pcvt and will delete it in the destructor.
Definition at line 250 of file locale_conv.h.

4.1052.2.3 wstring_convert() [3/4]

```
template<typename _Codecvt , typename _Elem = wchar_t, typename
```

```
_Wide_alloc = allocator<_Elem>, typename _Byte_alloc = allocator<char>>
std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::wstring_convert (
            _Codecvt * __pcvt,
            state_type __state )  [inline]
```

Construct with an initial converstion state.

Parameters

__pcvt	The facet to use for conversions.
__state	Initial conversion state.

Takes ownership of __pcvt and will delete it in the destructor. The object's conversion state will persist between conversions.
Definition at line 264 of file locale_conv.h.

4.1052.2.4 wstring_convert() [4/4]

```
template<typename _Codecvt , typename _Elem = wchar_t, typename
_Wide_alloc = allocator<_Elem>, typename _Byte_alloc = allocator<char>>
std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::wstring_convert (
            const byte_string & __byte_err,
            const wide_string & __wide_err = wide_string() )  [inline], [explicit]
```

Construct with error strings.

Parameters

__byte_err	A string to return on failed conversions.
__wide_err	A wide string to return on failed conversions.

Definition at line 277 of file locale_conv.h.

4.1052.3 Member Function Documentation

4.1052.3.1 converted()

```
template<typename _Codecvt , typename _Elem = wchar_t, typename _Wide_alloc
= allocator<_Elem>, typename _Byte_alloc = allocator<char>>
size_t std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::converted ( ) const
[inline], [noexcept]
```

The number of elements successfully converted in the last conversion.
Definition at line 367 of file locale_conv.h.

4.1052.3.2 from_bytes() [1/4]

```
template<typename _Codecvt , typename _Elem = wchar_t, typename _↩
Wide_alloc = allocator<_Elem>, typename _Byte_alloc = allocator<char>>
wide_string std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::from_bytes (
            char __byte )  [inline]
```

Convert from bytes.
Definition at line 296 of file locale_conv.h.
Referenced by std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::from_bytes().

4.1052.3.3 from_bytes() [2/4]

```
template<typename _Codecvt , typename _Elem = wchar_t, typename _↩
Wide_alloc = allocator<_Elem>, typename _Byte_alloc = allocator<char>>
```

```
wide_string std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::from_bytes (
            const byte_string & __str )  [inline]
```

Convert from bytes.
Definition at line 307 of file locale_conv.h.
References std::basic_string< _CharT, _Traits, _Alloc >::data(), std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::from_bytes(), and std::basic_string< _CharT, _Traits, _Alloc >::size().

4.1052.3.4 from_bytes() [3/4]

```
template<typename _Codecvt , typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>, typename _Byte_alloc = allocator<char>>
wide_string std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::from_bytes (
            const char * __first,
            const char * __last )  [inline]
```

Convert from bytes.
Definition at line 314 of file locale_conv.h.
References std::basic_string< _CharT, _Traits, _Alloc >::get_allocator().

4.1052.3.5 from_bytes() [4/4]

```
template<typename _Codecvt , typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>, typename _Byte_alloc = allocator<char>>
wide_string std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::from_bytes (
            const char * __ptr )  [inline]
```

Convert from bytes.
Definition at line 303 of file locale_conv.h.
References std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::from_bytes().

4.1052.3.6 state()

```
template<typename _Codecvt , typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>, typename _Byte_alloc = allocator<char>>
state_type std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::state ( ) const
[inline]
```

The final conversion state of the last conversion.
Definition at line 370 of file locale_conv.h.

4.1052.3.7 to_bytes() [1/4]

```
template<typename _Codecvt , typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>, typename _Byte_alloc = allocator<char>>
byte_string std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::to_bytes (
            _Elem __wchar )  [inline]
```

Convert to bytes.
Definition at line 330 of file locale_conv.h.
Referenced by std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::to_bytes().

4.1052.3.8 to_bytes() [2/4]

```
template<typename _Codecvt , typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>, typename _Byte_alloc = allocator<char>>
byte_string std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::to_bytes (
            const _Elem * __first,
            const _Elem * __last )  [inline]
```

Convert to bytes.
Definition at line 350 of file locale_conv.h.
References std::basic_string< _CharT, _Traits, _Alloc >::get_allocator().

4.1052.3.9 to_bytes() [3/4] template<typename _Codecvt , typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>, typename _Byte_alloc = allocator<char>>

```
byte_string std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::to_bytes (
            const _Elem * __ptr )  [inline]
```

Convert to bytes.
Definition at line 337 of file locale_conv.h.
References std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::to_bytes().

4.1052.3.10 to_bytes() [4/4] template<typename _Codecvt , typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>, typename _Byte_alloc = allocator<char>>

```
byte_string std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::to_bytes (
            const wide_string & __wstr )  [inline]
```

Convert to bytes.
Definition at line 343 of file locale_conv.h.
References std::basic_string< _CharT, _Traits, _Alloc >::data(), std::basic_string< _CharT, _Traits, _Alloc >::size(), and std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::to_bytes().

5.1.1 Detailed Description

Parallel STL function calls corresponding to the stl_algo.h header.
The functions defined here mainly do case switches and call the actual parallelized versions in other files. Inlining policy: Functions that basically only contain one function call, are declared inline. This file is a GNU parallel extension to the Standard C++ Library.

5.2.1 Detailed Description

Parallel STL function calls corresponding to the stl_algobase.h header. The functions defined here mainly do case switches and call the actual parallelized versions in other files. Inlining policy: Functions that basically only contain one function call, are declared inline. This file is a GNU parallel extension to the Standard C++ Library.

5.3 algorithm File Reference

Macros

- #define **_GLIBCXX_ALGORITHM**

5.3.1 Detailed Description

This is a Standard C++ Library header.

5.7.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <algorithm>.

5.29.1 Detailed Description

Implementation of a dynamically load-balanced parallel quicksort.
It works in-place and needs only logarithmic extra memory. The algorithm is similar to the one proposed in
P. Tsigas and Y. Zhang. A simple, fast parallel implementation of quicksort and its performance evaluation on SUN enterprise 10000. In 11th Euromicro Conference on Parallel, Distributed and Network-Based Processing, page 372, 2003.
This file is a GNU parallel extension to the Standard C++ Library.

5.30 base.h File Reference

Typedefs

- typedef __PTRDIFF_TYPE__ **std::ptrdiff_t**
- typedef __SIZE_TYPE__ **std::size_t**

Variables

- decltype(nullptr) typedef **std::nullptr_t**

5.52.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <version>.

5.53 c++io.h File Reference

Namespaces

- std

Typedefs

- typedef FILE **std::__c_file**
- typedef __gthread_mutex_t **std::__c_lock**

5.53.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <ios>.

5.54 c++locale.h File Reference

Namespaces

- std

Macros

- #define **_GLIBCXX_C_LOCALE_GNU**
- #define **_GLIBCXX_NUM_CATEGORIES**

Typedefs

- typedef __locale_t **std::__c_locale**

Functions

- int **std::__convert_from_v** (const __c_locale &__cloc, char *__out, const int __size, const char *__fmt,...)

5.54.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <locale>.

5.55 c++locale_internal.h File Reference

Namespaces

- std

Functions

- Catalogs & **std::get_catalogs** ()

5.55.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <locale>.

5.56 cassert File Reference

5.56.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the *.h implementation files.
This is the C++ version of the Standard C Library header `assert.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

5.57 cast.h File Reference

Classes

- struct __gnu_cxx::_Caster< _ToType >

Namespaces

- __gnu_cxx

Functions

- template<typename _ToType , typename _FromType >
  _ToType **__gnu_cxx::__const_pointer_cast** (_FromType *__arg)
- template<typename _ToType , typename _FromType >
  _ToType **__gnu_cxx::__const_pointer_cast** (const _FromType &__arg)
- template<typename _ToType , typename _FromType >
  _ToType **__gnu_cxx::__dynamic_pointer_cast** (_FromType *__arg)
- template<typename _ToType , typename _FromType >
  _ToType **__gnu_cxx::__dynamic_pointer_cast** (const _FromType &__arg)
- template<typename _ToType , typename _FromType >
  _ToType **__gnu_cxx::__reinterpret_pointer_cast** (_FromType *__arg)
- template<typename _ToType , typename _FromType >
  _ToType **__gnu_cxx::__reinterpret_pointer_cast** (const _FromType &__arg)
- template<typename _ToType , typename _FromType >
  _ToType __gnu_cxx::__static_pointer_cast (_FromType *__arg)
- template<typename _ToType , typename _FromType >
  _ToType __gnu_cxx::__static_pointer_cast (const _FromType &__arg)

5.57.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <ext/pointer.h>.

5.58 cc_hash_max_collision_check_resize_trigger_imp.hpp File Reference

5.58.1 Detailed Description

Contains a resize trigger implementation.

5.59 cc_ht_map_.hpp File Reference

Classes

- class __gnu_pbds::detail::cc_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash, Comb_Hash_Fn, Resize_Policy >

Namespaces

- __gnu_pbds

Macros

- #define **PB_DS_CC_HASH_NAME**
- #define **PB_DS_CC_HASH_TRAITS_BASE**
- #define **PB_DS_CLASS_C_DEC**
- #define **PB_DS_CLASS_T_DEC**
- #define **PB_DS_GEN_POS**
- #define **PB_DS_HASH_EQ_FN_C_DEC**
- #define **PB_DS_RANGED_HASH_FN_C_DEC**

5.59.1 Detailed Description

Contains an implementation class for cc_ht_map_.

5.60 ccomplex File Reference

Macros

- #define **_GLIBCXX_CCOMPLEX**

5.60.1 Detailed Description

This is a Standard C++ Library header.

5.61 ccomplex File Reference

Macros

- #define **_GLIBCXX_TR1_CCOMPLEX**

5.61.1 Detailed Description

This is a TR1 C++ Library header.

5.62 cctype File Reference

Namespaces

- std

Macros

- #define **_GLIBCXX_CCTYPE**

5.62.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*`.h implementation files.
This is the C++ version of the Standard C Library header `ctype.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

5.63 cctype File Reference

Macros

- #define **_GLIBCXX_TR1_CCTYPE**

5.63.1 Detailed Description

This is a TR1 C++ Library header.

5.64 cerrno File Reference

Macros

- #define **_GLIBCXX_CERRNO**
- #define **errno**

5.64.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*`.h implementation files.
This is the C++ version of the Standard C Library header `errno.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

5.65 cfenv File Reference

Macros

- #define **_GLIBCXX_CFENV**

5.65.1 Detailed Description

This is a Standard C++ Library header.

5.66 cfenv File Reference

Macros

- #define **_GLIBCXX_TR1_CFENV**

5.66.1 Detailed Description

This is a TR1 C++ Library header.

5.67 cfloat File Reference

Macros

- #define **_GLIBCXX_CFLOAT**
- #define **DECIMAL_DIG**
- #define **FLT_EVAL_METHOD**

5.67.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the *.h implementation files.
This is the C++ version of the Standard C Library header `float.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

5.68 cfloat File Reference

Macros

- #define **_GLIBCXX_TR1_CFLOAT**

5.68.1 Detailed Description

This is a TR1 C++ Library header.

5.69 char_traits.h File Reference

Classes

- struct __gnu_cxx::_Char_types< _CharT >
- struct __gnu_cxx::char_traits< _CharT >
- struct std::char_traits< _CharT >
- struct std::char_traits< char >
- struct std::char_traits< wchar_t >

Namespaces

- __gnu_cxx
- std

Macros

- #define **_GLIBCXX_ALWAYS_INLINE**

5.69.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <string>.

5.70 charconv File Reference

Classes

- struct std::from_chars_result
- struct std::to_chars_result

Namespaces

- std
- std::__detail

Macros

- #define **_GLIBCXX_CHARCONV**
- #define **_GLIBCXX_TO_CHARS**(T)

Typedefs

- template<typename _Tp >
  using **std::__detail::__integer_from_chars_result_type** = enable_if_t< __or_< __is_signed_integer< _Tp >, __is_unsigned_integer< _Tp >, is_same< char, remove_cv_t< _Tp > >>::value, from_chars_result >

5.81.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the *.h implementation files.
This is the C++ version of the Standard C Library header `math.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

5.82 cmath File Reference

Namespaces

- __gnu_cxx

Macros

- #define **_EXT_CMATH**

5.82.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

- #define _GLIBCXX_RANDOM_SHUFFLE_CONSIDER_TLB
- #define _GLIBCXX_SCALE_DOWN_FPU
- #define _GLIBCXX_VERBOSE_LEVEL

5.91.1 Detailed Description

Defines on options concerning debugging and performance, at compile-time. This file is a GNU parallel extension to the Standard C++ Library.

5.91.2 Macro Definition Documentation

5.91.2.1 _GLIBCXX_CALL `#define _GLIBCXX_CALL( __n )`

Macro to produce log message when entering a function.

Parameters

_↩ _n	Input size.

See also

_GLIBCXX_VERBOSE_LEVEL

Definition at line 44 of file compiletime_settings.h.

5.91.2.2 _GLIBCXX_PARALLEL_ASSERTIONS `#define _GLIBCXX_PARALLEL_ASSERTIONS`

Switch on many _GLIBCXX_PARALLEL_ASSERTions in parallel code. Should be switched on only locally.
Definition at line 61 of file compiletime_settings.h.

5.91.2.3 _GLIBCXX_RANDOM_SHUFFLE_CONSIDER_L1 `#define _GLIBCXX_RANDOM_SHUFFLE_CONSIDER_L1`

Switch on many _GLIBCXX_PARALLEL_ASSERTions in parallel code. Consider the size of the L1 cache for gnu_↩ parallel::__parallel_random_shuffle().
Definition at line 68 of file compiletime_settings.h.

5.91.2.4 _GLIBCXX_RANDOM_SHUFFLE_CONSIDER_TLB `#define _GLIBCXX_RANDOM_SHUFFLE_CONSIDER_↩ TLB`

Switch on many _GLIBCXX_PARALLEL_ASSERTions in parallel code. Consider the size of the TLB for gnu_parallel↩ ::__parallel_random_shuffle().
Definition at line 74 of file compiletime_settings.h.

5.91.2.5 _GLIBCXX_SCALE_DOWN_FPU `#define _GLIBCXX_SCALE_DOWN_FPU`

Use floating-point scaling instead of modulo for mapping random numbers to a range. This can be faster on certain CPUs.
Definition at line 55 of file compiletime_settings.h.

5.91.2.6 _GLIBCXX_VERBOSE_LEVEL `#define _GLIBCXX_VERBOSE_LEVEL`

Determine verbosity level of the parallel mode. Level 1 prints a message each time a parallel-mode function is entered.
Definition at line 37 of file compiletime_settings.h.

5.93.1 Detailed Description

This is a TR1 C++ Library header.

5.94 complex.h File Reference

Macros

- #define **_GLIBCXX_COMPLEX_H**

5.94.1 Detailed Description

This is a Standard C++ Library header.

5.95 concept_check.h File Reference

Macros

- #define **__glibcxx_class_requires**(_a, _b)
- #define **__glibcxx_class_requires2**(_a, _b, _c)
- #define **__glibcxx_class_requires3**(_a, _b, _c, _d)
- #define **__glibcxx_class_requires4**(_a, _b, _c, _d, _e)
- #define **__glibcxx_function_requires**(...)

5.95.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <iterator>.

5.96 concepts File Reference

Macros

- #define **_GLIBCXX_CONCEPTS**

5.96.1 Detailed Description

This is a Standard C++ Library header.

5.97 concurrence.h File Reference

Classes

- class __gnu_cxx::__scoped_lock

Namespaces

- __gnu_cxx

Enumerations

- enum **_Lock_policy** { **_S_single** , **_S_mutex** , **_S_atomic** }

Functions

- void **__gnu_cxx::__throw_concurrence_lock_error** ()
- void **__gnu_cxx::__throw_concurrence_unlock_error** ()

Variables

- static const _Lock_policy **__gnu_cxx::__default_lock_policy**

5.97.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

5.98 cond_dealtor.hpp File Reference

Classes

- class __gnu_pbds::detail::cond_dealtor< Entry, _Alloc >

Namespaces

- __gnu_pbds

5.98.1 Detailed Description

Contains a conditional deallocator.

5.99 cond_key_dtor_entry_dealtor.hpp File Reference

Classes

- class __gnu_pbds::detail::cond_dealtor< Entry, _Alloc >

Namespaces

- __gnu_pbds

5.99.1 Detailed Description

Contains a conditional key destructor, used for exception handling.

5.100 condition_variable File Reference

Classes

- class std::condition_variable
- class std::_V2::condition_variable_any

Namespaces

- std

Macros

- #define **_GLIBCXX_CONDITION_VARIABLE**

Enumerations

- enum class std::cv_status { **no_timeout** , **timeout** }

Functions

- void **std::notify_all_at_thread_exit** (condition_variable &, unique_lock< mutex >)

5.100.1 Detailed Description

This is a Standard C++ Library header.

5.101 const_iterator.hpp File Reference

Classes

- class __gnu_pbds::detail::binary_heap_const_iterator_< Value_Type, Entry, Simple, _Alloc >

Namespaces

- __gnu_pbds

Macros

- #define **PB_DS_BIN_HEAP_CIT_BASE**

5.101.1 Detailed Description

Contains an iterator class returned by the table's const find and insert methods.

5.102 const_iterator.hpp File Reference

Classes

- class __gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_< Node, _Alloc >

Namespaces

- __gnu_pbds

Macros

- #define **PB_DS_BASIC_HEAP_CIT_BASE**
- #define **PB_DS_CLASS_C_DEC**

5.102.1 Detailed Description

Contains an iterator class returned by the table's const find and insert methods.

5.103 const_iterator.hpp File Reference

5.103.1 Detailed Description

Contains an iterator class used for const ranging over the elements of the table.
This file is intended to be included inside a class definition, with PB_DS_CLASS_C_DEC defined to the name of the enclosing class.

5.104 constructor_destructor_fn_imps.hpp File Reference

5.104.1 Detailed Description

Contains implementations of cc_ht_map_'s constructors, destructor, and related functions.

5.105 constructor_destructor_fn_imps.hpp File Reference

5.105.1 Detailed Description

Contains implementations of gp_ht_map_'s constructors, destructor, and related functions.

5.106 constructor_destructor_fn_imps.hpp File Reference

5.107 constructor_destructor_no_store_hash_fn_imps.hpp File Reference

5.107.1 Detailed Description

Contains implementations of cc_ht_map_'s constructors, destructor, and related functions.

5.108 constructor_destructor_no_store_hash_fn_imps.hpp File Reference

5.108.1 Detailed Description

Contains implementations of gp_ht_map_'s constructors, destructor, and related functions.

5.109 constructor_destructor_store_hash_fn_imps.hpp File Reference

5.109.1 Detailed Description

Contains implementations of cc_ht_map_'s constructors, destructor, and related functions.

5.110 constructor_destructor_store_hash_fn_imps.hpp File Reference

5.110.1 Detailed Description

Contains implementations of gp_ht_map_'s constructors, destructor, and related functions.

5.111 constructors_destructor_fn_imps.hpp File Reference

5.111.1 Detailed Description

Contains an implementation class for binary_heap_.

5.112 constructors_destructor_fn_imps.hpp File Reference

5.112.1 Detailed Description

Contains an implementation for binomial_heap_.

5.113 constructors_destructor_fn_imps.hpp File Reference

5.113.1 Detailed Description

Contains an implementation class for a base of binomial heaps.

5.114 constructors_destructor_fn_imps.hpp File Reference

5.114.1 Detailed Description

Contains an implementation class for bin_search_tree_.

5.115 constructors_destructor_fn_imps.hpp File Reference

5.115.1 Detailed Description

Contains an implementation class for left_child_next_sibling_heap_.

5.116 constructors_destructor_fn_imps.hpp File Reference

5.116.1 Detailed Description

Contains an implementation class for ov_tree_.

5.117 constructors_destructor_fn_imps.hpp File Reference

5.117.1 Detailed Description

Contains an implementation class for a pairing heap.

5.118 constructors_destructor_fn_imps.hpp File Reference

5.118.1 Detailed Description

Contains an implementation class for pat_trie.

5.119 constructors_destructor_fn_imps.hpp File Reference

5.119.1 Detailed Description

Contains an implementation for rb_tree_.

5.120 constructors_destructor_fn_imps.hpp File Reference

5.120.1 Detailed Description

Contains an implementation for rc_binomial_heap_.

5.121 constructors_destructor_fn_imps.hpp File Reference

5.121.1 Detailed Description

Contains an implementation class for splay_tree_.

5.122 constructors_destructor_fn_imps.hpp File Reference

5.122.1 Detailed Description

Contains an implementation for thin_heap_.

5.123 container_base_dispatch.hpp File Reference

Classes

- struct __gnu_pbds::detail::container_base_dispatch< Key, Mapped, _Alloc, cc_hash_tag, Policy_Tl >
- struct __gnu_pbds::detail::container_base_dispatch< Key, Mapped, _Alloc, gp_hash_tag, Policy_Tl >

- #define **PB_DS_V2F**(X)
- #define **PB_DS_V2S**(X)
- #define **PB_DS_V2S**(X)

5.123.1 Detailed Description

Contains associative container dispatching.

5.124 cpp_type_traits.h File Reference

Namespaces

- std

Macros

- #define **__INT_N**(TYPE)

Functions

- template<typename _Iterator >
  constexpr _Iterator **std::__miter_base** (_Iterator __it)

5.124.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <ext/type_traits>.

5.125 cpu_defines.h File Reference

5.125.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <iosfwd>.

5.126 csetjmp File Reference

Namespaces

- std

Macros

- #define **_GLIBCXX_CSETJMP**
- #define **setjmp**(env)

5.126.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the *.h implementation files.
This is the C++ version of the Standard C Library header `setjmp.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

5.127 csignal File Reference

Namespaces

- std

Macros

- #define **_GLIBCXX_CSIGNAL**

5.127.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*`.h implementation files.
This is the C++ version of the Standard C Library header `signal.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

5.128 cstdalign File Reference

Macros

- #define **_GLIBCXX_CSTDALIGN**

5.128.1 Detailed Description

This is a Standard C++ Library header.

5.129 cstdarg File Reference

Namespaces

- std

Macros

- #define **_GLIBCXX_CSTDARG**
- #define **va_end**(ap)

5.129.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*`.h implementation files.
This is the C++ version of the Standard C Library header `stdarg.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

5.130 cstdarg File Reference

Macros

- #define **_GLIBCXX_TR1_CSTDARG**

5.130.1 Detailed Description

This is a TR1 C++ Library header.

5.131 cstdbool File Reference

Macros

- #define **_GLIBCXX_CSTDBOOL**

5.131.1 Detailed Description

This is a Standard C++ Library header.

5.132 cstdbool File Reference

Macros

- #define **_GLIBCXX_TR1_CSTDBOOL**

5.132.1 Detailed Description

This is a TR1 C++ Library header.

5.133 cstddef File Reference

Namespaces

- std

Macros

- #define **_GLIBCXX_CSTDDEF**

5.133.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the *.h implementation files.
This is the C++ version of the Standard C Library header `stddef.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

5.134 cstdint File Reference

Namespaces

- std

Macros

- #define **_GLIBCXX_CSTDINT**

5.134.1 Detailed Description

This is a Standard C++ Library header.

5.135 cstdint File Reference

Namespaces

- std
- std::tr1

Macros

- #define **_GLIBCXX_TR1_CSTDINT**

5.135.1 Detailed Description

This is a TR1 C++ Library header.

5.136 cstdio File Reference

Namespaces

- std

Macros

- #define **_GLIBCXX_CSTDIO**

5.136.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the *.h implementation files.
This is the C++ version of the Standard C Library header `stdio.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

5.137 cstdio File Reference

Macros

- #define **_GLIBCXX_TR1_CSTDIO**

5.137.1 Detailed Description

This is a TR1 C++ Library header.

5.138 cstdlib File Reference

Namespaces

- std

Macros

- #define **_GLIBCXX_CSTDLIB**
- #define **EXIT_FAILURE**
- #define **EXIT_SUCCESS**

Functions

- void **std::abort** (void) throw ()
- int **std::atexit** (void(*)(void)) throw ()
- void **std::exit** (int) throw ()

5.138.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the *.h implementation files.
This is the C++ version of the Standard C Library header `stdlib.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

5.139 cstdlib File Reference

Macros

- #define **_GLIBCXX_TR1_CSTDLIB**

5.139.1 Detailed Description

This is a TR1 C++ Library header.

5.140 cstring File Reference

Namespaces

- std

Macros

- #define **_GLIBCXX_CSTRING**

Functions

- void * **std::memchr** (void *__s, int __c, size_t __n)
- char * **std::strchr** (char *__s, int __n)

5.152.1 Detailed Description

The header provides an interface to the C++ ABI.

5.152.2 Function Documentation

5.152.2.1 __cxa_demangle() char* __cxxabiv1::__cxa_demangle (

```
const char * __mangled_name,
char * __output_buffer,
size_t * __length,
int * __status )
```

Demangling routine. ABI-mandated entry point in the C++ runtime library for demangling.

Parameters

__mangled_name	A NUL-terminated character string containing the name to be demangled.

Parameters

__output_buffer	A region of memory, allocated with malloc, of *__length* bytes, into which the demangled name is stored. If *__output_buffer* is not long enough, it is expanded using realloc. *__output_buffer* may instead be NULL; in that case, the demangled name is placed in a region of memory allocated with malloc.
__length	If *__length* is non-null, the length of the buffer containing the demangled name is placed in *__length*.
__status	If *__status* is non-null, *__status* is set to one of the following values: 0: The demangling operation succeeded. -1: A memory allocation failure occurred. -2: *mangled_name* is not a valid name under the C++ ABI mangling rules. -3: One of the arguments is invalid.

Returns

A pointer to the start of the NUL-terminated demangled name, or NULL if the demangling fails. The caller is responsible for deallocating this memory using `free`.

The demangling is performed using the C++ ABI mangling rules, with GNU extensions. For example, this function is used in __gnu_cxx::__verbose_terminate_handler.
See https://gcc.gnu.org/onlinedocs/libstdc++/manual/ext_demangling.html for other examples of use.

Note

The same demangling functionality is available via libiberty (`<libiberty/demangle.h>` and `libiberty.a`) in GCC 3.1 and later, but that requires explicit installation (`-enable-install-libiberty`) and uses a different API, although the ABI is unchanged.

5.157.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

5.158 debug_fn_imps.hpp File Reference

5.158.1 Detailed Description

Contains an implementation class for a binary_heap.

5.159 debug_fn_imps.hpp File Reference

5.159.1 Detailed Description

Contains an implementation for binomial_heap_.

5.160 debug_fn_imps.hpp File Reference

5.160.1 Detailed Description

Contains an implementation class for a base of binomial heaps.

5.161 debug_fn_imps.hpp File Reference

5.161.1 Detailed Description

Contains an implementation class for bin_search_tree_.

5.162 debug_fn_imps.hpp File Reference

5.162.1 Detailed Description

Contains implementations of cc_ht_map_'s debug-mode functions.

5.163 debug_fn_imps.hpp File Reference

5.163.1 Detailed Description

Contains implementations of gp_ht_map_'s debug-mode functions.

5.164 debug_fn_imps.hpp File Reference

5.164.1 Detailed Description

Contains an implementation class for left_child_next_sibling_heap_.

5.165 debug_fn_imps.hpp File Reference

5.165.1 Detailed Description

Contains implementations of cc_ht_map_'s debug-mode functions.

5.166 debug_fn_imps.hpp File Reference

5.166.1 Detailed Description

Contains an implementation class for ov_tree_.

5.167 debug_fn_imps.hpp File Reference

5.167.1 Detailed Description

Contains an implementation class for a pairing heap.

5.168 debug_fn_imps.hpp File Reference

5.168.1 Detailed Description

Contains an implementation class for pat_trie_.

5.169 debug_fn_imps.hpp File Reference

5.169.1 Detailed Description

Contains an implementation for rb_tree_.

5.170 debug_fn_imps.hpp File Reference

5.170.1 Detailed Description

Contains an implementation for rc_binomial_heap_.

5.171 debug_fn_imps.hpp File Reference

5.171.1 Detailed Description

Contains an implementation class for splay_tree_.

5.172 debug_fn_imps.hpp File Reference

5.172.1 Detailed Description

Contains an implementation for thin_heap_.

5.173 debug_map_base.hpp File Reference

5.173.1 Detailed Description

Contains a debug-mode base for all maps.

5.174 debug_no_store_hash_fn_imps.hpp File Reference

5.174.1 Detailed Description

Contains implementations of cc_ht_map_'s debug-mode functions.

5.175 debug_no_store_hash_fn_imps.hpp File Reference

5.175.1 Detailed Description

Contains implementations of gp_ht_map_'s debug-mode functions.

5.176 debug_store_hash_fn_imps.hpp File Reference

5.176.1 Detailed Description

Contains implementations of cc_ht_map_'s debug-mode functions.

5.177 debug_store_hash_fn_imps.hpp File Reference

5.177.1 Detailed Description

Contains implementations of gp_ht_map_'s debug-mode functions.

5.178.1 Detailed Description

This is a Standard C++ Library header.

5.179 deque File Reference

Macros

- #define **_GLIBCXX_DEQUE**

5.179.1 Detailed Description

This is a Standard C++ Library header.

5.180 deque File Reference

Classes

- class std::__debug::deque< _Tp, _Allocator >

Namespaces

- std
- std::__debug

Macros

- #define **_GLIBCXX_DEBUG_DEQUE**

Functions

- template<typename _Tp , typename _Alloc >
  bool **std::__debug::operator!=** (const deque< _Tp, _Alloc > &__lhs, const deque< _Tp, _Alloc > &__rhs)
- template<typename _Tp , typename _Alloc >
  bool **std::__debug::operator<** (const deque< _Tp, _Alloc > &__lhs, const deque< _Tp, _Alloc > &__rhs)
- template<typename _Tp , typename _Alloc >
  bool **std::__debug::operator<=** (const deque< _Tp, _Alloc > &__lhs, const deque< _Tp, _Alloc > &__rhs)
- template<typename _Tp , typename _Alloc >
  bool **std::__debug::operator==** (const deque< _Tp, _Alloc > &__lhs, const deque< _Tp, _Alloc > &__rhs)
- template<typename _Tp , typename _Alloc >
  bool **std::__debug::operator>** (const deque< _Tp, _Alloc > &__lhs, const deque< _Tp, _Alloc > &__rhs)
- template<typename _Tp , typename _Alloc >
  bool **std::__debug::operator>=** (const deque< _Tp, _Alloc > &__lhs, const deque< _Tp, _Alloc > &__rhs)
- template<typename _Tp , typename _Alloc >
  void **std::__debug::swap** (deque< _Tp, _Alloc > &__lhs, deque< _Tp, _Alloc > &__rhs) noexcept(/*conditional */)

5.180.1 Detailed Description

This file is a GNU debug extension to the Standard C++ Library.

5.181 deque File Reference

Namespaces

- std
- std::experimental

Macros

- #define **_GLIBCXX_EXPERIMENTAL_DEQUE**

Typedefs

- template<typename _Tp >
  using **std::experimental::fundamentals_v2::pmr::deque** = std::deque< _Tp, polymorphic_allocator< _Tp > >

Functions

- template<typename _Tp , typename _Alloc , typename _Up >
  void **std::experimental::erase** (deque< _Tp, _Alloc > &__cont, const _Up &__value)
- template<typename _Tp , typename _Alloc , typename _Predicate >
  void **std::experimental::erase_if** (deque< _Tp, _Alloc > &__cont, _Predicate __pred)

5.181.1 Detailed Description

This is a TS C++ Library header.

5.182 deque.tcc File Reference

5.187.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly.

5.188 enc_filebuf.h File Reference

Classes

- class __gnu_cxx::enc_filebuf< _CharT >

Namespaces

- __gnu_cxx

5.188.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

5.189 entry_cmp.hpp File Reference

Classes

- struct __gnu_pbds::detail::entry_cmp< _VTp, Cmp_Fn, _Alloc, false >
- struct __gnu_pbds::detail::entry_cmp< _VTp, Cmp_Fn, _Alloc, true >
- struct __gnu_pbds::detail::entry_cmp< _VTp, Cmp_Fn, _Alloc, false >::type

Namespaces

- __gnu_pbds

5.189.1 Detailed Description

Contains an implementation class for a binary_heap.

5.190 entry_list_fn_imps.hpp File Reference

5.190.1 Detailed Description

Contains implementations of cc_ht_map_'s entry-list related functions.

5.191 entry_metadata_base.hpp File Reference

Namespaces

- __gnu_pbds

5.191.1 Detailed Description

Contains an implementation for a list update map.

5.192 entry_pred.hpp File Reference

Classes

- struct __gnu_pbds::detail::entry_pred< _VTp, Pred, _Alloc, false >
- struct __gnu_pbds::detail::entry_pred< _VTp, Pred, _Alloc, true >

Namespaces

- __gnu_pbds

5.192.1 Detailed Description

Contains an implementation class for a binary_heap.

5.193 eq_by_less.hpp File Reference

Classes

- struct __gnu_pbds::detail::eq_by_less< Key, Cmp_Fn >

Namespaces

- __gnu_pbds

5.193.1 Detailed Description

Contains an equivalence function.

5.194 equally_split.h File Reference

Namespaces

- __gnu_parallel

Functions

- template<typename _DifferenceType , typename _OutputIterator >
  _OutputIterator __gnu_parallel::__equally_split (_DifferenceType __n, _ThreadIndex __num_threads, _Output↩
  Iterator __s)
- template<typename _DifferenceType >
  _DifferenceType __gnu_parallel::__equally_split_point (_DifferenceType __n, _ThreadIndex __num_threads, _↩
  ThreadIndex __thread_no)

5.194.1 Detailed Description

This file is a GNU parallel extension to the Standard C++ Library.

5.195 erase_fn_imps.hpp File Reference

5.195.1 Detailed Description

Contains an implementation class for a binary_heap.

5.196 erase_fn_imps.hpp File Reference

5.196.1 Detailed Description

Contains an implementation class for a base of binomial heaps.

5.197 erase_fn_imps.hpp File Reference

5.197.1 Detailed Description

Contains an implementation class for bin_search_tree_.

5.198 erase_fn_imps.hpp File Reference

5.198.1 Detailed Description

Contains implementations of cc_ht_map_'s erase related functions.

5.199 erase_fn_imps.hpp File Reference

5.199.1 Detailed Description

Contains implementations of gp_ht_map_'s erase related functions.

5.200 erase_fn_imps.hpp File Reference

5.200.1 Detailed Description

Contains an implementation class for left_child_next_sibling_heap_.

5.201 erase_fn_imps.hpp File Reference

5.201.1 Detailed Description

Contains implementations of lu_map_.

5.202 erase_fn_imps.hpp File Reference

5.202.1 Detailed Description

Contains an implementation class for ov_tree_.

5.203 erase_fn_imps.hpp File Reference

5.203.1 Detailed Description

Contains an implementation class for a pairing heap.

5.204 erase_fn_imps.hpp File Reference

5.204.1 Detailed Description

Contains an implementation class for pat_trie.

5.205 erase_fn_imps.hpp File Reference

5.205.1 Detailed Description

Contains an implementation for rb_tree_.

5.206 erase_fn_imps.hpp File Reference

5.206.1 Detailed Description

Contains an implementation for rc_binomial_heap_.

5.207 erase_fn_imps.hpp File Reference

5.207.1 Detailed Description

Contains an implementation class for splay_tree_.

5.208 erase_fn_imps.hpp File Reference

5.208.1 Detailed Description

Contains an implementation for thin_heap_.

5.209 erase_if.h File Reference

Namespaces

- std
- std::__detail

Functions

- template<typename _Container , typename _Predicate >

Namespaces

- __gnu_cxx

Functions

- template<typename _Tp >
  void **__gnu_cxx::swap** (_ExtPtr_allocator< _Tp > &__larg, _ExtPtr_allocator< _Tp > &__rarg)

5.221.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

Author

Bob Walters

An example allocator which uses an alternative pointer type from bits/pointer.h. Supports test cases which confirm container support for alternative pointers.

5.222 features.h File Reference

Macros

- #define _GLIBCXX_BAL_QUICKSORT
- #define _GLIBCXX_FIND_CONSTANT_SIZE_BLOCKS
- #define _GLIBCXX_FIND_EQUAL_SPLIT
- #define _GLIBCXX_FIND_GROWING_BLOCKS
- #define _GLIBCXX_MERGESORT
- #define _GLIBCXX_QUICKSORT
- #define _GLIBCXX_TREE_DYNAMIC_BALANCING
- #define _GLIBCXX_TREE_FULL_COPY
- #define _GLIBCXX_TREE_INITIAL_SPLITTING

5.222.1 Detailed Description

Defines on whether to include algorithm variants.
Less variants reduce executable size and compile time. This file is a GNU parallel extension to the Standard C++ Library.

5.222.2 Macro Definition Documentation

5.222.2.1 _GLIBCXX_BAL_QUICKSORT `#define _GLIBCXX_BAL_QUICKSORT`

Include parallel dynamically load-balanced quicksort.

See also

__gnu_parallel::_Settings::sort_algorithm

Definition at line 55 of file features.h.

5.222.2.2 _GLIBCXX_FIND_CONSTANT_SIZE_BLOCKS `#define _GLIBCXX_FIND_CONSTANT_SIZE_BLOCKS`

Include the equal-sized blocks variant for std::find.

See also

__gnu_parallel::_Settings::find_algorithm

Definition at line 67 of file features.h.

5.222.2.3 _GLIBCXX_FIND_EQUAL_SPLIT `#define _GLIBCXX_FIND_EQUAL_SPLIT`

Include the equal splitting variant for std::find.

See also

__gnu_parallel::_Settings::find_algorithm

Definition at line 74 of file features.h.

5.222.2.4 _GLIBCXX_FIND_GROWING_BLOCKS `#define _GLIBCXX_FIND_GROWING_BLOCKS`

Include the growing blocks variant for std::find.

See also

__gnu_parallel::_Settings::find_algorithm

Definition at line 61 of file features.h.

5.222.2.5 _GLIBCXX_MERGESORT `#define _GLIBCXX_MERGESORT`

Include parallel multi-way mergesort.

See also

__gnu_parallel::_Settings::sort_algorithm

Definition at line 41 of file features.h.

5.222.2.6 _GLIBCXX_QUICKSORT `#define _GLIBCXX_QUICKSORT`

Include parallel unbalanced quicksort.

See also

__gnu_parallel::_Settings::sort_algorithm

Definition at line 48 of file features.h.

5.222.2.7 _GLIBCXX_TREE_DYNAMIC_BALANCING `#define _GLIBCXX_TREE_DYNAMIC_BALANCING`

Include the dynamic balancing variant for _Rb_tree::insert_unique(_IIter beg, _IIter __end).

See also

__gnu_parallel::_Rb_tree

Definition at line 91 of file features.h.

5.222.2.8 _GLIBCXX_TREE_FULL_COPY `#define _GLIBCXX_TREE_FULL_COPY`

In order to sort the input sequence of _Rb_tree::insert_unique(_IIter beg, _IIter __end) a full copy of the input elements is done.

See also

__gnu_parallel::_Rb_tree

Definition at line 100 of file features.h.

5.222.2.9 _GLIBCXX_TREE_INITIAL_SPLITTING `#define _GLIBCXX_TREE_INITIAL_SPLITTING`

Include the initial splitting variant for _Rb_tree::insert_unique(_IIter beg, _IIter __end).

See also

__gnu_parallel::_Rb_tree

Definition at line 83 of file features.h.

5.223 fenv.h File Reference

5.223.1 Detailed Description

This is a Standard C++ Library header.

5.224 filesystem File Reference

Macros

- #define **_GLIBCXX_FILESYSTEM**

5.224.1 Detailed Description

This is a Standard C++ Library header.

5.225 filesystem File Reference

Macros

5.226.1 Detailed Description

Parallel implementation base for std::find(), std::equal() and related functions. This file is a GNU parallel extension to the Standard C++ Library.

5.227 find_fn_imps.hpp File Reference

5.227.1 Detailed Description

Contains an implementation class for a binary_heap.

5.228 find_fn_imps.hpp File Reference

5.228.1 Detailed Description

Contains an implementation class for a base of binomial heaps.

5.229 find_fn_imps.hpp File Reference

5.229.1 Detailed Description

Contains an implementation class for bin_search_tree_.

5.230 find_fn_imps.hpp File Reference

5.230.1 Detailed Description

Contains implementations of cc_ht_map_'s find related functions.

5.231 find_fn_imps.hpp File Reference

5.231.1 Detailed Description

Contains implementations of gp_ht_map_'s find related functions.

5.232 find_fn_imps.hpp File Reference

5.232.1 Detailed Description

Contains implementations of lu_map_.

5.233 find_fn_imps.hpp File Reference

5.233.1 Detailed Description

Contains an implementation class for a pairing heap.

5.234 find_fn_imps.hpp File Reference

5.234.1 Detailed Description

Contains an implementation class for pat_trie.

5.235 find_fn_imps.hpp File Reference

5.235.1 Detailed Description

Contains an implementation for rb_tree_.

5.236 find_fn_imps.hpp File Reference

5.236.1 Detailed Description

Contains an implementation class for splay_tree_.

5.237 find_fn_imps.hpp File Reference

5.237.1 Detailed Description

Contains an implementation for thin_heap_.

5.238 find_no_store_hash_fn_imps.hpp File Reference

5.238.1 Detailed Description

Contains implementations of gp_ht_map_'s find related functions, when the hash value is not stored.

5.239 find_selectors.h File Reference

Classes

- struct __gnu_parallel::__adjacent_find_selector
- struct __gnu_parallel::__find_first_of_selector< _FIterator >
- struct __gnu_parallel::__find_if_selector
- struct __gnu_parallel::__generic_find_selector
- struct __gnu_parallel::__mismatch_selector

Namespaces

- __gnu_parallel

5.239.1 Detailed Description

_Function objects representing different tasks to be plugged into the parallel find algorithm. This file is a GNU parallel extension to the Standard C++ Library.

5.240 find_store_hash_fn_imps.hpp File Reference

5.240.1 Detailed Description

Contains implementations of cc_ht_map_'s find related functions, when the hash value is stored.

5.241 find_store_hash_fn_imps.hpp File Reference

5.241.1 Detailed Description

Contains implementations of gp_ht_map_'s insert related functions, when the hash value is stored.

5.242 for_each.h File Reference

Namespaces

- __gnu_parallel

Functions

- template<typename _IIter , typename _UserOp , typename _Functionality , typename _Red , typename _Result >
  _UserOp __gnu_parallel::__for_each_template_random_access (_IIter __begin, _IIter __end, _UserOp __user↩
  _op, _Functionality &__functionality, _Red __reduction, _Result __reduction_start, _Result &__output, typename
  std::iterator_traits< _IIter >::difference_type __bound, _Parallelism __parallelism_tag)

5.242.1 Detailed Description

Main interface for embarrassingly parallel functions.
The explicit implementation are in other header files, like workstealing.h, par_loop.h, omp_loop.h, and omp_loop_↩
static.h. This file is a GNU parallel extension to the Standard C++ Library.

5.319.1 Detailed Description

This is a Standard C++ Library header.

5.320 iostream File Reference

Namespaces

- std

Macros

- #define **_GLIBCXX_IOSTREAM**

Variables

- static ios_base::Init std::__ioinit

Standard Stream Objects

The <iostream> header declares the eight standard stream objects. For other declarations, see http://gcc.gnu.org/onlinedocs/libstdc++/manual/io.html and the I/O forward declarations

They are required by default to cooperate with the global C library's FILE streams, and to be available during program startup and termination. For more information, see the section of the manual linked to above.

- ostream std::cerr
- istream std::cin
- ostream std::clog
- ostream std::cout
- wostream std::wcerr
- wistream std::wcin
- wostream std::wclog
- wostream std::wcout

5.320.1 Detailed Description

This is a Standard C++ Library header.

5.321 istream File Reference

5.326.1 Detailed Description

Helper iterator classes for the std::transform() functions. This file is a GNU parallel extension to the Standard C++ Library.

5.327 iterator.hpp File Reference

5.327.1 Detailed Description

Contains an iterator_ class used for ranging over the elements of the table.
This file is intended to be included inside a class definition, with PB_DS_CLASS_C_DEC defined to the name of the enclosing class.

5.328 iterator_concepts.h File Reference

5.328.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <iterator>.

5.329 iterator_fn_imps.hpp File Reference

5.329.1 Detailed Description

Contains implementations of gp_ht_map_'s iterators related functions, e.g., begin().

5.330 iterators_fn_imps.hpp File Reference

5.330.1 Detailed Description

Contains an implementation class for a binary_heap.

5.331 iterators_fn_imps.hpp File Reference

5.331.1 Detailed Description

Contains an implementation class for bin_search_tree_.

5.332 iterators_fn_imps.hpp File Reference

5.332.1 Detailed Description

Contains implementations of cc_ht_map_'s iterators related functions, e.g., begin().

5.333 iterators_fn_imps.hpp File Reference

5.333.1 Detailed Description

Contains an implementation class for left_child_next_sibling_heap_.

5.334 iterators_fn_imps.hpp File Reference

5.334.1 Detailed Description

Contains implementations of lu_map_.

5.335 iterators_fn_imps.hpp File Reference

5.335.1 Detailed Description

Contains an implementation class for ov_tree_.

5.336 iterators_fn_imps.hpp File Reference

5.336.1 Detailed Description

Contains an implementation class for pat_trie.

5.337 left_child_next_sibling_heap_.hpp File Reference

Classes

- class __gnu_pbds::detail::left_child_next_sibling_heap< Value_Type, Cmp_Fn, Node_Metadata, _Alloc >

Namespaces

- __gnu_pbds

Macros

- #define **PB_DS_CLASS_C_DEC**
- #define **PB_DS_CLASS_T_DEC**

5.337.1 Detailed Description

Contains an implementation class for a basic heap.

5.338 lfts_config.h File Reference

5.338.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly.

5.359.1 Detailed Description

This file is a GNU debug extension to the Standard C++ Library.

5.359.2 Macro Definition Documentation

5.359.2.1 __glibcxx_check_erase

```
#define __glibcxx_check_erase(
    _Position )
```

Verify that we can erase the element referenced by the iterator _Position. We can erase the element if the _Position iterator is dereferenceable and references this sequence.
Definition at line 222 of file macros.h.

5.359.2.2 __glibcxx_check_erase_after

```
#define __glibcxx_check_erase_after(
    _Position )
```

Verify that we can erase the element after the iterator _Position. We can erase the element if the _Position iterator is before a dereferenceable one and references this sequence.
Definition at line 236 of file macros.h.

5.359.2.3 __glibcxx_check_erase_range

```
#define __glibcxx_check_erase_range(
    _First,
    _Last )
```

Verify that we can erase the elements in the iterator range [_First, _Last). We can erase the elements if [_First, _Last) is a valid iterator range within this sequence.
Definition at line 250 of file macros.h.

5.359.2.4 __glibcxx_check_erase_range_after

```
#define __glibcxx_check_erase_range_after(
    _First,
    _Last )
```

Verify that we can erase the elements in the iterator range (_First, _Last). We can erase the elements if (_First, _Last) is a valid iterator range within this sequence.
Definition at line 262 of file macros.h.

5.359.2.5 __glibcxx_check_heap_pred

```
#define __glibcxx_check_heap_pred(
    _First,
    _Last,
    _Pred )
```

Verify that the iterator range [_First, _Last) is a heap w.r.t. the predicate _Pred.
Definition at line 447 of file macros.h.

5.359.2.6 __glibcxx_check_insert

```
#define __glibcxx_check_insert(
    _Position )
```

Verify that we can insert into ∗this with the iterator _Position. Insertion into a container at a specific position requires that the iterator be nonsingular, either dereferenceable or past-the-end, and that it reference the sequence we are inserting into. Note that this macro is only valid when the container is a_Safe_sequence and the iterator is a _Safe_iterator.
Definition at line 156 of file macros.h.

5.359.2.7 __glibcxx_check_insert_after

```
#define __glibcxx_check_insert_after(
    _Position )
```

Verify that we can insert into ∗this after the iterator _Position. Insertion into a container after a specific position requires that the iterator be nonsingular, either dereferenceable or before-begin, and that it reference the sequence we are inserting into. Note that this macro is only valid when the container is a_Safe_sequence and the iterator is a _Safe_↩ iterator.
Definition at line 173 of file macros.h.

5.359.2.8 __glibcxx_check_insert_range

```
#define __glibcxx_check_insert_range(
    _Position,
    _First,
    _Last,
    _Dist )
```

Verify that we can insert the values in the iterator range [_First, _Last) into ∗this with the iterator _Position. Insertion into a container at a specific position requires that the iterator be nonsingular (i.e., either dereferenceable or past-the-end), that it reference the sequence we are inserting into, and that the iterator range [_First, _Last) is a valid (possibly empty) range which does not reference the sequence we are inserting into. Note that this macro is only valid when the container is a _Safe_sequence and the _Position iterator is a _Safe_iterator.
Definition at line 190 of file macros.h.

5.359.2.9 __glibcxx_check_insert_range_after

```
#define __glibcxx_check_insert_range_after(
    _Position,
    _First,
    _Last,
    _Dist )
```

Verify that we can insert the values in the iterator range [_First, _Last) into ∗this after the iterator _Position. Insertion into a container after a specific position requires that the iterator be nonsingular (i.e., either dereferenceable or past-the-end), that it reference the sequence we are inserting into, and that the iterator range [_First, _Last) is a valid (possibly empty) range which does not reference the sequence we are inserting into. Note that this macro is only valid when the container is a _Safe_sequence and the _Position iterator is a _Safe_iterator.
Definition at line 209 of file macros.h.

5.359.2.10 __glibcxx_check_partitioned_lower

```
#define __glibcxx_check_partitioned_lower(
    _First,
    _Last,
    _Value )
```

Verify that the iterator range [_First, _Last) is partitioned w.r.t. the value _Value.
Definition at line 391 of file macros.h.

5.359.2.11 __glibcxx_check_partitioned_lower_pred

```
#define __glibcxx_check_partitioned_lower_pred(
    _First,
```

```
_Last,
_Value,
_Pred )
```

Verify that the iterator range [_First, _Last) is partitioned w.r.t. the value _Value and predicate _Pred.
Definition at line 413 of file macros.h.

5.359.2.12 __glibcxx_check_partitioned_upper_pred `#define __glibcxx_check_partitioned_upper_pred(`

```
_First,
_Last,
_Value,
_Pred )
```

Verify that the iterator range [_First, _Last) is partitioned w.r.t. the value _Value and predicate _Pred.
Definition at line 426 of file macros.h.

5.359.2.13 __glibcxx_check_sorted_pred `#define __glibcxx_check_sorted_pred(`

```
_First,
_Last,
_Pred )
```

Verify that the iterator range [_First, _Last) is sorted by the predicate _Pred.
Definition at line 356 of file macros.h.

5.359.2.14 _GLIBCXX_DEBUG_VERIFY_COND_AT `#define _GLIBCXX_DEBUG_VERIFY_COND_AT(`

```
_Cond,
_ErrMsg,
_File,
_Line,
_Func )
```

Macros used by the implementation to verify certain properties. These macros may only be used directly by the debug wrappers. Note that these are macros (instead of the more obviously *correct* choice of making them functions) because we need line and file information at the call site, to minimize the distance between the user error and where the error is reported.
Definition at line 50 of file macros.h.

5.372.1 Detailed Description

This is a TS C++ Library header.

5.372.2 Function Documentation

5.372.2.1 get_default_resource() `memory_resource * std::experimental::fundamentals_v2::pmr::get_↩ default_resource ( ) [inline], [noexcept]`

Get the current default resource.
Definition at line 549 of file experimental/memory_resource.

5.372.2.2 set_default_resource() `memory_resource * std::experimental::fundamentals_v2::pmr::set_↩ default_resource ( memory_resource * __r ) [inline], [noexcept]`

Change the default resource and return the previous one.
Definition at line 554 of file experimental/memory_resource.

- std::experimental

5.386.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <experimental/net>.

5.387 new File Reference

Classes

- class std::bad_alloc

Namespaces

- std

Typedefs

- typedef void(* std::new_handler) ()

Functions

- new_handler std::get_new_handler () noexcept
- void **operator delete** (void *) noexcept
- void **operator delete** (void *, const std::nothrow_t &) noexcept
- void **operator delete** (void *, void *) noexcept
- void **operator delete[ ]** (void *) noexcept
- void **operator delete[ ]** (void *, const std::nothrow_t &) noexcept
- void **operator delete[ ]** (void *, void *) noexcept
- void * operator new (std::size_t)
- void * **operator new** (std::size_t, const std::nothrow_t &) noexcept
- void * **operator new** (std::size_t, void *__p) noexcept
- void * **operator new[ ]** (std::size_t)
- void * **operator new[ ]** (std::size_t, const std::nothrow_t &) noexcept
- void * **operator new[ ]** (std::size_t, void *__p) noexcept
- new_handler std::set_new_handler (new_handler) throw ()

Variables

- const nothrow_t **std::nothrow**

5.387.1 Detailed Description

This is a Standard C++ Library header.
The header `new` defines several functions to manage dynamic memory and handling memory allocation errors; see `https://gcc.gnu.org/onlinedocs/libstdc++/manual/dynamic_memory.html` for more.

5.387.2 Function Documentation

5.387.2.1 operator new() `void* operator new ( std::size_t )`

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

5.388 new_allocator.h File Reference

Classes

- class __gnu_cxx::new_allocator< _Tp >

Namespaces

- __gnu_cxx

5.388.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

5.389 node.hpp File Reference

Classes

- struct __gnu_pbds::detail::left_child_next_sibling_heap_node_< _Value, _Metadata, _Alloc >

Namespaces

- __gnu_pbds

5.389.1 Detailed Description

Contains an implementation struct for this type of heap's node.

5.390 node.hpp File Reference

Classes

- struct __gnu_pbds::detail::rb_tree_node_< Value_Type, Metadata, _Alloc >

Namespaces

- __gnu_pbds

5.390.1 Detailed Description

Contains an implementation for rb_tree_.

5.391 node.hpp File Reference

Classes

- struct __gnu_pbds::detail::splay_tree_node_< Value_Type, Metadata, _Alloc >

Namespaces

- __gnu_pbds

5.391.1 Detailed Description

Contains an implementation struct for splay_tree_'s node.

5.392 node_handle.h File Reference

5.392.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <map,set,unordered_map,unordered_set>.

5.393 node_iterators.hpp File Reference

Classes

- class __gnu_pbds::detail::bin_search_tree_const_node_it_< Node, Const_Iterator, Iterator, _Alloc >
- class __gnu_pbds::detail::bin_search_tree_node_it_< Node, Const_Iterator, Iterator, _Alloc >

Namespaces

- __gnu_pbds

Macros

- #define **PB_DS_TREE_CONST_NODE_ITERATOR_CLASS_C_DEC**
- #define **PB_DS_TREE_NODE_ITERATOR_CLASS_C_DEC**

5.393.1 Detailed Description

Contains an implementation class for bin_search_tree_.

5.394 node_iterators.hpp File Reference

Classes

- class __gnu_pbds::detail::ov_tree_node_const_it_< Value_Type, Metadata_Type, _Alloc >
- class __gnu_pbds::detail::ov_tree_node_it_< Value_Type, Metadata_Type, _Alloc >

Namespaces

5.401.1 Detailed Description

Parallel STL function calls corresponding to stl_numeric.h. The functions defined here mainly do case switches and call the actual parallelized versions in other files. Inlining policy: Functions that basically only contain one function call, are declared inline. This file is a GNU parallel extension to the Standard C++ Library.

5.488.1 Detailed Description

Error and exception objects for the std regex library.
This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <regex>.

5.489 regex_executor.h File Reference

Classes

- class std::__detail::_Executor< _BiIter, _Alloc, _TraitsT, __dfs_mode >

Namespaces

- std
- std::__detail

5.489.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <regex>.

5.490 regex_executor.tcc File Reference

Namespaces

- std
- std::__detail

5.490.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <regex>.

5.491 regex_scanner.h File Reference

Classes

- class std::__detail::_Scanner< _CharT >

Namespaces

- std
- std::__detail

5.491.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <regex>.

5.492 regex_scanner.tcc File Reference

Namespaces

- std
- std::__detail

5.492.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <regex>.

5.493 resize_fn_imps.hpp File Reference

5.493.1 Detailed Description

Contains implementations of cc_ht_map_'s resize related functions.

5.494 resize_fn_imps.hpp File Reference

5.494.1 Detailed Description

Contains implementations of gp_ht_map_'s resize related functions.

5.495 resize_no_store_hash_fn_imps.hpp File Reference

5.495.1 Detailed Description

Contains implementations of cc_ht_map_'s resize related functions, when the hash value is not stored.

5.496 resize_no_store_hash_fn_imps.hpp File Reference

5.496.1 Detailed Description

Contains implementations of gp_ht_map_'s resize related functions, when the hash value is not stored.

5.497 resize_policy.hpp File Reference

Classes

- class __gnu_pbds::detail::resize_policy< _Tp >

Namespaces

- __gnu_pbds

5.497.1 Detailed Description

Contains an implementation class for a binary_heap.

5.498 resize_store_hash_fn_imps.hpp File Reference

5.498.1 Detailed Description

Contains implementations of cc_ht_map_'s resize related functions, when the hash value is stored.

5.499 resize_store_hash_fn_imps.hpp File Reference

5.499.1 Detailed Description

Contains implementations of gp_ht_map_'s resize related functions, when the hash value is stored.

5.500 rope File Reference

5.532.1 Detailed Description

Parallel implementations of set operations for random-access iterators. This file is a GNU parallel extension to the Standard C++ Library.

5.533 settings.h File Reference

Classes

- struct __gnu_parallel::_Settings

Namespaces

- __gnu_parallel

Macros

- #define _GLIBCXX_PARALLEL_CONDITION(__c)

5.533.1 Detailed Description

Runtime settings and tuning parameters, heuristics to decide whether to use parallelized algorithms.
This file is a GNU parallel extension to the Standard C++ Library.

5.533.2 Deciding whether to run an algorithm in parallel.

There are several ways the user can switch on and off the parallel execution of an algorithm, both at compile- and run-time.
Only sequential execution can be forced at compile-time. This reduces code size and protects code parts that have non-thread-safe side effects.
Ultimately, forcing parallel execution at compile-time makes sense. Often, the sequential algorithm implementation is used as a subroutine, so no reduction in code size can be achieved. Also, the machine the program is run on might have only one processor core, so to avoid overhead, the algorithm is executed sequentially.
To force sequential execution of an algorithm ultimately at compile-time, the user must add the tag gnu_parallel↩
::sequential_tag() to the end of the parameter list, e. g.

```
std::sort(__v.begin(), __v.end(), __gnu_parallel::sequential_tag());
```

This is compatible with all overloaded algorithm variants. No additional code will be instantiated, at all. The same holds for most algorithm calls with iterators not providing random access.
If the algorithm call is not forced to be executed sequentially at compile-time, the decision is made at run-time. The global variable __gnu_parallel::_Settings::algorithm_strategy is checked. It is a tristate variable corresponding to:

- a. force_sequential, meaning the sequential algorithm is executed.
- b. force_parallel, meaning the parallel algorithm is executed.
- c. heuristic

For heuristic, the parallel algorithm implementation is called only if the input size is sufficiently large. For most algorithms, the input size is the (combined) length of the input sequence(__s). The threshold can be set by the user, individually for each algorithm. The according variables are called gnu_parallel::_Settings::[algorithm]_minimal_n .
For some of the algorithms, there are even more tuning options, e. g. the ability to choose from multiple algorithm variants. See below for details.

5.533.3 Macro Definition Documentation

5.533.3.1 _GLIBCXX_PARALLEL_CONDITION `#define _GLIBCXX_PARALLEL_CONDITION( __c )`

Determine at compile(?)-time if the parallel variant of an algorithm should be called.

Parameters

_↩ _c	A condition that is convertible to bool that is overruled by __gnu_parallel::_Settings::algorithm_strategy. Usually a decision based on the input size.

Definition at line 94 of file settings.h.

5.546.1 Detailed Description

Contains an implementation class for splay trees.

5.547 split_fn_imps.hpp File Reference

5.547.1 Detailed Description

Contains an implementation class for pat_trie.

5.548 split_join_fn_imps.hpp File Reference

5.548.1 Detailed Description

Contains an implementation class for a binary_heap.

5.549 split_join_fn_imps.hpp File Reference

5.549.1 Detailed Description

Contains an implementation class for a base of binomial heaps.

5.550 split_join_fn_imps.hpp File Reference

5.550.1 Detailed Description

Contains an implementation class for bin_search_tree_.

5.551 split_join_fn_imps.hpp File Reference

5.551.1 Detailed Description

Contains an implementation class for ov_tree_.

5.552 split_join_fn_imps.hpp File Reference

5.552.1 Detailed Description

Contains an implementation class for a pairing heap.

5.553 split_join_fn_imps.hpp File Reference

5.553.1 Detailed Description

Contains an implementation for rb_tree_.

5.554 split_join_fn_imps.hpp File Reference

5.554.1 Detailed Description

Contains an implementation for rc_binomial_heap_.

5.555 split_join_fn_imps.hpp File Reference

5.555.1 Detailed Description

Contains an implementation class for splay_tree_.

5.556 split_join_fn_imps.hpp File Reference

5.556.1 Detailed Description

Contains an implementation for thin_heap_.

5.575.2 Macro Definition Documentation

5.575.2.1 _GLIBCXX_DEQUE_BUF_SIZE `#define _GLIBCXX_DEQUE_BUF_SIZE`

This function controls the size of memory nodes.

Parameters

__size	The size of an element.

Returns

The number (not byte size) of elements per node.

This function started off as a compiler kludge from SGI, but seems to be a useful wrapper around a repeated constant expression. The **512** is tunable (and no other code needs to change), but no investigation has been done since inheriting the SGI code. Touch _GLIBCXX_DEQUE_BUF_SIZE only if you know what you are doing, however: changing it breaks the binary compatibility!!
Definition at line 92 of file stl_deque.h.

5.578.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <iterator>.
This file implements reverse_iterator, back_insert_iterator, front_insert_iterator, insert_iterator, __normal_iterator, and their supporting functions and overloaded operators.

5.590.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <utility>.
Inclusion of this file has been removed from all of the other STL headers for safety reasons, except std_↩ utility.h. For more information, see the thread of about twenty messages starting with http://gcc.gnu.↩ org/ml/libstdc++/2001-01/msg00223.html, or http://gcc.gnu.org/onlinedocs/libstdc++/faq.↩ html#faq.ambiguous_overloads
Short summary: the rel_ops operators should be avoided for the present.

5.607.1 Detailed Description

This is a TS C++ Library header.

5.608 string_view.tcc File Reference

Macros

- #define **_GLIBCXX_STRING_VIEW_TCC**

5.608.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <string_view>.

5.609 string_view.tcc File Reference

Namespaces

- std
- std::experimental

Macros

- #define **_GLIBCXX_EXPERIMENTAL_STRING_VIEW_TCC**

5.609.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <experimental/string_view>.

5.610 stringfwd.h File Reference

Namespaces

- std

Typedefs

- typedef basic_string< char > std::string
- typedef basic_string< char16_t > std::u16string
- typedef basic_string< char32_t > std::u32string
- typedef basic_string< wchar_t > std::wstring

5.610.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <string>.

5.611 strstream File Reference

Namespaces

- std

5.611.1 Detailed Description

This is a Standard C++ Library header.

5.612 synth_access_traits.hpp File Reference

Classes

- struct __gnu_pbds::detail::synth_access_traits< Type_Traits, Set, _ATraits >

Namespaces

- __gnu_pbds

Macros

- #define **PB_DS_SYNTH_E_ACCESS_TRAITS_C_DEC**
- #define **PB_DS_SYNTH_E_ACCESS_TRAITS_T_DEC**

5.612.1 Detailed Description

Contains an implementation class for a patricia tree.

5.613 system_error File Reference

Classes

- class std::_V2::error_category
- struct std::error_code
- struct std::error_condition
- struct std::hash< error_code >

5.620.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.
Contains two exception-generating types (throw_value, throw_allocator) intended to be used as value and allocator types while testing exception safety in templatized containers and algorithms. The allocator has additional log and debug features. The exception generated is of type forced_exception_error.

5.621 time_members.h File Reference

Namespaces

- std

5.621.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <locale>.

5.622 trace_fn_imps.hpp File Reference

5.622.1 Detailed Description

Contains an implementation class for a binary_heap.

5.623 trace_fn_imps.hpp File Reference

5.623.1 Detailed Description

Contains implementations of cc_ht_map_'s trace-mode functions.

5.624 trace_fn_imps.hpp File Reference

5.624.1 Detailed Description

Contains implementations of gp_ht_map_'s trace-mode functions.

5.625 trace_fn_imps.hpp File Reference

5.625.1 Detailed Description

Contains an implementation class for left_child_next_sibling_heap_.

5.626 trace_fn_imps.hpp File Reference

5.626.1 Detailed Description

Contains implementations of lu_map_.

5.627 trace_fn_imps.hpp File Reference

5.627.1 Detailed Description

Contains an implementation class for pat_trie_.

5.628 trace_fn_imps.hpp File Reference

5.628.1 Detailed Description

Contains an implementation for rc_binomial_heap_.

5.629 trace_fn_imps.hpp File Reference

5.629.1 Detailed Description

Contains an implementation class for left_child_next_sibling_heap_.

5.630 traits.hpp File Reference

Classes

- struct __gnu_pbds::detail::bin_search_tree_traits< Key, Mapped, Cmp_Fn, Node_Update, Node, _Alloc >
- struct __gnu_pbds::detail::bin_search_tree_traits< Key, null_type, Cmp_Fn, Node_Update, Node, _Alloc >

Namespaces

5.643.1 Detailed Description

This is a Standard C++ Library header.

5.643.2 Macro Definition Documentation

5.643.2.1 _GLIBCXX_HAS_NESTED_TYPE `#define _GLIBCXX_HAS_NESTED_TYPE( _NTYPE )`

Use SFINAE to determine if the type _Tp has a publicly-accessible member type _NTYPE.
Definition at line 2614 of file type_traits.

5.669.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include <valarray>.

5.682.1 Detailed Description

Parallelization of embarrassingly parallel execution by means of work-stealing.
Work stealing is described in
R. D. Blumofe and C. E. Leiserson. Scheduling multithreaded computations by work stealing. Journal of the ACM, 46(5):720-748, 1999.
This file is a GNU parallel extension to the Standard C++ Library.
