This function provides for safer data access. The parameter is first checked that it is in the range of the deque. The function throws out_of_range if the check fails.

References [std::deque< _Tp, _Alloc >::_M_range_check\(\)](#).

at() [2/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
const_reference std::deque< _Tp, _Alloc >::at (
    size_type __n ) const [inline]
```

Provides access to the data contained in the deque.

Parameters

 <i>__n</i>	The index of the element for which data should be accessed.
-------------------------------------------------------------------------------------------------	-------------------------------------------------------------

Returns

Read-only (constant) reference to data.

Exceptions

<i>std::out_of_range</i>	If <i>__n</i> is an invalid index.
--------------------------	------------------------------------

This function provides for safer data access. The parameter is first checked that it is in the range of the deque. The function throws out_of_range if the check fails.

References [std::deque< _Tp, _Alloc >::_M_range_check\(\)](#).

back() [1/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
const_reference std::deque< _Tp, _Alloc >::back ( ) const [inline], [noexcept]
```

Returns a read-only (constant) reference to the data at the last element of the deque.

References [std::deque< _Tp, _Alloc >::end\(\)](#).

back() [2/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
reference std::deque< _Tp, _Alloc >::back ( ) [inline], [noexcept]
```

Returns a read/write reference to the data at the last element of the deque.

References [std::deque< _Tp, _Alloc >::end\(\)](#).

begin() [1/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
const_iterator std::deque< _Tp, _Alloc >::begin ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the deque. Iteration is done in ordinary element order.

begin() [2/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
iterator std::deque< _Tp, _Alloc >::begin ( ) [inline], [noexcept]
```

Returns a read/write iterator that points to the first element in the deque. Iteration is done in ordinary element order.

Referenced by `std::deque<_Tp, _Alloc>::deque()`, `std::deque<_Tp, _Alloc>::deque()`, `std::deque<_Tp, _Alloc>::~~deque()`, `std::deque<_Tp, _Alloc>::clear()`, `std::deque<_Tp, _Alloc>::front()`, `std::deque<_Tp, _Alloc>::front()`, `std::deque<_Tp, _Alloc>::insert()`, `std::deque<_Tp, _Alloc>::insert()`, `std::operator<()`, `std::deque<_Tp, _Alloc>::operator=()`, and `std::operator==()`.

cbegin()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_iterator std::deque<_Tp, _Alloc>::cbegin ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the deque. Iteration is done in ordinary element order.

Referenced by `std::deque<_Tp, _Alloc>::insert()`, `std::deque<_Tp, _Alloc>::insert()`, and `std::deque<_Tp, _Alloc>::insert()`.

cend()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_iterator std::deque<_Tp, _Alloc>::cend ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the deque. Iteration is done in ordinary element order.

clear()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::deque<_Tp, _Alloc>::clear ( ) [inline], [noexcept]
```

Erases all the elements. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

References `std::deque<_Tp, _Alloc>::begin()`.

crbegin()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::deque<_Tp, _Alloc>::crbegin ( ) const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the deque. Iteration is done in reverse element order.

crend()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::deque<_Tp, _Alloc>::crend ( ) const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first element in the deque. Iteration is done in reverse element order.

emplace()

```
template<typename _Tp, typename _Alloc >
template<typename... _Args>
deque<_Tp, _Alloc>::iterator deque::emplace (
    const_iterator __position,
    _Args &&... __args )
```

Inserts an object in deque before specified iterator.

Parameters

<code>__position</code>	A const_iterator into the deque.
<code>__args</code>	Arguments.

Returns

An iterator that points to the inserted data.

This function will insert an object of type T constructed with T(std::forward<Args>(args)...) before the specified location. Referenced by [std::deque< _Tp, _Alloc >::insert\(\)](#).

empty()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
bool std::deque< _Tp, _Alloc >::empty ( ) const [inline], [noexcept]
```

Returns true if the deque is empty. (Thus begin() would equal end().)

end() [1/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
const_iterator std::deque< _Tp, _Alloc >::end ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the deque. Iteration is done in ordinary element order.

end() [2/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
iterator std::deque< _Tp, _Alloc >::end ( ) [inline], [noexcept]
```

Returns a read/write iterator that points one past the last element in the deque. Iteration is done in ordinary element order.

Referenced by [std::deque< _Tp, _Alloc >::deque\(\)](#), [std::deque< _Tp, _Alloc >::deque\(\)](#), [std::deque< _Tp, _Alloc >::~~deque\(\)](#), [std::deque< _Tp, _Alloc >::back\(\)](#), [std::deque< _Tp, _Alloc >::back\(\)](#), [std::operator<\(\)](#), [std::deque< _Tp, _Alloc >::operator=\(\)](#), and [std::operator==\(\)](#).

erase() [1/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
iterator std::deque< _Tp, _Alloc >::erase (
    const_iterator __first,
    const_iterator __last ) [inline]
```

Remove a range of elements.

Parameters

<code>__first</code>	Iterator pointing to the first element to be erased.
<code>__last</code>	Iterator pointing to one past the last element to be erased.

Returns

An iterator pointing to the element pointed to by *last* prior to erasing (or end()).

This function will erase the elements in the range [`__first`,`__last`) and shorten the deque accordingly. The user is cautioned that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [2/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
iterator std::deque< _Tp, _Alloc >::erase (
    const_iterator __position ) [inline]
```

Remove element at given position.

Parameters

<code>__position</code>	Iterator pointing to element to be erased.
-------------------------	--------------------------------------------

Returns

An iterator pointing to the next element (or end()).

This function will erase the element at the given position and thus shorten the deque by one.

The user is cautioned that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

front() [1/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
const_reference std::deque< _Tp, _Alloc >::front ( ) const [inline], [noexcept]
```

Returns a read-only (constant) reference to the data at the first element of the deque.

References [std::deque< _Tp, _Alloc >::begin\(\)](#).

front() [2/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
reference std::deque< _Tp, _Alloc >::front ( ) [inline], [noexcept]
```

Returns a read/write reference to the data at the first element of the deque.

References [std::deque< _Tp, _Alloc >::begin\(\)](#).

get_allocator()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
allocator_type std::deque< _Tp, _Alloc >::get_allocator ( ) const [inline], [noexcept]
```

Get a copy of the memory allocation object.

Referenced by [std::deque< _Tp, _Alloc >::operator=\(\)](#).

insert() [1/5]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
iterator std::deque< _Tp, _Alloc >::insert (
    const_iterator __p,
    initializer_list< value_type > __l ) [inline]
```

Inserts an initializer list into the deque.

Parameters

<code>__p</code>	An iterator into the deque.
<code>__l</code>	An initializer_list.

Returns

An iterator that points to the inserted data.

This function will insert copies of the data in the initializer_list `__l` into the deque before the location specified by `__p`. This is known as *list insert*.

References [std::deque< _Tp, _Alloc >::begin\(\)](#), and [std::deque< _Tp, _Alloc >::cbegin\(\)](#).

insert() [2/5]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
template<typename _InputIterator , typename = std::_RequireInputIter<_InputIterator>>
iterator std::deque< _Tp, _Alloc >::insert (
    const_iterator __position,
    _InputIterator __first,
    _InputIterator __last ) [inline]
```

Inserts a range into the deque.

Parameters

<code>__position</code>	A const_iterator into the deque.
<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

Returns

An iterator that points to the inserted data.

This function will insert copies of the data in the range [`__first`,`__last`) into the deque before the location specified by `__position`. This is known as *range insert*.

References [std::__iterator_category\(\)](#), [std::deque< _Tp, _Alloc >::begin\(\)](#), and [std::deque< _Tp, _Alloc >::cbegin\(\)](#).

insert() [3/5]

```
template<typename _Tp , typename _Alloc >
deque< _Tp, _Alloc >::iterator deque::insert (
    const_iterator __position,
    const value_type & __x )
```

Inserts given value into deque before specified iterator.

Parameters

<code>__position</code>	A const_iterator into the deque.
<code>__x</code>	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a copy of the given value before the specified location.

insert() [4/5]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
iterator std::deque< _Tp, _Alloc >::insert (
    const_iterator __position,
    size_type __n,
    const value_type & __x ) [inline]
```

Inserts a number of copies of given data into the deque.

Parameters

<code>__position</code>	A const_iterator into the deque.
-------------------------	----------------------------------

Parameters

<code>__n</code>	Number of elements to be inserted.
<code>__x</code>	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a specified number of copies of the given data before the location specified by `__position`.
References [std::deque< _Tp, _Alloc >::begin\(\)](#), and [std::deque< _Tp, _Alloc >::cbegin\(\)](#).

insert() [5/5]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
iterator std::deque< _Tp, _Alloc >::insert (
    const_iterator __position,
    value_type && __x ) [inline]
```

Inserts given rvalue into deque before specified iterator.

Parameters

<code>__position</code>	A const_iterator into the deque.
<code>__x</code>	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a copy of the given rvalue before the specified location.
References [std::deque< _Tp, _Alloc >::emplace\(\)](#), and [std::move\(\)](#).

max_size()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
size_type std::deque< _Tp, _Alloc >::max_size ( ) const [inline], [noexcept]
```

Returns the size() of the largest possible deque.

operator=() [1/3]

```
template<typename _Tp , typename _Alloc >
deque< _Tp, _Alloc > & deque::operator= (
    const deque< _Tp, _Alloc > & __x )
```

Deque assignment operator.

Parameters

<code>__x</code>	A deque of identical element and allocator types.
------------------	---------------------------------------------------

All the elements of `x` are copied.

The newly-created deque uses a copy of the allocator object used by `__x` (unless the allocator traits dictate a different object).

References [std::deque<_Tp, _Alloc>::begin\(\)](#), [std::deque<_Tp, _Alloc>::end\(\)](#), [std::deque<_Tp, _Alloc>::get_allocator\(\)](#), [std::deque<_Tp, _Alloc>::size\(\)](#), and [std::size\(\)](#).

operator=() [2/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
deque & std::deque<_Tp, _Alloc>::operator= (
    deque<_Tp, _Alloc> && __x ) [inline], [noexcept]
```

Deque move assignment operator.

Parameters

\leftrightarrow	A deque of identical element and allocator types.
__x	

The contents of [__x](#) are moved into this deque (without copying, if the allocators permit it). [__x](#) is a valid, but unspecified deque.

References [std::move\(\)](#).

operator=() [3/3]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
deque & std::deque<_Tp, _Alloc>::operator= (
    initializer_list<value_type> __l ) [inline]
```

Assigns an initializer list to a deque.

Parameters

\leftrightarrow	An initializer_list.
__l	
\leftrightarrow	
__l	
/	

This function fills a deque with copies of the elements in the initializer_list [__l](#).

Note that the assignment completely changes the deque and that the resulting deque's size is the same as the number of elements assigned.

operator[]() [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reference std::deque<_Tp, _Alloc>::operator[] (
    size_type __n ) const [inline], [noexcept]
```

Subscript access to the data contained in the deque.

Parameters

\leftrightarrow	The index of the element for which data should be accessed.
__n	

Returns

Read-only (constant) reference to data.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and out_of_range lookups are not defined. (For checked lookups see at().)

operator[]() [2/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
reference std::deque< _Tp, _Alloc >::operator[] (
    size_type __n ) [inline], [noexcept]
```

Subscript access to the data contained in the deque.

Parameters

\leftarrow _n	The index of the element for which data should be accessed.
--------------------	-------------------------------------------------------------

Returns

Read/write reference to data.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and out_of_range lookups are not defined. (For checked lookups see at().)

pop_back()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
void std::deque< _Tp, _Alloc >::pop_back ( ) [inline], [noexcept]
```

Removes last element.

This is a typical stack operation. It shrinks the deque by one.

Note that no data is returned, and if the last element's data is needed, it should be retrieved before pop_back() is called.

References std::deque< _Tp, _Alloc >::M_pop_back_aux().

pop_front()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
void std::deque< _Tp, _Alloc >::pop_front ( ) [inline], [noexcept]
```

Removes first element.

This is a typical stack operation. It shrinks the deque by one.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before pop_front() is called.

References std::deque< _Tp, _Alloc >::M_pop_front_aux().

push_back()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
void std::deque< _Tp, _Alloc >::push_back (
    const value_type & __x ) [inline]
```

Add data to the end of the deque.

Parameters

\leftarrow _X	Data to be added.
--------------------	-------------------

This is a typical stack operation. The function creates an element at the end of the deque and assigns the given data to it. Due to the nature of a deque this operation can be done in constant time.

References [std::deque<_Tp, _Alloc>::_M_push_back_aux\(\)](#).

push_front()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
void std::deque<_Tp, _Alloc>::push_front (
    const value_type & __x ) [inline]
```

Add data to the front of the deque.

Parameters

<code>__x</code>	Data to be added.
------------------	-------------------

This is a typical stack operation. The function creates an element at the front of the deque and assigns the given data to it. Due to the nature of a deque this operation can be done in constant time.

References [std::deque<_Tp, _Alloc>::_M_push_front_aux\(\)](#).

rbegin() [1/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::deque<_Tp, _Alloc>::rbegin ( ) const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the deque. Iteration is done in reverse element order.

rbegin() [2/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
reverse_iterator std::deque<_Tp, _Alloc>::rbegin ( ) [inline], [noexcept]
```

Returns a read/write reverse iterator that points to the last element in the deque. Iteration is done in reverse element order.

rend() [1/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::deque<_Tp, _Alloc>::rend ( ) const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first element in the deque. Iteration is done in reverse element order.

rend() [2/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
reverse_iterator std::deque<_Tp, _Alloc>::rend ( ) [inline], [noexcept]
```

Returns a read/write reverse iterator that points to one before the first element in the deque. Iteration is done in reverse element order.

resize() [1/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
void std::deque<_Tp, _Alloc>::resize (
    size_type __new_size ) [inline]
```

Resizes the deque to the specified number of elements.

Parameters

<code>__new_size</code>	Number of elements the deque should contain.
-------------------------	----------------------------------------------

This function will resize the deque to the specified number of elements. If the number is smaller than the deque's current size the deque is truncated, otherwise default constructed elements are appended.

References [std::deque< _Tp, _Alloc >::size\(\)](#).

resize() [2/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
void std::deque< _Tp, _Alloc >::resize (
    size_type __new_size,
    const value_type & __x ) [inline]
```

Resizes the deque to the specified number of elements.

Parameters

<code>__new_size</code>	Number of elements the deque should contain.
<code>__x</code>	Data with which new elements should be populated.

This function will resize the deque to the specified number of elements. If the number is smaller than the deque's current size the deque is truncated, otherwise the deque is extended and new elements are populated with given data.

References [std::deque< _Tp, _Alloc >::size\(\)](#).

shrink_to_fit()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
void std::deque< _Tp, _Alloc >::shrink_to_fit ( ) [inline], [noexcept]
```

A non-binding request to reduce memory use.

size()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
size_type std::deque< _Tp, _Alloc >::size ( ) const [inline], [noexcept]
```

Returns the number of elements in the deque.

Referenced by [std::deque< _Tp, _Alloc >::M_range_check\(\)](#), [std::deque< _Tp, _Alloc >::operator=\(\)](#), [std::operator==\(\)](#), [std::deque< _Tp, _Alloc >::resize\(\)](#), and [std::deque< _Tp, _Alloc >::resize\(\)](#).

swap()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
void std::deque< _Tp, _Alloc >::swap (
    deque< _Tp, _Alloc > & __x ) [inline], [noexcept]
```

Swaps data with another deque.

Parameters

<code>__x</code>	A deque of the same element and allocator types.
------------------	--------------------------------------------------

This exchanges the elements between two deques in constant time. (Four pointers, so it should be quite fast.) Note that

the global `std::swap()` function is specialized such that `std::swap(d1,d2)` will feed to this function. Whether the allocators are swapped depends on the allocator traits. The documentation for this class was generated from the following files:

- [stl_deque.h](#)

5.410 `std::tr2::direct_bases<_Tp>` Struct Template Reference

Public Types

- typedef [__reflection_typelist](#)< `__direct_bases(_Tp)...` > **type**

5.410.1 Detailed Description

```
template<typename _Tp>
struct std::tr2::direct_bases<_Tp>
```

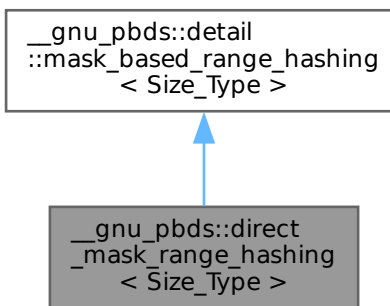

Enumerate all the direct base classes of a class. Form of a typelist. The documentation for this struct was generated from the following file:

- [tr2/type_traits](#)

5.411 `__gnu_pbds::direct_mask_range_hashing<Size_Type>` Class Template Reference

```
#include <hash_policy.hpp>
```

Inheritance diagram for `__gnu_pbds::direct_mask_range_hashing<Size_Type>`:

Public Types

- typedef `Size_Type` **size_type**

Public Member Functions

- void **swap** ([direct_mask_range_hashing](#)< `Size_Type` > &other)

Protected Member Functions

- void **notify_resized** (size_type size)
- size_type **operator()** (size_type hash) const
- size_type **range_hash** (size_type hash) const
- void **swap** (mask_based_range_hashing &other)

5.411.1 Detailed Description

```
template<typename Size_Type = std::size_t>
class __gnu_pbds::direct_mask_range_hashing< Size_Type >
```

A mask range-hashing class (uses a bitmask).

5.411.2 Member Function Documentation**operator()()**

```
template<typename Size_Type = std::size_t>
size_type __gnu_pbds::direct_mask_range_hashing< Size_Type >::operator() (
    size_type hash ) const [inline], [protected]
```

Transforms the `__hash` value hash into a ranged-hash value (using a bit-mask).

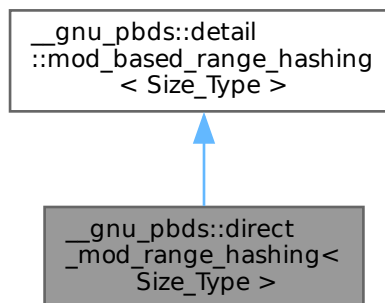

The documentation for this class was generated from the following file:

- [hash_policy.hpp](#)

5.412 `__gnu_pbds::direct_mod_range_hashing< Size_Type >` Class Template Reference

5.415.1 Detailed Description

template<typename `_RandomNumberEngine`, size_t __p, size_t __r>
class `std::discard_block_engine<_RandomNumberEngine, __p, __r>`

Produces random numbers from some base engine by discarding blocks of data.

`0 <= __r <= __p`

5.415.2 Member Typedef Documentation

result_type

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
typedef _RandomNumberEngine::result_type std::discard_block_engine<_RandomNumberEngine, __p, __r>::result_type
```

The type of the generated random value.

5.415.3 Constructor & Destructor Documentation

`discard_block_engine()` [1/5]

```
template<typename _RandomNumberEngine, size_t __p, size_t __r>
std::discard_block_engine<_RandomNumberEngine, __p, __r>::discard_block_engine ( ) [inline]
```

Constructs a default `discard_block_engine` engine.

The underlying engine is default constructed as well.

discard_block_engine() [2/5]

```
template<typename _RandomNumberEngine , size_t __p, size_t __r>
std::discard_block_engine< _RandomNumberEngine, __p, __r >::discard_block_engine (
    const _RandomNumberEngine & __rng ) [inline], [explicit]
```

Copy constructs a discard_block_engine engine.

Copies an existing base class random number generator.

Parameters

<code>__rng</code>	An existing (base class) engine object.
--------------------	-----------------------------------------

discard_block_engine() [3/5]

```
template<typename _RandomNumberEngine , size_t __p, size_t __r>
std::discard_block_engine< _RandomNumberEngine, __p, __r >::discard_block_engine (
    _RandomNumberEngine && __rng ) [inline], [explicit]
```

Move constructs a discard_block_engine engine.

Copies an existing base class random number generator.

Parameters

<code>__rng</code>	An existing (base class) engine object.
--------------------	-----------------------------------------

discard_block_engine() [4/5]

```
template<typename _RandomNumberEngine , size_t __p, size_t __r>
std::discard_block_engine< _RandomNumberEngine, __p, __r >::discard_block_engine (
    result_type __s ) [inline], [explicit]
```

Seed constructs a discard_block_engine engine.

Constructs the underlying generator engine seeded with `__s`.

Parameters

<code>__s</code>	A seed value for the base class engine.
------------------	-----------------------------------------

discard_block_engine() [5/5]

```
template<typename _RandomNumberEngine , size_t __p, size_t __r>
template<typename _Sseq , typename = _If_seed_seq<_Sseq>>
std::discard_block_engine< _RandomNumberEngine, __p, __r >::discard_block_engine (
    _Sseq & __q ) [inline], [explicit]
```

Generator construct a discard_block_engine engine.

Parameters

<code>__q</code>	A seed sequence.
------------------	------------------

5.415.4 Member Function Documentation

base()

```
template<typename _RandomNumberEngine , size_t __p, size_t __r>
const _RandomNumberEngine & std::discard_block_engine<_RandomNumberEngine, __p, __r>::base ( )
const [inline], [noexcept]
```

Gets a const reference to the underlying generator engine object.

discard()

```
template<typename _RandomNumberEngine , size_t __p, size_t __r>
void std::discard_block_engine<_RandomNumberEngine, __p, __r>::discard (
    unsigned long long __z ) [inline]
```

Discard a sequence of random numbers.

max()

```
template<typename _RandomNumberEngine , size_t __p, size_t __r>
static constexpr result_type std::discard_block_engine<_RandomNumberEngine, __p, __r>::max ( )
[inline], [static], [constexpr]
```

Gets the maximum value in the generated random number range.

min()

```
template<typename _RandomNumberEngine , size_t __p, size_t __r>
static constexpr result_type std::discard_block_engine<_RandomNumberEngine, __p, __r>::min ( )
[inline], [static], [constexpr]
```

Gets the minimum value in the generated random number range.

operator>()

```
template<typename _RandomNumberEngine , size_t __p, size_t __r>
discard_block_engine<_RandomNumberEngine, __p, __r>::result_type std::discard_block_engine<_↵
_RandomNumberEngine, __p, __r>::operator()
```

Gets the next value in the generated random number sequence.

seed() [1/3]

```
template<typename _RandomNumberEngine , size_t __p, size_t __r>
void std::discard_block_engine<_RandomNumberEngine, __p, __r>::seed ( ) [inline]
```

Reseeds the discard_block_engine object with the default seed for the underlying base class generator engine.

seed() [2/3]

```
template<typename _RandomNumberEngine , size_t __p, size_t __r>
template<typename _Sseq >
_If_seed_seq<_Sseq > std::discard_block_engine<_RandomNumberEngine, __p, __r>::seed (
    _Sseq & __q ) [inline]
```

Reseeds the discard_block_engine object with the given seed sequence.

Parameters

<code>_↵</code>	A seed generator function.
<code>_q</code>	

seed() [3/3]

```
template<typename _RandomNumberEngine , size_t __p, size_t __r>
void std::discard_block_engine< _RandomNumberEngine, __p, __r >::seed (
    result_type __s ) [inline]
```

Reseeds the discard_block_engine object with the default seed for the underlying base class generator engine.

5.415.5 Friends And Related Symbol Documentation**operator<<**

```
template<typename _RandomNumberEngine , size_t __p, size_t __r>
template<typename _RandomNumberEngine1 , size_t __p1, size_t __r1, typename _CharT , typename _Traits >
std::basic_ostream< _CharT, _Traits > & operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::discard_block_engine< _RandomNumberEngine1, __p1, __r1 > & __x ) [friend]
```

Inserts the current state of a discard_block_engine random number generator engine __x into the output stream __os.

Parameters

__os	An output stream.
__x	A discard_block_engine random number generator engine.

Returns

The output stream with the state of __x inserted or in an error state.

operator==

```
template<typename _RandomNumberEngine , size_t __p, size_t __r>
bool operator== (
    const discard_block_engine< _RandomNumberEngine, __p, __r > & __lhs,
    const discard_block_engine< _RandomNumberEngine, __p, __r > & __rhs ) [friend]
```

Compares two discard_block_engine random number generator objects of the same type for equality.

Parameters

__lhs	A discard_block_engine random number generator object.
__rhs	Another discard_block_engine random number generator object.

Returns

true if the infinite sequences of generated values would be equal, false otherwise.

operator>>

```
template<typename _RandomNumberEngine , size_t __p, size_t __r>
template<typename _RandomNumberEngine1 , size_t __p1, size_t __r1, typename _CharT , typename _Traits >
std::basic_istream< _CharT, _Traits > & operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::discard_block_engine< _RandomNumberEngine1, __p1, __r1 > & __x ) [friend]
```

Extracts the current state of a % subtract_with_carry_engine random number generator engine `__x` from the input stream `__is`.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A discard_block_engine random number generator engine.

Returns

The input stream with the state of `__x` extracted or in an error state.

The documentation for this class was generated from the following files:

5.416.1 Detailed Description

template<typename _IntType = int>
class [std::discrete_distribution](#)< _IntType >

A [discrete_distribution](#) random number distribution.
The formula for the discrete probability mass function is

5.416.2 Member Typedef Documentation

result_type

```
template<typename _IntType = int>
typedef _IntType std::discrete\_distribution< _IntType >::result_type
```

The type of the range of the distribution.

5.416.3 Member Function Documentation

max()

```
template<typename _IntType = int>
result\_type std::discrete\_distribution< _IntType >::max ( ) const [inline]
```

Returns the least upper bound value of the distribution.
References [std::vector](#)< _Tp, _Alloc >::empty(), and [std::vector](#)< _Tp, _Alloc >::size().

min()

```
template<typename _IntType = int>
result\_type std::discrete\_distribution< _IntType >::min ( ) const [inline]
```

Returns the greatest lower bound value of the distribution.

operator()()

```
template<typename _IntType = int>
template<typename _UniformRandomNumberGenerator >
result\_type std::discrete\_distribution< _IntType >::operator() (
    _UniformRandomNumberGenerator & __urng ) [inline]
```

Generating functions.
References [std::discrete_distribution](#)< _IntType >::operator()().
Referenced by [std::discrete_distribution](#)< _IntType >::operator()().

param() [1/2]

```
template<typename _IntType = int>
param_type std::discrete_distribution< _IntType >::param ( ) const [inline]
```

Returns the parameter set of the distribution.

param() [2/2]

```
template<typename _IntType = int>
void std::discrete_distribution< _IntType >::param (
    const param_type & __param ) [inline]
```

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--------------------------------------------

probabilities()

```
template<typename _IntType = int>
std::vector< double > std::discrete_distribution< _IntType >::probabilities ( ) const [inline]
```

Returns the probabilities of the distribution.

References `std::vector< _Tp, _Alloc >::empty()`.

reset()

```
template<typename _IntType = int>
void std::discrete_distribution< _IntType >::reset ( ) [inline]
```

Resets the distribution state.

5.416.4 Friends And Related Symbol Documentation**operator<<**

```
template<typename _IntType = int>
template<typename _IntType1 , typename _CharT , typename _Traits >
std::basic_ostream< _CharT, _Traits > & operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::discrete_distribution< _IntType1 > & __x ) [friend]
```

Inserts a discrete_distribution random number distribution `__x` into the output stream `__os`.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A discrete_distribution random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

operator==

```
template<typename _IntType = int>
bool operator== (
```

```
const discrete_distribution< _IntType > & __d1,
const discrete_distribution< _IntType > & __d2 ) [friend]
```

Return true if two discrete distributions have the same parameters.

operator>>

```
template<typename _IntType = int>
template<typename _IntType1 , typename _CharT , typename _Traits >
std::basic_istream< _CharT, _Traits > & operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::discrete_distribution< _IntType1 > & __x ) [friend]
```

Extracts a discrete_distribution random number distribution __x from the input stream __is.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A discrete_distribution random number generator engine.

Returns

The input stream with __x extracted or in an error state.

5.423.1 Detailed Description

template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
class std::tr2::dynamic_bitset<_WordT, _Alloc >

The `dynamic_bitset` class represents a sequence of bits.

See N2050, Proposal to Add a Dynamically Sizeable Bitset to the Standard Library. <http://www.open-std.org/jtc1/sc22/wg21/docs/papers/2006/n2050.pdf>

In the general unoptimized case, storage is allocated in word-sized blocks. Let B be the number of bits in a word, then $(Nb+(B-1))/B$ words will be used for storage. $B - Nb$ bits are unused. (They are the high-order bits in the highest word.)

It is a class invariant that those unused bits are always zero.

If you think of `dynamic_bitset` as "a simple array of bits," be aware that your mental picture is reversed: a `dynamic_bitset` behaves the same way as bits in integers do, with the bit at index 0 in the "least significant / right-hand" position, and the bit at index $Nb-1$ in the "most significant / left-hand" position. Thus, unlike other containers, a `dynamic_bitset`'s index "counts from right to left," to put it very loosely.

This behavior is preserved when translating to and from strings. For example, the first line of the following program probably prints "b('a') is 0001100001" on a modern ASCII system.

```
#include <dynamic_bitset>
#include <iostream>
#include <sstream>

using namespace std;

int main()
{
    long    a = 'a';
    dynamic_bitset<> b(a);

    cout << "b('a') is " << b << endl;

    ostringstream s;
    s << b;
    string str = s.str();
    cout << "index 3 in the string is " << str[3] << " but\n"
         << "index 3 in the bitset is " << b[3] << endl;
}
```

Most of the actual code isn't contained in `dynamic_bitset<>` itself, but in the base class `__dynamic_bitset_base`. The base class works with whole words, not with individual bits. This allows us to specialize `__dynamic_bitset_base` for the important special case where the `dynamic_bitset` is only a single word.

Extra confusion can result due to the fact that the storage for `__dynamic_bitset_base` *is* a vector, and is indexed as such. This is carefully encapsulated.

5.423.2 Constructor & Destructor Documentation

dynamic_bitset() [1/7]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
std::tr2::dynamic_bitset< _WordT, _Alloc >::dynamic_bitset ( ) [default]
```

All bits set to zero.

dynamic_bitset() [2/7]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
std::tr2::dynamic_bitset< _WordT, _Alloc >::dynamic_bitset (
    const allocator_type & __alloc ) [inline], [explicit]
```

All bits set to zero.

dynamic_bitset() [3/7]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
std::tr2::dynamic_bitset< _WordT, _Alloc >::dynamic_bitset (
    size_type __nbits,
    unsigned long long __val = 0ULL,
    const allocator_type & __alloc = allocator_type() ) [inline], [explicit]
```

Initial bits bitwise-copied from a single word (others set to zero).

dynamic_bitset() [4/7]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
template<typename _CharT , typename _Traits , typename _Alloc1 >
std::tr2::dynamic_bitset< _WordT, _Alloc >::dynamic_bitset (
    const std::basic_string< _CharT, _Traits, _Alloc1 > & __str,
    typename basic_string< _CharT, _Traits, _Alloc1 >::size_type __pos = 0,
    typename basic_string< _CharT, _Traits, _Alloc1 >::size_type __n = std::basic_string<←
    _CharT, _Traits, _Alloc1>::npos,
    _CharT __zero = _CharT('0'),
    _CharT __one = _CharT('1'),
    const allocator_type & __alloc = allocator_type() ) [inline], [explicit]
```

Use a subset of a string.

Parameters

<code>__str</code>	A string of '0' and '1' characters.
<code>__pos</code>	Index of the first character in <code>__str</code> to use.
<code>__n</code>	The number of characters to copy.
<code>__zero</code>	The character to use for unset bits.
<code>__one</code>	The character to use for set bits.
<code>__alloc</code>	An allocator.

Exceptions

<code>std::out_of_range</code>	If <code>__pos</code> is bigger the size of <code>__str</code> .
<code>std::invalid_argument</code>	If a character appears in the string which is neither '0' nor '1'.

dynamic_bitset() [5/7]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
std::tr2::dynamic_bitset< _WordT, _Alloc >::dynamic_bitset (
    const char * __str,
    const allocator_type & __alloc = allocator_type() ) [inline], [explicit]
```

Construct from a string.

Parameters

<code>__str</code>	A string of '0' and '1' characters.
<code>__alloc</code>	An allocator.

Exceptions

<code>std::invalid_argument</code>	If a character appears in the string which is neither '0' nor '1'.
------------------------------------	--------------------------------------------------------------------

dynamic_bitset() [6/7]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
std::tr2::dynamic_bitset< _WordT, _Alloc >::dynamic_bitset (
    const dynamic_bitset< _WordT, _Alloc > & ) [default]
```

Copy constructor.

dynamic_bitset() [7/7]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
std::tr2::dynamic_bitset< _WordT, _Alloc >::dynamic_bitset (
    dynamic_bitset< _WordT, _Alloc > && __b ) [inline], [noexcept]
```

Move constructor.

5.423.3 Member Function Documentation**all()**

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
bool std::tr2::dynamic_bitset< _WordT, _Alloc >::all ( ) const [inline]
```

Tests whether all the bits are on.

Returns

True if all the bits are set.

any()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
bool std::tr2::dynamic_bitset< _WordT, _Alloc >::any ( ) const [inline]
```

Tests whether any of the bits are on.

Returns

True if at least one bit is set.

append() [1/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
template<typename _BlockInputIterator >
void std::tr2::dynamic_bitset< _WordT, _Alloc >::append (
    _BlockInputIterator __first,
    _BlockInputIterator __last ) [inline]
```

Append an iterator range of blocks.

append() [2/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
void std::tr2::dynamic_bitset< _WordT, _Alloc >::append (
    block_type __block ) [inline]
```

Append a block.

clear()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
void std::tr2::dynamic_bitset< _WordT, _Alloc >::clear ( ) [inline]
```

Clear the bitset.

count()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
size_type std::tr2::dynamic_bitset< _WordT, _Alloc >::count ( ) const [inline], [noexcept]
```

Returns the number of bits which are set.

empty()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
bool std::tr2::dynamic_bitset< _WordT, _Alloc >::empty ( ) const [inline], [noexcept]
```

Returns true if the dynamic_bitset is empty.

find_first()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
size_type std::tr2::dynamic_bitset< _WordT, _Alloc >::find_first ( ) const [inline]
```

Finds the index of the first "on" bit.

Returns

The index of the first bit set, or size() if not found.

See also

find_next

find_next()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
size_type std::tr2::dynamic_bitset< _WordT, _Alloc >::find_next (
    size_t __prev ) const [inline]
```

Finds the index of the next "on" bit after prev.

Returns

The index of the next bit set, or size() if not found.

Parameters

<code>__prev</code>	Where to start searching.
---------------------	---------------------------

See also

find_first

flip() [1/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset< _WordT, _Alloc >::flip ( ) [inline]
```

Toggles every bit to its opposite value.

flip() [2/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset< _WordT, _Alloc >::flip (
    size_type __pos ) [inline]
```

Toggles a given bit to its opposite value.

Parameters

<code>__pos</code>	The index of the bit.
--------------------	-----------------------

Exceptions

<code>std::out_of_range</code>	If <code>__pos</code> is bigger the size of the set.
--------------------------------	------------------------------------------------------

get_allocator()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
allocator_type std::tr2::dynamic_bitset< _WordT, _Alloc >::get_allocator ( ) const [inline],
[noexcept]
```

Return the allocator for the bitset.

max_size()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
constexpr size_type std::tr2::dynamic_bitset< _WordT, _Alloc >::max_size ( ) [inline], [constexpr],
[noexcept]
```

Returns the maximum size of a dynamic_bitset object having the same type as *this. The real answer is max() * bits_per_block but is likely to overflow.

none()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
bool std::tr2::dynamic_bitset< _WordT, _Alloc >::none ( ) const [inline]
```

Tests whether any of the bits are on.

Returns

True if none of the bits are set.

num_blocks()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
size_type std::tr2::dynamic_bitset< _WordT, _Alloc >::num_blocks ( ) const [inline], [noexcept]
```

Returns the total number of blocks.

operator&=() [1/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset< _WordT, _Alloc >::operator&= (
    const dynamic_bitset< _WordT, _Alloc > & __rhs ) [inline]
```

Operations on dynamic_bitsets.

Parameters

<code>__rhs</code>	A same-sized dynamic_bitset.
--------------------	------------------------------

These should be self-explanatory.

operator&=() [2/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset< _WordT, _Alloc >::operator&= (
    dynamic_bitset< _WordT, _Alloc > && __rhs ) [inline]
```

Operations on dynamic_bitsets.

Parameters

<code>__rhs</code>	A same-sized dynamic_bitset.
--------------------	------------------------------

These should be self-explanatory.

operator-=()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset< _WordT, _Alloc >::operator-= (
    const dynamic_bitset< _WordT, _Alloc > & __rhs ) [inline]
```

Operations on dynamic_bitsets.

Parameters

<code>__rhs</code>	A same-sized dynamic_bitset.
--------------------	------------------------------

These should be self-explanatory.

operator<<()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset std::tr2::dynamic_bitset< _WordT, _Alloc >::operator<< (
    size_type __pos ) const [inline]
```

Self-explanatory.

operator<<=()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset< _WordT, _Alloc >::operator<<= (
    size_type __pos ) [inline]
```

Operations on dynamic_bitsets.

Parameters

<code>__pos</code>	The number of places to shift.
--------------------	--------------------------------

These should be self-explanatory.

operator=() [1/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset< _WordT, _Alloc >::operator= (
    const dynamic_bitset< _WordT, _Alloc > & ) [default]
```

Copy assignment operator.

operator=() [2/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset< _WordT, _Alloc >::operator= (
    dynamic_bitset< _WordT, _Alloc > && __b ) [inline], [noexcept]
```

Move assignment operator.

operator>>()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset std::tr2::dynamic_bitset< _WordT, _Alloc >::operator>> (
    size_type __pos ) const [inline]
```

Self-explanatory.

operator>>=()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset< _WordT, _Alloc >::operator>>= (
    size_type __pos ) [inline]
```

Operations on dynamic_bitsets.

Parameters

<code>__pos</code>	The number of places to shift.
--------------------	--------------------------------

These should be self-explanatory.

operator[]() [1/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
reference std::tr2::dynamic_bitset< _WordT, _Alloc >::operator[] (
    size_type __pos ) [inline]
```

Array-indexing support.

Parameters

<code>__pos</code>	Index into the dynamic_bitset.
--------------------	--------------------------------

Returns

A bool for a 'const dynamic_bitset'. For non-const bitsets, an instance of the reference proxy class.

Note

These operators do no range checking and throw no exceptions, as required by DR 11 to the standard.

operator[]() [2/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
const_reference std::tr2::dynamic_bitset<_WordT, _Alloc >::operator[] (
    size_type __pos ) const [inline]
```

Array-indexing support.

Parameters

<code>__pos</code>	Index into the dynamic_bitset.
--------------------	--------------------------------

Returns

A bool for a 'const dynamic_bitset'. For non-const bitsets, an instance of the reference proxy class.

Note

These operators do no range checking and throw no exceptions, as required by DR 11 to the standard.

operator^=()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset<_WordT, _Alloc >::operator^= (
    const dynamic_bitset<_WordT, _Alloc > & __rhs ) [inline]
```

Operations on dynamic_bitsets.

Parameters

<code>__rhs</code>	A same-sized dynamic_bitset.
--------------------	------------------------------

These should be self-explanatory.

operator" |=()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset<_WordT, _Alloc >::operator|= (
    const dynamic_bitset<_WordT, _Alloc > & __rhs ) [inline]
```

Operations on dynamic_bitsets.

Parameters

<code>__rhs</code>	A same-sized <code>dynamic_bitset</code> .
--------------------	--------------------------------------------

These should be self-explanatory.

operator~()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset< std::tr2::dynamic_bitset< _WordT, _Alloc >::operator~ ( ) const [inline]
```

See the no-argument `flip()`.

push_back()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
void std::tr2::dynamic_bitset< _WordT, _Alloc >::push_back (
    bool __bit ) [inline]
```

Push a bit onto the high end of the bitset.

reset() [1/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset< _WordT, _Alloc >::reset ( ) [inline]
```

Sets every bit to false.

reset() [2/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset< _WordT, _Alloc >::reset (
    size_type __pos ) [inline]
```

Sets a given bit to false.

Parameters

<code>__pos</code>	The index of the bit.
--------------------	-----------------------

Exceptions

<code>std::out_of_range</code>	If <code>__pos</code> is bigger the size of the set.
--------------------------------	------------------------------------------------------

Same as writing `set (__pos, false)`.

resize()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
void std::tr2::dynamic_bitset< _WordT, _Alloc >::resize (
    size_type __nbits,
    bool __value = false ) [inline]
```

Resize the bitset.

Referenced by `std::tr2::operator>>()`.

set() [1/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset< _WordT, _Alloc >::set ( ) [inline]
```

Sets every bit to true.

set() [2/2]

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
dynamic_bitset & std::tr2::dynamic_bitset< _WordT, _Alloc >::set (
    size_type __pos,
    bool __val = true ) [inline]
```

Sets a given bit to a particular value.

Parameters

<code>__pos</code>	The index of the bit.
<code>__val</code>	Either true or false, defaults to true.

Exceptions

<code>std::out_of_range</code>	If <code>__pos</code> is bigger the size of the set.
--------------------------------	------------------------------------------------------

size()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
size_type std::tr2::dynamic_bitset< _WordT, _Alloc >::size ( ) const [inline], [noexcept]
```

Returns the total number of bits.

Referenced by [std::tr2::operator>>\(\)](#).

swap()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
void std::tr2::dynamic_bitset< _WordT, _Alloc >::swap (
    dynamic_bitset< _WordT, _Alloc > & __b ) [inline], [noexcept]
```

Swap with another bitset.

test()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
bool std::tr2::dynamic_bitset< _WordT, _Alloc >::test (
    size_type __pos ) const [inline]
```

Tests the value of a bit.

Parameters

<code>__pos</code>	The index of a bit.
--------------------	---------------------

Returns

The value at `__pos`.

Exceptions

<code>std::out_of_range</code>	If <code>__pos</code> is bigger the size of the set.
--------------------------------	------------------------------------------------------

to_string()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
template<typename _CharT = char, typename _Traits = std::char_traits<_CharT>, typename _Alloc1 =
std::allocator<_CharT>>
std::basic_string< _CharT, _Traits, _Alloc1 > std::tr2::dynamic_bitset< _WordT, _Alloc >::to_↵
string (
    _CharT __zero = _CharT('0'),
    _CharT __one = _CharT('1') ) const [inline]
```

Returns a character interpretation of the `dynamic_bitset`.

Returns

The string equivalent of the bits.

Note the ordering of the bits: decreasing character positions correspond to increasing bit positions (see the main class notes for an example).

to_ulong()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
unsigned long long std::tr2::dynamic_bitset< _WordT, _Alloc >::to_ulong ( ) const [inline]
```

Returns a numerical interpretation of the `dynamic_bitset`.

Returns

The integral equivalent of the bits.

Exceptions

<code>std::overflow_error</code>	If there are too many bits to be represented in an unsigned long.
----------------------------------	-------------------------------------------------------------------

to_ulong()

```
template<typename _WordT = unsigned long long, typename _Alloc = std::allocator<_WordT>>
unsigned long std::tr2::dynamic_bitset< _WordT, _Alloc >::to_ulong ( ) const [inline]
```

Returns a numerical interpretation of the `dynamic_bitset`.

Returns

The integral equivalent of the bits.

Exceptions

<code>std::overflow_error</code>	If there are too many bits to be represented in an unsigned long.

5.426.1 Detailed Description

```
template<typename _CharT>
class __gnu_cxx::enc_filebuf< _CharT >
```

class `enc_filebuf`.

5.426.2 Member Function Documentation

`_M_create_pback()`

```
void std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::_M_create_pback ( ) [inline],
[protected], [inherited]
```

Initializes pback buffers, and moves normal buffers to safety. Assumptions: `_M_in_cur` has already been moved back

`_M_destroy_pback()`

```
void std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::_M_destroy_pback ( ) throw (
) [inline], [protected], [inherited]
```

Deactivates pback buffer contents, and restores normal buffer. Assumptions: The pback buffer has only moved forward.

`_M_set_buffer()`

```
void std::basic_filebuf<_CharT, encoding_char_traits<_CharT> >::_M_set_buffer (
    streamsize __off) [inline], [protected], [inherited]
```

This function sets the pointers of the internal buffer, both get and put areas. Typically:

`__off == egptr() - eback()` upon underflow/uflow (**read** mode); `__off == 0` upon overflow (**write** mode); `__off == -1` upon open, setbuf, seekoff/pos (**uncommitted** mode).

NB: `egptr() - pbase() == _M_buf_size - 1`, since `_M_buf_size` reflects the actual allocated memory and the last cell is reserved for the overflow char of a full put area.

`close()`

```
basic_filebuf<_CharT, encoding_char_traits<_CharT> >::__filebuf_type * std::basic_filebuf<_CharT, encoding_char_traits<_CharT> >::close [inherited]
```

Closes the currently associated file.

Returns

`this` on success, `NULL` on failure

If no file is currently open, this function immediately fails.

If a *put buffer area* exists, `overflow(eof)` is called to flush all the characters. The file is then closed.

If any operations fail, this function also fails.

`eback()`

```
template<typename _CharT, typename _Traits>
char_type * std::basic_streambuf<_CharT, _Traits>::eback ( ) const [inline], [protected],
[inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- `eback()` returns the beginning pointer for the input sequence
- `gptr()` returns the next pointer for the input sequence
- `egptr()` returns the end pointer for the input sequence

`egptr()`

```
template<typename _CharT, typename _Traits>
char_type * std::basic_streambuf<_CharT, _Traits>::egptr ( ) const [inline], [protected],
[inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- `eback()` returns the beginning pointer for the input sequence
- `gptr()` returns the next pointer for the input sequence
- `egptr()` returns the end pointer for the input sequence

Referenced by `std::wbuffer_convert<_Codecvt, _Elem, _Tr>::underflow()`.

epptr()

```
template<typename _CharT , typename _Traits >
char_type * std::basic\_streambuf< _CharT, _Traits >::epptr ( ) const [inline], [protected],
[inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- pbase() returns the beginning pointer for the output sequence
- pptr() returns the next pointer for the output sequence
- epptr() returns the end pointer for the output sequence

gbump()

```
template<typename _CharT , typename _Traits >
void std::basic\_streambuf< _CharT, _Traits >::gbump (
    int __n ) [inline], [protected], [inherited]
```

Moving the read position.

Parameters

<code>__n</code>	The delta by which to move.
------------------	-----------------------------

This just advances the read position without returning any data.

getloc()

```
template<typename _CharT , typename _Traits >
locale std::basic\_streambuf< _CharT, _Traits >::getloc ( ) const [inline], [inherited]
```

Locale access.

Returns

The current locale in effect.

If pubimbue(loc) has been called, then the most recent loc is returned. Otherwise the global locale in effect at the time of construction is returned.

gptr()

```
template<typename _CharT , typename _Traits >
char_type * std::basic\_streambuf< _CharT, _Traits >::gptr ( ) const [inline], [protected], [inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- eback() returns the beginning pointer for the input sequence
- gptr() returns the next pointer for the input sequence
- egptr() returns the end pointer for the input sequence

Referenced by [std::wbuffer_convert< _Codecv, _Elem, _Tr >::underflow\(\)](#).

imbue()

```
void std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>::imbue (
    const locale & __loc ) [protected], [virtual], [inherited]
```

Changes translations.

Parameters

<code>__loc</code>	A new locale.
--------------------	---------------

Translations done during I/O which depend on the current locale are changed by this call. The standard adds, *Between invocations of this function a class derived from streambuf can safely cache results of calls to locale functions and to members of facets so obtained.*

Note

Base class version does nothing.

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

in_avail()

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf<_CharT, _Traits>::in_avail ( ) [inline], [inherited]
```

Looking ahead into the stream.

Returns

The number of characters available.

If a read position is available, returns the number of characters available for reading before the buffer must be refilled. Otherwise returns the derived `showmanyc()`.

is_open()

```
bool std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>::is_open ( ) const throw ( )
[inline], [inherited]
```

Returns true if the external file is open.

open() [1/3]

```
_If_fs_path<_Path, __filebuf_type * > std::basic_filebuf<_CharT, encoding_char_traits<_CharT>
>::open (
    const _Path & __s,
    ios_base::openmode __mode ) [inline], [inherited]
```

Opens an external file.

Parameters

<code>__s</code>	The name of the file, as a <code>filesystem::path</code> .
<code>__mode</code>	The open mode flags.

Returns

`this` on success, NULL on failure

open() [2/3]

```
basic_filebuf< _CharT, encoding_char_traits< _CharT > >::__filebuf_type * std::basic_filebuf< ↵
_Chart, encoding_char_traits< _CharT > >::open (
    const char * __s,
    ios_base::openmode __mode ) [inherited]
```

Opens an external file.

Parameters

<code>__s</code>	The name of the file.
<code>__mode</code>	The open mode flags.

Returns

`this` on success, NULL on failure

If a file is already open, this function immediately fails. Otherwise it tries to open the file named `__s` using the flags given in `__mode`.

Table 92, adapted here, gives the relation between openmode combinations and the equivalent `fopen()` flags. (NB: lines app, in|out|app, in|app, binary|app, binary|in|out|app, and binary|in|app per DR 596)

ios_base Flag combination					stdio equivalent
binary	in	out	trunc	app	
		+			w
		+		+	a
				+	a
		+	+		w
	+				r
	+	+			r+
	+	+	+		w+
	+	+		+	a+
	+			+	a+
+		+			wb
+		+		+	ab
+				+	ab
+		+	+		wb
+	+				rb
+	+	+			r+b
+	+	+	+		w+b
+	+	+		+	a+b
+	+			+	a+b

open() [3/3]

```
__filebuf_type * std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::open (
    const std::string & __s,
    ios_base::openmode __mode ) [inline], [inherited]
```

Opens an external file.

Parameters

<code>__s</code>	The name of the file.
<code>__mode</code>	The open mode flags.

Returns

`this` on success, NULL on failure

overflow()

```
basic_filebuf<_CharT, encoding_char_traits<_CharT>>::int_type std::basic_filebuf<_CharT,
encoding_char_traits<_CharT>>::overflow (
    int_type __c = _Traits::eof() ) [protected], [virtual], [inherited]
```

Consumes data from the buffer; writes to the controlled sequence.

Parameters

<code>__c</code>	An additional character to consume.
------------------	-------------------------------------

Returns

`eof()` to indicate failure, something else (usually `__c`, or `not_eof()`)

Informally, this function is called when the output buffer is full (or does not exist, as buffering need not actually be done). If a buffer exists, it is *consumed*, with *some effect* on the controlled sequence. (Typically, the buffer is written out to the sequence verbatim.) In either case, the character `c` is also written out, if `__c` is not `eof()`.

For a formal definition of this function, see a good text such as Langer & Kreft, or [27.5.2.4.5]/3-7.

A functioning output streambuf can be created by overriding only this function (no buffer area will be used).

Note

Base class version does nothing, returns `eof()`.

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

pbackfail()

```
basic_filebuf<_CharT, encoding_char_traits<_CharT>>::int_type std::basic_filebuf<_CharT,
encoding_char_traits<_CharT>>::pbackfail (
    int_type __c = _Traits::eof() ) [protected], [virtual], [inherited]
```

Tries to back up the input sequence.

Parameters

<code>__c</code>	The character to be inserted back into the sequence.
------------------	------------------------------------------------------

Returns

`eof()` on failure, *some other value* on success

Postcondition

The constraints of `gptr()`, `eback()`, and `pptr()` are the same as for `underflow()`.

Note

Base class version does nothing, returns `eof()`.

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

pbase()

```
template<typename _CharT , typename _Traits >
char_type * std::basic_streambuf< _CharT, _Traits >::pbase ( ) const [inline], [protected],
[inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- pbase() returns the beginning pointer for the output sequence
- pptr() returns the next pointer for the output sequence
- epptr() returns the end pointer for the output sequence

pbump()

```
template<typename _CharT , typename _Traits >
void std::basic_streambuf< _CharT, _Traits >::pbump (
    int __n ) [inline], [protected], [inherited]
```

Moving the write position.

Parameters

<code>__n</code>	The delta by which to move.
------------------	-----------------------------

This just advances the write position without returning any data.

pptr()

```
template<typename _CharT , typename _Traits >
char_type * std::basic_streambuf< _CharT, _Traits >::pptr ( ) const [inline], [protected], [inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- pbase() returns the beginning pointer for the output sequence
- pptr() returns the next pointer for the output sequence
- epptr() returns the end pointer for the output sequence

pubimbue()

```
template<typename _CharT , typename _Traits >
locale std::basic_streambuf< _CharT, _Traits >::pubimbue (
    const locale & __loc ) [inline], [inherited]
```

Entry point for imbue().

Parameters

<code>__loc</code>	The new locale.
--------------------	-----------------

Returns

The previous locale.

Calls the derived `imbue(__loc)`.

pubseekoff()

```
template<typename _CharT , typename _Traits >
pos_type std::basic_streambuf< _CharT, _Traits >::pubseekoff (
    off_type __off,
    ios_base::seekdir __way,
    ios_base::openmode __mode = ios_base::in | ios_base::out ) [inline], [inherited]
```

Alters the stream position.

Parameters

<code>__off</code>	Offset.
<code>__way</code>	Value for <code>ios_base::seekdir</code> .
<code>__mode</code>	Value for <code>ios_base::openmode</code> .

Calls virtual `seekoff` function.

pubseekpos()

```
template<typename _CharT , typename _Traits >
pos_type std::basic_streambuf< _CharT, _Traits >::pubseekpos (
    pos_type __sp,
    ios_base::openmode __mode = ios_base::in | ios_base::out ) [inline], [inherited]
```

Alters the stream position.

Parameters

<code>__sp</code>	Position
<code>__mode</code>	Value for <code>ios_base::openmode</code> .

Calls virtual `seekpos` function.

pubsetbuf()

```
template<typename _CharT , typename _Traits >
basic_streambuf * std::basic_streambuf< _CharT, _Traits >::pubsetbuf (
    char_type * __s,
    streamsize __n ) [inline], [inherited]
```

Entry points for derived buffer functions.

The public versions of `pubfoo` dispatch to the protected derived `foo` member functions, passing the arguments (if any) and returning the result unchanged.

pubsync()

```
template<typename _CharT , typename _Traits >
int std::basic_streambuf< _CharT, _Traits >::pubsync ( ) [inline], [inherited]
```

Calls virtual `sync` function.

Referenced by `std::wbuffer_convert<_Codecvt, _Elem, _Tr>::sync()`, and `std::basic_istream<_CharT, _Traits>::sync()`.

sbumpc()

```
template<typename _CharT , typename _Traits >
int_type std::basic_streambuf< _CharT, _Traits >::sbumpc ( ) [inline], [inherited]
```

Getting the next character.

Returns

The next character, or eof.

If the input read position is available, returns that character and increments the read pointer, otherwise calls and returns `uflow()`.

Referenced by `std::basic_istream< char >::getline()`, `std::istreambuf_iterator< _CharT, _Traits >::operator++()`, and `std::istreambuf_iterator< _CharT, _Traits >::operator++()`.

seekoff()

```
basic_filebuf< _CharT, encoding_char_traits< _CharT > >::pos_type std::basic_filebuf< _CharT,
encoding_char_traits< _CharT > >::seekoff (
    off_type __off,
    ios_base::seekdir __way,
    ios_base::openmode __mode = ios_base::in | ios_base::out ) [protected], [virtual],
[inherited]
```

Alters the stream positions.

Each derived class provides its own appropriate behavior.

Note

Base class version does nothing, returns a `pos_type` that represents an invalid stream position.

Reimplemented from `std::basic_streambuf< _CharT, _Traits >`.

seekpos()

```
basic_filebuf< _CharT, encoding_char_traits< _CharT > >::pos_type std::basic_filebuf< _CharT,
encoding_char_traits< _CharT > >::seekpos (
    pos_type __pos,
    ios_base::openmode __mode = ios_base::in | ios_base::out ) [protected], [virtual],
[inherited]
```

Alters the stream positions.

Each derived class provides its own appropriate behavior.

Note

Base class version does nothing, returns a `pos_type` that represents an invalid stream position.

Reimplemented from `std::basic_streambuf< _CharT, _Traits >`.

setbuf()

```
basic_filebuf< _CharT, encoding_char_traits< _CharT > >::__streambuf_type * std::basic_filebuf<
_CharT, encoding_char_traits< _CharT > >::setbuf (
    char_type * __s,
    streamsize __n ) [protected], [virtual], [inherited]
```

Manipulates the buffer.

Parameters

<code>__s</code>	Pointer to a buffer area.
<code>__n</code>	Size of <code>__s</code> .

Returns

`this`

If no file has been opened, and both `__s` and `__n` are zero, then the stream becomes unbuffered. Otherwise, `__s` is used as a buffer; see <https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.html#io.streambuf.buffering> for more.

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

setg()

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf<_CharT, _Traits>::setg (
    char_type * __gbeg,
    char_type * __gnext,
    char_type * __gend ) [inline], [protected], [inherited]
```

Setting the three read area pointers.

Parameters

<code>__gbeg</code>	A pointer.
<code>__gnext</code>	A pointer.
<code>__gend</code>	A pointer.

Postcondition

`__gbeg == eback()`, `__gnext == gptr()`, and `__gend == egptr()`

Referenced by `std::wbuffer_convert<_Codecvt, _Elem, _Tr>::wbuffer_convert()`.

setp()

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf<_CharT, _Traits>::setp (
    char_type * __pbeg,
    char_type * __pend ) [inline], [protected], [inherited]
```

Setting the three write area pointers.

Parameters

<code>__pbeg</code>	A pointer.
<code>__pend</code>	A pointer.

Postcondition

`__pbeg == pbase()`, `__pbeg == pptr()`, and `__pend == epptr()`

Referenced by `std::wbuffer_convert<_Codecv, _Elem, _Tr>::wbuffer_convert()`.

sgetc()

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::sgetc ( ) [inline], [inherited]
```

Getting the next character.

Returns

The next character, or eof.

If the input read position is available, returns that character, otherwise calls and returns `underflow()`. Does not move the read position after fetching the character.

Referenced by `std::basic_istream<_CharT, _Traits>::sentry::sentry()`, `std::basic_istream<_CharT, _Traits>::get()`, `std::basic_istream<_CharT, _Traits>::get()`, `std::basic_istream<char>::getline()`, `std::basic_istream<_CharT, _Traits>::ignore()`, `std::istreambuf_iterator<_CharT, _Traits>::operator++()`, `std::istreambuf_iterator<_CharT, _Traits>::operator++()`, and `std::basic_istream<char>::seekg()`.

sgetn()

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf<_CharT, _Traits>::sgetn (
    char_type * __s,
    streamsize __n ) [inline], [inherited]
```

Entry point for `xsgetn`.

Parameters

<code>__s</code>	A buffer area.
<code>__n</code>	A count.

Returns `xsgetn(__s, __n)`. The effect is to fill `__s[0]` through `__s[__n-1]` with characters from the input sequence, if possible.

showmanyc()

```
streamsize std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>::showmanyc [protected],
[virtual], [inherited]
```

Investigating the data available.

Returns

An estimate of the number of characters available in the input sequence, or -1.

If it returns a positive value, then successive calls to `underflow()` will not return `traits::eof()` until at least that number of characters have been supplied. If `showmanyc()` returns -1, then calls to `underflow()` or `uflow()` will fail. [27.5.2.4.3]/1

Note

Base class version does nothing, returns zero.

The standard adds that *the intention is not only that the calls [to underflow or uflow] will not return `eof()` but that they will return immediately.*

The standard adds that *the morphemes of `showmanyc` are **es-how-many-see**, not **show-manic**.*

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

snextc()

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::snextc ( ) [inline], [inherited]
Getting the next character.
```

Returns

The next character, or `eof`.

Calls `sbumpc()`, and if that function returns `traits::eof()`, so does this function. Otherwise, `sgetc()`.

Referenced by `std::basic_istream<_CharT, _Traits>::sentry::sentry()`, `std::basic_istream<_CharT, _Traits>::get()`, `std::basic_istream<char>::getline()`, `std::basic_istream<char>::putback()`, and `std::basic_istream<char>::seekg()`.

sputbackc()

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::sputbackc (
    char_type __c ) [inline], [inherited]
```

Pushing characters back into the input stream.

Parameters

<code>__c</code>	The character to push back.
------------------	-----------------------------

Returns

The previous character, if possible.

Similar to `sungetc()`, but `__c` is pushed onto the stream instead of *the previous character*. If successful, the next character fetched from the input stream will be `__c`.

Referenced by `std::basic_istream<_CharT, _Traits>::putback()`.

sputc()

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::sputc (
    char_type __c ) [inline], [inherited]
```

Entry point for all single-character output functions.

Parameters

<code>__c</code>	A character to output.
------------------	------------------------

Returns

__c, if possible.

One of two public output functions.

If a write position is available for the output sequence (i.e., the buffer is not full), stores __c in that position, increments the position, and returns `traits::to_int_type(__c)`. If a write position is not available, returns `overflow(↵__c)`.

Referenced by `std::ostreambuf_iterator<_CharT, _Traits>::operator=()`, and `std::wbuffer_convert<_Codecvt, _Elem, _Tr>::overflow()`.

sputn()

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf<_CharT, _Traits>::sputn (
    const char_type * __s,
    streamsize __n) [inline], [inherited]
```

Entry point for all single-character output functions.

Parameters

↵ __s	A buffer read area.
↵ __n	A count.

One of two public output functions.

Returns `xsputn(__s, __n)`. The effect is to write `__s[0]` through `__s[__n-1]` to the output sequence, if possible.

sungetc()

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::sungetc ( ) [inline], [inherited]
```

Moving backwards in the input stream.

Returns

The previous character, if possible.

If a putback position is available, this function decrements the input pointer and returns that character. Otherwise, calls and returns `pbackfail()`. The effect is to *unget* the last character *gotten*.

Referenced by `std::basic_istream<_CharT, _Traits>::unget()`.

sync()

```
int std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>::sync [protected], [virtual],
[inherited]
```

Synchronizes the buffer arrays with the controlled sequences.

Returns

-1 on failure.

Each derived class provides its own appropriate behavior, including the definition of *failure*.

Note

Base class version does nothing, returns zero.

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

uflow()

```
template<typename _CharT, typename _Traits>
virtual int_type std::basic_streambuf<_CharT, _Traits>::uflow ( ) [inline], [protected], [virtual],
[inherited]
```

Fetches more data from the controlled sequence.

Returns

The first character from the *pending sequence*.

Informally, this function does the same thing as `underflow()`, and in fact is required to call that function. It also returns the new character, like `underflow()` does. However, this function also moves the read position forward by one.

Reimplemented in `__gnu_cxx::stdio_sync_filebuf<_CharT, _Traits>`.

underflow()

```
basic_filebuf<_CharT, encoding_char_traits<_CharT> >::int_type std::basic_filebuf<_CharT,
encoding_char_traits<_CharT> >::underflow [protected], [virtual], [inherited]
```

Fetches more data from the controlled sequence.

Returns

The first character from the *pending sequence*.

Informally, this function is called when the input buffer is exhausted (or does not exist, as buffering need not actually be done). If a buffer exists, it is *refilled*. In either case, the next available character is returned, or `traits::eof()` to indicate a null pending sequence.

For a formal definition of the pending sequence, see a good text such as Langer & Kreft, or [27.5.2.4.3]/7-14.

A functioning input streambuf can be created by overriding only this function (no buffer area will be used). For an example, see <https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.html>

Note

Base class version does nothing, returns `eof()`.

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

xsgetn()

```
streamsize std::basic_filebuf<_CharT, encoding_char_traits<_CharT> >::xsgetn (
    char_type * __s,
    streamsize __n ) [protected], [virtual], [inherited]
```

Multiple character extraction.

Parameters

<code>__s</code>	A buffer area.
<code>__n</code>	Maximum number of characters to assign.

Returns

The number of characters assigned.

Fills `__s[0]` through `__s[__n-1]` with characters from the input sequence, as if by `sbumpc()`. Stops when either `__n` characters have been copied, or when `traits::eof()` would be copied.

It is expected that derived classes provide a more efficient implementation by overriding this definition.
Reimplemented from [std::basic_streambuf<_CharT, _Traits>](#).

xspn()

```
streamsize std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>::xspn (
    const char_type * __s,
    streamsize __n ) [protected], [virtual], [inherited]
```

Multiple character insertion.

Parameters

 <code>__s</code>	A buffer area.
 <code>__n</code>	Maximum number of characters to write.

Returns

The number of characters written.

Writes `__s[0]` through `__s[__n-1]` to the output sequence, as if by `sputc()`. Stops when either `n` characters have been copied, or when `sputc()` would return `traits::eof()`.

It is expected that derived classes provide a more efficient implementation by overriding this definition.
Reimplemented from [std::basic_streambuf<_CharT, _Traits>](#).

5.426.3 Member Data Documentation

`_M_buf`

```
char_type* std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>::_M_buf [protected],
[inherited]
```

Pointer to the beginning of internal buffer.

`_M_buf_locale`

```
template<typename _CharT, typename _Traits>
locale std::basic_streambuf<_CharT, _Traits>::_M_buf_locale [protected], [inherited]
```

Current locale setting.

Referenced by [std::basic_filebuf<_CharT, _Traits>::basic_filebuf\(\)](#).

`_M_buf_size`

```
size_t std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>::_M_buf_size [protected],
[inherited]
```

Actual size of internal buffer. This number is equal to the size of the put area + 1 position, reserved for the overflow char of a full area.

`_M_ext_buf`

```
char* std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>::_M_ext_buf [protected],
[inherited]
```

Buffer for external characters. Used for input when `codecvt::always_noconv() == false`. When valid, this corresponds to `eback()`.

`_M_ext_buf_size`

```
streamsize std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>::_M_ext_buf_size [protected],  
[inherited]
```

Size of buffer held by `_M_ext_buf`.

`_M_ext_next`

```
const char* std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>::_M_ext_next [protected],  
[inherited]
```

Pointers into the buffer held by `_M_ext_buf` that delimit a subsequence of bytes that have been read but not yet converted. When valid, `_M_ext_next` corresponds to `egptr()`.

`_M_in_beg`

```
template<typename _CharT, typename _Traits>  
char_type* std::basic_streambuf<_CharT, _Traits>::_M_in_beg [protected], [inherited]
```

Start of get area.

`_M_in_cur`

```
template<typename _CharT, typename _Traits>  
char_type* std::basic_streambuf<_CharT, _Traits>::_M_in_cur [protected], [inherited]
```

Current read area.

`_M_in_end`

```
template<typename _CharT, typename _Traits>  
char_type* std::basic_streambuf<_CharT, _Traits>::_M_in_end [protected], [inherited]
```

End of get area.

`_M_mode`

```
ios_base::openmode std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>::_M_mode [protected],  
[inherited]
```

Place to stash in || out || in | out settings for current filebuf.

`_M_out_beg`

```
template<typename _CharT, typename _Traits>  
char_type* std::basic_streambuf<_CharT, _Traits>::_M_out_beg [protected], [inherited]
```

Start of put area.

`_M_out_cur`

```
template<typename _CharT, typename _Traits>  
char_type* std::basic_streambuf<_CharT, _Traits>::_M_out_cur [protected], [inherited]
```

Current put area.

`_M_out_end`

```
template<typename _CharT, typename _Traits>  
char_type* std::basic_streambuf<_CharT, _Traits>::_M_out_end [protected], [inherited]
```

End of put area.

`_M_pback`

```
char_type std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::_M_pback [protected],  
[inherited]
```

Necessary bits for putback buffer management.

Note

pbacks of over one character are not currently supported.

`_M_pback_cur_save`

```
char_type* std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::_M_pback_cur_save [protected],  
[inherited]
```

Necessary bits for putback buffer management.

Note

pbacks of over one character are not currently supported.

`_M_pback_end_save`

```
char_type* std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::_M_pback_end_save [protected],  
[inherited]
```

Necessary bits for putback buffer management.

Note

pbacks of over one character are not currently supported.

`_M_pback_init`

```
bool std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::_M_pback_init [protected],  
[inherited]
```

Necessary bits for putback buffer management.

Note

pbacks of over one character are not currently supported.

`_M_reading`

```
bool std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >::_M_reading [protected],  
[inherited]
```

`_M_reading == false` && `_M_writing == false` for **uncommitted** mode; `_M_reading == true` for **read** mode; `_M_writing == true` for **write** mode;

NB: `_M_reading == true` && `_M_writing == true` is unused.

5.439.1 Detailed Description

Abstract base class for types defining a category of error codes.

An error category defines a context that give meaning to the integer stored in an `error_code` or `error_condition` object. For example, the standard `errno` constants such a `EINVAL` and `ENOMEM` are associated with the "generic" category and other OS-specific error numbers are associated with the "system" category, but a user-defined category might give different meanings to the same numerical values.

Since

C++11

5.440.1 Detailed Description

Class `error_code`

This class is a value type storing an integer error number and a category that gives meaning to the error number. Typically this is done close to the point where the error happens, to capture the original error value.

An `error_code` object can be used to store the original error value emitted by some subsystem, with a category relevant to the subsystem. For example, errors from POSIX library functions can be represented by an `errno` value and the "generic" category, but errors from an HTTP library might be represented by an HTTP response status code (e.g. 404) and a custom category defined by the library.

- bool **operator==** (const [error_condition](#) &__lhs, const [error_condition](#) &__rhs) noexcept

5.441.1 Detailed Description

Class `error_condition`

This class represents error conditions that may be visible at an API boundary. Different `error_code` values that can occur within a library or module might map to the same `error_condition`.

An `error_condition` represents something that the program can test for, and subsequently take appropriate action.

5.445.1 Detailed Description

template<typename _RealType = double>
class std::exponential_distribution<_RealType>

An exponential continuous distribution for random numbers.

The formula for the exponential probability density function is $p(x|\lambda) = \lambda e^{-\lambda x}$.

Table 2032 Distribution Statistics

Mean	$\frac{1}{\lambda}$
Median	$\frac{\ln 2}{\lambda}$
Mode	<i>zero</i>
Range	$[0, \infty]$
Standard Deviation	$\frac{1}{\lambda}$

5.445.2 Member Typedef Documentation

result_type

template<typename _RealType = double>

```
typedef _RealType std::exponential_distribution< _RealType >::result_type
```

The type of the range of the distribution.

5.445.3 Constructor & Destructor Documentation

exponential_distribution() [1/2]

```
template<typename _RealType = double>
std::exponential_distribution< _RealType >::exponential_distribution ( ) [inline]
```

Constructs an exponential distribution with inverse scale parameter 1.0.

exponential_distribution() [2/2]

```
template<typename _RealType = double>
std::exponential_distribution< _RealType >::exponential_distribution (
    _RealType __lambda ) [inline], [explicit]
```

Constructs an exponential distribution with inverse scale parameter λ .

5.445.4 Member Function Documentation

lambda()

```
template<typename _RealType = double>
_RealType std::exponential_distribution< _RealType >::lambda ( ) const [inline]
```

Returns the inverse scale parameter of the distribution.

max()

```
template<typename _RealType = double>
result_type std::exponential_distribution< _RealType >::max ( ) const [inline]
```

Returns the least upper bound value of the distribution.
References [std::numeric_limits< _Tp >::max\(\)](#).

min()

```
template<typename _RealType = double>
result_type std::exponential_distribution< _RealType >::min ( ) const [inline]
```

Returns the greatest lower bound value of the distribution.

operator>()()

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator >
result_type std::exponential_distribution< _RealType >::operator() (
    _UniformRandomNumberGenerator & __urng ) [inline]
```

Generating functions.

References [std::exponential_distribution< _RealType >::operator>\(\)](#).

Referenced by [std::exponential_distribution< _RealType >::operator>\(\)](#).

param() [1/2]

```
template<typename _RealType = double>
param_type std::exponential_distribution< _RealType >::param ( ) const [inline]
```

Returns the parameter set of the distribution.
Referenced by [std::operator>>\(\)](#).

param() [2/2]

```
template<typename _RealType = double>
void std::exponential_distribution< _RealType >::param (
    const param_type & __param ) [inline]
```

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--------------------------------------------

reset()

```
template<typename _RealType = double>
void std::exponential_distribution< _RealType >::reset ( ) [inline]
```

Resets the distribution state.

Has no effect on exponential distributions.

5.445.5 Friends And Related Symbol Documentation**operator==**

```
template<typename _RealType = double>
bool operator== (
    const exponential_distribution< _RealType > & __d1,
    const exponential_distribution< _RealType > & __d2 ) [friend]
```

Return true if two exponential distributions have the same parameters.

5.447.1 Detailed Description

`template<typename _RealType = double>`
class `std::extreme_value_distribution<_RealType>`

A `extreme_value_distribution` random number distribution.
 The formula for the normal probability mass function is

$$p(x|a,b) = \frac{1}{b} \exp\left(\frac{a-x}{b} - \exp\left(\frac{a-x}{b}\right)\right)$$

5.447.2 Member Typedef Documentation

result_type

`template<typename _RealType = double>`
`typedef _RealType std::extreme_value_distribution<_RealType>::result_type`
 The type of the range of the distribution.

5.447.3 Member Function Documentation

a()

`template<typename _RealType = double>`
`_RealType std::extreme_value_distribution<_RealType>::a () const [inline]`
 Return the *a* parameter of the distribution.

b()

`template<typename _RealType = double>`
`_RealType std::extreme_value_distribution<_RealType>::b () const [inline]`
 Return the *b* parameter of the distribution.

max()

`template<typename _RealType = double>`
`result_type std::extreme_value_distribution<_RealType>::max () const [inline]`
 Returns the least upper bound value of the distribution.
 References `std::numeric_limits<_Tp>::max()`.

min()

`template<typename _RealType = double>`
`result_type std::extreme_value_distribution<_RealType>::min () const [inline]`
 Returns the greatest lower bound value of the distribution.
 References `std::numeric_limits<_Tp>::lowest()`.

operator()()

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator >
result_type std::extreme_value_distribution< _RealType >::operator() (
    _UniformRandomNumberGenerator & __urng ) [inline]
```

Generating functions.

- class **locale::_Impl**

5.448.1 Detailed Description

Localization functionality base class.

The facet class is the base class for a localization feature, such as money, time, and number printing. It provides common support for facets and reference management.

Facets may not be copied or assigned.

5.448.2 Constructor & Destructor Documentation

facet()

```
std::locale::facet::facet (
    size_t __refs = 0 ) throw ( )    [inline], [explicit], [protected]
```

Facet constructor.

This is the constructor provided by the standard. If refs is 0, the facet is destroyed when the last referencing locale is destroyed. Otherwise the facet will never be destroyed.

Parameters

<code>__refs</code>	The initial value for reference count.
---------------------	----------------------------------------

~facet()

```
virtual std::locale::facet::~~facet ( )    [protected], [virtual]
```

Facet destructor.

The documentation for this class was generated from the following file:

5.454.1 Detailed Description

template<typename _RealType = double>
class std::fisher_f_distribution<_RealType>

A fisher_f_distribution random number distribution.

The formula for the normal probability mass function is

$$p(x|m, n) = \frac{\Gamma((m+n)/2)}{\Gamma(m/2)\Gamma(n/2)} \left(\frac{m}{n}\right)^{m/2} x^{(m/2)-1} \left(1 + \frac{mx}{n}\right)^{-(m+n)/2}$$

5.454.2 Member Typedef Documentation

result_type

```
template<typename _RealType = double>
typedef _RealType std::fisher_f_distribution< _RealType >::result_type
```

The type of the range of the distribution.

5.454.3 Member Function Documentation

max()

```
template<typename _RealType = double>
result_type std::fisher_f_distribution< _RealType >::max ( ) const [inline]
```

Returns the least upper bound value of the distribution.
References [std::numeric_limits< _Tp >::max\(\)](#).

min()

```
template<typename _RealType = double>
result_type std::fisher_f_distribution< _RealType >::min ( ) const [inline]
```

Returns the greatest lower bound value of the distribution.

operator>()()

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator >
result_type std::fisher_f_distribution< _RealType >::operator() (
    _UniformRandomNumberGenerator & __urng ) [inline]
```

Generating functions.

param() [1/2]

```
template<typename _RealType = double>
param_type std::fisher_f_distribution< _RealType >::param ( ) const [inline]
```

Returns the parameter set of the distribution.

param() [2/2]

```
template<typename _RealType = double>
void std::fisher_f_distribution< _RealType >::param (
    const param_type & __param ) [inline]
```

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--------------------------------------------

reset()

```
template<typename _RealType = double>
void std::fisher_f_distribution< _RealType >::reset ( ) [inline]
```

Resets the distribution state.
References [std::gamma_distribution< _RealType >::reset\(\)](#).

5.454.4 Friends And Related Symbol Documentation

operator<<

```
template<typename _RealType = double>
template<typename _RealType1 , typename _CharT , typename _Traits >
std::basic_ostream< _CharT, _Traits > & operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::fisher_f_distribution< _RealType1 > & __x ) [friend]
```

Inserts a fisher_f_distribution random number distribution __x into the output stream __os.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A fisher_f_distribution random number distribution.

Returns

The output stream with the state of __x inserted or in an error state.

operator==

```
template<typename _RealType = double>
bool operator== (
    const fisher_f_distribution< _RealType > & __d1,
    const fisher_f_distribution< _RealType > & __d2 ) [friend]
```

Return true if two Fisher f distributions have the same parameters and the sequences that would be generated are equal.

operator>>

```
template<typename _RealType = double>
template<typename _RealType1 , typename _CharT , typename _Traits >
std::basic_istream< _CharT, _Traits > & operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::fisher_f_distribution< _RealType1 > & __x ) [friend]
```

Extracts a fisher_f_distribution random number distribution __x from the input stream __is.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A fisher_f_distribution random number generator engine.

Returns

The input stream with __x extracted or in an error state.

5.458.1 Detailed Description

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
class std::forward_list< _Tp, _Alloc >
```

A standard container with linear time access to elements, and fixed time insertion/deletion at any point in the sequence.

Template Parameters

<code>_Tp</code>	Type of element.
<code>_Alloc</code>	Allocator type, defaults to <code>allocator<_Tp></code> .

Meets the requirements of a `container`, a `sequence`, including the `optional sequence requirements` with the exception of `at` and `operator[]`.

This is a *singly linked* list. Traversal up the list requires linear time, but adding and removing elements (or *nodes*) is done in constant time, regardless of where the change takes place. Unlike `std::vector` and `std::deque`, random-access iterators are not provided, so subscripting (`[]`) access is not allowed. For algorithms which only need sequential access, this lack makes no difference.

Also unlike the other standard containers, `std::forward_list` provides specialized algorithms unique to linked lists, such as splicing, sorting, and in-place reversal.

5.458.2 Constructor & Destructor Documentation

`forward_list()` [1/10]

```
template<typename _Tp , typename _Alloc = allocator<_Tp>>
std::forward_list< _Tp, _Alloc >::forward_list ( ) [default]
```

Creates a `forward_list` with no elements.

`forward_list()` [2/10]

```
template<typename _Tp , typename _Alloc = allocator<_Tp>>
std::forward_list< _Tp, _Alloc >::forward_list (
    const _Alloc & __a1 ) [inline], [explicit], [noexcept]
```

Creates a `forward_list` with no elements.

Parameters

<code>__a1</code>	An allocator object.
-------------------	----------------------

forward_list() [3/10]

```
template<typename _Tp , typename _Alloc = allocator<_Tp>>
std::forward_list< _Tp, _Alloc >::forward_list (
    const forward_list< _Tp, _Alloc > & __list,
    const _Alloc & __al ) [inline]
```

Copy constructor with allocator argument.

Parameters

<code>__list</code>	Input list to copy.
<code>__al</code>	An allocator object.

References [std::forward_list<_Tp, _Alloc >::begin\(\)](#), and [std::forward_list<_Tp, _Alloc >::end\(\)](#).

forward_list() [4/10]

```
template<typename _Tp , typename _Alloc = allocator<_Tp>>
std::forward_list< _Tp, _Alloc >::forward_list (
    forward_list< _Tp, _Alloc > && __list,
    const _Alloc & __al ) [inline], [noexcept]
```

Move constructor with allocator argument.

Parameters

<code>__list</code>	Input list to move.
<code>__al</code>	An allocator object.

forward_list() [5/10]

```
template<typename _Tp , typename _Alloc = allocator<_Tp>>
std::forward_list< _Tp, _Alloc >::forward_list (
    size_type __n,
    const _Alloc & __al = _Alloc() ) [inline], [explicit]
```

Creates a forward_list with default constructed elements.

Parameters

<code>__n</code>	The number of elements to initially create.
<code>__al</code>	An allocator object.

This constructor creates the forward_list with `__n` default constructed elements.

forward_list() [6/10]

```
template<typename _Tp , typename _Alloc = allocator<_Tp>>
std::forward_list< _Tp, _Alloc >::forward_list (
    size_type __n,
    const _Tp & __value,
    const _Alloc & __al = _Alloc() ) [inline]
```

Creates a forward_list with copies of an exemplar element.

Parameters

<code>__n</code>	The number of elements to initially create.
<code>__value</code>	An element to copy.
<code>__al</code>	An allocator object.

This constructor fills the `forward_list` with `__n` copies of `__value`.

forward_list() [7/10]

```
template<typename _Tp , typename _Alloc = allocator<_Tp>>
template<typename _InputIterator , typename = std::_RequireInputIter<_InputIterator>>
std::forward_list< _Tp, _Alloc >::forward_list (
    _InputIterator __first,
    _InputIterator __last,
    const _Alloc & __al = _Alloc() ) [inline]
```

Builds a `forward_list` from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__al</code>	An allocator object.

Create a `forward_list` consisting of copies of the elements from `[__first,__last)`. This is linear in N (where N is distance(`↔` `__first,__last`)).

forward_list() [8/10]

```
template<typename _Tp , typename _Alloc = allocator<_Tp>>
std::forward_list< _Tp, _Alloc >::forward_list (
    const forward_list< _Tp, _Alloc > & __list ) [inline]
```

The `forward_list` copy constructor.

Parameters

<code>__list</code>	A <code>forward_list</code> of identical element and allocator types.
---------------------	-----------------------------------------------------------------------

References `std::forward_list< _Tp, _Alloc >::begin()`, and `std::forward_list< _Tp, _Alloc >::end()`.

forward_list() [9/10]

```
template<typename _Tp , typename _Alloc = allocator<_Tp>>
std::forward_list< _Tp, _Alloc >::forward_list (
    forward_list< _Tp, _Alloc > && ) [default]
```

The `forward_list` move constructor.

Parameters

<code>__list</code>	A <code>forward_list</code> of identical element and allocator types.
---------------------	-----------------------------------------------------------------------

The newly-created `forward_list` contains the exact contents of the moved instance. The contents of the moved instance are a valid, but unspecified `forward_list`.

forward_list() [10/10]

```
template<typename _Tp , typename _Alloc = allocator<_Tp>>
std::forward_list< _Tp, _Alloc >::forward_list (
    std::initializer_list< _Tp > __il,
    const _Alloc & __al = _Alloc() ) [inline]
```

Builds a forward_list from an initializer_list.

Parameters

<code>__il</code>	An initializer_list of value_type.
<code>__al</code>	An allocator object.

Create a forward_list consisting of copies of the elements in the initializer_list `__il`. This is linear in `__il.size()`.

~forward_list()

```
template<typename _Tp , typename _Alloc = allocator<_Tp>>
std::forward_list< _Tp, _Alloc >::~~forward_list ( ) [inline], [noexcept]
```

The forward_list dtor.

5.458.3 Member Function Documentation**assign()** [1/3]

```
template<typename _Tp , typename _Alloc = allocator<_Tp>>
template<typename _InputIterator , typename = std::RequireInputIter<_InputIterator>>
void std::forward_list< _Tp, _Alloc >::assign (
    _InputIterator __first,
    _InputIterator __last ) [inline]
```

Assigns a range to a forward_list.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

This function fills a forward_list with copies of the elements in the range `[__first, __last)`.

Note that the assignment completely changes the forward_list and that the number of elements of the resulting forward_list is the same as the number of elements assigned.

Referenced by `std::forward_list< _Tp, _Alloc >::assign()`, and `std::forward_list< _Tp, _Alloc >::operator=()`.

assign() [2/3]

```
template<typename _Tp , typename _Alloc = allocator<_Tp>>
void std::forward_list< _Tp, _Alloc >::assign (
    size_type __n,
    const _Tp & __val ) [inline]
```

Assigns a given value to a forward_list.

Parameters

<code>__n</code>	Number of elements to be assigned.
------------------	------------------------------------

Parameters

<code>__val</code>	Value to be assigned.
--------------------	-----------------------

This function fills a `forward_list` with `__n` copies of the given value. Note that the assignment completely changes the `forward_list`, and that the resulting `forward_list` has `__n` elements.

assign() [3/3]

```
template<typename _Tp , typename _Alloc = allocator<_Tp>>
void std::forward_list< _Tp, _Alloc >::assign (
    std::initializer_list< _Tp > __il ) [inline]
```

Assigns an `initializer_list` to a `forward_list`.

Parameters

<code>__il</code>	An <code>initializer_list</code> of <code>value_type</code> .
-------------------	---------------------------------------------------------------

Replace the contents of the `forward_list` with copies of the elements in the `initializer_list` `__il`. This is linear in `il.size()`. References [std::forward_list< _Tp, _Alloc >::assign\(\)](#).

before_begin() [1/2]

```
template<typename _Tp , typename _Alloc = allocator<_Tp>>
const_iterator std::forward_list< _Tp, _Alloc >::before_begin ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points before the first element in the `forward_list`. Iteration is done in ordinary element order.

before_begin() [2/2]

```
template<typename _Tp , typename _Alloc = allocator<_Tp>>
iterator std::forward_list< _Tp, _Alloc >::before_begin ( ) [inline], [noexcept]
```

Returns a read/write iterator that points before the first element in the `forward_list`. Iteration is done in ordinary element order.

Referenced by [std::forward_list< _Tp, _Alloc >::insert_after\(\)](#), and [std::forward_list< _Tp, _Alloc >::insert_after\(\)](#).

begin() [1/2]

```
template<typename _Tp , typename _Alloc = allocator<_Tp>>
const_iterator std::forward_list< _Tp, _Alloc >::begin ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the `forward_list`. Iteration is done in ordinary element order.

begin() [2/2]

```
template<typename _Tp , typename _Alloc = allocator<_Tp>>
iterator std::forward_list< _Tp, _Alloc >::begin ( ) [inline], [noexcept]
```

Returns a read/write iterator that points to the first element in the `forward_list`. Iteration is done in ordinary element order.

Referenced by [std::forward_list< _Tp, _Alloc >::forward_list\(\)](#), and [std::forward_list< _Tp, _Alloc >::forward_list\(\)](#).

cbefore_begin()

```
template<typename _Tp , typename _Alloc = allocator<_Tp>>
```

```
const_iterator std::forward_list< _Tp, _Alloc >::cbefore_begin ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points before the first element in the forward_list. Iteration is done in ordinary element order.

Referenced by `std::forward_list< _Tp, _Alloc >::emplace_front()`, `std::forward_list< _Tp, _Alloc >::push_front()`, and `std::forward_list< _Tp, _Alloc >::remove()`.

cbegin()

```
template<typename _Tp , typename _Alloc = allocator<_Tp>>
```

```
const_iterator std::forward_list< _Tp, _Alloc >::cbegin ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the forward_list. Iteration is done in ordinary element order.

Referenced by `std::operator<()`, `std::forward_list< _Tp, _Alloc >::operator=()`, and `std::operator==(())`.

cend()

```
template<typename _Tp , typename _Alloc = allocator<_Tp>>
```

```
const_iterator std::forward_list< _Tp, _Alloc >::cend ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the forward_list. Iteration is done in ordinary element order.

Referenced by `std::operator<()`, `std::forward_list< _Tp, _Alloc >::operator=()`, and `std::operator==(())`.

clear()

```
template<typename _Tp , typename _Alloc = allocator<_Tp>>
```

```
void std::forward_list< _Tp, _Alloc >::clear ( ) [inline], [noexcept]
```

Erases all the elements.

Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

emplace_after()

```
template<typename _Tp , typename _Alloc = allocator<_Tp>>
```

```
template<typename... _Args>
```

```
iterator std::forward_list< _Tp, _Alloc >::emplace_after (
```

```
    const_iterator __pos,
```

```
    _Args &&... __args ) [inline]
```

Constructs object in forward_list after the specified iterator.

Parameters

<code>__pos</code>	A const_iterator into the forward_list.
<code>__args</code>	Arguments.

Returns

An iterator that points to the inserted data.

This function will insert an object of type T constructed with `T(std::forward<Args>(args)...) after the specified location. Due to the nature of a forward_list this operation can be done in constant time, and does not invalidate iterators and references.`

emplace_front()

```
template<typename _Tp , typename _Alloc = allocator<_Tp>>
template<typename... _Args>
reference std::forward_list< _Tp, _Alloc >::emplace_front (
    _Args &&... __args ) [inline]
```

Constructs object in forward_list at the front of the list.

Parameters

<code>__args</code>	Arguments.
---------------------	------------

This function will insert an object of type `Tp` constructed with `Tp(std::forward<Args>(args)...)` at the front of the list. Due to the nature of a `forward_list` this operation can be done in constant time, and does not invalidate iterators and references.

References [std::forward_list< _Tp, _Alloc >::cbefore_begin\(\)](#), and [std::forward_list< _Tp, _Alloc >::front\(\)](#).

empty()

```
template<typename _Tp , typename _Alloc = allocator<_Tp>>
bool std::forward_list< _Tp, _Alloc >::empty ( ) const [inline], [noexcept]
```

Returns true if the `forward_list` is empty. (Thus `begin()` would equal `end()`.)

Referenced by [std::forward_list< _Tp, _Alloc >::insert_after\(\)](#).

end() [1/2]

```
template<typename _Tp , typename _Alloc = allocator<_Tp>>
const_iterator std::forward_list< _Tp, _Alloc >::end ( ) const [inline], [noexcept]
```

Returns a read-only iterator that points one past the last element in the `forward_list`. Iteration is done in ordinary element order.

end() [2/2]

```
template<typename _Tp , typename _Alloc = allocator<_Tp>>
iterator std::forward_list< _Tp, _Alloc >::end ( ) [inline], [noexcept]
```

Returns a read/write iterator that points one past the last element in the `forward_list`. Iteration is done in ordinary element order.

Referenced by [std::forward_list< _Tp, _Alloc >::forward_list\(\)](#), [std::forward_list< _Tp, _Alloc >::forward_list\(\)](#), [std::forward_list< _Tp, _Alloc >::insert_after\(\)](#), and [std::forward_list< _Tp, _Alloc >::insert_after\(\)](#).

erase_after() [1/2]

```
template<typename _Tp , typename _Alloc = allocator<_Tp>>
iterator std::forward_list< _Tp, _Alloc >::erase_after (
    const_iterator __pos ) [inline]
```

Removes the element pointed to by the iterator following `pos`.

Parameters

<code>__pos</code>	Iterator pointing before element to be erased.
--------------------	------------------------------------------------

Returns

An iterator pointing to the element following the one that was erased, or end() if no such element exists.

This function will erase the element at the given position and thus shorten the forward_list by one.

Due to the nature of a forward_list this operation can be done in constant time, and only invalidates iterators/references to the element being removed. The user is also cautioned that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase_after() [2/2]

```
template<typename _Tp , typename _Alloc = allocator<_Tp>>
iterator std::forward_list< _Tp, _Alloc >::erase_after (
    const_iterator __pos,
    const_iterator __last ) [inline]
```

Remove a range of elements.

Parameters

<code>__pos</code>	Iterator pointing before the first element to be erased.
<code>__last</code>	Iterator pointing to one past the last element to be erased.

Returns

@ `__last`.

This function will erase the elements in the range (`__pos`, `__last`) and shorten the forward_list accordingly.

This operation is linear time in the size of the range and only invalidates iterators/references to the element being removed. The user is also cautioned that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

front() [1/2]

```
template<typename _Tp , typename _Alloc = allocator<_Tp>>
reference std::forward_list< _Tp, _Alloc >::front ( ) [inline]
```

Returns a read/write reference to the data at the first element of the forward_list.
Referenced by `std::forward_list< _Tp, _Alloc >::emplace_front()`.

front() [2/2]

```
template<typename _Tp , typename _Alloc = allocator<_Tp>>
const_reference std::forward_list< _Tp, _Alloc >::front ( ) const [inline]
```

Returns a read-only (constant) reference to the data at the first element of the forward_list.

get_allocator()

```
template<typename _Tp , typename _Alloc = allocator<_Tp>>
allocator_type std::forward_list< _Tp, _Alloc >::get_allocator ( ) const [inline], [noexcept]
```

Get a copy of the memory allocation object.

insert_after() [1/4]

```
template<typename _Tp , typename _Alloc >
template<typename _InputIterator , typename >
forward_list< _Tp, _Alloc >::iterator forward_list::insert_after (
    const_iterator __pos,
```

```
__InputIterator __first,  
__InputIterator __last )
```

Inserts a range into the `forward_list`.

Parameters

<code>__pos</code>	An iterator into the <code>forward_list</code> .
<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

Returns

An iterator pointing to the last inserted element or `__pos` if `__first == __last`.

This function will insert copies of the data in the range `[__first,__last)` into the `forward_list` after the location specified by `__pos`.

This operation is linear in the number of elements inserted and does not invalidate iterators and references.

References [std::forward_list<_Tp, _Alloc>::before_begin\(\)](#), [std::forward_list<_Tp, _Alloc>::empty\(\)](#), and [std::forward_list<_Tp, _Alloc>::begin\(\)](#).

`insert_after()` [2/4]

```
template<typename _Tp , typename _Alloc = allocator<_Tp>>  
iterator std::forward_list<_Tp, _Alloc>::insert_after (   
    const_iterator __pos,  
    const _Tp & __val ) [inline]
```

Inserts given value into `forward_list` after specified iterator.

Parameters

<code>__pos</code>	An iterator into the <code>forward_list</code> .
<code>__val</code>	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a copy of the given value after the specified location. Due to the nature of a `forward_list` this operation can be done in constant time, and does not invalidate iterators and references.

Referenced by [std::forward_list<_Tp, _Alloc>::insert_after\(\)](#).

`insert_after()` [3/4]

```
template<typename _Tp , typename _Alloc >  
forward_list<_Tp, _Alloc>::iterator forward_list::insert_after (   
    const_iterator __pos,  
    size_type __n,  
    const _Tp & __val )
```

Inserts a number of copies of given data into the `forward_list`.

Parameters

<code>__pos</code>	An iterator into the <code>forward_list</code> .
<code>__n</code>	Number of elements to be inserted.
<code>__val</code>	Data to be inserted.

Returns

An iterator pointing to the last inserted copy of *val* or *pos* if *n* == 0.

This function will insert a specified number of copies of the given data after the location specified by *pos*. This operation is linear in the number of elements inserted and does not invalidate iterators and references. References `std::forward_list<_Tp, _Alloc>::before_begin()`, and `std::forward_list<_Tp, _Alloc>::end()`.

insert_after() [4/4]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
iterator std::forward_list<_Tp, _Alloc>::insert_after (
    const_iterator __pos,
    std::initializer_list<_Tp> __il ) [inline]
```

Inserts the contents of an `initializer_list` into `forward_list` after the specified iterator.

Parameters

<code>__pos</code>	An iterator into the <code>forward_list</code> .
<code>__il</code>	An <code>initializer_list</code> of <code>value_type</code> .

Returns

An iterator pointing to the last inserted element or `__pos` if `__il` is empty.

This function will insert copies of the data in the `initializer_list` `__il` into the `forward_list` before the location specified by `__pos`.

This operation is linear in the number of elements inserted and does not invalidate iterators and references.

References `std::forward_list<_Tp, _Alloc>::insert_after()`.

max_size()

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
size_type std::forward_list<_Tp, _Alloc>::max_size ( ) const [inline], [noexcept]
```

Returns the largest possible number of elements of `forward_list`.

References `__gnu_cxx::__alloc_traits<_Alloc, typename>::max_size()`.

merge() [1/2]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list<_Tp, _Alloc>::merge (
    forward_list<_Tp, _Alloc> && __list ) [inline]
```

Merge sorted lists.

Parameters

<code>__list</code>	Sorted list to merge.
---------------------	-----------------------

Assumes that both *list* and this list are sorted according to `operator<()`. Merges elements of `__list` into this list in sorted order, leaving `__list` empty when complete. Elements in this list precede elements in `__list` that are equal.

References `std::forward_list<_Tp, _Alloc>::merge()`, and `std::move()`.

Referenced by `std::forward_list<_Tp, _Alloc>::merge()`.

merge() [2/2]

```
template<typename _Tp , typename _Alloc >
template<typename _Comp >
void forward_list::merge (
    forward_list< _Tp, _Alloc > && __list,
    _Comp __comp )
```

Merge sorted lists according to comparison function.

Parameters

<code>__list</code>	Sorted list to merge.
<code>__comp</code>	Comparison function defining sort order.

Assumes that both `__list` and this list are sorted according to `comp`. Merges elements of `__list` into this list in sorted order, leaving `__list` empty when complete. Elements in this list precede elements in `__list` that are equivalent according to `comp()`.

References [std::__addressof\(\)](#), and [std::move\(\)](#).

operator=() [1/3]

```
template<typename _Tp , typename _Alloc >
forward_list< _Tp, _Alloc > & forward_list::operator= (
    const forward_list< _Tp, _Alloc > & __list )
```

The `forward_list` assignment operator.

Parameters

<code>__list</code>	A <code>forward_list</code> of identical element and allocator types.
---------------------	-----------------------------------------------------------------------

All the elements of `__list` are copied.

Whether the allocator is copied depends on the allocator traits.

References [std::__addressof\(\)](#), [std::forward_list< _Tp, _Alloc >::cbegin\(\)](#), and [std::forward_list< _Tp, _Alloc >::cend\(\)](#).

operator=() [2/3]

```
template<typename _Tp , typename _Alloc = allocator<_Tp>>
forward_list & std::forward_list< _Tp, _Alloc >::operator= (
    forward_list< _Tp, _Alloc > && __list ) [inline], [noexcept]
```

The `forward_list` move assignment operator.

Parameters

<code>__list</code>	A <code>forward_list</code> of identical element and allocator types.
---------------------	-----------------------------------------------------------------------

The contents of `__list` are moved into this `forward_list` (without copying, if the allocators permit it).

Afterwards `__list` is a valid, but unspecified `forward_list`

Whether the allocator is moved depends on the allocator traits.

References [std::move\(\)](#).

operator=() [3/3]

```
template<typename _Tp , typename _Alloc = allocator<_Tp>>
forward_list & std::forward_list< _Tp, _Alloc >::operator= (
```

```
std::initializer_list<_Tp> __il ) [inline]
```

The `forward_list` initializer list assignment operator.

Parameters

<code>__il</code>	An <code>initializer_list</code> of <code>value_type</code> .
-------------------	---------------------------------------------------------------

Replace the contents of the `forward_list` with copies of the elements in the `initializer_list __il`. This is linear in `__il.size()`.
References [std::forward_list<_Tp, _Alloc >::assign\(\)](#).

`pop_front()`

```
template<typename _Tp , typename _Alloc = allocator<_Tp>>
void std::forward_list<_Tp, _Alloc >::pop_front ( ) [inline]
```

Removes first element.

This is a typical stack operation. It shrinks the `forward_list` by one. Due to the nature of a `forward_list` this operation can be done in constant time, and only invalidates iterators/references to the element being removed.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before `pop_front()` is called.

`push_front()`

```
template<typename _Tp , typename _Alloc = allocator<_Tp>>
void std::forward_list<_Tp, _Alloc >::push_front (
    const _Tp & __val ) [inline]
```

Add data to the front of the `forward_list`.

Parameters

<code>__val</code>	Data to be added.
--------------------	-------------------

This is a typical stack operation. The function creates an element at the front of the `forward_list` and assigns the given data to it. Due to the nature of a `forward_list` this operation can be done in constant time, and does not invalidate iterators and references.

References [std::forward_list<_Tp, _Alloc >::cbefore_begin\(\)](#).

`remove()`

```
template<typename _Tp , typename _Alloc >
auto forward_list::remove (
    const _Tp & __val )
```

Remove all elements equal to value.

Parameters

<code>__val</code>	The value to remove.
--------------------	----------------------

Removes every element in the list equal to `__val`. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

References [std::forward_list<_Tp, _Alloc >::cbefore_begin\(\)](#), and [std::forward_list<_Tp, _Alloc >::splice_after\(\)](#).

remove_if()

```
template<typename _Tp , typename _Alloc = allocator<_Tp>>
template<typename _Pred >
__remove_return_type std::forward_list< _Tp, _Alloc >::remove_if (
    _Pred __pred )
```

Remove all elements satisfying a predicate.

Parameters

<code>__pred</code>	Unary predicate function or object.
---------------------	-------------------------------------

Removes every element in the list for which the predicate returns true. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

resize() [1/2]

```
template<typename _Tp , typename _Alloc >
void forward_list::resize (
    size_type __sz )
```

Resizes the forward_list to the specified number of elements.

Parameters

<code>__sz</code>	Number of elements the forward_list should contain.
-------------------	-----------------------------------------------------

This function will resize the forward_list to the specified number of elements. If the number is smaller than the forward_list's current number of elements the forward_list is truncated, otherwise the forward_list is extended and the new elements are default constructed.

References [std::end\(\)](#).

resize() [2/2]

```
template<typename _Tp , typename _Alloc >
void forward_list::resize (
    size_type __sz,
    const value_type & __val )
```

Resizes the forward_list to the specified number of elements.

Parameters

<code>__sz</code>	Number of elements the forward_list should contain.
<code>__val</code>	Data with which new elements should be populated.

This function will resize the forward_list to the specified number of elements. If the number is smaller than the forward_list's current number of elements the forward_list is truncated, otherwise the forward_list is extended and new elements are populated with given data.

References [std::end\(\)](#).

reverse()

```
template<typename _Tp , typename _Alloc = allocator<_Tp>>
void std::forward_list< _Tp, _Alloc >::reverse ( ) [inline], [noexcept]
```

Reverse the elements in list.
Reverse the order of elements in the list in linear time.

sort() [1/2]

```
template<typename _Tp , typename _Alloc = allocator<_Tp>>
void std::forward_list< _Tp, _Alloc >::sort ( ) [inline]
```

Sort the elements of the list.
Sorts the elements of this list in NlogN time. Equivalent elements remain in list order.
References `std::forward_list<_Tp, _Alloc >::sort()`.
Referenced by `std::forward_list<_Tp, _Alloc >::sort()`.

sort() [2/2]

```
template<typename _Tp , class _Alloc >
template<typename _Comp >
void forward_list::sort (
    _Comp __comp )
```

Sort the `forward_list` using a comparison function.
Sorts the elements of this list in NlogN time. Equivalent elements remain in list order.

splice_after() [1/4]

```
template<typename _Tp , typename _Alloc = allocator<_Tp>>
void std::forward_list< _Tp, _Alloc >::splice_after (
    const_iterator __pos,
    forward_list< _Tp, _Alloc > && ,
    const_iterator __before,
    const_iterator __last ) [inline], [noexcept]
```

Insert range from another `forward_list`.

Parameters

<code>__pos</code>	Iterator referencing the element to insert after.
<code>__list</code>	Source list.
<code>__before</code>	Iterator referencing before the start of range in list.
<code>__last</code>	Iterator referencing the end of range in list.

Removes elements in the range (`__before`,`__last`) and inserts them after `__pos` in constant time.
Undefined if `__pos` is in (`__before`,`__last`).

splice_after() [2/4]

```
template<typename _Tp , typename _Alloc = allocator<_Tp>>
void std::forward_list< _Tp, _Alloc >::splice_after (
    const_iterator __pos,
    forward_list< _Tp, _Alloc > && __list ) [inline], [noexcept]
```

Insert contents of another `forward_list`.

Parameters

<code>__pos</code>	Iterator referencing the element to insert after.
<code>__list</code>	Source list.

The elements of *list* are inserted in constant time after the element referenced by *pos*. *list* becomes an empty list.
 Requires this != x.
 Referenced by `std::forward_list<_Tp, _Alloc>::remove()`.

splice_after() [3/4]

```
template<typename _Tp, typename _Alloc >
void forward_list::splice_after (
    const_iterator __pos,
    forward_list< _Tp, _Alloc > && __list,
    const_iterator __i ) [noexcept]
```

Insert element from another forward_list.

Parameters

<code>__pos</code>	Iterator referencing the element to insert after.
<code>__list</code>	Source list.
<code>__i</code>	Iterator referencing the element before the element to move.

Removes the element in list *list* referenced by *i* and inserts it into the current list after *pos*.

splice_after() [4/4]

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list< _Tp, _Alloc >::splice_after (
    const_iterator __pos,
    forward_list< _Tp, _Alloc > & ,
    const_iterator __before,
    const_iterator __last ) [inline], [noexcept]
```

Insert range from another forward_list.

Parameters

<code>__pos</code>	Iterator referencing the element to insert after.
<code>__list</code>	Source list.
<code>__before</code>	Iterator referencing before the start of range in list.
<code>__last</code>	Iterator referencing the end of range in list.

Removes elements in the range (`__before`,`__last`) and inserts them after `__pos` in constant time.
 Undefined if `__pos` is in (`__before`,`__last`).

swap()

```
template<typename _Tp, typename _Alloc = allocator<_Tp>>
void std::forward_list< _Tp, _Alloc >::swap (
    forward_list< _Tp, _Alloc > & __list ) [inline], [noexcept]
```

Swaps data with another forward_list.

Parameters

<code>__list</code>	A forward_list of the same element and allocator types.
---------------------	---------------------------------------------------------

This exchanges the elements between two lists in constant time. Note that the global `std::swap()` function is specialized

such that `std::swap(l1,l2)` will feed to this function.

Whether the allocators are swapped depends on the allocator traits.

References [std::swap\(\)](#).

`unique()` [1/2]

```
template<typename _Tp , typename _Alloc = allocator<_Tp>>
__remove_return_type std::forward_list<_Tp, _Alloc >::unique ( ) [inline]
```

Remove consecutive duplicate elements.

For each consecutive set of elements with the same value, remove all but the first one. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

References [std::forward_list<_Tp, _Alloc >::unique\(\)](#).

Referenced by [std::forward_list<_Tp, _Alloc >::unique\(\)](#).

`unique()` [2/2]

```
template<typename _Tp , typename _Alloc = allocator<_Tp>>
template<typename _BinPred >
__remove_return_type std::forward_list<_Tp, _Alloc >::unique (
    _BinPred __binary_pred )
```

Remove consecutive elements satisfying a predicate.

Parameters

<code>__binary_pred</code>	Binary predicate function or object.
----------------------------	--------------------------------------

For each consecutive set of elements `[first,last)` that satisfy `predicate(first,i)` where `i` is an iterator in `[first,last)`, remove all but the first one. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

5.459 `std::fpos<_StateT>` Class Template Reference

```
#include <postypes.h>
```

Public Member Functions

- `fpos` (const `fpos` &)=default
- `fpos` (`streamoff` __off)
- `operator streamoff` () const
- `fpos operator+` (`streamoff` __off) const
- `fpos & operator+=` (`streamoff` __off)
- `streamoff operator-` (const `fpos` &__other) const
- `fpos operator-` (`streamoff` __off) const
- `fpos & operator-=` (`streamoff` __off)
- `fpos & operator=` (const `fpos` &)=default
- `_StateT state` () const
- void `state` (`_StateT` __st)

5.459.1 Detailed Description

```
template<typename _StateT>
class std::fpos< _StateT >
```

Class representing stream positions.

The standard places no requirements upon the template parameter StateT. In this implementation StateT must be DefaultConstructible, CopyConstructible and Assignable. The standard only requires that fpos should contain a member of type StateT. In this implementation it also contains an offset stored as a signed integer.

Parameters

<i>StateT</i>	Type passed to and returned from state().
---------------	-------------------------------------------

5.459.2 Constructor & Destructor Documentation

fpos()

```
template<typename _StateT >
std::fpos< _StateT >::fpos (
    streamoff __off ) [inline]
```

Construct position from offset.

5.459.3 Member Function Documentation

operator streamoff()

```
template<typename _StateT >
std::fpos< _StateT >::operator streamoff ( ) const [inline]
```

Convert to streamoff.

operator+()

```
template<typename _StateT >
fpos std::fpos< _StateT >::operator+ (
    streamoff __off ) const [inline]
```

Add position and offset.

operator+=()

```
template<typename _StateT >
fpos & std::fpos< _StateT >::operator+= (
    streamoff __off ) [inline]
```

Add offset to this position.

operator-() [1/2]

```
template<typename _StateT >
streamoff std::fpos< _StateT >::operator- (
    const fpos< _StateT > & __other ) const [inline]
```

Subtract position to return offset.

operator-() [2/2]

```
template<typename _StateT >
fpos< std::fpos< _StateT >::operator- (
    streamoff __off ) const [inline]
```

Subtract offset from position.

operator-=()

```
template<typename _StateT >
fpos & std::fpos< _StateT >::operator-= (
    streamoff __off ) [inline]
```

Subtract offset from this position.

state() [1/2]

```
template<typename _StateT >
_StateT std::fpos< _StateT >::state ( ) const [inline]
```

Return the last set value of *st*.

state() [2/2]

```
template<typename _StateT >
void std::fpos< _StateT >::state (
    _StateT __st ) [inline]
```

Remember the value of *st*.

5.460 __gnu_cxx::free_list Class Reference

```
#include <bitmap_allocator.h>
```

Inheritance diagram for __gnu_cxx::free_list:

**Public Types**

- typedef __mutex **mutex_type**
- typedef vector_type::iterator **iterator**
- typedef std::size_t * **value_type**
- typedef __detail::__mini_vector< value_type > **vector_type**

Public Member Functions

- void [_M_clear](#) ()
- std::size_t * [_M_get](#) (std::size_t __sz)
- void [_M_insert](#) (std::size_t * __addr) throw ()

5.460.1 Detailed Description

The free list class for managing chunks of memory to be given to and returned by the `bitmap_allocator`.

5.460.2 Member Function Documentation

[_M_clear\(\)](#)

```
void __gnu_cxx::free_list::_M_clear ( )
```

This function just clears the internal Free List, and gives back all the memory to the OS.

[_M_get\(\)](#)

```
std::size_t * __gnu_cxx::free_list::_M_get (
    std::size_t __sz )
```

This function gets a block of memory of the specified size from the free list.

Parameters

<code>__sz</code>	The size in bytes of the memory required.
-------------------	-------------------------------------------

Returns

A pointer to the new memory block of size at least equal to that requested.

[_M_insert\(\)](#)

```
void __gnu_cxx::free_list::_M_insert (
    std::size_t * __addr ) throw ( ) [inline]
```

This function returns the block of memory to the internal free list.

Parameters

<code>__addr</code>	The pointer to the memory block that was given by a call to the <code>_M_get</code> function.
---------------------	-----------------------------------------------------------------------------------------------

Referenced by [__gnu_cxx::bitmap_allocator<_Tp>::_M_deallocate_single_object\(\)](#).

The documentation for this class was generated from the following file:

- [bitmap_allocator.h](#)

5.461 std::from_chars_result Struct Reference

Public Attributes

- typedef void [difference_type](#)
- typedef [output_iterator_tag](#) [iterator_category](#)
- typedef void [pointer](#)
- typedef void [reference](#)
- typedef void [value_type](#)

Public Member Functions

- constexpr [front_insert_iterator](#) (`_Container &__x`)
- constexpr [front_insert_iterator](#) & [operator*](#) ()
- constexpr [front_insert_iterator](#) & [operator++](#) ()
- constexpr [front_insert_iterator](#) [operator++](#) (int)
- constexpr [front_insert_iterator](#) & [operator=](#) (const typename `_Container::value_type` &__value)
- constexpr [front_insert_iterator](#) & [operator=](#) (typename `_Container::value_type` &&__value)

Protected Attributes

- `_Container *` **container**

5.462.1 Detailed Description

```
template<typename _Container>
class std::front_insert_iterator< _Container >
```

Turns assignment into insertion.

These are output iterators, constructed from a container-of-T. Assigning a T to the iterator prepends it to the container using `push_front`.

Tip: Using the `front_inserter` function to create these iterators can save typing.

5.462.2 Member Typedef Documentation

container_type

```
template<typename _Container >
typedef _Container std::front_insert_iterator< _Container >::container_type
```

A nested typedef for the type of whatever container you used.

difference_type

```
typedef void std::iterator< output_iterator_tag , void , void , void , void >::difference_type
[inherited]
```

Distance between iterators is represented as this type.

iterator_category

```
typedef output_iterator_tag std::iterator< output_iterator_tag , void , void , void , void >←
::iterator_category [inherited]
```

One of the [tag types](#).

pointer

```
typedef void std::iterator< output_iterator_tag , void , void , void , void >::pointer [inherited]
```

This type represents a pointer-to-value_type.

reference

```
typedef void std::iterator< output_iterator_tag , void , void , void , void >::reference [inherited]
```

This type represents a reference-to-value_type.

value_type

```
typedef void std::iterator< output_iterator_tag , void , void , void , void >::value_type [inherited]
```

The type "pointed to" by the iterator.

5.462.3 Constructor & Destructor Documentation

front_insert_iterator()

```
template<typename _Container >
constexpr std::front_insert_iterator< _Container >::front_insert_iterator (
    _Container & __x ) [inline], [explicit], [constexpr]
```

The only way to create this iterator is with a container.

5.462.4 Member Function Documentation

operator*()

```
template<typename _Container >
constexpr front_insert_iterator & std::front_insert_iterator< _Container >::operator* ( ) [inline],
[constexpr]
```

Simply returns *this.

operator++() [1/2]

```
template<typename _Container >
constexpr front_insert_iterator & std::front_insert_iterator< _Container >::operator++ ( ) [inline],
[constexpr]
```

Simply returns *this. (This iterator does not *move*.)

operator++() [2/2]

```
template<typename _Container >
constexpr front_insert_iterator std::front_insert_iterator< _Container >::operator++ (
    int ) [inline], [constexpr]
```

Simply returns *this. (This iterator does not *move*.)

operator=()

```
template<typename _Container >
constexpr front_insert_iterator & std::front_insert_iterator< _Container >::operator= (
    const typename _Container::value_type & __value ) [inline], [constexpr]
```

Parameters

<code>__value</code>	An instance of whatever type <code>container_type::const_reference</code> is; presumably a reference-to-const T for <code>container<T></code> .
----------------------	-------------------------------------------------------------------------------------------------------------------------------------------------------

Returns

This iterator, for chained operations.

This kind of iterator doesn't really have a *position* in the container (you can think of the position as being permanently at the front, if you like). Assigning a value to the iterator will always prepend the value to the front of the container.

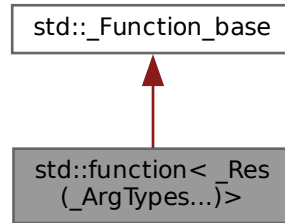

The documentation for this class was generated from the following file:

const `_Functor * target` () const noexcept

5.463.1 Detailed Description

template<typename `_Res`, typename... `_ArgTypes`>
class `std::function<_Res(_ArgTypes...)>`

Polymorphic function wrapper.

Since

C++11

5.463.2 Constructor & Destructor Documentation

function() [1/5]

```
template<typename _Res , typename... _ArgTypes>
std::function< _Res(_ArgTypes...)>::function ( ) [inline], [noexcept]
```

Default construct creates an empty function call wrapper.

Postcondition

!(bool)*this

function() [2/5]

```
template<typename _Res , typename... _ArgTypes>
std::function< _Res(_ArgTypes...)>::function (
    nullptr_t ) [inline], [noexcept]
```

Creates an empty function call wrapper.

Postcondition

!(bool)*this

function() [3/5]

```
template<typename _Res , typename... _ArgTypes>
std::function< _Res(_ArgTypes...)>::function (
    const function< _Res(_ArgTypes...)> & __x ) [inline]
```

Function copy constructor.

Parameters

	A function object with identical call signature.
	

Postcondition

bool(*this) == bool(__x)

The newly-created function contains a copy of the target of __x (if it has one).

function() [4/5]

```
template<typename _Res , typename... _ArgTypes>
std::function< _Res(_ArgTypes...)>::function (
    function< _Res(_ArgTypes...)> && __x ) [inline], [noexcept]
```

Function move constructor.

Parameters

	A function object rvalue with identical call signature.
	

The newly-created function contains the target of `__x` (if it has one).

function() [5/5]

```
template<typename _Res , typename... _ArgTypes>
template<typename _Functor , typename _Constraints = _Requires<_Callable<_Functor>>>
std::function< _Res(_ArgTypes...)>::function (
    _Functor && __f ) [inline], [noexcept]
```

Builds a function that targets a copy of the incoming function object.

Parameters

<code>←</code>	A function object that is callable with parameters of type <code>ArgTypes...</code> and returns a value convertible to <code>Res</code> .
<code>←</code>	
<code>←</code>	
<code>←</code>	
<code>f</code>	

The newly-created function object will target a copy of `__f`. If `__f` is `reference_wrapper<F>`, then this function object will contain a reference to the function object `__f.get()`. If `__f` is a null function pointer, null pointer-to-member, or empty `std::function`, the newly-created object will be empty.

If `__f` is a non-null function pointer or an object of type `reference_wrapper<F>`, this function will not throw.

5.463.3 Member Function Documentation

operator bool()

```
template<typename _Res , typename... _ArgTypes>
std::function< _Res(_ArgTypes...)>::operator bool ( ) const [inline], [explicit], [noexcept]
```

Determine if the function wrapper has a target.

Returns

`true` when this function object contains a target, or `false` when it is empty.

This function will not throw an exception.

operator()()

```
template<typename _Res , typename... _ArgTypes>
_Res std::function< _Res(_ArgTypes...)>::operator() (
    _ArgTypes... __args ) const [inline]
```

Invokes the function targeted by `*this`.

Returns

the result of the target.

Exceptions

<code>bad_function_call</code>	when <code>!(bool)*this</code>
--------------------------------	--------------------------------

The function call operator invokes the target function object stored by `this`.

operator=() [1/5]

```
template<typename _Res , typename... _ArgTypes>
template<typename _Functor >
_requires< _Callable< _Functor >, function & > std::function< _Res(_ArgTypes...)>::operator= (
    _Functor && __f ) [inline], [noexcept]
```

Function assignment to a new target.

Parameters

\leftrightarrow	A function object that is callable with parameters of type T1, T2, ..., TN and returns a value convertible to Res.
$_ \leftrightarrow$	
\leftrightarrow	
$_ \leftrightarrow$	
<i>f</i>	

Returns

*this

This function object wrapper will target a copy of *__f*. If *__f* is `reference_wrapper<F>`, then this function object will contain a reference to the function object `__f.get()`. If *__f* is a NULL function pointer or NULL pointer-to-member, this object will be empty.

If *__f* is a non-NULL function pointer or an object of type `reference_wrapper<F>`, this function will not throw.

operator=() [2/5]

```
template<typename _Res , typename... _ArgTypes>
function & std::function< _Res(_ArgTypes...)>::operator= (
    const function< _Res(_ArgTypes...)> & __x ) [inline]
```

Function assignment operator.

Parameters

$_ \leftrightarrow$	A function with identical call signature.
<i>__x</i>	

Postcondition

(bool)*this == (bool)x

Returns

*this

The target of *__x* is copied to *this. If *__x* has no target, then *this will be empty.

If *__x* targets a function pointer or a reference to a function object, then this operation will not throw an exception.

operator=() [3/5]

```
template<typename _Res , typename... _ArgTypes>
function & std::function< _Res(_ArgTypes...)>::operator= (
    function< _Res(_ArgTypes...)> && __x ) [inline], [noexcept]
```

Function move-assignment operator.

Parameters

<u>↔</u> <u>x</u>	A function rvalue with identical call signature.
------------------------------------------------------	--------------------------------------------------

Returns

`*this`

The target of `__x` is moved to `*this`. If `__x` has no target, then `*this` will be empty.

If `__x` targets a function pointer or a reference to a function object, then this operation will not throw an exception.

References [std::move\(\)](#).

operator=() [4/5]

```
template<typename _Res , typename... _ArgTypes>
function & std::function< _Res(_ArgTypes...)>::operator= (
    nullptr_t ) [inline], [noexcept]
```

Function assignment to zero.

Postcondition

`!(bool)*this`

Returns

`*this`

The target of `*this` is deallocated, leaving it empty.

operator=() [5/5]

```
template<typename _Res , typename... _ArgTypes>
template<typename _Functor >
function & std::function< _Res(_ArgTypes...)>::operator= (
    reference_wrapper< _Functor > __f ) [inline], [noexcept]
```

This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.

swap()

```
template<typename _Res , typename... _ArgTypes>
void std::function< _Res(_ArgTypes...)>::swap (
    function< _Res(_ArgTypes...)> & __x ) [inline], [noexcept]
```

Swap the targets of two function objects.

Parameters

<u>↔</u> <u>x</u>	A function with identical call signature.
------------------------------------------------------	-------------------------------------------

Swap the targets of `this` function object and `__f`. This function will not throw an exception.

References [std::swap\(\)](#).

target() [1/2]

```
template<typename _Res , typename... _ArgTypes>
template<typename _Functor >
const _Functor * std::function< _Res(_ArgTypes...)>::target ( ) const [inline], [noexcept]
```

Access the stored target function object.

Returns

Returns a pointer to the stored target function object, if typeid(_Functor).equals(target_type()); otherwise, a null pointer.

This function does not throw exceptions.

target() [2/2]

```
template<typename _Res , typename... _ArgTypes>
template<typename _Functor >
_Functor * std::function< _Res(_ArgTypes...)>::target ( ) [inline], [noexcept]
```

Access the stored target function object.

Returns

Returns a pointer to the stored target function object, if typeid(_Functor).equals(target_type()); otherwise, a null pointer.

This function does not throw exceptions.

target_type()

```
template<typename _Res , typename... _ArgTypes>
const type_info & std::function< _Res(_ArgTypes...)>::target_type ( ) const [inline], [noexcept]
```

Determine the type of the target of this function object wrapper.

Returns

the type identifier of the target function object, or `typeid(void)` if `!(bool)*this`.

This function will not throw an exception.

5.468.1 Detailed Description

```
template<typename _RealType = double>
class std::gamma_distribution<_RealType>
```

A gamma continuous distribution for random numbers.

The formula for the gamma probability density function is:

$$p(x|\alpha, \beta) = \frac{1}{\beta\Gamma(\alpha)} (x/\beta)^{\alpha-1} e^{-x/\beta}$$

5.468.2 Member Typedef Documentation

result_type

```
template<typename _RealType = double>
typedef _RealType std::gamma_distribution< _RealType >::result_type
```

The type of the range of the distribution.

5.468.3 Constructor & Destructor Documentation

gamma_distribution() [1/2]

```
template<typename _RealType = double>
std::gamma_distribution< _RealType >::gamma_distribution ( ) [inline]
```

Constructs a gamma distribution with parameters 1 and 1.

gamma_distribution() [2/2]

```
template<typename _RealType = double>
std::gamma_distribution< _RealType >::gamma_distribution (
    _RealType __alpha_val,
    _RealType __beta_val = _RealType(1) ) [inline], [explicit]
```

Constructs a gamma distribution with parameters α and β .

5.468.4 Member Function Documentation

alpha()

```
template<typename _RealType = double>
_RealType std::gamma_distribution< _RealType >::alpha ( ) const [inline]
```

Returns the α of the distribution.

beta()

```
template<typename _RealType = double>
_RealType std::gamma_distribution< _RealType >::beta ( ) const [inline]
```

Returns the β of the distribution.

max()

```
template<typename _RealType = double>
result_type std::gamma_distribution< _RealType >::max ( ) const [inline]
```

Returns the least upper bound value of the distribution.
References [std::numeric_limits<_Tp>::max\(\)](#).

min()

```
template<typename _RealType = double>
result_type std::gamma_distribution< _RealType >::min ( ) const [inline]
```

Returns the greatest lower bound value of the distribution.

operator()() [1/2]

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator >
result_type std::gamma_distribution< _RealType >::operator() (
    _UniformRandomNumberGenerator & __urng ) [inline]
```

Generating functions.

gamma_distribution<_RealType >::result_type std::gamma_distribution<_RealType >::operator() (
    _UniformRandomNumberGenerator & __urng,
    const param_type & __param )
```

Marsaglia, G. and Tsang, W. W. "A Simple Method for Generating Gamma Variables" ACM Transactions on Mathematical Software, 26, 3, 363-372, 2000.

References [std::log\(\)](#), and [std::pow\(\)](#).

`param()` [1/2]

```
template<typename _RealType = double>
param_type std::gamma_distribution<_RealType >::param ( ) const [inline]
```

Returns the parameter set of the distribution.

Referenced by [std::chi_squared_distribution<_RealType>::param\(\)](#).

`param()` [2/2]

```
template<typename _RealType = double>
void std::gamma_distribution<_RealType >::param (
    const param_type & __param ) [inline]
```

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--------------------------------------------

`reset()`

```
template<typename _RealType = double>
void std::gamma_distribution<_RealType >::reset ( ) [inline]
```

Resets the distribution state.

References [std::normal_distribution<_RealType>::reset\(\)](#).

Referenced by [std::chi_squared_distribution<_RealType>::reset\(\)](#), [std::fisher_f_distribution<_RealType>::reset\(\)](#), [std::student_t_distribution<_RealType>::reset\(\)](#), and [std::negative_binomial_distribution<_IntType>::reset\(\)](#).

5.468.5 Friends And Related Symbol Documentation

`operator<<`

```
template<typename _RealType = double>
template<typename _RealType1 , typename _CharT , typename _Traits >
std::basic_ostream<_CharT, _Traits > & operator<< (
    std::basic_ostream<_CharT, _Traits > & __os,
    const std::gamma_distribution<_RealType1 > & __x ) [friend]
```

Inserts a `gamma_distribution` random number distribution `__x` into the output stream `__os`.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>gamma_distribution</code> random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

operator==

```
template<typename _RealType = double>
bool operator== (
    const gamma\_distribution< _RealType > & __d1,
    const gamma\_distribution< _RealType > & __d2 ) [friend]
```

Return true if two gamma distributions have the same parameters and the sequences that would be generated are equal.

operator>>

```
template<typename _RealType = double>
template<typename _RealType1 , typename _CharT , typename _Traits >
std::basic\_istream< _CharT, _Traits > & operator>> (
    std::basic\_istream< _CharT, _Traits > & __is,
    std::gamma\_distribution< _RealType1 > & __x ) [friend]
```

Extracts a `gamma_distribution` random number distribution `__x` from the input stream `__is`.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A <code>gamma_distribution</code> random number generator engine.

Returns

The input stream with `__x` extracted or in an error state.

5.469.1 Detailed Description

```
template<typename _IntType = int>
class std::geometric_distribution<_IntType>
```

A discrete geometric random number distribution.

The formula for the geometric probability density function is $p(i|p) = p(1 - p)^i$ where p is the parameter of the distribution.

5.469.2 Member Typedef Documentation**result_type**

```
template<typename _IntType = int>
typedef _IntType std::geometric\_distribution<\_IntType>::result\_type
```

The type of the range of the distribution.

5.469.3 Member Function Documentation**max()**

```
template<typename _IntType = int>
result\_type std::geometric\_distribution<\_IntType>::max ( ) const [inline]
```

Returns the least upper bound value of the distribution.
References [std::numeric_limits<_Tp>::max\(\)](#).

min()

```
template<typename _IntType = int>
result_type std::geometric_distribution< _IntType >::min ( ) const [inline]
```

Returns the greatest lower bound value of the distribution.

operator()()

```
template<typename _IntType = int>
template<typename _UniformRandomNumberGenerator >
result_type std::geometric_distribution< _IntType >::operator() (
    _UniformRandomNumberGenerator & __urng ) [inline]
```

Generating functions.

References [std::geometric_distribution< _IntType >::operator\(\)\(\)](#).

Referenced by [std::geometric_distribution< _IntType >::operator\(\)\(\)](#).

p()

```
template<typename _IntType = int>
double std::geometric_distribution< _IntType >::p ( ) const [inline]
```

Returns the distribution parameter p.

param() [1/2]

```
template<typename _IntType = int>
param_type std::geometric_distribution< _IntType >::param ( ) const [inline]
```

Returns the parameter set of the distribution.

Referenced by [std::operator>>\(\)](#).

param() [2/2]

```
template<typename _IntType = int>
void std::geometric_distribution< _IntType >::param (
    const param_type & __param ) [inline]
```

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--------------------------------------------

reset()

```
template<typename _IntType = int>
void std::geometric_distribution< _IntType >::reset ( ) [inline]
```

Resets the distribution state.

Does nothing for the geometric distribution.

5.469.4 Friends And Related Symbol Documentation**operator==**

```
template<typename _IntType = int>
bool operator== (
    const geometric_distribution< _IntType > & __d1,
    const geometric_distribution< _IntType > & __d2 ) [friend]
```

Return true if two geometric distributions have the same parameters.

5.470.1 Detailed Description

```
template<typename Key, typename Mapped, typename Hash_Fn = typename detail::default_hash_fn<↵
Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn =
detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb_Probe_↵
_Fn>::type, typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_Fn>::type, bool
Store_Hash = detail::default_store_hash, typename _Alloc = std::allocator<char>>
class __gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_↵
Policy, Store_Hash, _Alloc >
```

A general-probing hash-based associative container.

Template Parameters

<i>Key</i>	Key type.
<i>Mapped</i>	Map type.
<i>Hash_Fn</i>	Hashing functor.
<i>Eq_Fn</i>	Equal functor.
<i>Comb_Probe_Fn</i>	Combining probe functor. If Hash_Fn is not null_type, then this is the ranged-probe functor; otherwise, this is the range-hashing functor. XXX See Design::Hash-Based Containers::Hash Policies.
<i>Probe_Fn</i>	Probe functor.
<i>Resize_Policy</i>	Resizes hash.
<i>Store_Hash</i>	Indicates whether the hash value will be stored along with each key. If Hash_Fn is null_type, then the container will not compile if this value is true
<i>_Alloc</i>	Allocator type.

Base tag choices are: `gp_hash_tag`.

Base is `basic_hash_table`.

5.470.2 Constructor & Destructor Documentation

`gp_hash_table()` [1/12]

```
template<typename Key , typename Mapped , typename Hash_Fn = typename detail::default_hash_fn<↵
Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn =
detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb_↵
Probe_Fn>::type, typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_Fn>↵
::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std::allocator<char>>
__gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy,
Store_Hash, _Alloc >::gp_hash_table ( ) [inline]
```

Default constructor.

`gp_hash_table()` [2/12]

```
template<typename Key , typename Mapped , typename Hash_Fn = typename detail::default_hash_fn<↵
Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn =
```

```
detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb_Probe_Fn>::type, typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_Fn>::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std::allocator<char>>
__gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy, Store_Hash, _Alloc >::gp_hash_table (
    const hash_fn & h ) [inline]
```

Constructor taking some policy objects. `r_hash_fn` will be copied by the `hash_fn` object of the container object.

`gp_hash_table()` [3/12]

```
template<typename Key , typename Mapped , typename Hash_Fn = typename detail::default_hash_fn<Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn = detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb_Probe_Fn>::type, typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_Fn>::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std::allocator<char>>
__gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy, Store_Hash, _Alloc >::gp_hash_table (
    const hash_fn & h,
    const eq_fn & e ) [inline]
```

Constructor taking some policy objects. `r_hash_fn` will be copied by the `hash_fn` object of the container object, and `r_eq_fn` will be copied by the `eq_fn` object of the container object.

`gp_hash_table()` [4/12]

```
template<typename Key , typename Mapped , typename Hash_Fn = typename detail::default_hash_fn<Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn = detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb_Probe_Fn>::type, typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_Fn>::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std::allocator<char>>
__gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy, Store_Hash, _Alloc >::gp_hash_table (
    const hash_fn & h,
    const eq_fn & e,
    const comb_probe_fn & cp ) [inline]
```

Constructor taking some policy objects. `r_hash_fn` will be copied by the `hash_fn` object of the container object, `r_eq_fn` will be copied by the `eq_fn` object of the container object, and `r_comb_probe_fn` will be copied by the `comb_probe_fn` object of the container object.

`gp_hash_table()` [5/12]

```
template<typename Key , typename Mapped , typename Hash_Fn = typename detail::default_hash_fn<Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn = detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb_Probe_Fn>::type, typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_Fn>::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std::allocator<char>>
__gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy, Store_Hash, _Alloc >::gp_hash_table (
    const hash_fn & h,
    const eq_fn & e,
    const comb_probe_fn & cp,
    const probe_fn & p ) [inline]
```

Constructor taking some policy objects. `r_hash_fn` will be copied by the `hash_fn` object of the container object, `r_eq_fn` will be copied by the `eq_fn` object of the container object, `r_comb_probe_fn` will be copied by the `comb_probe_fn` object of the container object, and `r_probe_fn` will be copied by the `probe_fn` object of the container object.

gp_hash_table() [6/12]

```
template<typename Key , typename Mapped , typename Hash_Fn = typename detail::default_hash_fn<↵
Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn =
detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb_↵
Probe_Fn>::type, typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_Fn>↵
::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std::allocator<char>>
__gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy,
Store_Hash, _Alloc >::gp_hash_table (
    const hash_fn & h,
    const eq_fn & e,
    const comb_probe_fn & cp,
    const probe_fn & p,
    const resize_policy & rp ) [inline]
```

Constructor taking some policy objects. `r_hash_fn` will be copied by the `hash_fn` object of the container object, `r_eq_fn` will be copied by the `eq_fn` object of the container object, `r_comb_probe_fn` will be copied by the `comb_probe_fn` object of the container object, `r_probe_fn` will be copied by the `probe_fn` object of the container object, and `r_resize_policy` will be copied by the `Resize_Policy` object of the container object.

gp_hash_table() [7/12]

```
template<typename Key , typename Mapped , typename Hash_Fn = typename detail::default_hash_fn<↵
Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn =
detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb_↵
Probe_Fn>::type, typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_Fn>↵
::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std::allocator<char>>
template<typename It >
__gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy,
Store_Hash, _Alloc >::gp_hash_table (
    It first,
    It last ) [inline]
```

Constructor taking `__iterators` to a range of `value_types`. The `value_types` between `first_it` and `last_it` will be inserted into the container object.

gp_hash_table() [8/12]

```
template<typename Key , typename Mapped , typename Hash_Fn = typename detail::default_hash_fn<↵
Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn =

Probe_Fn>::type, typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_Fn>↵
::type, bool Store_Hash = detail::default_store_hash, typename _Alloc = std::allocator<char>>
template<typename It >
__gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy,
Store_Hash, _Alloc >::gp_hash_table (
    It first,
    It last,
    const hash_fn & h ) [inline]
```

Constructor taking `__iterators` to a range of `value_types` and some policy objects. The `value_types` between `first_it` and `last_it` will be inserted into the container object. `r_hash_fn` will be copied by the `hash_fn` object of the container object.

gp_hash_table() [9/12]

```
template<typename Key , typename Mapped , typename Hash_Fn = typename detail::default_hash_fn<↵
Key>::type, typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn =
```

```

detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb_Probe_Fn>::type,
typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_Fn>::type, bool Store_Hash = detail::default_store_hash,
typename _Alloc = std::allocator<char>>
template<typename It >
__gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy,
Store_Hash, _Alloc >::gp_hash_table (
    It first,
    It last,
    const hash_fn & h,
    const eq_fn & e ) [inline]

```

Constructor taking `__iterators` to a range of `value_types` and some policy objects. The `value_types` between `first_it` and `last_it` will be inserted into the container object. `r_hash_fn` will be copied by the `hash_fn` object of the container object, and `r_eq_fn` will be copied by the `eq_fn` object of the container object.

`gp_hash_table()` [10/12]

```

template<typename Key , typename Mapped , typename Hash_Fn = typename detail::default_hash_fn<Key>::type,
typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn =
detail::default_comb_hash_fn::type, typename Probe_Fn = typename detail::default_probe_fn<Comb_Probe_Fn>::type,
typename Resize_Policy = typename detail::default_resize_policy<Comb_Probe_Fn>::type, bool Store_Hash = detail::default_store_hash,
typename _Alloc = std::allocator<char>>
template<typename It >
__gnu_pbds::gp_hash_table< Key, Mapped, Hash_Fn, Eq_Fn, Comb_Probe_Fn, Probe_Fn, Resize_Policy,
Store_Hash, _Alloc >::gp_hash_table (
    It first,
    It last,
    const hash_fn & h,
    const eq_fn & e,
    const comb_probe_fn & cp ) [inline]

```

Constructor taking `__iterators` to a range of `value_types` and some policy objects. The `value_types` between `first_it` and `last_it` will be inserted into the container object. `r_hash_fn` will be copied by the `hash_fn` object of the container object, `r_eq_fn` will be copied by the `eq_fn` object of the container object, and `r_comb_probe_fn` will be copied by the `comb_probe_fn` object of the container object.

`gp_hash_table()` [11/12]

```

template<typename Key , typename Mapped , typename Hash_Fn = typename detail::default_hash_fn<Key>::type,
typename Eq_Fn = typename detail::default_eq_fn<Key>::type, typename Comb_Probe_Fn =

5.472.1 Detailed Description

`template<typename Key, typename Mapped, typename Hash_Fn, typename Eq_Fn, typename _Alloc, bool Store_Hash, typename Comb_Probe_Fn, typename Probe_Fn, typename Resize_Policy>`
`class __gnu_pbds::detail::gp_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash, Comb_Probe_Fn, Probe_Fn, Resize_Policy >`

A general-probing hash-based container.

Template Parameters

<i>Key</i>	Key type.
<i>Mapped</i>	Map type.
<i>Hash_Fn</i>	Hashing functor. Default is <code>__gnu_cxx::hash</code> .
<i>Eq_Fn</i>	Equal functor. Default <code>std::equal_to<Key></code>
<i>_Alloc</i>	Allocator type.
<i>Store_Hash</i>	If key type stores extra metadata. Defaults to false.
<i>Comb_Probe_Fn</i>	Combining probe functor. If <i>Hash_Fn</i> is not null_type, then this is the ranged-probe functor; otherwise, this is the range-hashing functor. XXX See Design::Hash-Based Containers::Hash Policies. Default <code>direct_mask_range_hashing</code> .
<i>Probe_Fn</i>	Probe functor. Defaults to <code>linear_probe_fn</code> , also <code>quadratic_probe_fn</code> .
<i>Resize_Policy</i>	Resizes hash. Defaults to <code>hash_standard_resize_policy</code> , using <code>hash_exponential_size_policy</code> and <code>hash_load_check_resize_trigger</code> .

Bases are: `detail::hash_eq_fn`, `Resize_Policy`, `detail::ranged_probe_fn`, `detail::types_traits`. (Optional: `detail::debug_map_base`.)

5.472.2 Member Enumeration Documentation

anonymous enum

```
template<typename Key , typename Mapped , typename Hash_Fn , typename Eq_Fn , typename _Alloc ,
bool Store_Hash, typename Comb_Probe_Fn , typename Probe_Fn , typename Resize_Policy >
anonymous enum
```

Value stores hash, true or false.

5.472.3 Member Function Documentation

`empty()`

```
template<typename Key , typename Mapped , typename Hash_Fn , typename Eq_Fn , typename _Alloc ,
bool Store_Hash, typename Comb_Probe_Fn , typename Probe_Fn , typename Resize_Policy >
bool __gnu_pbds::detail::gp_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash, Comb_Probe_
Fn, Probe_Fn, Resize_Policy >::empty ( ) const [inline]
```

True if size() == 0.

get_comb_probe_fn() [1/2]

```
template<typename Key , typename Mapped , typename Hash_Fn , typename Eq_Fn , typename _Alloc ,
bool Store_Hash, typename Comb_Probe_Fn , typename Probe_Fn , typename Resize_Policy >
Comb_Probe_Fn & __gnu_pbds::detail::gp_ht_map< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash,

Friends

- `template<typename _Tp >`
class [valarray](#)

5.479.1 Detailed Description

Class defining multi-dimensional subset of an array.

The slice class represents a multi-dimensional subset of an array, specified by three parameter sets: start offset, size array, and stride array. The start offset is the index of the first element of the array that is part of the subset. The size and stride array describe each dimension of the slice. Size is the number of elements in that dimension, and stride is

the distance in the array between successive elements in that dimension. Each dimension's size and stride is taken to begin at an array element described by the previous dimension. The size array and stride array must be the same size. For example, if you have `offset==3`, `stride[0]==11`, `size[1]==3`, `stride[1]==3`, then `slice[0,0]==array[3]`, `slice[0,1]==array[6]`, `slice[0,2]==array[9]`, `slice[1,0]==array[14]`, `slice[1,1]==array[17]`, `slice[1,2]==array[20]`.

Friends

- class **valarray**<_Tp>

5.480.1 Detailed Description

template<typename _Tp>
class std::gslice_array<_Tp>

Reference to multi-dimensional subset of an array.

A gslice_array is a reference to the actual elements of an array specified by a gslice. The way to get a gslice_array is to call operator[](gslice) on a valarray. The returned gslice_array then permits carrying operations out on the referenced subset of elements in the original valarray. For example, operator+=(valarray) will add values to the subset of elements in the underlying valarray this gslice_array refers to.

Parameters

<i>Tp</i>	Element type.
-----------	---------------

5.480.2 Member Function Documentation

operator%=()

```
template<typename _Tp>
void std::gslice_array<_Tp>::operator%= (
    const valarray<_Tp> & ) const
```

Modulo slice elements by corresponding elements of *v*.

operator&=()

```
template<typename _Tp>
void std::gslice_array<_Tp>::operator&= (
    const valarray<_Tp> & ) const
```

Logical and slice elements with corresponding elements of *v*.

operator*=()

```
template<typename _Tp>
void std::gslice_array<_Tp>::operator*= (
    const valarray<_Tp> & ) const
```

Multiply slice elements by corresponding elements of *v*.

operator+=()

```
template<typename _Tp>
void std::gslice_array<_Tp>::operator+= (
    const valarray<_Tp> & ) const
```

Add corresponding elements of *v* to slice elements.

operator-=()

```
template<typename _Tp>
void std::gslice_array<_Tp>::operator-= (
    const valarray<_Tp> & ) const
```

Subtract corresponding elements of *v* from slice elements.

operator/=()

```
template<typename _Tp >
void std::gslice_array< _Tp >::operator/= (
    const valarray< _Tp > & ) const
```

Divide slice elements by corresponding elements of *v*.

operator<<=()

```
template<typename _Tp >
void std::gslice_array< _Tp >::operator<<= (
    const valarray< _Tp > & ) const
```

Left shift slice elements by corresponding elements of *v*.

operator>>=()

```
template<typename _Tp >
void std::gslice_array< _Tp >::operator>>= (
    const valarray< _Tp > & ) const
```

Right shift slice elements by corresponding elements of *v*.

operator^=()

```
template<typename _Tp >
void std::gslice_array< _Tp >::operator^= (
    const valarray< _Tp > & ) const
```

Logical xor slice elements with corresponding elements of *v*.

operator" |= ()

```
template<typename _Tp >
void std::gslice_array< _Tp >::operator|= (
    const valarray< _Tp > & ) const
```

Logical or slice elements with corresponding elements of *v*.

5.498.1 Detailed Description

Specialization for `double`.

The documentation for this struct was generated from the following file:

- [functional_hash.h](#)

5.499 `std::hash< error_code >` Struct Reference

Inherits `std::__hash_base< _Result, _Arg >`.

Public Types

- typedef `_Arg` **argument_type**
- typedef `_Result` **result_type**

Public Member Functions

- `size_t operator() (const error_code &__e) const` noexcept

5.499.1 Detailed Description

`std::hash` specialization for `error_code`.

The documentation for this struct was generated from the following file:

- [system_error](#)

5.500 `std::hash< error_condition >` Struct Reference

Inherits `std::__hash_base< _Result, _Arg >`.

Public Types

- typedef `_Arg` **argument_type**
- typedef `_Result` **result_type**

Public Member Functions

- `size_t operator()` (const [error_condition](#) &__e) const noexcept

5.500.1 Detailed Description

`std::hash` specialization for `error_condition`.

The documentation for this struct was generated from the following file:

- [system_error](#)

5.501 `std::hash< experimental::optional< _Tp > >` Struct Template Reference

Public Types

- using `argument_type` = [experimental::optional](#)< _Tp >
- using `result_type` = `size_t`

Public Member Functions

- `size_t operator()` (const [experimental::optional](#)< _Tp > &__t) const noexcept(noexcept([hash](#)< _Tp > {}(*__t)))

5.501.1 Detailed Description

`template<typename _Tp>`

`struct std::hash< experimental::optional< _Tp > >`

`std::hash` partial specialization for `experimental::optional`

The documentation for this struct was generated from the following file:

- [experimental/optional](#)

5.502 `std::hash< experimental::shared_ptr< _Tp > >` Struct Template Reference

```
#include <shared_ptr.h>
```

Inherits `std::__hash_base< _Result, _Arg >`.

Public Types

- typedef `_Arg` `argument_type`
- typedef `_Result` `result_type`

Public Member Functions

- `size_t operator()` (const `experimental::shared_ptr`< _Tp > &__s) const noexcept

5.502.1 Detailed Description

`template<typename _Tp>`

`struct std::hash< experimental::shared_ptr< _Tp > >`

`std::hash` specialization for `shared_ptr`.

The documentation for this struct was generated from the following file:

- [experimental/bits/shared_ptr.h](#)

5.503 std::hash< float > Struct Reference

```
#include <functional_hash.h>  
Inherits std::__hash_base< _Result, _Arg >.
```

Public Types

- typedef _Arg **argument_type**
- typedef _Result **result_type**

Public Member Functions

- size_t **operator()** (float __val) const noexcept

5.503.1 Detailed Description

Specialization for float.

The documentation for this struct was generated from the following file:

- [functional_hash.h](#)

5.504 std::hash< int > Struct Reference

```
#include <functional_hash.h>  
Inherits std::__hash_base< _Result, _Arg >.
```

Public Types

- typedef _Arg **argument_type**
- typedef _Result **result_type**

Public Member Functions

- size_t **operator()** (int __val) const noexcept

5.504.1 Detailed Description

Explicit specialization for int.

The documentation for this struct was generated from the following file:

- [functional_hash.h](#)

5.505 std::hash< long > Struct Reference

```
#include <functional_hash.h>  
Inherits std::__hash_base< _Result, _Arg >.
```

Public Types

- typedef _Arg **argument_type**
- typedef _Result **result_type**

Public Member Functions

- size_t **operator()** (long __val) const noexcept

5.505.1 Detailed Description

Explicit specialization for long.

The documentation for this struct was generated from the following file:

- [functional_hash.h](#)

5.506 std::hash< long double > Struct Reference

```
#include <functional_hash.h>
```

Inherits std::__hash_base< _Result, _Arg >.

Public Types

- typedef _Arg **argument_type**
- typedef _Result **result_type**

Public Member Functions

- size_t **operator()** (long double __val) const noexcept

5.506.1 Detailed Description

Specialization for long double.

The documentation for this struct was generated from the following file:

- [functional_hash.h](#)

5.507 std::hash< long long > Struct Reference

```
#include <functional_hash.h>
```

Inherits std::__hash_base< _Result, _Arg >.

Public Types

- typedef _Arg **argument_type**
- typedef _Result **result_type**

Public Member Functions

- size_t **operator()** (long long __val) const noexcept

5.507.1 Detailed Description

Explicit specialization for long long.

The documentation for this struct was generated from the following file:

- [functional_hash.h](#)

5.508 std::hash< shared_ptr< _Tp > > Struct Template Reference

```
#include <shared_ptr.h>
```

Inherits std::__hash_base< _Result, _Arg >.

Public Types

- typedef _Arg **argument_type**
- typedef _Result **result_type**

Public Member Functions

- **size_t operator()** (const [shared_ptr](#)< _Tp > &__s) const noexcept

5.508.1 Detailed Description

```
template<typename _Tp>
struct std::hash< shared_ptr< _Tp > >
```

std::hash specialization for shared_ptr.

The documentation for this struct was generated from the following file:

- [bits/shared_ptr.h](#)

5.509 std::hash< short > Struct Reference

```
#include <functional_hash.h>
Inherits std::__hash_base< _Result, _Arg >.
```

Public Types

- typedef _Arg **argument_type**
- typedef _Result **result_type**

Public Member Functions

- **size_t operator()** (short __val) const noexcept

5.509.1 Detailed Description

Explicit specialization for short.

The documentation for this struct was generated from the following file:

- [functional_hash.h](#)

5.510 std::hash< signed char > Struct Reference

```
#include <functional_hash.h>
Inherits std::__hash_base< _Result, _Arg >.
```

Public Types

- typedef _Arg **argument_type**
- typedef _Result **result_type**

Public Member Functions

- **size_t operator()** (signed char __val) const noexcept

5.510.1 Detailed Description

Explicit specialization for signed char.

The documentation for this struct was generated from the following file:

- [functional_hash.h](#)

5.511 std::hash< string > Struct Reference

```
#include <basic_string.h>
```

Inherits std::__hash_base< _Result, _Arg >.

Public Types

- typedef _Arg **argument_type**
- typedef _Result **result_type**

Public Member Functions

- size_t **operator()** (const [string](#) &__s) const noexcept

5.511.1 Detailed Description

std::hash specialization for string.

The documentation for this struct was generated from the following file:

- [basic_string.h](#)

5.512 std::hash< thread::id > Struct Reference

```
#include <std_thread.h>
```

Inherits std::__hash_base< _Result, _Arg >.

Public Types

- typedef _Arg **argument_type**
- typedef _Result **result_type**

Public Member Functions

- size_t **operator()** (const [thread::id](#) &__id) const noexcept

5.512.1 Detailed Description

std::hash specialization for thread::id.

The documentation for this struct was generated from the following file:

- [std_thread.h](#)

5.513 std::hash< type_index > Struct Reference

Public Types

- typedef [type_index](#) **argument_type**
- typedef size_t **result_type**

Public Member Functions

- `size_t operator()` (const [type_index](#) &__ti) const noexcept

5.513.1 Detailed Description

`std::hash` specialization for `type_index`.

The documentation for this struct was generated from the following file:

- [typeindex](#)

5.514 `std::hash< u16string >` Struct Reference

```
#include <basic_string.h>
```

Inherits `std::__hash_base< _Result, _Arg >`.

Public Types

- typedef `_Arg` **argument_type**
- typedef `_Result` **result_type**

Public Member Functions

- `size_t operator()` (const [u16string](#) &__s) const noexcept

5.514.1 Detailed Description

`std::hash` specialization for `u16string`.

The documentation for this struct was generated from the following file:

- [basic_string.h](#)

5.515 `std::hash< u32string >` Struct Reference

```
#include <basic_string.h>
```

Inherits `std::__hash_base< _Result, _Arg >`.

Public Types

- typedef `_Arg` **argument_type**
- typedef `_Result` **result_type**

Public Member Functions

- `size_t operator()` (const [u32string](#) &__s) const noexcept

5.515.1 Detailed Description

`std::hash` specialization for `u32string`.

The documentation for this struct was generated from the following file:

- [basic_string.h](#)

5.516 `std::hash< unique_ptr< _Tp, _Dp > >` Struct Template Reference

```
#include <unique_ptr.h>
```

Inherits `std::__hash_base< _Result, _Arg >`, and `__uniq_ptr_hash< unique_ptr< _Tp, _Dp > >`.

Public Types

- typedef `_Arg` **argument_type**
- typedef `_Result` **result_type**

5.516.1 Detailed Description

```
template<typename _Tp, typename _Dp>  
struct std::hash< unique_ptr< _Tp, _Dp > >
```

std::hash specialization for unique_ptr.

The documentation for this struct was generated from the following file:

- [unique_ptr.h](#)

5.517 std::hash< unsigned char > Struct Reference

```
#include <functional_hash.h>  
Inherits std::__hash_base< _Result, _Arg >.
```

Public Types

- typedef `_Arg` **argument_type**
- typedef `_Result` **result_type**

Public Member Functions

- `size_t operator()` (unsigned char __val) const noexcept

5.517.1 Detailed Description

Explicit specialization for unsigned char.

The documentation for this struct was generated from the following file:

- [functional_hash.h](#)

5.518 std::hash< unsigned int > Struct Reference

```
#include <functional_hash.h>  
Inherits std::__hash_base< _Result, _Arg >.
```

Public Types

- typedef `_Arg` **argument_type**
- typedef `_Result` **result_type**

Public Member Functions

- `size_t operator()` (unsigned int __val) const noexcept

5.518.1 Detailed Description

Explicit specialization for unsigned int.

The documentation for this struct was generated from the following file:

- [functional_hash.h](#)

5.519 `std::hash< unsigned long >` Struct Reference

```
#include <functional_hash.h>  
Inherits std::__hash_base< _Result, _Arg >.
```

Public Types

- `typedef _Arg argument_type`
- `typedef _Result result_type`

Public Member Functions

- `size_t operator() (unsigned long __val) const` noexcept

5.519.1 Detailed Description

Explicit specialization for unsigned long.

The documentation for this struct was generated from the following file:

- [functional_hash.h](#)

5.520 `std::hash< unsigned long long >` Struct Reference

```
#include <functional_hash.h>  
Inherits std::__hash_base< _Result, _Arg >.
```

Public Types

- `typedef _Arg argument_type`
- `typedef _Result result_type`

Public Member Functions

- `size_t operator() (unsigned long long __val) const` noexcept

5.520.1 Detailed Description

Explicit specialization for unsigned long long.

The documentation for this struct was generated from the following file:

- [functional_hash.h](#)

5.521 `std::hash< unsigned short >` Struct Reference

```
#include <functional_hash.h>  
Inherits std::__hash_base< _Result, _Arg >.
```

Public Types

- `typedef _Arg argument_type`
- `typedef _Result result_type`

Public Member Functions

- `size_t operator() (unsigned short __val) const` noexcept

5.521.1 Detailed Description

Explicit specialization for unsigned short.

The documentation for this struct was generated from the following file:

- [functional_hash.h](#)

5.522 `std::hash< wchar_t >` Struct Reference

```
#include <functional_hash.h>
```

Inherits `std::__hash_base< _Result, _Arg >`.

Public Types

- typedef `_Arg` **argument_type**
- typedef `_Result` **result_type**

Public Member Functions

- `size_t operator()` (`wchar_t __val`) const noexcept

5.522.1 Detailed Description

Explicit specialization for `wchar_t`.

The documentation for this struct was generated from the following file:

- [functional_hash.h](#)

5.523 `std::hash< wstring >` Struct Reference

```
#include <basic_string.h>
```

Inherits `std::__hash_base< _Result, _Arg >`.

Public Types

- typedef `_Arg` **argument_type**
- typedef `_Result` **result_type**

Public Member Functions

- `size_t operator()` (const [wstring](#) &__s) const noexcept

5.523.1 Detailed Description

`std::hash` specialization for `wstring`.

The documentation for this struct was generated from the following file:

- [basic_string.h](#)

5.524 `std::hash<::bitset< _Nb > >` Struct Template Reference

Inherits `std::__hash_base< _Result, _Arg >`.

Public Types

- typedef `_Arg` **argument_type**
- typedef `_Result` **result_type**

Public Member Functions

- `size_t operator()` (`const ::bitset< _Nb > &__b`) `const noexcept`

5.524.1 Detailed Description

```
template<size_t _Nb>
struct std::hash<::bitset< _Nb > >
```

`std::hash` specialization for `bitset`.

The documentation for this struct was generated from the following file:

- [bitset](#)

5.525 `std::hash<::vector< bool, _Alloc > >` Struct Template Reference

```
#include <stl_bvector.h>
```

Inherits `std::__hash_base< _Result, _Arg >`.

Public Types

- typedef `_Arg` **argument_type**
- typedef `_Result` **result_type**

Public Member Functions

- `size_t operator()` (`const ::vector< bool, _Alloc > &`) `const noexcept`

5.525.1 Detailed Description

```
template<typename _Alloc>
struct std::hash<::vector< bool, _Alloc > >
```

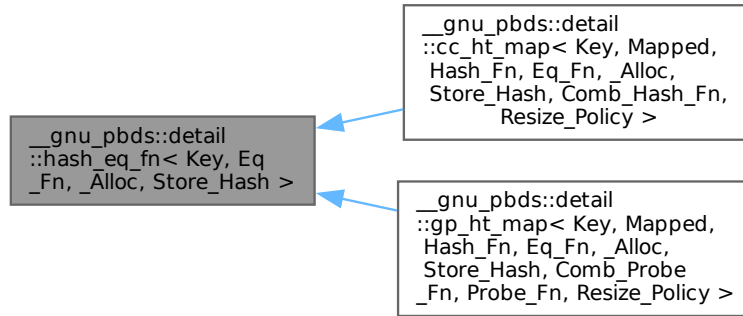

`std::hash` specialization for `vector<bool>`.

The documentation for this struct was generated from the following files:

- [stl_bvector.h](#)
- [vector.tcc](#)

5.526 `__gnu_pbds::detail::hash_eq_fn< Key, Eq_Fn, _Alloc, Store_Hash >` Struct Template Reference

Inheritance diagram for `__gnu_pbds::detail::hash_eq_fn< Key, Eq_Fn, _Alloc, Store_Hash >`:

5.526.1 Detailed Description

```
template<typename Key, typename Eq_Fn, typename _Alloc, bool Store_Hash>
struct __gnu_pbds::detail::hash_eq_fn< Key, Eq_Fn, _Alloc, Store_Hash >
```

Primary template.

The documentation for this struct was generated from the following file:

- [hash_eq_fn.hpp](#)

5.527 `__gnu_pbds::detail::hash_eq_fn< Key, Eq_Fn, _Alloc, false >` Struct Template Reference

```
#include <hash_eq_fn.hpp>
Inherits Eq_Fn.
```

Public Types

- typedef `Eq_Fn` **eq_fn_base**
- typedef `rebind_traits< _Alloc, Key >::const_reference` **key_const_reference**

Public Member Functions

- **hash_eq_fn** (`const Eq_Fn &r_eq_fn`)
- **operator()** (`key_const_reference r_lhs_key, key_const_reference r_rhs_key`) `const`
- **swap** (`const hash_eq_fn &other`)

5.527.1 Detailed Description

```
template<typename Key, typename Eq_Fn, typename _Alloc>
struct __gnu_pbds::detail::hash_eq_fn< Key, Eq_Fn, _Alloc, false >
```

Specialization 1 - The client requests that hash values not be stored.

The documentation for this struct was generated from the following file:

- [hash_eq_fn.hpp](#)

5.528 `__gnu_pbds::detail::hash_eq_fn< Key, Eq_Fn, _Alloc, true >` Struct Template Reference

`#include <hash_eq_fn.hpp>`

Inherits `Eq_Fn`.

Public Types

- typedef `Eq_Fn` **eq_fn_base**
- typedef [rebind_traits](#)< `_Alloc`, `Key` >::const_reference **key_const_reference**
- typedef `_Alloc::size_type` **size_type**

Public Member Functions

- **hash_eq_fn** (`const Eq_Fn &r_eq_fn`)
- bool **operator()** (`key_const_reference r_lhs_key`, `size_type lhs_hash`, `key_const_reference r_rhs_key`, `size_type rhs_hash`) const
- void **swap** (`const hash_eq_fn &other`)

5.528.1 Detailed Description

`template<typename Key, class Eq_Fn, class _Alloc>`
`struct __gnu_pbds::detail::hash_eq_fn< Key, Eq_Fn, _Alloc, true >`

Specialization 2 - The client requests that hash values be stored.

The documentation for this struct was generated from the following file:

- [hash_eq_fn.hpp](#)

5.529 `__gnu_pbds::hash_exponential_size_policy< Size_Type >` Class Template Reference

`#include <hash_policy.hpp>`

Inheritance diagram for `__gnu_pbds::hash_exponential_size_policy< Size_Type >`:

Public Types

- typedef `Size_Type` **size_type**

Public Member Functions

- [hash_exponential_size_policy](#) (`size_type start_size=8`, `size_type grow_factor=2`)
- void **swap** ([hash_exponential_size_policy](#)< `Size_Type` > &other)

Protected Member Functions

- size_type **get_nearest_larger_size** (size_type size) const
- size_type **get_nearest_smaller_size** (size_type size) const

5.529.1 Detailed Description

```
template<typename Size_Type = std::size_t>
class __gnu_pbds::hash_exponential_size_policy< Size_Type >
```

A size policy whose sequence of sizes form an exponential sequence (typically powers of 2).

5.529.2 Constructor & Destructor Documentation

hash_exponential_size_policy()

```
template<typename Size_Type = std::size_t>
__gnu_pbds::hash_exponential_size_policy< Size_Type >::hash_exponential_size_policy (
    size_type start_size = 8,
    size_type grow_factor = 2 )
```

Default constructor, or onstructor taking a start_size, or constructor taking a start size and grow_factor. The policy will use the sequence of sizes start_size, start_size* grow_factor, start_size* grow_factor^2, ...

The documentation for this class was generated from the following file:

- [hash_policy.hpp](#)

5.530 __gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size_Type > Class Template Reference

```
#include <hash_policy.hpp>
```

Inheritance diagram for __gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size_Type >:

Public Types

- enum { [external_load_access](#) }
- typedef Size_Type **size_type**

Public Member Functions

- [hash_load_check_resize_trigger](#) (float load_min=0.125, float load_max=0.5)
- [std::pair](#)< float, float > [get_loads](#) () const
- void [set_loads](#) ([std::pair](#)< float, float > load_pair)
- void **swap** ([hash_load_check_resize_trigger](#) &other)

Protected Member Functions

- bool `is_grow_needed` (size_type size, size_type num_entries) const
- bool `is_resize_needed` () const
- void `notify_cleared` ()
- void `notify_erase_search_collision` ()
- void `notify_erase_search_end` ()
- void `notify_erase_search_start` ()
- void `notify_erased` (size_type num_entries)
- void `notify_externally_resized` (size_type new_size)
- void `notify_find_search_collision` ()
- void `notify_find_search_end` ()
- void `notify_find_search_start` ()
- void `notify_insert_search_collision` ()
- void `notify_insert_search_end` ()
- void `notify_insert_search_start` ()
- void `notify_inserted` (size_type num_entries)
- void `notify_resized` (size_type new_size)

5.530.1 Detailed Description

```
template<bool External_Load_Access = false, typename Size_Type = std::size_t>
class __gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size_Type >
```

A resize trigger policy based on a load check. It keeps the load factor between some load factors `load_min` and `load_max`.

5.530.2 Member Enumeration Documentation

anonymous enum

```
template<bool External_Load_Access = false, typename Size_Type = std::size_t>
anonymous enum
```

Enumerator

<code>external_load_access</code>	Specifies whether the load factor can be accessed externally. The two options have different trade-offs in terms of flexibility, genericity, and encapsulation.
-----------------------------------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------

5.530.3 Constructor & Destructor Documentation

`hash_load_check_resize_trigger()`

```
template<bool External_Load_Access = false, typename Size_Type = std::size_t>
__gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size_Type >::hash_load_check_↵
resize_trigger (
    float load_min = 0.125,
    float load_max = 0.5 )
```

Default constructor, or constructor taking `load_min` and `load_max` load factors between which this policy will keep the actual load.

5.530.4 Member Function Documentation

get_loads()

```
template<bool External_Load_Access = false, typename Size_Type = std::size_t>
std::pair< float, float > __gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size_Type >::get_loads ( ) const [inline]
```

Returns a pair of the minimal and maximal loads, respectively.

notify_cleared()

```
template<bool External_Load_Access = false, typename Size_Type = std::size_t>
void __gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size_Type >::notify_cleared ( ) [protected]
```

Notifies the table was cleared.

notify_inserted()

```
template<bool External_Load_Access = false, typename Size_Type = std::size_t>
void __gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size_Type >::notify_inserted (
    size_type num_entries ) [inline], [protected]
```

Notifies an element was inserted. The total number of entries in the table is num_entries.

notify_resized()

```
template<bool External_Load_Access = false, typename Size_Type = std::size_t>
void __gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size_Type >::notify_resized (
    size_type new_size ) [protected]
```

Notifies the table was resized as a result of this object's signifying that a resize is needed.

set_loads()

```
template<bool External_Load_Access = false, typename Size_Type = std::size_t>
void __gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size_Type >::set_loads (
    std::pair< float, float > load_pair )
```

Sets the loads through a pair of the minimal and maximal loads, respectively.

The documentation for this class was generated from the following file:

- [hash_policy.hpp](#)

5.531 __gnu_pbds::detail::hash_load_check_resize_trigger_size_base< Size_Type, Hold_Size > Class Template Reference

Inheritance diagram for __gnu_pbds::detail::hash_load_check_resize_trigger_size_base< Size_Type, Hold_Size >:

5.531.1 Detailed Description

```
template<typename Size_Type, bool Hold_Size>
class __gnu_pbds::detail::hash_load_check_resize_trigger_size_base< Size_Type, Hold_Size >
```

Primary template.

The documentation for this class was generated from the following file:

5.538.1 Detailed Description

```
template<typename Size_Policy = hash_exponential_size_policy<>, typename Trigger_Policy = hash_load_↵
check_resize_trigger<>, bool External_Size_Access = false, typename Size_Type = std::size_t>
class __gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_Size_Access, Size_↵
Type >
```

A resize policy which delegates operations to size and trigger policies.

5.538.2 Member Enumeration Documentation

anonymous enum

```
template<bool External_Load_Access = false, typename Size_Type = std::size_t>
anonymous enum [inherited]
```

Enumerator

external_load_access	Specifies whether the load factor can be accessed externally. The two options have different trade-offs in terms of flexibility, genericity, and encapsulation.
----------------------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------

5.538.3 Constructor & Destructor Documentation

hash_standard_resize_policy() [1/3]

```
template<typename Size_Policy = hash_exponential_size_policy<>, typename Trigger_Policy = hash_↵
load_check_resize_trigger<>, bool External_Size_Access = false, typename Size_Type = std::size_t>
__gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_Size_Access, Size_↵
_Type >::hash_standard_resize_policy ( )
```

Default constructor.

hash_standard_resize_policy() [2/3]

```
template<typename Size_Policy = hash_exponential_size_policy<>, typename Trigger_Policy = hash_↵
load_check_resize_trigger<>, bool External_Size_Access = false, typename Size_Type = std::size_t>
__gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_Size_Access, Size_↵
_Type >::hash_standard_resize_policy (
    const Size_Policy & r_size_policy )
```

constructor taking some policies r_size_policy will be copied by the Size_Policy object of this object.

hash_standard_resize_policy() [3/3]

```
template<typename Size_Policy = hash_exponential_size_policy<>, typename Trigger_Policy = hash_↵
load_check_resize_trigger<>, bool External_Size_Access = false, typename Size_Type = std::size_t>
__gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_Size_Access, Size_↵
_Type >::hash_standard_resize_policy (
    const Size_Policy & r_size_policy,
    const Trigger_Policy & r_trigger_policy )
```

constructor taking some policies. r_size_policy will be copied by the Size_Policy object of this object. r_trigger_policy will be copied by the Trigger_Policy object of this object.

5.538.4 Member Function Documentation

get_actual_size()

```
template<typename Size_Policy = hash_exponential_size_policy<>, typename Trigger_Policy = hash_↵
load_check_resize_trigger<>, bool External_Size_Access = false, typename Size_Type = std::size_t>
size_type __gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_Size_↵
Access, Size_Type >::get_actual_size ( ) const [inline]
```

Returns the actual size of the container.

get_loads()

```
template<bool External_Load_Access = false, typename Size_Type = std::size_t>
std::pair< float, float > __gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size_↵
_Type >::get_loads ( ) const [inline], [inherited]
```

Returns a pair of the minimal and maximal loads, respectively.

get_new_size()

```
template<typename Size_Policy = hash_exponential_size_policy<>, typename Trigger_Policy = hash_↵
load_check_resize_trigger<>, bool External_Size_Access = false, typename Size_Type = std::size_t>
size_type \_\_gnu\_pbds::hash\_standard\_resize\_policy< Size_Policy, Trigger_Policy, External_Size_↵
Access, Size_Type >::get_new_size (
    size_type size,
    size_type num_used_e ) const [protected]
```

Queries what the new size should be, when the container is resized naturally. The current `__size` of the container is `size`, and the number of used entries within the container is `num_used_e`.

get_size_policy() [1/2]

```
template<typename Size_Policy = hash_exponential_size_policy<>, typename Trigger_Policy = hash_↵
load_check_resize_trigger<>, bool External_Size_Access = false, typename Size_Type = std::size_t>
Size_Policy & \_\_gnu\_pbds::hash\_standard\_resize\_policy< Size_Policy, Trigger_Policy, External_↵
Size_Access, Size_Type >::get_size_policy ( )
```

Access to the `Size_Policy` object used.

get_size_policy() [2/2]

```
template<typename Size_Policy = hash_exponential_size_policy<>, typename Trigger_Policy = hash_↵
load_check_resize_trigger<>, bool External_Size_Access = false, typename Size_Type = std::size_t>
const Size_Policy & \_\_gnu\_pbds::hash\_standard\_resize\_policy< Size_Policy, Trigger_Policy, External_↵
_Size_Access, Size_Type >::get_size_policy ( ) const
```

Const access to the `Size_Policy` object used.

get_trigger_policy() [1/2]

```
template<typename Size_Policy = hash_exponential_size_policy<>, typename Trigger_Policy = hash_↵
load_check_resize_trigger<>, bool External_Size_Access = false, typename Size_Type = std::size_t>
Trigger_Policy & \_\_gnu\_pbds::hash\_standard\_resize\_policy< Size_Policy, Trigger_Policy, External_↵
Size_Access, Size_Type >::get_trigger_policy ( )
```

Access to the `Trigger_Policy` object used.

get_trigger_policy() [2/2]

```
template<typename Size_Policy = hash_exponential_size_policy<>, typename Trigger_Policy = hash_↵
load_check_resize_trigger<>, bool External_Size_Access = false, typename Size_Type = std::size_t>
const Trigger_Policy & \_\_gnu\_pbds::hash\_standard\_resize\_policy< Size_Policy, Trigger_Policy,
External_Size_Access, Size_Type >::get_trigger_policy ( ) const
```

Access to the `Trigger_Policy` object used.

resize()

```
template<typename Size_Policy = hash_exponential_size_policy<>, typename Trigger_Policy = hash_↵
load_check_resize_trigger<>, bool External_Size_Access = false, typename Size_Type = std::size_t>
void \_\_gnu\_pbds::hash\_standard\_resize\_policy< Size_Policy, Trigger_Policy, External_Size_Access,
Size_Type >::resize (
    size_type suggested_new_size )
```

Resizes the container to `suggested_new_size`, a suggested size (the actual size will be determined by the `Size_Policy` object).

set_loads()

```
template<bool External_Load_Access = false, typename Size_Type = std::size_t>
void __gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size_Type >::set_loads (
    std::pair< float, float > load_pair ) [inherited]
```

Sets the loads through a pair of the minimal and maximal loads, respectively.

The documentation for this class was generated from the following file:

- [hash_policy.hpp](#)

5.539 std::locale::id Class Reference

```
#include <locale_classes.h>
```

Public Member Functions

- [id](#) ()
- [size_t _M_id](#) () const throw ()

Friends

- template<typename _Facet >
bool [has_facet](#) (const [locale](#) &) throw ()
- class **locale**
- class **locale::_Impl**
- template<typename _Facet >
const _Facet & [use_facet](#) (const [locale](#) &)

5.539.1 Detailed Description

Facet ID class.

The ID class provides facets with an index used to identify them. Every facet class must define a public static member `locale::id`, or be derived from a facet that provides this member, otherwise the facet cannot be used in a locale. The `locale::id` ensures that each class type gets a unique identifier.

5.539.2 Constructor & Destructor Documentation**id()**

```
std::locale::id::id ( ) [inline]
```

Constructor.

5.539.3 Friends And Related Symbol Documentation**has_facet**

```
template<typename _Facet >
bool has_facet (
    const locale & ) throw ( ) [friend]
```

Test for the presence of a facet.

`has_facet` tests the locale argument for the presence of the facet type provided as the template parameter. Facets derived from the facet parameter will also return true.

Template Parameters

<code>_Facet</code>	The facet type to test the presence of.
---------------------	-----------------------------------------

Parameters

<code>__loc</code>	The locale to test.
--------------------	---------------------

Returns

true if `__loc` contains a facet of type `_Facet`, else false.

use_facet

```
template<typename _Facet >
const _Facet & use_facet (
    const locale & ) [friend]
```

Return a facet.

`use_facet` looks for and returns a reference to a facet of type `Facet` where `Facet` is the template parameter. If `has_facet(locale)` is true, there is a suitable facet to return. It throws `std::bad_cast` if the locale doesn't contain a facet of type `Facet`.

Template Parameters

<code>_Facet</code>	The facet type to access.
---------------------	---------------------------

Parameters

<code>__loc</code>	The locale to use.
--------------------	--------------------

Returns

Reference to facet of type `Facet`.

Exceptions

<code>std::bad_cast</code>	if <code>__loc</code> doesn't contain a facet of type <code>_Facet</code> .
----------------------------	-----------------------------------------------------------------------------

5.542.1 Detailed Description

```
template<typename _RandomNumberEngine, size_t __w, typename _UIntType>
class std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >
```

Produces random numbers by combining random numbers from some base engine to produce random numbers with a specified number of bits `__w`.

5.542.2 Member Typedef Documentation

result_type

```
template<typename _RandomNumberEngine , size_t __w, typename _UIntType >
typedef _UIntType std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::result_type
```

The type of the generated random value.

5.542.3 Constructor & Destructor Documentation

independent_bits_engine() [1/5]

```
template<typename _RandomNumberEngine , size_t __w, typename _UIntType >
std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::independent_bits_engine ( )
[inline]
```

Constructs a default `independent_bits_engine` engine.

The underlying engine is default constructed as well.

independent_bits_engine() [2/5]

```
template<typename _RandomNumberEngine , size_t __w, typename _UIntType >
std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::independent_bits_engine (
    const _RandomNumberEngine & __rng ) [inline], [explicit]
```

Copy constructs a `independent_bits_engine` engine.

Copies an existing base class random number generator.

Parameters

<code>__rng</code>	An existing (base class) engine object.
--------------------	-----------------------------------------

independent_bits_engine() [3/5]

```
template<typename _RandomNumberEngine , size_t __w, typename _UIntType >
std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::independent_bits_engine (
    _RandomNumberEngine && __rng ) [inline], [explicit]
```

Move constructs a `independent_bits_engine` engine.

Copies an existing base class random number generator.

Parameters

<code>__rng</code>	An existing (base class) engine object.
--------------------	-----------------------------------------

independent_bits_engine() [4/5]

```
template<typename _RandomNumberEngine , size_t __w, typename _UIntType >
```

```
std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::independent_bits_engine (
    result_type __s ) [inline], [explicit]
```

Seed constructs a `independent_bits_engine` engine.

Constructs the underlying generator engine seeded with `__s`.

Parameters

<code>__s</code>	A seed value for the base class engine.
------------------	-----------------------------------------

`independent_bits_engine()` [5/5]

```
template<typename _RandomNumberEngine , size_t __w, typename _UIntType >
template<typename _Sseq , typename = _If_seed_seq<_Sseq>>
std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::independent_bits_engine (
    _Sseq & __q ) [inline], [explicit]
```

Generator construct a `independent_bits_engine` engine.

Parameters

<code>__q</code>	A seed sequence.
------------------	------------------

5.542.4 Member Function Documentation

`base()`

```
template<typename _RandomNumberEngine , size_t __w, typename _UIntType >
const _RandomNumberEngine & std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::
base ( ) const [inline], [noexcept]
```

Gets a const reference to the underlying generator engine object.

`discard()`

```
template<typename _RandomNumberEngine , size_t __w, typename _UIntType >
void std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::discard (
    unsigned long long __z ) [inline]
```

Discard a sequence of random numbers.

`max()`

```
template<typename _RandomNumberEngine , size_t __w, typename _UIntType >
static constexpr result_type std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::
max ( ) [inline], [static], [constexpr]
```

Gets the maximum value in the generated random number range.

`min()`

```
template<typename _RandomNumberEngine , size_t __w, typename _UIntType >
static constexpr result_type std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::
min ( ) [inline], [static], [constexpr]
```

Gets the minimum value in the generated random number range.

operator()()

```
template<typename _RandomNumberEngine , size_t __w, typename _UIntType >
independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::result_type std::independent_bits_engine<
_RandomNumberEngine, __w, _UIntType >::operator()

```

Gets the next value in the generated random number sequence.

References `std::lg()`, `std::numeric_limits<_Tp>::max()`, and `std::numeric_limits<_Tp>::min()`.

seed() [1/3]

```
template<typename _RandomNumberEngine , size_t __w, typename _UIntType >
void std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::seed ( ) [inline]

```

Reseeds the `independent_bits_engine` object with the default seed for the underlying base class generator engine.

seed() [2/3]

```
template<typename _RandomNumberEngine , size_t __w, typename _UIntType >
template<typename _Sseq >
_If_seed_seq< _Sseq > std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::seed
(
    _Sseq & __q ) [inline]

```

Reseeds the `independent_bits_engine` object with the given seed sequence.

Parameters

<code>__q</code>	A seed generator function.
------------------	----------------------------

seed() [3/3]

```
template<typename _RandomNumberEngine , size_t __w, typename _UIntType >
void std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::seed (
    result_type __s ) [inline]

```

Reseeds the `independent_bits_engine` object with the default seed for the underlying base class generator engine.

5.542.5 Friends And Related Symbol Documentation**operator==**

```
template<typename _RandomNumberEngine , size_t __w, typename _UIntType >
bool operator== (
    const independent_bits_engine< _RandomNumberEngine, __w, _UIntType > & __lhs,
    const independent_bits_engine< _RandomNumberEngine, __w, _UIntType > & __rhs ) [friend]

```

Compares two `independent_bits_engine` random number generator objects of the same type for equality.

Parameters

<code>__lhs</code>	A <code>independent_bits_engine</code> random number generator object.
<code>__rhs</code>	Another <code>independent_bits_engine</code> random number generator object.

Returns

true if the infinite sequences of generated values would be equal, false otherwise.

operator>>

```
template<typename _RandomNumberEngine , size_t __w, typename _UIntType >
template<typename _CharT , typename _Traits >
std::basic_istream< _CharT, _Traits > & operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType > & __x ) [friend]
```

Extracts the current state of a % subtract_with_carry_engine random number generator engine __x from the input stream __is.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A independent_bits_engine random number generator engine.

Returns

The input stream with the state of __x extracted or in an error state.

- class **valarray**<_Tp>

5.543.1 Detailed Description

template<class _Tp>
class std::indirect_array<_Tp>

Reference to arbitrary subset of an array.

An **indirect_array** is a reference to the actual elements of an array specified by an ordered array of indices. The way to get an **indirect_array** is to call **operator[]**(**valarray**<size_t>) on a **valarray**. The returned **indirect_array** then permits carrying operations out on the referenced subset of elements in the original **valarray**.

For example, if an **indirect_array** is obtained using the array (4,2,0) as an argument, and then assigned to an array containing (1,2,3), then the underlying array will have **array**[0]==3, **array**[2]==2, and **array**[4]==1.

Parameters

<i>Tp</i>	Element type.
-----------	---------------

5.543.2 Member Function Documentation

operator%=()

```
template<class _Tp>
void std::indirect_array<_Tp>::operator%= (
    const valarray<_Tp> & ) const
```

Modulo slice elements by corresponding elements of *v*.

operator&=()

```
template<class _Tp>
void std::indirect_array<_Tp>::operator&= (
```

```
const valarray< _Tp > & ) const
```

Logical and slice elements with corresponding elements of *v*.

operator*=()

```
template<class _Tp >
void std::indirect_array< _Tp >::operator*= (
    const valarray< _Tp > & ) const
```

Multiply slice elements by corresponding elements of *v*.

operator+=()

```
template<class _Tp >
void std::indirect_array< _Tp >::operator+= (
    const valarray< _Tp > & ) const
```

Add corresponding elements of *v* to slice elements.

operator-=()

```
template<class _Tp >
void std::indirect_array< _Tp >::operator-= (
    const valarray< _Tp > & ) const
```

Subtract corresponding elements of *v* from slice elements.

operator/=()

```
template<class _Tp >
void std::indirect_array< _Tp >::operator/= (
    const valarray< _Tp > & ) const
```

Divide slice elements by corresponding elements of *v*.

operator<<=()

```
template<class _Tp >
void std::indirect_array< _Tp >::operator<<= (
    const valarray< _Tp > & ) const
```

Left shift slice elements by corresponding elements of *v*.

operator>>=()

```
template<class _Tp >
void std::indirect_array< _Tp >::operator>>= (
    const valarray< _Tp > & ) const
```

Right shift slice elements by corresponding elements of *v*.

operator^=()

```
template<class _Tp >
void std::indirect_array< _Tp >::operator^= (
    const valarray< _Tp > & ) const
```

Logical xor slice elements with corresponding elements of *v*.

operator" |=(

```
template<class _Tp >
void std::indirect_array< _Tp >::operator|= (
    const valarray< _Tp > & ) const
```

Logical or slice elements with corresponding elements of v.

5.544.1 Detailed Description

template<class _E>

class std::initializer_list<_E>

initializer_list

5.544.2 Friends And Related Symbol Documentation**begin()**

```
template<class _Tp >
constexpr const _Tp * begin (
    initializer_list< _Tp > __ils ) [related]
```

Return an iterator pointing to the first element of the initializer_list.

Parameters

__ils	Initializer list.
-----------------------	-------------------

end()

```
template<class _Tp >
constexpr const _Tp * end (
    initializer_list< _Tp > __ils ) [related]
```

Return an iterator pointing to one past the last element of the `initializer_list`.

Parameters

<code>__ils</code>	Initializer list.
--------------------	-------------------

5.546 __gnu_pbds::insert_error Struct Reference

```
#include <exception.hpp>
```

Inheritance diagram for `__gnu_pbds::insert_error`:

Public Member Functions

- virtual const char * `what` () const noexcept

5.546.1 Detailed Description

An entry cannot be inserted into a container object for logical reasons (not, e.g., if memory is unavailable, in which case the `allocator_type`'s exception will be thrown).

5.546.2 Member Function Documentation

`what()`

```
virtual const char * std::logic_error::what ( ) const [virtual], [noexcept], [inherited]
```

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

Reimplemented in [std::future_error](#).

The documentation for this struct was generated from the following file:

- [exception.hpp](#)

5.547 `std::insert_iterator<_Container>` Class Template Reference

```
#include <stl_iterator.h>
```

Inheritance diagram for `std::insert_iterator< _Container >`:

Public Types

- typedef `_Container` `container_type`
- typedef void `difference_type`
- typedef `output_iterator_tag` `iterator_category`
- typedef void `pointer`
- typedef void `reference`
- typedef void `value_type`

Public Member Functions

- constexpr `insert_iterator` (`_Container` &__x, `_Iter` __i)
- constexpr `insert_iterator` & `operator*` ()
- constexpr `insert_iterator` & `operator++` ()
- constexpr `insert_iterator` & `operator++` (int)
- constexpr `insert_iterator` & `operator=` (const typename `_Container::value_type` &__value)
- constexpr `insert_iterator` & `operator=` (typename `_Container::value_type` &&__value)

Protected Attributes

- `_Container` * `container`
- `_Iter` `iter`

5.547.1 Detailed Description

```

template<typename _Container>
class std::insert_iterator< _Container >

```

Turns assignment into insertion.

These are output iterators, constructed from a container-of-T. Assigning a T to the iterator inserts it in the container at the iterator's position, rather than overwriting the value at that position.

(Sequences will actually insert a *copy* of the value before the iterator's position.)

Tip: Using the `inserter` function to create these iterators can save typing.

5.547.2 Member Typedef Documentation

container_type

```
template<typename _Container >
typedef _Container std::insert_iterator< _Container >::container_type
```

A nested typedef for the type of whatever container you used.

difference_type

```
typedef void std::iterator< output_iterator_tag , void , void , void , void >::difference_type
[inherited]
```

Distance between iterators is represented as this type.

iterator_category

```
typedef output_iterator_tag std::iterator< output_iterator_tag , void , void , void , void >←
::iterator_category [inherited]
```

One of the [tag types](#).

pointer

```
typedef void std::iterator< output_iterator_tag , void , void , void , void >::pointer [inherited]
```

This type represents a pointer-to-value_type.

reference

```
typedef void std::iterator< output_iterator_tag , void , void , void , void >::reference [inherited]
```

This type represents a reference-to-value_type.

value_type

```
typedef void std::iterator< output_iterator_tag , void , void , void , void >::value_type [inherited]
```

The type "pointed to" by the iterator.

5.547.3 Constructor & Destructor Documentation

insert_iterator()

```
template<typename _Container >
constexpr std::insert_iterator< _Container >::insert_iterator (
    _Container & __x,
    _Iter __i ) [inline], [constexpr]
```

The only way to create this iterator is with a container and an initial position (a normal iterator into the container).

5.547.4 Member Function Documentation

operator*()

```
template<typename _Container >
constexpr insert_iterator & std::insert_iterator< _Container >::operator* ( ) [inline], [constexpr]
```

Simply returns *this.

operator++() [1/2]

```
template<typename _Container >
constexpr insert\_iterator & std::insert\_iterator< _Container >::operator++ ( ) [inline], [constexpr]
Simply returns *this. (This iterator does not move.)
```

operator++() [2/2]

```
template<typename _Container >
constexpr insert\_iterator & std::insert\_iterator< _Container >::operator++ (
    int ) [inline], [constexpr]
Simply returns *this. (This iterator does not move.)
```

operator=()

```
template<typename _Container >
constexpr insert\_iterator & std::insert\_iterator< _Container >::operator= (
    const typename _Container::value_type & __value ) [inline], [constexpr]
```

Parameters

<code>__value</code>	An instance of whatever type <code>container_type::const_reference</code> is; presumably a reference-to-const T for <code>container<T></code> .
----------------------	-------------------------------------------------------------------------------------------------------------------------------------------------------

Returns

This iterator, for chained operations.

This kind of iterator maintains its own position in the container. Assigning a value to the iterator will insert the value into the container at the place before the iterator.

The position is maintained such that subsequent assignments will insert values immediately after one another. For example,

```
// vector v contains A and Z
insert\_iterator i (v, ++v.begin());
i = 1;
i = 2;
i = 3;

// vector v contains A, 1, 2, 3, and Z
```

5.552.1 Detailed Description

The base of the I/O class hierarchy.

This class defines everything that can be defined about I/O that does not depend on the type of characters being input or output. Most people will only see `ios_base` when they need to specify the full name of the various I/O flags (e.g., the openmodes).

5.552.2 Member Typedef Documentation

event_callback

```
typedef void(* std::ios_base::event_callback) (event __e, ios_base &__b, int __i)
```

The type of an event callback function.

Parameters

<code>__e</code>	One of the members of the event enum.
<code>__b</code>	Reference to the ios_base object.
<code>__i</code>	The integer provided when the callback was registered.

Event callbacks are user defined functions that get called during several ios_base and basic_ios functions, specifically imbue(), copyfmt(), and ~ios().

fmtflags

```
typedef _Ios_Fmtflags std::ios_base::fmtflags
```

This is a bitmask type.

`_Ios_Fmtflags` is implementation-defined, but it is valid to perform bitwise operations on these values and expect the Right Thing to happen. Defined objects of type fmtflags are:

- boolalpha
- dec
- fixed
- hex
- internal
- left
- oct
- right
- scientific
- showbase
- showpoint
- showpos
- skipws
- unitbuf
- uppercase
- adjustfield
- basefield
- floatfield

iostate

```
typedef _Ios_Iostate std::ios_base::iostate
```

This is a bitmask type.

`_Ios_Iostate` is implementation-defined, but it is valid to perform bitwise operations on these values and expect the Right Thing to happen. Defined objects of type `iostate` are:

- `badbit`
- `eofbit`
- `failbit`
- `goodbit`

openmode

```
typedef _Ios_Openmode std::ios_base::openmode
```

This is a bitmask type.

`_Ios_Openmode` is implementation-defined, but it is valid to perform bitwise operations on these values and expect the Right Thing to happen. Defined objects of type `openmode` are:

- `app`
- `ate`
- `binary`
- `in`
- `out`
- `trunc`

seekdir

```
typedef _Ios_Seekdir std::ios_base::seekdir
```

This is an enumerated type.

`_Ios_Seekdir` is implementation-defined. Defined values of type `seekdir` are:

- `beg`
- `cur`, equivalent to `SEEK_CUR` in the C standard library.
- `end`, equivalent to `SEEK_END` in the C standard library.

5.552.3 Member Enumeration Documentation

event

```
enum std::ios_base::event
```

The set of events that may be passed to an event callback.

`erase_event` is used during `~ios()` and `copyfmt()`. `imbue_event` is used during `imbue()`. `copyfmt_event` is used during `copyfmt()`.

5.552.4 Constructor & Destructor Documentation

`~ios_base()`

```
virtual std::ios_base::~~ios_base ( ) [virtual]
```

Invokes each callback with `erase_event`. Destroys local storage.

Note that the `ios_base` object for the standard streams never gets destroyed. As a result, any callbacks registered with the standard streams will not get invoked with `erase_event` (unless `copyfmt` is used).

5.552.5 Member Function Documentation

`_M_getloc()`

```
const locale & std::ios_base::_M_getloc ( ) const [inline]
```

Locale access.

Returns

A reference to the current locale.

Like `getloc` above, but returns a reference instead of generating a copy.

Referenced by `std::money_get<_CharT, _Inlter>::do_get()`, `std::time_get<_CharT, _Inlter>::do_get()`, `std::num_get<_CharT, _Inlter>::do_get()`, `std::time_get<_CharT, _Inlter>::do_get_date()`, `std::time_get<_CharT, _Inlter>::do_get_monthname()`, `std::time_get<_CharT, _Inlter>::do_get_weekday()`, `std::num_put<_CharT, _Outlter>::do_put()`, `std::time_put<_CharT, _Outlter>::do_put()`, `std::time_get<_CharT, _Inlter>::get()`, and `std::time_put<_CharT, _Outlter>::put()`.

`flags()` [1/2]

```
fmtflags std::ios_base::flags ( ) const [inline]
```

Access to format flags.

Returns

The format control flags for both input and output.

Referenced by `std::basic_istream<_CharT, _Traits>::sentry::sentry()`, `std::basic_ios<_CharT, _Traits>::copyfmt()`, `std::num_get<_CharT, _Inlter>::do_get()`, `std::num_get<_CharT, _Inlter>::do_get()`, `std::num_put<_CharT, _Outlter>::do_put()`, `std::num_put<_CharT, _Outlter>::do_put()`, `std::gamma_distribution<result_type>::operator()`, `std::operator<<()`, `std::operator>>()`, `std::operator>>()`, `std::__detail::operator>>()`, `std::operator>>()`, `std::operator>>()`, `std::operator>>()`, and `std::operator>>()`.

`flags()` [2/2]

```
fmtflags std::ios_base::flags (
    fmtflags __fmtfl ) [inline]
```

Setting new format flags all at once.

Parameters

<code>__fmtfl</code>	The new flags to set.
----------------------	-----------------------

Returns

The previous format control flags.

This function overwrites all the format flags with `__fmtfl`.

getloc()

```
locale std::ios_base::getloc ( ) const [inline]
```

Locale access.

Returns

A copy of the current locale.

If `imbue(loc)` has previously been called, then this function returns `loc`. Otherwise, it returns a copy of `std::locale()`, the global C++ locale.

Referenced by `std::basic_ios<_CharT, _Traits>::copyfmt()`, `std::money_put<_CharT, _OutIter>::do_put()`, `std::operator>>()`, `std::operator>>()`, and `std::ws()`.

imbue()

```
locale std::ios_base::imbue (
    const locale & __loc ) throw ( )
```

Setting a new locale.

Parameters

<code>__loc</code>	The new locale.
--------------------	-----------------

Returns

The previous locale.

Sets the new locale for this stream, and then invokes each callback with `imbue_event`.

Referenced by `std::basic_ios<_CharT, _Traits>::imbue()`.

iword()

```
long & std::ios_base::iword (
    int __ix ) [inline]
```

Access to integer array.

Parameters

<code>__ix</code>	Index into the array.
-------------------	-----------------------

Returns

A reference to an integer associated with the index.

The `iword` function provides access to an array of integers that can be used for any purpose. The array grows as required to hold the supplied index. All integers in the array are initialized to 0.

The implementation reserves several indices. You should use `xalloc` to obtain an index that is safe to use. Also note that since the array can grow dynamically, it is not safe to hold onto the reference.

precision() [1/2]

```
streamsize std::ios_base::precision ( ) const [inline]
```

Flags access.

Returns

The precision to generate on certain output operations.

Be careful if you try to give a definition of *precision* here; see DR 189.

Referenced by [std::basic_ios<_CharT, _Traits>::copyfmt\(\)](#), and [std::gamma_distribution<result_type>::operator\(\)\(\)](#).

precision() [2/2]

```
streamsize std::ios_base::precision (
    streamsize __prec ) [inline]
```

Changing flags.

Parameters

<code>__prec</code>	The new precision value.
---------------------	--------------------------

Returns

The previous value of `precision()`.

pword()

```
void *& std::ios_base::pword (
    int __ix ) [inline]
```

Access to void pointer array.

Parameters

<code>__ix</code>	Index into the array.
-------------------	-----------------------

Returns

A reference to a `void*` associated with the index.

The `pword` function provides access to an array of pointers that can be used for any purpose. The array grows as required to hold the supplied index. All pointers in the array are initialized to 0.

The implementation reserves several indices. You should use `xalloc` to obtain an index that is safe to use. Also note that since the array can grow dynamically, it is not safe to hold onto the reference.

register_callback()

```
void std::ios_base::register_callback (
    event_callback __fn,
    int __index )
```

Add the callback `__fn` with parameter `__index`.

Parameters

<code>__fn</code>	The function to add.
-------------------	----------------------

Parameters

<code>__index</code>	The integer to pass to the function when invoked.
----------------------	---------------------------------------------------

Registers a function as an event callback with an integer parameter to be passed to the function when invoked. Multiple copies of the function are allowed. If there are multiple callbacks, they are invoked in the order they were registered.

setf() [1/2]

```
fmtflags std::ios_base::setf (
    fmtflags __fmtfl ) [inline]
```

Setting new format flags.

Parameters

<code>__fmtfl</code>	Additional flags to set.
----------------------	--------------------------

Returns

The previous format control flags.

This function sets additional flags in format control. Flags that were previously set remain set. Referenced by [std::__detail::operator<>\(\)](#).

setf() [2/2]

```
fmtflags std::ios_base::setf (
    fmtflags __fmtfl,
    fmtflags __mask ) [inline]
```

Setting new format flags.

Parameters

<code>__fmtfl</code>	Additional flags to set.
<code>__mask</code>	The flags mask for <i>fmtfl</i> .

Returns

The previous format control flags.

This function clears *mask* in the format flags, then sets *fmtfl* & *mask*. An example mask is `ios_base::adjustfield`.

sync_with_stdio()

```
static bool std::ios_base::sync_with_stdio (
    bool __sync = true ) [static]
```

Interaction with the standard C I/O objects.

Parameters

<code>__sync</code>	Whether to synchronize or not.
---------------------	--------------------------------

Returns

True if the standard streams were previously synchronized.

The synchronization referred to is *only* that between the standard C facilities (e.g., `stdout`) and the standard C++ objects (e.g., `cout`). User-declared streams are unaffected. See <https://gcc.gnu.org/onlinedocs/libstdc++/manual/fstreams.html#std.io.filestreams.binary>

unsetf()

```
void std::ios_base::unsetf (
    fmtflags __mask ) [inline]
```

Clearing format flags.

Parameters

<code>__mask</code>	The flags to unset.
---------------------	---------------------

This function clears `__mask` in the format flags.

width() [1/2]

```
streamsize std::ios_base::width ( ) const [inline]
```

Flags access.

Returns

The minimum field width to generate on output operations.

Minimum field width refers to the number of characters.

Referenced by `std::basic_ios<_CharT, _Traits>::copyfmt()`, `std::num_put<_CharT, _Outiter>::do_put()`, `std::operator>>()`, and `std::operator>>()`.

width() [2/2]

```
streamsize std::ios_base::width (
    streamsize __wide ) [inline]
```

Changing flags.

Parameters

<code>__wide</code>	The new width value.
---------------------	----------------------

Returns

The previous value of `width()`.

xalloc()

```
static int std::ios_base::xalloc ( ) throw ( ) [static]
```

Access to unique indices.

Returns

An integer different from all previous calls.

This function returns a unique integer every time it is called. It can be used for any purpose, but is primarily intended to be a unique index for the `iword` and `pword` functions. The expectation is that an application calls `xalloc` in order to obtain an index in the `iword` and `pword` arrays that can be used without fear of conflict.

The implementation maintains a static variable that is incremented and returned on each invocation. `xalloc` is guaranteed to return an index that is safe to use in the `iword` and `pword` arrays.

5.552.6 Member Data Documentation**adjustfield**

```
const fmtflags std::ios_base::adjustfield [static]
```

A mask of `left|right|internal`. Useful for the 2-arg form of `setf`.

Referenced by `std::num_put<_CharT, _OutIter>::do_put()`, `std::internal()`, `std::left()`, and `std::right()`.

app

```
const openmode std::ios_base::app [static]
```

Seek to end before each write.

Referenced by `std::basic_filebuf<_CharT, _Traits>::overflow()`, and `std::basic_filebuf<_CharT, _Traits>::xsputn()`.

ate

```
const openmode std::ios_base::ate [static]
```

Open and seek to end immediately after opening.

Referenced by `std::basic_filebuf<_CharT, _Traits>::open()`.

badbit

```
const iostate std::ios_base::badbit [static]
```

Indicates a loss of integrity in an input or output sequence (such as an irrecoverable read error from a file).

Referenced by `std::basic_istream<_CharT, _Traits>::sentry::sentry()`, `std::basic_ios<_CharT, _Traits>::bad()`, `std::basic_ios<_CharT, _Traits>::fail()`, `std::basic_ostream<_CharT, _Traits>::flush()`, `std::basic_istream<_CharT, _Traits>::get()`, `std::basic_istream<char>::get()`, `std::basic_istream<char>::ignore()`, `std::basic_ostream<_CharT, _Traits>::operator<<()`, `std::operator>>()`, `std::basic_istream<_CharT, _Traits>::operator>>()`, `std::basic_istream<_CharT, _Traits>::peek()`, `std::basic_ostream<_CharT, _Traits>::put()`, `std::basic_istream<_CharT, _Traits>::putback()`, `std::basic_istream<_CharT, _Traits>::seekg()`, `std::basic_istream<_CharT, _Traits>::seekg()`, `std::basic_ostream<_CharT, _Traits>::seekp()`, `std::basic_istream<_CharT, _Traits>::sync()`, `std::basic_istream<_CharT, _Traits>::tellp()`, and `std::basic_istream<_CharT, _Traits>::unset()`.

basefield

```
const fmtflags std::ios_base::basefield [static]
```

A mask of `dec|oct|hex`. Useful for the 2-arg form of `setf`.

Referenced by `std::dec()`, `std::num_get<_CharT, _InIter>::do_get()`, `std::num_put<_CharT, _OutIter>::do_put()`, `std::hex()`, and `std::oct()`.

beg

```
const seekdir std::ios_base::beg [static]
```

Request a seek relative to the beginning of the stream.

Referenced by `std::basic_filebuf<_CharT, _Traits>::seekpos()`.

binary

```
const openmode std::ios_base::binary [static]
```

Perform input and output in binary mode (as opposed to text mode). This is probably not what you think it is; see <https://gcc.gnu.org/onlinedocs/libstdc++/manual/fstreams.html#std.io.↵filestreams.binary>.

Referenced by `std::basic_filebuf< _CharT, _Traits >::showmanyc()`.

boolalpha

```
const fmtflags std::ios_base::boolalpha [static]
```

Insert/extract `bool` in alphabetic rather than numeric format.

Referenced by `std::boolalpha()`, `std::num_get< _CharT, _InIter >::do_get()`, `std::num_put< _CharT, _OutIter >::do_put()`, and `std::noboolalpha()`.

cur

```
const seekdir std::ios_base::cur [static]
```

Request a seek relative to the current position within the sequence.

Referenced by `std::basic_filebuf< _CharT, _Traits >::imbue()`, `std::basic_filebuf< _CharT, _Traits >::overflow()`, `std::basic_filebuf< _CharT, _Traits >::pbackfail()`, `std::basic_filebuf< _CharT, _Traits >::seekoff()`, `std::basic_stringbuf< _CharT, _Traits, std::basic_istream< _CharT, _Traits >::tellg()`, and `std::basic_ostream< _CharT, _Traits >::tellp()`.

dec

```
const fmtflags std::ios_base::dec [static]
```

Converts integer input or generates integer output in decimal base.

Referenced by `std::dec()`.

end

```
const seekdir std::ios_base::end [static]
```

Request a seek relative to the current end of the sequence.

Referenced by `std::basic_filebuf< _CharT, _Traits >::open()`, and `std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff()`.

eofbit

```
const iostate std::ios_base::eofbit [static]
```

Indicates that an input operation reached the end of an input sequence.

Referenced by `std::basic_istream< _CharT, _Traits >::sentry::sentry()`, `std::basic_istream< char >::sentry::sentry()`, `std::time_get< _CharT, _InIter >::do_get()`, `std::num_get< _CharT, _InIter >::do_get()`, `std::num_get< _CharT, _InIter >::do_get()`, `std::num_get< _CharT, _InIter >::do_get()`, `std::time_get< _CharT, _InIter >::do_get_date()`, `std::time_get< _CharT, _InIter >::do_get_monthname()`, `std::time_get< _CharT, _InIter >::do_get_time()`, `std::time_get< _CharT, _InIter >::do_get_year()`, `std::basic_ios< _CharT, _Traits >::eof()`, `std::basic_istream< _CharT, _Traits >::get()`, `std::basic_istream< _CharT, _Traits >::get()`, `std::time_get< _CharT, _InIter >::get()`, `std::basic_istream< char >::getline()`, `std::basic_istream< _CharT, _Traits >::operator>>()`, `std::operator>>()`, `std::basic_istream< _CharT, _Traits >::peek()`, `std::basic_istream< _CharT, _Traits >::putback()`, `std::basic_istream< _CharT, _Traits >::read()`, `std::basic_istream< _CharT, _Traits >::seekg()`, `std::basic_istream< char >::sync()`, `std::basic_istream< _CharT, _Traits >::unget()`, and `std::ws()`.

failbit

```
const iostate std::ios_base::failbit [static]
```

Indicates that an input operation failed to read the expected characters, or that an output operation failed to generate the desired characters.

Referenced by [std::basic_istream<_CharT, _Traits>::sentry::sentry\(\)](#), [std::basic_ostream<_CharT, _Traits>::sentry::sentry\(\)](#), [std::num_get<_CharT, _InIter>::do_get\(\)](#), [std::time_get<_CharT, _InIter>::do_get_monthname\(\)](#), [std::time_get<_CharT, _InIter>::do_get_year\(\)](#), [std::basic_ios<_CharT, _Traits>::fail\(\)](#), [std::time_get<_CharT, _InIter>::get\(\)](#), [std::basic_istream<char>::getline\(\)](#), [std::basic_istream<_CharT, _Traits>::operator>>\(\)](#), [std::operator>>\(\)](#), [std::basic_istream<char>::operator>>\(\)](#), [std::basic_istream<_CharT, _Traits>::operator>>\(\)](#), [std::basic_istream<_CharT, _Traits>::seekg\(\)](#), [std::basic_istream<_CharT, _Traits>::seekg\(\)](#), [std::basic_ostream<_CharT, _Traits>::seekp\(\)](#), and [std::basic_ostream<_CharT, _Traits>::seekp\(\)](#).

fixed

```
const fmtflags std::ios_base::fixed [static]
```

Generate floating-point output in fixed-point notation.

Referenced by [std::fixed\(\)](#), and [std::hexfloat\(\)](#).

floatfield

```
const fmtflags std::ios_base::floatfield [static]
```

A mask of scientific|fixed. Useful for the 2-arg form of `setf`.

Referenced by [std::defaultfloat\(\)](#), [std::fixed\(\)](#), [std::hexfloat\(\)](#), and [std::scientific\(\)](#).

goodbit

```
const iostate std::ios_base::goodbit [static]
```

Indicates all is well.

Referenced by [std::basic_istream<_CharT, _Traits>::sentry::sentry\(\)](#), [std::time_get<_CharT, _InIter>::do_get\(\)](#), [std::num_get<_CharT, _InIter>::do_get\(\)](#), [std::time_get<_CharT, _InIter>::do_get_monthname\(\)](#), [std::time_get<_CharT, _InIter>::do_get_year\(\)](#), [std::basic_ostream<_CharT, _Traits>::flush\(\)](#), [std::basic_istream<_CharT, _Traits>::get\(\)](#), [std::basic_istream<_CharT, _Traits>::get\(\)](#), [std::basic_istream<_CharT, _Traits>::get\(\)](#), [std::time_get<_CharT, _InIter>::get\(\)](#), [std::basic_istream<char>::getline\(\)](#), [std::basic_istream<_CharT, _Traits>::ignore\(\)](#), [std::basic_istream<_CharT, _Traits>::ignore\(\)](#), [std::basic_istream<_CharT, _Traits>::ignore\(\)](#), [std::basic_ostream<_CharT, _Traits>::operator>>\(\)](#), [std::operator>>\(\)](#), [std::basic_istream<_CharT, _Traits>::operator>>\(\)](#), [std::basic_istream<char>::operator>>\(\)](#), [std::basic_istream<_CharT, _Traits>::peek\(\)](#), [std::basic_ostream<_CharT, _Traits>::put\(\)](#), [std::basic_istream<_CharT, _Traits>::putback\(\)](#), [std::basic_istream<_CharT, _Traits>::read\(\)](#), [std::basic_istream<_CharT, _Traits>::seekg\(\)](#), [std::basic_istream<_CharT, _Traits>::seekg\(\)](#), [std::basic_ostream<_CharT, _Traits>::seekp\(\)](#), [std::basic_istream<_CharT, _Traits>::sync\(\)](#), and [std::basic_istream<_CharT, _Traits>::sync\(\)](#).

hex

```
const fmtflags std::ios_base::hex [static]
```

Converts integer input or generates integer output in hexadecimal base.

Referenced by [std::num_get<_CharT, _InIter>::do_get\(\)](#), [std::num_put<_CharT, _OutIter>::do_put\(\)](#), and [std::hex\(\)](#).

in

```
const openmode std::ios_base::in [static]
```

Open for input. Default for `ifstream` and `fstream`.

Referenced by [std::basic_stringbuf<_CharT, _Traits, _Alloc>::overflow\(\)](#), [std::basic_filebuf<_CharT, _Traits>::pbackfail\(\)](#), [std::basic_istream<_CharT, _Traits>::seekg\(\)](#), [std::basic_istream<_CharT, _Traits>::seekg\(\)](#), [std::basic_stringbuf<_CharT, _Traits, _Alloc>::seekpos\(\)](#), [std::basic_filebuf<_CharT, _Traits>::showmanyc\(\)](#), [std::basic_istream<_CharT, _Traits>::tellg\(\)](#), [std::basic_filebuf<_CharT, _Traits>::underflow\(\)](#), [std::basic_stringbuf<_CharT, _Traits, _Alloc>::xsgetn\(\)](#), and [std::basic_filebuf<_CharT, _Traits>::xsgetn\(\)](#).

internal

```
const fmtflags std::ios_base::internal [static]
```

Adds fill characters at a designated internal point in certain generated output, or identical to `right` if no such point is designated.

Referenced by [std::internal\(\)](#).

left

```
const fmtflags std::ios_base::left [static]
```

Adds fill characters on the right (final positions) of certain generated output. (I.e., the thing you print is flush left.)

Referenced by [std::num_put< _CharT, _OutIter >::do_put\(\)](#), and [std::left\(\)](#).

oct

```
const fmtflags std::ios_base::oct [static]
```

Converts integer input or generates integer output in octal base.

Referenced by [std::oct\(\)](#).

out

```
const openmode std::ios_base::out [static]
```

Open for output. Default for `ofstream` and `fstream`.

Referenced by [std::basic_filebuf< _CharT, _Traits >::overflow\(\)](#), [std::basic_stringbuf< _CharT, _Traits, _Alloc >::overflow\(\)](#), [std::basic_stringbuf< _CharT, _Traits, _Alloc >::pbackfail\(\)](#), [std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekoff\(\)](#), [std::basic_ostream< _CharT, _Traits >::seekp\(\)](#), [std::basic_ostream< _CharT, _Traits >::seekp\(\)](#), [std::basic_stringbuf< _CharT, _Traits, _Alloc >::seekp\(\)](#), [std::basic_ostream< _CharT, _Traits >::tellp\(\)](#), and [std::basic_filebuf< _CharT, _Traits >::xsputn\(\)](#).

right

```
const fmtflags std::ios_base::right [static]
```

Adds fill characters on the left (initial positions) of certain generated output. (I.e., the thing you print is flush right.)

Referenced by [std::right\(\)](#).

scientific

```
const fmtflags std::ios_base::scientific [static]
```

Generates floating-point output in scientific notation.

Referenced by [std::hexfloat\(\)](#), and [std::scientific\(\)](#).

showbase

```
const fmtflags std::ios_base::showbase [static]
```

Generates a prefix indicating the numeric base of generated integer output.

Referenced by [std::num_put< _CharT, _OutIter >::do_put\(\)](#), [std::noshowbase\(\)](#), and [std::showbase\(\)](#).

showpoint

```
const fmtflags std::ios_base::showpoint [static]
```

Generates a decimal-point character unconditionally in generated floating-point output.

Referenced by [std::noshowpoint\(\)](#), and [std::showpoint\(\)](#).

showpos

```
const fmtflags std::ios_base::showpos [static]
```

Generates a + sign in non-negative generated numeric output.

Referenced by [std::noshowpos\(\)](#), and [std::showpos\(\)](#).

skipws

```
const fmtflags std::ios_base::skipws [static]
```

Skips leading white space before certain input operations.

Referenced by [std::basic_istream< _CharT, _Traits >::sentry::sentry\(\)](#), [std::noskipws\(\)](#), [std::__detail::operator>>\(\)](#), and [std::skipws\(\)](#).

trunc

```
const openmode std::ios_base::trunc [static]
```

Truncate an existing stream when opening. Default for ofstream.

unitbuf

```
const fmtflags std::ios_base::unitbuf [static]
```

Flushes output after each output operation.

Referenced by [std::nounitbuf\(\)](#), and [std::unitbuf\(\)](#).

uppercase

```
const fmtflags std::ios_base::uppercase [static]
```

Replaces certain lowercase letters with their uppercase equivalents in generated output.

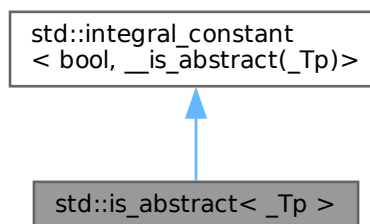

Referenced by [std::num_put< _CharT, _Outiter >::do_put\(\)](#), [std::nouppercase\(\)](#), and [std::uppercase\(\)](#).

5.555 std::is_array< typename > Struct Template Reference

Inheritance diagram for `std::is_array< typename >`:

Public Types

- typedef [integral_constant](#)< _Tp, __v > **type**
- typedef _Tp **value_type**

Public Member Functions

- constexpr **operator value_type** () const noexcept
- constexpr value_type **operator()** () const noexcept

Static Public Attributes

- static constexpr _Tp **value**

5.555.1 Detailed Description

template<typename>

struct std::is_array< typename >

is_array

The documentation for this struct was generated from the following file:

- [type_traits](#)

5.556 std::is_assignable< _Tp, _Up > Struct Template Reference

Inherits __bool_constant< __is_assignable(_Tp, _Up)>.

5.556.1 Detailed Description

template<typename _Tp, typename _Up>

struct std::is_assignable< _Tp, _Up >

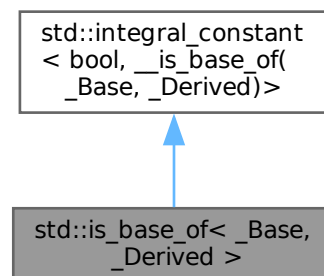

is_assignable

The documentation for this struct was generated from the following file:

- [type_traits](#)

5.557 std::is_base_of< _Base, _Derived > Struct Template Reference

Inheritance diagram for std::is_base_of< _Base, _Derived >:

**Public Types**

- typedef [integral_constant](#)< bool, __v > **type**
- typedef bool **value_type**

Public Member Functions

- constexpr **operator value_type** () const noexcept
- constexpr value_type **operator()** () const noexcept

Static Public Attributes

- static constexpr bool **value**

5.557.1 Detailed Description

```
template<typename _Base, typename _Derived>
struct std::is_base_of< _Base, _Derived >
```

is_base_of

The documentation for this struct was generated from the following file:

- [type_traits](#)

5.558 std::is_bind_expression< _Tp > Struct Template Reference

Inheritance diagram for std::is_bind_expression< _Tp >:

Public Types

- typedef [integral_constant](#)< _Tp, __v > **type**
- typedef _Tp **value_type**

Public Member Functions

- constexpr **operator value_type** () const noexcept
- constexpr value_type **operator()** () const noexcept

Static Public Attributes

- static constexpr _Tp **value**

5.558.1 Detailed Description

```
template<typename _Tp>
struct std::is_bind_expression< _Tp >
```

Determines if the given type `_Tp` is a function object that should be treated as a subexpression when evaluating calls to function objects returned by `bind()`.

C++11 [func.bind.isbind].

The documentation for this struct was generated from the following file:

- [functional](#)

5.559 std::is_bind_expression< _Bind< _Signature > > Struct Template Reference

Inheritance diagram for `std::is_bind_expression< _Bind< _Signature > >`:

Public Types

- typedef [integral_constant](#)< `_Tp`, `__v` > **type**
- typedef `_Tp` **value_type**

Public Member Functions

- constexpr **operator value_type** () const noexcept
- constexpr value_type **operator()** () const noexcept

Static Public Attributes

- static constexpr `_Tp` **value**

5.559.1 Detailed Description

```
template<typename _Signature>
struct std::is_bind_expression< _Bind< _Signature > >
```

Class template `_Bind` is always a bind expression.

The documentation for this struct was generated from the following file:

- [functional](#)

5.560 `std::is_bind_expression<_Bind_result<_Result,_Signature>>` Struct Template Reference

Inheritance diagram for `std::is_bind_expression<_Bind_result<_Result,_Signature>>`:

Public Types

- typedef [integral_constant](#)<_Tp, __v> **type**
- typedef _Tp **value_type**

Public Member Functions

- constexpr **operator value_type** () const noexcept
- constexpr value_type **operator()** () const noexcept

Static Public Attributes

- static constexpr _Tp **value**

5.560.1 Detailed Description

```
template<typename _Result, typename _Signature>
struct std::is_bind_expression<_Bind_result<_Result,_Signature>>>
```

Class template `_Bind_result` is always a bind expression.

The documentation for this struct was generated from the following file:

- [functional](#)

5.561 std::is_bind_expression< const _Bind< _Signature > > Struct Template Reference

Inheritance diagram for std::is_bind_expression< const _Bind< _Signature > >:

**Public Types**

- typedef [integral_constant](#)< _Tp, __v > **type**
- typedef _Tp **value_type**

Public Member Functions

- constexpr **operator value_type** () const noexcept

struct std::is_nothrow_swappable_with< _Tp, _Up >
```

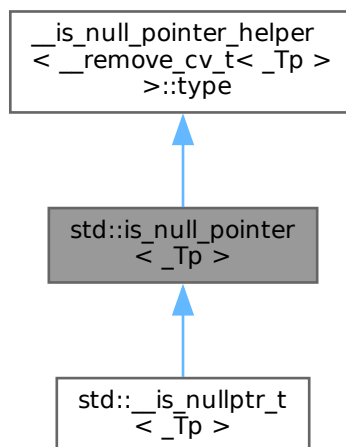

is_nothrow_swappable_with

The documentation for this struct was generated from the following file:

- [type_traits](#)

5.607 std::is_null_pointer< _Tp > Struct Template Reference

Inheritance diagram for `std::is_null_pointer< _Tp >`:

Public Types

- typedef [integral_constant](#)< _Tp, __v > **type**
- typedef _Tp **value_type**

Public Member Functions

- constexpr **operator value_type** () const noexcept
- constexpr value_type **operator()** () const noexcept

Static Public Attributes

- static constexpr _Tp **value**

5.607.1 Detailed Description

template<typename _Tp>
struct std::is_null_pointer< _Tp >

is_null_pointer (LWG 2247).

The documentation for this struct was generated from the following file:

- [type_traits](#)

5.608 std::is_object< _Tp > Struct Template Reference

Inherits __not_::type.

5.608.1 Detailed Description

template<typename _Tp>
struct std::is_object< _Tp >

is_object

The documentation for this struct was generated from the following file:

- [type_traits](#)

5.609 std::is_placeholder< _Tp > Struct Template Reference

Inheritance diagram for std::is_placeholder< _Tp >:

**Public Types**

- typedef [integral_constant](#)< int, __v > **type**
- typedef int **value_type**

Public Member Functions

- constexpr **operator value_type** () const noexcept
- constexpr value_type **operator()** () const noexcept

Static Public Attributes

- static constexpr int **value**

5.609.1 Detailed Description

```
template<typename _Tp>
struct std::is_placeholder< _Tp >
```

Determines if the given type `_Tp` is a placeholder in a `bind()` expression and, if so, which placeholder it is. C++11 [func.bind.isplace].

The documentation for this struct was generated from the following file:

- [functional](#)

5.610 `std::is_placeholder< _Placeholder< _Num > >` Struct Template Reference

Inheritance diagram for `std::is_placeholder< _Placeholder< _Num > >`:

Public Types

- typedef [integral_constant](#)< int, __v > **type**
- typedef int **value_type**

Public Member Functions

- constexpr **operator value_type** () const noexcept
- constexpr value_type **operator()** () const noexcept

Static Public Attributes

- static constexpr int **value**

5.610.1 Detailed Description

```
template<int _Num>
struct std::is_placeholder< _Placeholder< _Num > >
```

Partial specialization of is_placeholder that provides the placeholder number for the placeholder objects defined by libstdc++.

The documentation for this struct was generated from the following file:

- [functional](#)

5.611 std::is_pod< _Tp > Struct Template Reference

Inheritance diagram for std::is_pod< _Tp >:

Public Types

- typedef [integral_constant](#)< bool, __v > **type**
- typedef bool **value_type**

Public Member Functions

- constexpr **operator value_type** () const noexcept
- constexpr value_type **operator()** () const noexcept

Static Public Attributes

- static constexpr bool **value**

5.611.1 Detailed Description

```
template<typename _Tp>
struct std::is_pod< _Tp >
```

is_pod (deprecated in C++20)

Deprecated Use `is_standard_layout` && `is_trivial` instead.

The documentation for this struct was generated from the following file:

5.636.1 Detailed Description

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>, typename _Dist = ptrdiff_t>
```

```
class std::istream_iterator< _Tp, _CharT, _Traits, _Dist >
```

Provides input iterator semantics for streams.

5.636.2 Member Typedef Documentation

difference_type

```
template<typename _Category , typename _Tp , typename _Distance = ptrdiff_t, typename _Pointer = _Tp*, typename _Reference = _Tp&>
typedef _Distance std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >::difference_type [inherited]
```

Distance between iterators is represented as this type.

iterator_category

```
template<typename _Category , typename _Tp , typename _Distance = ptrdiff_t, typename _Pointer = _Tp*, typename _Reference = _Tp&>
typedef _Category std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >::iterator_category [inherited]
```

One of the [tag types](#).

pointer

```
template<typename _Category , typename _Tp , typename _Distance = ptrdiff_t, typename _Pointer = _Tp*, typename _Reference = _Tp&>
typedef _Pointer std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >::pointer [inherited]
```

This type represents a pointer-to-value_type.

reference

```
template<typename _Category , typename _Tp , typename _Distance = ptrdiff_t, typename _Pointer = _Tp*, typename _Reference = _Tp&>
typedef _Reference std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >::reference [inherited]
```

This type represents a reference-to-value_type.

value_type

```
template<typename _Category , typename _Tp , typename _Distance = ptrdiff_t, typename _Pointer = _Tp*, typename _Reference = _Tp&>
typedef _Tp std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >::value_type [inherited]
```

The type "pointed to" by the iterator.

5.636.3 Constructor & Destructor Documentation

istream_iterator() [1/2]

```
template<typename _Tp , typename _CharT = char, typename _Traits = char_traits<_CharT>, typename _Dist = ptrdiff_t>
constexpr std::istream_iterator< _Tp, _CharT, _Traits, _Dist >::istream_iterator ( ) [inline],
[constexpr]
```

Construct end of input stream iterator.

istream_iterator() [2/2]

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>, typename
_Dist = ptrdiff_t>
std::istream_iterator<_Tp, _CharT, _Traits, _Dist>::istream_iterator (
    istream_type & __s ) [inline]
```

Construct start of input stream iterator.

5.636.4 Friends And Related Symbol Documentation**operator"!="**

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>, typename
_Dist = ptrdiff_t>
bool operator!= (
    const istream_iterator<_Tp, _CharT, _Traits, _Dist> & __x,
    const istream_iterator<_Tp, _CharT, _Traits, _Dist> & __y ) [friend]
```

Return true if the iterators refer to different streams, or if one is at end-of-stream and the other is not.

operator==

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>, typename
_Dist = ptrdiff_t>
bool operator== (
    const istream_iterator<_Tp, _CharT, _Traits, _Dist> & __x,
    const istream_iterator<_Tp, _CharT, _Traits, _Dist> & __y ) [friend]
```

Return true if the iterators refer to the same stream, or are both at end-of-stream.

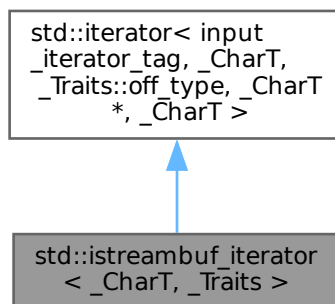

The documentation for this class was generated from the following file:

- [stream_iterator.h](#)

5.637 std::istreambuf_iterator<_CharT, _Traits> Class Template Reference

5.637.1 Detailed Description

template<typename `_CharT`, typename `_Traits`>
class `std::istreambuf_iterator`< `_CharT`, `_Traits` >

Provides input iterator semantics for streambufs.

5.637.2 Member Typedef Documentation

char_type

```
template<typename _CharT , typename _Traits >
typedef _CharT std::istreambuf_iterator< _CharT, _Traits >::char_type
Public typedefs.
```

difference_type

```
typedef _Traits::off_type std::iterator< input_iterator_tag , _CharT , _Traits::off_type , _CharT
* , _CharT >::difference_type [inherited]
Distance between iterators is represented as this type.
```

int_type

```
template<typename _CharT , typename _Traits >
typedef _Traits::int_type std::istreambuf_iterator< _CharT, _Traits >::int_type
Public typedefs.
```

istream_type

```
template<typename _CharT , typename _Traits >
typedef basic_istream<_CharT, _Traits> std::istreambuf_iterator< _CharT, _Traits >::istream_type
Public typedefs.
```

iterator_category

```
typedef input_iterator_tag std::iterator< input_iterator_tag , _CharT , _Traits::off_type , _↵
CharT * , _CharT >::iterator_category [inherited]
One of the tag types.
```

pointer

```
typedef _CharT * std::iterator< input_iterator_tag , _CharT , _Traits::off_type , _CharT * , _↵
CharT >::pointer [inherited]
This type represents a pointer-to-value_type.
```

reference

```
typedef _CharT std::iterator< input_iterator_tag , _CharT , _Traits::off_type , _CharT * , _CharT
>::reference [inherited]
This type represents a reference-to-value_type.
```

streambuf_type

```
template<typename _CharT , typename _Traits >
typedef basic_streambuf<_CharT, _Traits> std::istreambuf_iterator< _CharT, _Traits >::streambuf↵
_type
Public typedefs.
```

traits_type

```
template<typename _CharT , typename _Traits >
typedef _Traits std::istreambuf_iterator< _CharT, _Traits >::traits_type
Public typedefs.
```

value_type

```
typedef _CharT std::iterator< input_iterator_tag , _CharT , _Traits::off_type , _CharT * , _CharT  
>::value_type [inherited]
```

The type "pointed to" by the iterator.

5.637.3 Constructor & Destructor Documentation**istreambuf_iterator() [1/3]**

```
template<typename _CharT , typename _Traits >  
constexpr std::istreambuf_iterator< _CharT, _Traits >::istreambuf_iterator ( ) [inline], [constexpr],  
[noexcept]
```

Construct end of input stream iterator.

istreambuf_iterator() [2/3]

```
template<typename _CharT , typename _Traits >  
std::istreambuf_iterator< _CharT, _Traits >::istreambuf_iterator (   
    istream_type & __s ) [inline], [noexcept]
```

Construct start of input stream iterator.

istreambuf_iterator() [3/3]

```
template<typename _CharT , typename _Traits >  
std::istreambuf_iterator< _CharT, _Traits >::istreambuf_iterator (   
    streambuf_type * __s ) [inline], [noexcept]
```

Construct start of streambuf iterator.

5.637.4 Member Function Documentation**equal()**

```
template<typename _CharT , typename _Traits >  
bool std::istreambuf_iterator< _CharT, _Traits >::equal (   
    const istreambuf_iterator< _CharT, _Traits > & __b ) const [inline]
```

Return true both iterators are end or both are not end.

operator*()

```
template<typename _CharT , typename _Traits >  
char_type std::istreambuf_iterator< _CharT, _Traits >::operator* ( ) const [inline]
```

Return the current character pointed to by iterator. This returns streambuf.sgetc(). It cannot be assigned. NB: The result of operator*() on an end of stream is undefined.

operator++() [1/2]

```
template<typename _CharT , typename _Traits >  
istreambuf_iterator & std::istreambuf_iterator< _CharT, _Traits >::operator++ ( ) [inline]
```

Advance the iterator. Calls streambuf.sbumpc().

References [std::basic_streambuf< _CharT, _Traits >::sbumpc\(\)](#), and [std::basic_streambuf< _CharT, _Traits >::sgetc\(\)](#).

operator++() [2/2]

```
template<typename _CharT , typename _Traits >  
istreambuf_iterator std::istreambuf_iterator< _CharT, _Traits >::operator++ (   
    int ) [inline]
```

Advance the iterator. Calls `streambuf.sbumpc()`.

References `std::basic_streambuf<_CharT, _Traits>::sbumpc()`, and `std::basic_streambuf<_CharT, _Traits>::sgetc()`.

5.640.1 Detailed Description

An iterator for the components of a path.

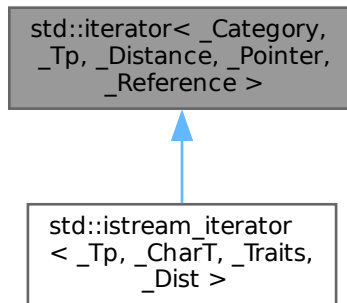

The documentation for this class was generated from the following file:

- [bits/fs_path.h](#)

5.641 `std::iterator<_Category, _Tp, _Distance, _Pointer, _Reference>` Struct Template Reference

```
#include <stl_iterator_base_types.h>
```

Inheritance diagram for `std::iterator<_Category, _Tp, _Distance, _Pointer, _Reference>`:

Public Types

- typedef `_Distance` [difference_type](#)
- typedef `_Category` [iterator_category](#)
- typedef `_Pointer` [pointer](#)
- typedef `_Reference` [reference](#)
- typedef `_Tp` [value_type](#)

5.641.1 Detailed Description

template<typename `_Category`, typename `_Tp`, typename `_Distance = ptrdiff_t`, typename `_Pointer = _Tp*`, typename `_Reference = _Tp&`>

struct `std::iterator<_Category, _Tp, _Distance, _Pointer, _Reference>`

Common iterator class.

This class does nothing but define nested typedefs. Iterator classes can inherit from this class to save some work. The typedefs are then used in specializations and overloading.

In particular, there are no default implementations of requirements such as `operator++` and the like. (How could there be?)

5.641.2 Member Typedef Documentation

`difference_type`

template<typename `_Category` , typename `_Tp` , typename `_Distance = ptrdiff_t`, typename `_Pointer = _Tp*`, typename `_Reference = _Tp&`>

typedef `_Distance` `std::iterator<_Category, _Tp, _Distance, _Pointer, _Reference>::difference_type`

Distance between iterators is represented as this type.

`iterator_category`

template<typename `_Category` , typename `_Tp` , typename `_Distance = ptrdiff_t`, typename `_Pointer = _Tp*`, typename `_Reference = _Tp&`>

```
typedef _Category std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >::iterator_category
```

One of the [tag types](#).

pointer

```
template<typename _Category , typename _Tp , typename _Distance = ptrdiff_t, typename _Pointer =
_Tp*, typename _Reference = _Tp&>
typedef _Pointer std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >::pointer
```

This type represents a pointer-to-value_type.

reference

```
template<typename _Category , typename _Tp , typename _Distance = ptrdiff_t, typename _Pointer =
_Tp*, typename _Reference = _Tp&>
typedef _Reference std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >::reference
```

This type represents a reference-to-value_type.

value_type

```
template<typename _Category , typename _Tp , typename _Distance = ptrdiff_t, typename _Pointer =
_Tp*, typename _Reference = _Tp&>
typedef _Tp std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >::value_type
```

The type "pointed to" by the iterator.

The documentation for this struct was generated from the following file:

- [stl_iterator_base_types.h](#)

5.642 `std::iterator_traits<_Iterator>` Struct Template Reference

Inherits `std::__iterator_traits<_Iterator, typename>`.

5.642.1 Detailed Description

```
template<typename _Iterator>
struct std::iterator_traits<_Iterator>
```

Traits class for iterators.

This class does nothing but define nested typedefs. The general version simply *forwards* the nested typedefs from the `Iterator` argument. Specialized versions for pointers and pointers-to-const provide tighter, more correct semantics.

The documentation for this struct was generated from the following file:

- [cpp_type_traits.h](#)

5.643 `std::iterator_traits<_Tp*>` Struct Template Reference

```
#include <stl_iterator_base_types.h>
```

Public Types

- typedef `ptrdiff_t` **difference_type**
- typedef [random_access_iterator_tag](#) **iterator_category**
- typedef `_Tp*` **pointer**
- typedef `_Tp&` **reference**
- typedef `_Tp` **value_type**

5.643.1 Detailed Description

```
template<typename _Tp>
struct std::iterator_traits< _Tp * >
```

Partial specialization for pointer types.

The documentation for this struct was generated from the following file:

- [stl_iterator_base_types.h](#)

5.644 std::iterator_traits< const _Tp * > Struct Template Reference

```
#include <stl_iterator_base_types.h>
```

- typedef [random_access_iterator_tag](#) **iterator_category**
- typedef const _Tp * **pointer**
- typedef const _Tp & **reference**
- typedef _Tp **value_type**

5.644.1 Detailed Description

```
template<typename _Tp>
struct std::iterator_traits< const _Tp * >
```

Partial specialization for const pointer types.

The documentation for this struct was generated from the following file:

- [stl_iterator_base_types.h](#)

5.645 __gnu_pbds::join_error Struct Reference

```
#include <exception.hpp>
```

Inheritance diagram for `__gnu_pbds::join_error`:

Public Member Functions

- virtual const char * [what](#) () const noexcept

5.645.1 Detailed Description

A join cannot be performed logical reasons (i.e., the ranges of the two container objects being joined overlaps.

5.645.2 Member Function Documentation

`what()`

```
virtual const char * std::logic_error::what ( ) const [virtual], [noexcept], [inherited]
```

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

Reimplemented in [std::future_error](#).

The documentation for this struct was generated from the following file:

- [exception.hpp](#)

5.646 `__gnu_pbds::detail::left_child_next_sibling_heap< Value_Type, Cmp_Fn, Node_Metadata, _Alloc >` Class Template Reference

5.647.1 Detailed Description

```
template<typename Node, typename _Alloc>
class __gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_< Node, _Alloc >
```

Const point-type iterator.

5.647.2 Member Typedef Documentation

`const_pointer`

```
template<typename Node , typename _Alloc >
typedef base_type::const_pointer __gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_<
Node, _Alloc >::const_pointer
Iterator's const pointer type.
```

`const_reference`

```
template<typename Node , typename _Alloc >
typedef base_type::const_reference __gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_<
Node, _Alloc >::const_reference
Iterator's const reference type.
```

`difference_type`

```
template<typename Node , typename _Alloc >
typedef _Alloc::difference_type __gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_<
Node, _Alloc >::difference_type
Difference type.
```

`iterator_category`

```
template<typename Node , typename _Alloc >
typedef std::forward_iterator_tag __gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_<
Node, _Alloc >::iterator_category
Category.
```

`pointer`

```
template<typename Node , typename _Alloc >
typedef base_type::pointer __gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_<
Node, _Alloc >::pointer
Iterator's pointer type.
```

reference

```
template<typename Node , typename _Alloc >
typedef base\_type::reference \_\_gnu\_pbds::detail::left\_child\_next\_sibling\_heap\_const\_iterator\_<
Node, _Alloc >::reference
Iterator's reference type.
```

value_type

```
template<typename Node , typename _Alloc >
typedef base\_type::value\_type \_\_gnu\_pbds::detail::left\_child\_next\_sibling\_heap\_const\_iterator\_<
Node, _Alloc >::value_type
Iterator's value type.
```

5.647.3 Constructor & Destructor Documentation

`left_child_next_sibling_heap_const_iterator_()` [1/2]

- `length_error` & `operator=` (const [length_error](#) &)=default
- `length_error` & `operator=` ([length_error](#) &&)=default
- virtual const char * `what` () const noexcept

5.650.1 Detailed Description

Thrown when an object is constructed that would exceed its maximum permitted size (e.g., a `basic_string` instance).

5.650.2 Member Function Documentation

`what()`

```
virtual const char * std::length_error::what ( ) const [virtual], [noexcept], [inherited]
```

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

Reimplemented in [std::future_error](#).

5.657.1 Detailed Description

template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m>
class std::linear_congruential_engine< _UIntType, __a, __c, __m >

A model of a linear congruential random number generator.

A random number generator that produces pseudorandom numbers via linear function:

$$x_{i+1} \leftarrow (ax_i + c) \bmod m$$

The template parameter `_UIntType` must be an unsigned integral type large enough to store values up to `(__m-1)`. If the template parameter `__m` is 0, the modulus `__m` used is `std::numeric_limits<_UIntType>::max()` plus 1. Otherwise, the template parameters `__a` and `__c` must be less than `__m`.

The size of the state is 1.

5.657.2 Member Typedef Documentation

result_type

template<typename _UIntType , _UIntType __a, _UIntType __c, _UIntType __m>
 typedef _UIntType [std::linear_congruential_engine](#)< _UIntType, __a, __c, __m >::result_type

The type of the generated random value.

5.657.3 Constructor & Destructor Documentation

linear_congruential_engine() [1/3]

```
template<typename _UIntType , _UIntType __a, _UIntType __c, _UIntType __m>
std::linear_congruential_engine< _UIntType, __a, __c, __m >::linear_congruential_engine ( ) [inline]
Constructs a linear_congruential_engine random number generator engine with seed 1.
```

linear_congruential_engine() [2/3]

```
template<typename _UIntType , _UIntType __a, _UIntType __c, _UIntType __m>
std::linear_congruential_engine< _UIntType, __a, __c, __m >::linear_congruential_engine (
    result_type __s ) [inline], [explicit]
Constructs a linear_congruential_engine random number generator engine with seed __s. The default seed value is 1.
```

Parameters

<code>__s</code>	The initial seed value.
------------------	-------------------------

References [std::linear_congruential_engine< _UIntType, __a, __c, __m >::seed\(\)](#).

linear_congruential_engine() [3/3]

```
template<typename _UIntType , _UIntType __a, _UIntType __c, _UIntType __m>
template<typename _Sseq , typename = _If_seed_seq<_Sseq>>
std::linear_congruential_engine< _UIntType, __a, __c, __m >::linear_congruential_engine (
    _Sseq & __q ) [inline], [explicit]
Constructs a linear_congruential_engine random number generator engine seeded from the seed sequence __q.
```

Parameters

<code>__q</code>	the seed sequence.
------------------	--------------------

References [std::linear_congruential_engine< _UIntType, __a, __c, __m >::seed\(\)](#).

5.657.4 Member Function Documentation

discard()

```
template<typename _UIntType , _UIntType __a, _UIntType __c, _UIntType __m>
void std::linear_congruential_engine< _UIntType, __a, __c, __m >::discard (
    unsigned long long __z ) [inline]
Discard a sequence of random numbers.
```

max()

```
template<typename _UIntType , _UIntType __a, _UIntType __c, _UIntType __m>
static constexpr result_type std::linear_congruential_engine< _UIntType, __a, __c, __m >::max ( )
[inline], [static], [constexpr]
Gets the largest possible value in the output range.
```

min()

```
template<typename _UIntType , _UIntType __a, _UIntType __c, _UIntType __m>
```

```
static constexpr result_type std::linear_congruential_engine<_UIntType, __a, __c, __m>::min ( )
[inline], [static], [constexpr]
```

Gets the smallest possible value in the output range.

The minimum depends on the __c parameter: if it is zero, the minimum generated must be > 0, otherwise 0 is allowed.

operator>()()

```
template<typename _UIntType , _UIntType __a, _UIntType __c, _UIntType __m>
result_type std::linear_congruential_engine<_UIntType, __a, __c, __m>::operator() ( ) [inline]
```

Gets the next random number in the sequence.

seed() [1/3]

```
template<typename _UIntType , _UIntType __a, _UIntType __c, _UIntType __m>
template<typename _Sseq >
_If_seed_seq< _Sseq > std::linear_congruential_engine<_UIntType, __a, __c, __m>::seed (
    _Sseq & __q )
```

Reseeds the linear_congruential_engine random number generator engine sequence using values from the seed sequence __q.

Parameters

\leftrightarrow __q	the seed sequence.
--------------------------	--------------------

seed() [2/3]

```
template<typename _UIntType , _UIntType __a, _UIntType __c, _UIntType __m>
template<typename _Sseq >
auto std::linear_congruential_engine<_UIntType, __a, __c, __m>::seed (
    _Sseq & __q ) -> _If_seed_seq<_Sseq>
```

Seeds the LCR engine with a value generated by __q.

References std::__lg().

seed() [3/3]

```
template<typename _UIntType , _UIntType __a, _UIntType __c, _UIntType __m>
void std::linear_congruential_engine<_UIntType, __a, __c, __m>::seed (
    result_type __s = default_seed )
```

Reseeds the linear_congruential_engine random number generator engine sequence to the seed __s.

Parameters

\leftrightarrow __s	The new seed.
--------------------------	---------------

Seeds the LCR with integral value __s, adjusted so that the ring identity is never a member of the convergence set.

Referenced by std::linear_congruential_engine<_UIntType, __a, __c, __m>::linear_congruential_engine(), and std::linear_congruential_engine<_UIntType, __a, __c, __m>::linear_congruential_engine().

5.657.5 Friends And Related Symbol Documentation

operator<<

```
template<typename _UIntType , _UIntType __a, _UIntType __c, _UIntType __m>
template<typename _UIntType1 , _UIntType1 __a1, _UIntType1 __c1, _UIntType1 __m1, typename _CharT
, typename _Traits >
std::basic_ostream< _CharT, _Traits > & operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::linear_congruential_engine< _UIntType1, __a1, __c1, __m1 > & __lcr )
[friend]
```

Writes the textual representation of the state x(i) of x to __os.

Parameters

<code>__os</code>	The output stream.
<code>__lcr</code>	A % linear_congruential_engine random number generator.

Returns

`__os`.

operator==

```
template<typename _UIntType , _UIntType __a, _UIntType __c, _UIntType __m>
bool operator== (
    const std::linear_congruential_engine< _UIntType, __a, __c, __m > & __lhs,
    const std::linear_congruential_engine< _UIntType, __a, __c, __m > & __rhs ) [friend]
```

Compares two linear congruential random number generator objects of the same type for equality.

Parameters

<code>__lhs</code>	A linear congruential random number generator object.
<code>__rhs</code>	Another linear congruential random number generator object.

Returns

true if the infinite sequences of generated values would be equal, false otherwise.

operator>>

```
template<typename _UIntType , _UIntType __a, _UIntType __c, _UIntType __m>
template<typename _UIntType1 , _UIntType1 __a1, _UIntType1 __c1, _UIntType1 __m1, typename _CharT
, typename _Traits >
std::basic_istream< _CharT, _Traits > & operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::linear_congruential_engine< _UIntType1, __a1, __c1, __m1 > & __lcr ) [friend]
```

Sets the state of the engine by reading its textual representation from __is.

The textual representation must have been previously written using an output stream whose imbued locale and whose type's template specialization arguments `_CharT` and `_Traits` were the same as those of `__is`.

Parameters

<code>__is</code>	The input stream.
<code>__lcr</code>	A % linear_congruential_engine random number generator.

Returns

`__is`.

5.657.6 Member Data Documentation

increment

```
template<typename _UIntType , _UIntType __a, _UIntType __c, _UIntType __m>
constexpr _UIntType std::linear_congruential_engine< _UIntType, __a, __c, __m >::increment [static],
[constexpr]
An increment.
```

modulus

```
template<typename _UIntType , _UIntType __a, _UIntType __c, _UIntType __m>
constexpr _UIntType std::linear_congruential_engine< _UIntType, __a, __c, __m >::modulus [static],
[constexpr]
The modulus.
```

multiplier

```
template<typename _UIntType , _UIntType __a, _UIntType __c, _UIntType __m>
constexpr _UIntType std::linear_congruential_engine< _UIntType, __a, __c, __m >::multiplier [static],
[constexpr]
The multiplier.
```

5.660.1 Detailed Description

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
class std::list<_Tp, _Alloc >
```

A standard container with linear time access to elements, and fixed time insertion/deletion at any point in the sequence.

Template Parameters

_Tp	Type of element.
_Alloc	Allocator type, defaults to <code>allocator<_Tp></code> .

Meets the requirements of a [container](#), a [reversible container](#), and a [sequence](#), including the [optional sequence requirements](#) with the exception of `at` and `operator[]`.

This is a *doubly linked* list. Traversal up and down the list requires linear time, but adding and removing elements (or *nodes*) is done in constant time, regardless of where the change takes place. Unlike `std::vector` and `std::deque`, random-access iterators are not provided, so subscripting (`[]`) access is not allowed. For algorithms which only need sequential access, this lack makes no difference.

Also unlike the other standard containers, `std::list` provides specialized algorithms unique to linked lists, such as splicing, sorting, and in-place reversal.

A couple points on memory allocation for `list<Tp>`:

First, we never actually allocate a `Tp`, we allocate `List_node<Tp>`'s and trust [20.1.5]/4 to DTRT. This is to ensure that after elements from `list<X,Alloc1>` are spliced into `list<X,Alloc2>`, destroying the memory of the second list is a valid operation, i.e., `Alloc1` giveth and `Alloc2` taketh away.

Second, a list conceptually represented as

```
A <---> B <---> C <---> D
```

is actually circular; a link exists between A and D. The list class holds (as its only data member) a private `list::iterator` pointing to *D*, not to *A*! To get to the head of the list, we start at the tail and move forward by one. When this member iterator's `next/previous` pointers refer to itself, the list is empty.

5.660.2 Constructor & Destructor Documentation

list() [1/8]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
std::list<_Tp, _Alloc >::list ( ) [default]
```

Creates a list with no elements.

list() [2/8]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
std::list<_Tp, _Alloc>::list (
    const allocator_type & __a ) [inline], [explicit], [noexcept]
```

Creates a list with no elements.

Parameters

 <code>__a</code>	An allocator object.
----------------------------------------------------------------------------------------------------	----------------------

list() [3/8]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
std::list<_Tp, _Alloc>::list (
    size_type __n,
    const allocator_type & __a = allocator_type() ) [inline], [explicit]
```

Creates a list with default constructed elements.

Parameters

 <code>__n</code>	The number of elements to initially create.
 <code>__a</code>	An allocator object.

This constructor fills the list with `__n` default constructed elements.

list() [4/8]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
std::list<_Tp, _Alloc>::list (
    size_type __n,
    const value_type & __value,
    const allocator_type & __a = allocator_type() ) [inline]
```

Creates a list with copies of an exemplar element.

Parameters

<code>__n</code>	The number of elements to initially create.
<code>__value</code>	An element to copy.
<code>__a</code>	An allocator object.

This constructor fills the list with `__n` copies of `__value`.

list() [5/8]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
std::list<_Tp, _Alloc>::list (
    const list<_Tp, _Alloc> & __x ) [inline]
```

List copy constructor.

Parameters

<code>__x</code>	A list of identical element and allocator types.
------------------	--------------------------------------------------

The newly-created list uses a copy of the allocation object used by `__x` (unless the allocator traits dictate a different object).

References `std::list<_Tp, _Alloc>::begin()`, and `std::list<_Tp, _Alloc>::end()`.

list() [6/8]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
std::list<_Tp, _Alloc>::list (
    list<_Tp, _Alloc> && ) [default]
```

List move constructor.

The newly-created list contains the exact contents of the moved instance. The contents of the moved instance are a valid, but unspecified list.

list() [7/8]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
std::list<_Tp, _Alloc>::list (
    initializer_list<value_type> & __l,
    const allocator_type & __a = allocator_type() ) [inline]
```

Builds a list from an `initializer_list`.

Parameters

<code>__l</code>	An <code>initializer_list</code> of <code>value_type</code> .
<code>__a</code>	An allocator object.

Create a list consisting of copies of the elements in the `initializer_list __l`. This is linear in `__l.size()`.

list() [8/8]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
template<typename _InputIterator , typename = std::_RequireInputIter<_InputIterator>>
std::list<_Tp, _Alloc>::list (
    _InputIterator __first,
    _InputIterator __last,
    const allocator_type & __a = allocator_type() ) [inline]
```

Builds a list from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__a</code>	An allocator object.

Create a list consisting of copies of the elements from `[__first, __last)`. This is linear in `N` (where `N` is `distance(__first, __last)`).

~list()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
std::list<_Tp, _Alloc>::~~list ( ) [default]
```

No explicit dtor needed as the _Base dtor takes care of things. The _Base dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

5.660.3 Member Function Documentation**_M_create_node()**

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
template<typename... _Args>
_Node * std::list<_Tp, _Alloc>::_M_create_node (
    _Args &&... __args ) [inline], [protected]
```

Parameters

<code>__args</code>	An instance of user data.
---------------------	---------------------------

Allocates space for a new node and constructs a copy of `__args` in it.

assign() [1/3]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
template<typename _InputIterator , typename = std::enable_if_t<_RequireInputIter<_InputIterator>>>
void std::list<_Tp, _Alloc>::assign (
    _InputIterator __first,
    _InputIterator __last ) [inline]
```

Assigns a range to a list.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

This function fills a list with copies of the elements in the range `[__first, __last)`.

Note that the assignment completely changes the list and that the resulting list's size is the same as the number of elements assigned.

assign() [2/3]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
void std::list<_Tp, _Alloc>::assign (
    initializer_list<value_type> __l ) [inline]
```

Assigns an initializer_list to a list.

Parameters

<code>↵</code>	An initializer_list of value_type.
<code>__↵</code>	
<code>↵</code>	
<code>__↵</code>	
<code>/</code>	

Replace the contents of the list with copies of the elements in the initializer_list __l/. This is linear in __l.size().

assign() [3/3]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::assign (
    size_type __n,
    const value_type & __val ) [inline]
```

Assigns a given value to a list.

Parameters

<code>__n</code>	Number of elements to be assigned.
<code>__val</code>	Value to be assigned.

This function fills a list with __n copies of the given value. Note that the assignment completely changes the list and that the resulting list's size is the same as the number of elements assigned.

Referenced by `std::list< _Tp, _Alloc >::operator=()`.

back() [1/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
const_reference std::list< _Tp, _Alloc >::back ( ) const [inline], [noexcept]
```

Returns a read-only (constant) reference to the data at the last element of the list.

References `std::list< _Tp, _Alloc >::end()`.

back() [2/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
reference std::list< _Tp, _Alloc >::back ( ) [inline], [noexcept]
```

Returns a read/write reference to the data at the last element of the list.

References `std::list< _Tp, _Alloc >::end()`.

begin() [1/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
const_iterator std::list< _Tp, _Alloc >::begin ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the list. Iteration is done in ordinary element order.

begin() [2/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
iterator std::list< _Tp, _Alloc >::begin ( ) [inline], [noexcept]
```

Returns a read/write iterator that points to the first element in the list. Iteration is done in ordinary element order.

Referenced by `std::list< _Tp, _Alloc >::list()`, `std::list< _Tp, _Alloc >::crend()`, `std::list< _Tp, _Alloc >::front()`, `std::list< _Tp, _Alloc >::front()`, `std::list< _Tp, _Alloc >::insert()`, `std::list< _Tp, _Alloc >::insert()`, `std::list< _Tp, _Alloc >::merge()`, `std::list< _Tp, _Alloc >::merge()`, `std::operator<()`, `std::list< _Tp, _Alloc >::operator=()`, `std::operator==()`, `std::list< _Tp, _Alloc >::pop_f`, `std::list< _Tp, _Alloc >::push_front()`, `std::list< _Tp, _Alloc >::remove()`, `std::list< _Tp, _Alloc >::remove_if()`, `std::list< _Tp, _Alloc >::rend()`, `std::list< _Tp, _Alloc >::rend()`, `std::list< _Tp, _Alloc >::sort()`, `std::list< _Tp, _Alloc >::sort()`, `std::list< _Tp, _Alloc >::splice()`, `std::list< _Tp, _Alloc >::unique()`, and `std::list< _Tp, _Alloc >::unique()`.

cbegin()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
const_iterator std::list<_Tp, _Alloc>::cbegin ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the list. Iteration is done in ordinary element order.

cend()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
const_iterator std::list<_Tp, _Alloc>::cend ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the list. Iteration is done in ordinary element order.

clear()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
void std::list<_Tp, _Alloc>::clear ( ) [inline], [noexcept]
```

Erases all the elements. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

crbegin()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::list<_Tp, _Alloc>::crbegin ( ) const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the list. Iteration is done in reverse element order.

References `std::list<_Tp, _Alloc>::end()`.

crend()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::list<_Tp, _Alloc>::crend ( ) const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first element in the list. Iteration is done in reverse element order.

References `std::list<_Tp, _Alloc>::begin()`.

emplace()

```
template<typename _Tp , typename _Alloc >
template<typename... _Args>
list<_Tp, _Alloc>::iterator list::emplace (
    const_iterator __position,
    _Args &&... __args )
```

Constructs object in list before specified iterator.

Parameters

<code>__position</code>	A <code>const_iterator</code> into the list.
<code>__args</code>	Arguments.

Returns

An iterator that points to the inserted data.

This function will insert an object of type T constructed with `T(std::forward<Args>(args)...) before the specified location. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references. Referenced by std::list<_Tp, _Alloc>::insert().`

empty()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
bool std::list<_Tp, _Alloc>::empty ( ) const [inline], [noexcept]
```

Returns true if the list is empty. (Thus `begin()` would equal `end()`.)

Referenced by `std::list<_Tp, _Alloc>::insert()`, `std::list<_Tp, _Alloc>::sort()`, `std::list<_Tp, _Alloc>::sort()`, and `std::list<_Tp, _Alloc>::splice()`.

end() [1/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
const_iterator std::list<_Tp, _Alloc>::end ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the list. Iteration is done in ordinary element order.

end() [2/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
iterator std::list<_Tp, _Alloc>::end ( ) [inline], [noexcept]
```

Returns a read/write iterator that points one past the last element in the list. Iteration is done in ordinary element order.

Referenced by `std::list<_Tp, _Alloc>::list()`, `std::list<_Tp, _Alloc>::back()`, `std::list<_Tp, _Alloc>::back()`, `std::list<_Tp, _Alloc>::cbegin()`, `std::list<_Tp, _Alloc>::merge()`, `std::list<_Tp, _Alloc>::merge()`, `std::operator<()`, `std::list<_Tp, _Alloc>::operator=()`, `std::operator==()`, `std::list<_Tp, _Alloc>::push_back()`, `std::list<_Tp, _Alloc>::rbegin()`, `std::list<_Tp, _Alloc>::rbegin()`, and `std::list<_Tp, _Alloc>::splice()`.

erase() [1/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
iterator std::list<_Tp, _Alloc>::erase (
    const_iterator __first,
    const_iterator __last ) [inline], [noexcept]
```

Remove a range of elements.

Parameters

<code>__first</code>	Iterator pointing to the first element to be erased.
<code>__last</code>	Iterator pointing to one past the last element to be erased.

Returns

An iterator pointing to the element pointed to by `last` prior to erasing (or `end()`).

This function will erase the elements in the range `[first,last)` and shorten the list accordingly.

This operation is linear time in the size of the range and only invalidates iterators/references to the element being removed. The user is also cautioned that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

References `std::list<_Tp, _Alloc>::erase()`.

erase() [2/2]

```
template<typename _Tp , typename _Alloc >
list< _Tp, _Alloc >::iterator list::erase (
    const_iterator __position ) [noexcept]
```

Remove element at given position.

Parameters

<code>__position</code>	Iterator pointing to element to be erased.
-------------------------	--------------------------------------------

Returns

An iterator pointing to the next element (or end()).

This function will erase the element at the given position and thus shorten the list by one.

Due to the nature of a list this operation can be done in constant time, and only invalidates iterators/references to the element being removed. The user is also cautioned that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Referenced by [std::list<_Tp, _Alloc>::erase\(\)](#).

front() [1/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
const_reference std::list< _Tp, _Alloc >::front ( ) const [inline], [noexcept]
```

Returns a read-only (constant) reference to the data at the first element of the list.

References [std::list<_Tp, _Alloc>::begin\(\)](#).

front() [2/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
reference std::list< _Tp, _Alloc >::front ( ) [inline], [noexcept]
```

Returns a read/write reference to the data at the first element of the list.

References [std::list<_Tp, _Alloc>::begin\(\)](#).

get_allocator()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
allocator_type std::list< _Tp, _Alloc >::get_allocator ( ) const [inline], [noexcept]
```

Get a copy of the memory allocation object.

insert() [1/5]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
iterator std::list< _Tp, _Alloc >::insert (
    const_iterator __p,
    initializer_list< value_type > __l ) [inline]
```

Inserts the contents of an initializer_list into list before specified const_iterator.

Parameters

<code>__p</code>	A const_iterator into the list.
<code>__l</code>	An initializer_list of value_type.

Returns

An iterator pointing to the first element inserted (or `__position`).

This function will insert copies of the data in the initializer_list / into the list before the location specified by *p*. This operation is linear in the number of elements inserted and does not invalidate iterators and references. References [std::list< _Tp, _Alloc >::insert\(\)](#).

insert() [2/5]

```
template<typename _Tp , typename _Alloc >
template<typename _InputIterator , typename >
list< _Tp, _Alloc >::iterator list::insert (
    const_iterator __position,
    _InputIterator __first,
    _InputIterator __last )
```

Inserts a range into the list.

Parameters

<code>__position</code>	A const_iterator into the list.
<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

Returns

An iterator pointing to the first element inserted (or `__position`).

This function will insert copies of the data in the range [*first,last*) into the list before the location specified by *position*. This operation is linear in the number of elements inserted and does not invalidate iterators and references. References [std::list< _Tp, _Alloc >::begin\(\)](#), and [std::list< _Tp, _Alloc >::empty\(\)](#).

insert() [3/5]

```
template<typename _Tp , typename _Alloc >
list< _Tp, _Alloc >::iterator list::insert (
    const_iterator __position,
    const value_type & __x )
```

Inserts given value into list before specified iterator.

Parameters

<code>__position</code>	A const_iterator into the list.
<code>__x</code>	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a copy of the given value before the specified location. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references. Referenced by [std::list< _Tp, _Alloc >::insert\(\)](#).

insert() [4/5]

```
template<typename _Tp , typename _Alloc >
```

```
list<_Tp, _Alloc>::iterator list::insert (
    const_iterator __position,
    size_type __n,
    const value_type & __x )
```

Inserts a number of copies of given data into the list.

Parameters

<code>__position</code>	A <code>const_iterator</code> into the list.
<code>__n</code>	Number of elements to be inserted.
<code>__x</code>	Data to be inserted.

Returns

An iterator pointing to the first element inserted (or `__position`).

This function will insert a specified number of copies of the given data before the location specified by *position*.

This operation is linear in the number of elements inserted and does not invalidate iterators and references.

References [std::list<_Tp, _Alloc>::begin\(\)](#).

`insert()` [5/5]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
iterator std::list<_Tp, _Alloc>::insert (
    const_iterator __position,
    value_type && __x ) [inline]
```

Inserts given rvalue into list before specified iterator.

Parameters

<code>__position</code>	A <code>const_iterator</code> into the list.
<code>__x</code>	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a copy of the given rvalue before the specified location. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references.

References [std::list<_Tp, _Alloc>::emplace\(\)](#), and [std::move\(\)](#).

`max_size()`

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
size_type std::list<_Tp, _Alloc>::max_size ( ) const [inline], [noexcept]
```

Returns the `size()` of the largest possible list.

References [__gnu_cxx::__alloc_traits<_Alloc, typename>::max_size\(\)](#).

`merge()` [1/2]

```
template<typename _Tp , typename _Alloc >
void list::merge (
    list<_Tp, _Alloc> && __x )
```

Merge sorted lists.

Parameters

<code>__x</code>	Sorted list to merge.
------------------	-----------------------

Assumes that both `__x` and this list are sorted according to `operator<()`. Merges elements of `__x` into this list in sorted order, leaving `__x` empty when complete. Elements in this list precede elements in `__x` that are equal.

References [std::__addressof\(\)](#), [std::list<_Tp, _Alloc>::begin\(\)](#), [std::begin\(\)](#), [std::list<_Tp, _Alloc>::end\(\)](#), and [std::end\(\)](#).

Referenced by [std::list<_Tp, _Alloc>::sort\(\)](#), and [std::list<_Tp, _Alloc>::sort\(\)](#).

merge() [2/2]

```
template<typename _Tp , typename _Alloc >
template<typename _StrictWeakOrdering >
void list::merge (
    list< _Tp, _Alloc > && __x,
    _StrictWeakOrdering __comp )
```

Merge sorted lists according to comparison function.

Template Parameters

<code>_StrictWeakOrdering</code>	Comparison function defining sort order.
----------------------------------	------------------------------------------

Parameters

<code>__x</code>	Sorted list to merge.
<code>__comp</code>	Comparison functor.

Assumes that both `__x` and this list are sorted according to `StrictWeakOrdering`. Merges elements of `__x` into this list in sorted order, leaving `__x` empty when complete. Elements in this list precede elements in `__x` that are equivalent according to `StrictWeakOrdering()`.

References [std::__addressof\(\)](#), [std::list<_Tp, _Alloc>::begin\(\)](#), [std::begin\(\)](#), [std::list<_Tp, _Alloc>::end\(\)](#), and [std::end\(\)](#).

operator=() [1/3]

```
template<typename _Tp , typename _Alloc >
list< _Tp, _Alloc > & list::operator= (
    const list< _Tp, _Alloc > & __x )
```

List assignment operator.

Parameters

<code>__x</code>	A list of identical element and allocator types.
------------------	--------------------------------------------------

All the elements of `__x` are copied.

Whether the allocator is copied depends on the allocator traits.

References [std::__addressof\(\)](#), [std::list<_Tp, _Alloc>::begin\(\)](#), and [std::list<_Tp, _Alloc>::end\(\)](#).

operator=() [2/3]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
list & std::list< _Tp, _Alloc >::operator= (
    initializer_list< value_type > __l ) [inline]
```

List initializer list assignment operator.

Parameters

↔	An initializer_list of value_type.
↔	
↔	
↔	
/	

Replace the contents of the list with copies of the elements in the initializer_list __l. This is linear in l.size().
References [std::list< _Tp, _Alloc >::assign\(\)](#).

operator=() [3/3]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
list & std::list< _Tp, _Alloc >::operator= (
    list< _Tp, _Alloc > && __x ) [inline], [noexcept]
```

List move assignment operator.

Parameters

↔	A list of identical element and allocator types.
__x	

The contents of __x are moved into this list (without copying).
Afterwards __x is a valid, but unspecified list
Whether the allocator is moved depends on the allocator traits.
References [std::move\(\)](#).

pop_back()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::pop_back ( ) [inline], [noexcept]
```

Removes last element.

This is a typical stack operation. It shrinks the list by one. Due to the nature of a list this operation can be done in constant time, and only invalidates iterators/references to the element being removed.

Note that no data is returned, and if the last element's data is needed, it should be retrieved before pop_back() is called.

pop_front()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::pop_front ( ) [inline], [noexcept]
```

Removes first element.

This is a typical stack operation. It shrinks the list by one. Due to the nature of a list this operation can be done in constant time, and only invalidates iterators/references to the element being removed.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before pop_front() is called.

References [std::list< _Tp, _Alloc >::begin\(\)](#).

push_back()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
void std::list<_Tp, _Alloc>::push_back (
    const value_type & __x ) [inline]
```

Add data to the end of the list.

Parameters

	Data to be added.
<code>__x</code>	

This is a typical stack operation. The function creates an element at the end of the list and assigns the given data to it. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references. References [std::list<_Tp, _Alloc>::end\(\)](#).

push_front()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
void std::list<_Tp, _Alloc>::push_front (
    const value_type & __x ) [inline]
```

Add data to the front of the list.

Parameters

	Data to be added.
<code>__x</code>	

This is a typical stack operation. The function creates an element at the front of the list and assigns the given data to it. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references. References [std::list<_Tp, _Alloc>::begin\(\)](#).

rbegin() [1/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::list<_Tp, _Alloc>::rbegin ( ) const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the list. Iteration is done in reverse element order.

References [std::list<_Tp, _Alloc>::end\(\)](#).

rbegin() [2/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
reverse_iterator std::list<_Tp, _Alloc>::rbegin ( ) [inline], [noexcept]
```

Returns a read/write reverse iterator that points to the last element in the list. Iteration is done in reverse element order. References [std::list<_Tp, _Alloc>::end\(\)](#).

remove()

```
template<typename _Tp , typename _Alloc >
list<_Tp, _Alloc>::__remove_return_type list::remove (
    const _Tp & __value )
```

Remove all elements equal to value.

Parameters

<code>__value</code>	The value to remove.
----------------------	----------------------

Removes every element in the list equal to *value*. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

References [std::list< _Tp, _Alloc >::begin\(\)](#), [std::begin\(\)](#), [std::end\(\)](#), [std::list< _Tp, _Alloc >::size\(\)](#), and [std::list< _Tp, _Alloc >::splice\(\)](#).

remove_if()

```
template<typename _Tp , typename _Alloc >
template<typename _Predicate >
list< _Tp, _Alloc >::__remove_return_type list::remove_if (
    _Predicate __pred )
```

Remove all elements satisfying a predicate.

Template Parameters

<code>_Predicate</code>	Unary predicate function or object.
-------------------------	-------------------------------------

Removes every element in the list for which the predicate returns true. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

References [std::list< _Tp, _Alloc >::begin\(\)](#), [std::begin\(\)](#), [std::end\(\)](#), [std::list< _Tp, _Alloc >::size\(\)](#), and [std::list< _Tp, _Alloc >::splice\(\)](#).

rend() [1/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::list< _Tp, _Alloc >::rend ( ) const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first element in the list. Iteration is done in reverse element order.

References [std::list< _Tp, _Alloc >::begin\(\)](#).

rend() [2/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
reverse_iterator std::list< _Tp, _Alloc >::rend ( ) [inline], [noexcept]
```

Returns a read/write reverse iterator that points to one before the first element in the list. Iteration is done in reverse element order.

References [std::list< _Tp, _Alloc >::begin\(\)](#).

resize() [1/2]

```
template<typename _Tp , typename _Alloc >
void list::resize (
    size_type __new_size )
```

Resizes the list to the specified number of elements.

Parameters

<code>__new_size</code>	Number of elements the list should contain.
-------------------------	---------------------------------------------

This function will resize the list to the specified number of elements. If the number is smaller than the list's current size

the list is truncated, otherwise default constructed elements are appended.

References [std::end\(\)](#).

resize() [2/2]

```
template<typename _Tp, typename _Alloc >
void list::resize (
    size_type __new_size,
    const value_type & __x )
```

Resizes the list to the specified number of elements.

Parameters

<code>__new_size</code>	Number of elements the list should contain.
<code>__x</code>	Data with which new elements should be populated.

This function will resize the list to the specified number of elements. If the number is smaller than the list's current size the list is truncated, otherwise the list is extended and new elements are populated with given data.

References [std::end\(\)](#).

reverse()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list<_Tp, _Alloc>::reverse ( ) [inline], [noexcept]
```

Reverse the elements in list.

Reverse the order of elements in the list in linear time.

size()

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
size_type std::list<_Tp, _Alloc>::size ( ) const [inline], [noexcept]
```

Returns the number of elements in the list.

Referenced by [std::operator==\(\)](#), [std::list<_Tp, _Alloc>::remove\(\)](#), [std::list<_Tp, _Alloc>::remove_if\(\)](#), [std::list<_Tp, _Alloc>::unique\(\)](#) and [std::list<_Tp, _Alloc>::unique\(\)](#).

sort() [1/2]

```
template<typename _Tp, typename _Alloc >
void list::sort
```

Sort the elements.

Sorts the elements of this list in NlogN time. Equivalent elements remain in list order.

References [std::list<_Tp, _Alloc>::begin\(\)](#), [std::begin\(\)](#), [std::list<_Tp, _Alloc>::empty\(\)](#), [std::empty\(\)](#), [std::end\(\)](#), [std::list<_Tp, _Alloc>::merge\(\)](#), [std::list<_Tp, _Alloc>::splice\(\)](#), [std::swap\(\)](#), and [std::list<_Tp, _Alloc>::swap\(\)](#).

sort() [2/2]

```
template<typename _Tp, typename _Alloc >
template<typename _StrictWeakOrdering >
void list::sort (
    _StrictWeakOrdering __comp )
```

Sort the elements according to comparison function.

Sorts the elements of this list in NlogN time. Equivalent elements remain in list order.

References [std::list<_Tp, _Alloc>::begin\(\)](#), [std::begin\(\)](#), [std::list<_Tp, _Alloc>::empty\(\)](#), [std::empty\(\)](#), [std::end\(\)](#), [std::list<_Tp, _Alloc>::merge\(\)](#), [std::list<_Tp, _Alloc>::splice\(\)](#), [std::swap\(\)](#), and [std::list<_Tp, _Alloc>::swap\(\)](#).

splice() [1/5]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::splice (
    const_iterator __position,
    list< _Tp, _Alloc > && __x ) [inline], [noexcept]
```

Insert contents of another list.

Parameters

<code>__position</code>	Iterator referencing the element to insert before.
<code>__x</code>	Source list.

The elements of `__x` are inserted in constant time in front of the element referenced by `__position`. `__x` becomes an empty list.

Requires this `!= __x`.

References `std::list< _Tp, _Alloc >::begin()`, `std::list< _Tp, _Alloc >::empty()`, and `std::list< _Tp, _Alloc >::end()`.

Referenced by `std::list< _Tp, _Alloc >::remove()`, `std::list< _Tp, _Alloc >::remove_if()`, `std::list< _Tp, _Alloc >::sort()`, `std::list< _Tp, _Alloc >::sort()`, `std::list< _Tp, _Alloc >::splice()`, `std::list< _Tp, _Alloc >::splice()`, `std::list< _Tp, _Alloc >::unique()`, and `std::list< _Tp, _Alloc >::unique()`.

splice() [2/5]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::splice (
    const_iterator __position,
    list< _Tp, _Alloc > && __x,
    const_iterator __first,
    const_iterator __last ) [inline], [noexcept]
```

Insert range from another list.

Parameters

<code>__position</code>	Const_iterator referencing the element to insert before.
<code>__x</code>	Source list.
<code>__first</code>	Const_iterator referencing the start of range in x.
<code>__last</code>	Const_iterator referencing the end of range in x.

Removes elements in the range `[__first, __last)` and inserts them before `__position` in constant time.

Undefined if `__position` is in `[__first, __last)`.

References `std::__addressof()`.

splice() [3/5]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::splice (
    const_iterator __position,
    list< _Tp, _Alloc > && __x,
    const_iterator __i ) [inline], [noexcept]
```

Insert element from another list.

Parameters

<code>__position</code>	Const_iterator referencing the element to insert before.
-------------------------	----------------------------------------------------------

Parameters

<code>__x</code>	Source list.
<code>__i</code>	Const_iterator referencing the element to move.

Removes the element in list `__x` referenced by `__i` and inserts it into the current list before `__position`.
References [std::__addressof\(\)](#).

splice() [4/5]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
void std::list<_Tp, _Alloc>::splice (
    const_iterator __position,
    list<_Tp, _Alloc> & __x,
    const_iterator __first,
    const_iterator __last ) [inline], [noexcept]
```

Insert range from another list.

Parameters

<code>__position</code>	Const_iterator referencing the element to insert before.
<code>__x</code>	Source list.
<code>__first</code>	Const_iterator referencing the start of range in x.
<code>__last</code>	Const_iterator referencing the end of range in x.

Removes elements in the range `[__first,__last)` and inserts them before `__position` in constant time.
Undefined if `__position` is in `[__first,__last)`.
References [std::move\(\)](#), and [std::list<_Tp, _Alloc>::splice\(\)](#).

splice() [5/5]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
void std::list<_Tp, _Alloc>::splice (
    const_iterator __position,
    list<_Tp, _Alloc> & __x,
    const_iterator __i ) [inline], [noexcept]
```

Insert element from another list.

Parameters

<code>__position</code>	Const_iterator referencing the element to insert before.
<code>__x</code>	Source list.
<code>__i</code>	Const_iterator referencing the element to move.

Removes the element in list `__x` referenced by `__i` and inserts it into the current list before `__position`.
References [std::move\(\)](#), and [std::list<_Tp, _Alloc>::splice\(\)](#).

swap()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
void std::list<_Tp, _Alloc>::swap (
    list<_Tp, _Alloc> & __x ) [inline], [noexcept]
```

Swaps data with another list.

Parameters

<code>_↔</code>	A list of the same element and allocator types.
<code>_X</code>	

This exchanges the elements between two lists in constant time. Note that the global `std::swap()` function is specialized such that `std::swap(l1,l2)` will feed to this function.

Whether the allocators are swapped depends on the allocator traits.

Referenced by [std::list<_Tp, _Alloc>::sort\(\)](#), and [std::list<_Tp, _Alloc>::sort\(\)](#).

unique() [1/2]

```
template<typename _Tp , typename _Alloc >
list< _Tp, _Alloc >::__remove_return_type list::unique
```

Remove consecutive duplicate elements.

For each consecutive set of elements with the same value, remove all but the first one. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

References [std::list<_Tp, _Alloc>::begin\(\)](#), [std::begin\(\)](#), [std::end\(\)](#), [std::list<_Tp, _Alloc>::size\(\)](#), and [std::list<_Tp, _Alloc>::splice\(\)](#).

unique() [2/2]

```
template<typename _Tp , typename _Alloc >
template<typename _BinaryPredicate >
list< _Tp, _Alloc >::__remove_return_type list::unique (
    _BinaryPredicate __binary_pred )
```

Remove consecutive elements satisfying a predicate.

Template Parameters

<code>_BinaryPredicate</code>	Binary predicate function or object.
-------------------------------	--------------------------------------

For each consecutive set of elements `[first,last)` that satisfy `predicate(first,i)` where `i` is an iterator in `[first,last)`, remove all but the first one. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

References [std::list<_Tp, _Alloc>::begin\(\)](#), [std::begin\(\)](#), [std::end\(\)](#), [std::list<_Tp, _Alloc>::size\(\)](#), and [std::list<_Tp, _Alloc>::splice\(\)](#).

5.661 `__gnu_pbds::list_update< Key, Mapped, Eq_Fn, Update_Policy, _Alloc >` Class

Template Reference

```
#include <assoc_container.hpp>
```

Inherits `detail::container_base_dispatch::type`.

Public Types

- typedef [list_update_tag](#) `container_category`
- typedef `Eq_Fn` `eq_fn`
- typedef `Update_Policy` `update_policy`

Public Member Functions

- **list_update** (const [list_update](#) &other)
- template<typename It >
 [list_update](#) (It first, It last)
- **list_update** & **operator=** (const [list_update](#) &other)
- void **swap** ([list_update](#) &other)

5.661.1 Detailed Description

template<typename Key, typename Mapped, class Eq_Fn = typename detail::default_eq_fn<Key>::type, class Update_Policy = detail::default_update_policy::type, class _Alloc = std::allocator<char>>
class `__gnu_pbds::list_update`< Key, Mapped, Eq_Fn, Update_Policy, _Alloc >

A list-update based associative container.

Template Parameters

<i>Key</i>	Key type.
<i>Mapped</i>	Map type.
<i>Eq_Fn</i>	Equal functor.
<i>Update_Policy</i>	Update policy, determines when an element will be moved to the front of the list.
<i>_Alloc</i>	Allocator type.

Base is detail::lu_map.

5.661.2 Constructor & Destructor Documentation

`list_update()`

```
template<typename Key , typename Mapped , class Eq_Fn = typename detail::default_eq_fn<Key>↵
::type, class Update_Policy = detail::default_update_policy::type, class _Alloc = std::allocator<char>>
template<typename It >
\_\_gnu\_pbds::list\_update< Key, Mapped, Eq_Fn, Update_Policy, _Alloc >::list_update (
    It first,
    It last ) [inline]
```

Constructor taking `__iterators` to a range of `value_types`. The `value_types` between `first_it` and `last_it` will be inserted into the container object.

5.663.1 Detailed Description

Container class for localization functionality.

The locale class is first a class wrapper for C library locales. It is also an extensible container for user-defined localization. A locale is a collection of facets that implement various localization features such as money, time, and number printing. Constructing C++ locales does not change the C library locale.

This library supports efficient construction and copying of locales through a reference counting implementation of the locale class.

5.663.2 Member Typedef Documentation

category

```
typedef int std::locale::category
```

Definition of locale::category.

5.663.3 Constructor & Destructor Documentation

locale() [1/8]

```
std::locale::locale ( ) throw ( )
```

Default constructor.

Constructs a copy of the global locale. If no locale has been explicitly set, this is the C locale.

Referenced by [combine\(\)](#).

locale() [2/8]

```
std::locale::locale (
    const locale & __other ) throw ( )
```

Copy constructor.

Constructs a copy of *other*.

Parameters

<code>__other</code>	The locale to copy.
----------------------	---------------------

locale() [3/8]

```
std::locale::locale (
    const char * __s ) [explicit]
```

Named locale constructor.

Constructs a copy of the named C library locale.

Parameters

<code>__s</code>	Name of the locale to construct.
------------------	----------------------------------

Exceptions

<code>std::runtime_error</code>	if <code>__s</code> is null or an undefined locale.
---------------------------------	-----------------------------------------------------

locale() [4/8]

```
std::locale::locale (
    const locale & __base,
    const char * __s,
    category __cat )
```

Construct locale with facets from another locale.

Constructs a copy of the locale *base*. The facets specified by *cat* are replaced with those from the locale named by *s*. If *base* is named, this locale instance will also be named.

Parameters

<code>__base</code>	The locale to copy.
<code>__s</code>	Name of the locale to use facets from.
<code>__cat</code>	Set of categories defining the facets to use from <code>__s</code> .

Exceptions

<code>std::runtime_error</code>	if <code>__s</code> is null or an undefined locale.
---------------------------------	-----------------------------------------------------

locale() [5/8]

```
std::locale::locale (
    const std::string & __s ) [inline], [explicit]
```

Named locale constructor.

Constructs a copy of the named C library locale.

Parameters

<code>__s</code>	Name of the locale to construct.
------------------	----------------------------------

Exceptions

<code>std::runtime_error</code>	if <code>__s</code> is an undefined locale.
---------------------------------	---------------------------------------------

locale() [6/8]

```
std::locale::locale (
    const locale & __base,
    const std::string & __s,
    category __cat ) [inline]
```

Construct locale with facets from another locale.

Constructs a copy of the locale *base*. The facets specified by *cat* are replaced with those from the locale named by *s*. If *base* is named, this locale instance will also be named.

Parameters

<code>__base</code>	The locale to copy.
<code>__s</code>	Name of the locale to use facets from.
<code>__cat</code>	Set of categories defining the facets to use from <code>__s</code> .

Exceptions

<code>std::runtime_error</code>	if <code>__s</code> is an undefined locale.
---------------------------------	---------------------------------------------

locale() [7/8]

```
std::locale::locale (
    const locale & __base,
    const locale & __add,
    category __cat )
```

Construct locale with facets from another locale.

Constructs a copy of the locale *base*. The facets specified by *cat* are replaced with those from the locale *add*. If *base* and *add* are named, this locale instance will also be named.

Parameters

<code>__base</code>	The locale to copy.
<code>__add</code>	The locale to use facets from.
<code>__cat</code>	Set of categories defining the facets to use from add.

locale() [8/8]

```
template<typename _Facet >
std::locale::locale (
    const locale & __other,
    _Facet * __f )
```

Construct locale with another facet.

Constructs a copy of the locale `__other`. The facet `__f` is added to `__other`, replacing an existing facet of type `Facet` if there is one. If `__f` is null, this locale is a copy of `__other`.

Parameters

<code>__other</code>	The locale to copy.
<code>__f</code>	The facet to add in.

~locale()

```
std::locale::~~locale ( ) throw ( )
```

Locale destructor.

5.663.4 Member Function Documentation**classic()**

```
static const locale & std::locale::classic ( ) [static]
```

Return reference to the C locale.

combine()

```
template<typename _Facet >
locale std::locale::combine (
    const locale & __other ) const
```

Construct locale with another facet.

Constructs and returns a new copy of this locale. Adds or replaces an existing facet of type `Facet` from the locale *other* into the new locale.

Template Parameters

<code>_Facet</code>	The facet type to copy from other
---------------------	-----------------------------------

Parameters

Parameters

<code>__other</code>	The locale to copy from.
----------------------	--------------------------

Returns

Newly constructed locale.

Exceptions

<code>std::runtime_error</code>	if <code>__other</code> has no facet of type <code>_Facet</code> .
---------------------------------	--------------------------------------------------------------------

References [locale\(\)](#).

global()

```
static locale std::locale::global (  
    const locale & __loc ) [static]
```

Set global locale.

This function sets the global locale to the argument and returns a copy of the previous global locale. If the argument has a name, it will also call `std::setlocale(LC_ALL, loc.name())`.

Parameters

<code>__loc</code>	The new locale to make global.
--------------------	--------------------------------

Returns

Copy of the old global locale.

name()

```
string std::locale::name ( ) const
```

Return locale name.

Returns

Locale name or "*" if unnamed.

operator"!=()"

```
bool std::locale::operator!= (  
    const locale & __other ) const throw ( ) [inline]
```

Locale inequality.

Parameters

<code>__other</code>	The locale to compare against.
----------------------	--------------------------------

Returns

! (*this == __other)

References [operator==\(\)](#).

operator>()()

```
template<typename _Char , typename _Traits , typename _Alloc >
bool std::locale::operator() (
    const basic\_string< _Char, _Traits, _Alloc > & __s1,
    const basic\_string< _Char, _Traits, _Alloc > & __s2 ) const
```

Compare two strings according to collate.

Template operator to compare two strings using the compare function of the collate facet in this locale. One use is to provide the locale to the sort function. For example, a vector v of strings could be sorted according to locale loc by doing:

```
std::sort(v.begin(), v.end(), loc);
```

Parameters

<code>__s1</code>	First string to compare.
<code>__s2</code>	Second string to compare.

Returns

True if `collate<_Char> facet` compares `__s1 < __s2`, else false.

operator=()

```
const locale & std::locale::operator= (
    const locale & __other ) throw ( )
```

Assignment operator.

Set this locale to be a copy of *other*.

Parameters

<code>__other</code>	The locale to copy.
----------------------	---------------------

Returns

A reference to this locale.

operator==()

```
bool std::locale::operator== (
    const locale & __other ) const throw ( )
```

Locale equality.

Parameters

<code>__other</code>	The locale to compare against.
----------------------	--------------------------------

Returns

True if other and this refer to the same locale instance, are copies, or have the same name. False otherwise.

Referenced by [operator!=\(\)](#).

5.663.5 Friends And Related Symbol Documentation**has_facet**

```
template<typename _Facet >
bool has_facet (
    const locale & ) throw ( ) [friend]
```

Test for the presence of a facet.

has_facet tests the locale argument for the presence of the facet type provided as the template parameter. Facets derived from the facet parameter will also return true.

Template Parameters

<code>_Facet</code>	The facet type to test the presence of.
---------------------	-----------------------------------------

Parameters

<code>__loc</code>	The locale to test.
--------------------	---------------------

Returns

true if `__loc` contains a facet of type `_Facet`, else false.

use_facet

```
template<typename _Facet >
const _Facet & use_facet (
    const locale & ) [friend]
```

Return a facet.

use_facet looks for and returns a reference to a facet of type Facet where Facet is the template parameter. If `has_facet(locale)` is true, there is a suitable facet to return. It throws `std::bad_cast` if the locale doesn't contain a facet of type Facet.

Template Parameters

<code>_Facet</code>	The facet type to access.
---------------------	---------------------------

Parameters

<code>__loc</code>	The locale to use.
--------------------	--------------------

Returns

Reference to facet of type Facet.

Exceptions

<code>std::bad_cast</code>	if <code>__loc</code> doesn't contain a facet of type <code>_Facet</code> .
----------------------------	-----------------------------------------------------------------------------

5.664 `std::lock_guard<_Mutex>` Class Template Reference

```
#include <std_mutex.h>
```

Public Types

- typedef `_Mutex` **mutex_type**

Public Member Functions

- **lock_guard** (const [lock_guard](#) &)=delete
- **lock_guard** (mutex_type &__m)
- **lock_guard** (mutex_type &__m, [adopt_lock_t](#)) noexcept
- [lock_guard](#) & **operator=** (const [lock_guard](#) &)=delete

5.664.1 Detailed Description

```
template<typename _Mutex>
```

```
class std::lock_guard<_Mutex>
```

A simple scoped lock type.

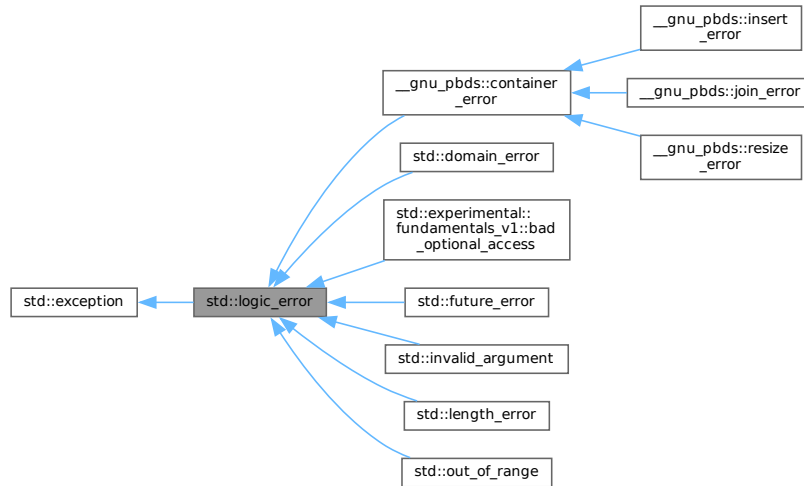

A `lock_guard` controls mutex ownership within a scope, releasing ownership in the destructor.

The documentation for this class was generated from the following file:

- [std_mutex.h](#)

5.665 std::logic_error Class Reference

Inheritance diagram for std::logic_error:

Public Member Functions

- **logic_error** (const char *) _GLIBCXX_TXN_SAFE
- **logic_error** (const [logic_error](#) &)=default
- **logic_error** (const [string](#) &__arg) _GLIBCXX_TXN_SAFE

- **logic_error** & **operator=** (const [logic_error](#) &)=default
- **logic_error** & **operator=** ([logic_error](#) &&) noexcept
- virtual const char * **what** () const noexcept

5.665.1 Detailed Description

One of two subclasses of exception.

Logic errors represent problems in the internal logic of a program; in theory, these are preventable, and even detectable before the program runs (e.g., violations of class invariants).

5.665.2 Constructor & Destructor Documentation

logic_error()

```
std::logic_error::logic_error (
    const string & __arg ) [explicit]
```

Takes a character string describing the error.

5.665.3 Member Function Documentation

what()

```
virtual const char * std::logic_error::what ( ) const [virtual], [noexcept]
```

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

Reimplemented in [std::future_error](#).

The documentation for this class was generated from the following file:

5.672.1 Detailed Description

`template<typename _RealType = double>`
`class std::lognormal_distribution< _RealType >`

A `lognormal_distribution` random number distribution.
 The formula for the normal probability mass function is

$$p(x|m, s) = \frac{1}{sx\sqrt{2\pi}} \exp - \frac{(\ln x - m)^2}{2s^2}$$

5.672.2 Member Typedef Documentation

result_type

`template<typename _RealType = double>`
`typedef _RealType std::lognormal_distribution< _RealType >::result_type`
 The type of the range of the distribution.

5.672.3 Member Function Documentation

max()

`template<typename _RealType = double>`
`result_type std::lognormal_distribution< _RealType >::max () const [inline]`
 Returns the least upper bound value of the distribution.
 References `std::numeric_limits< _Tp >::max()`.

min()

`template<typename _RealType = double>`
`result_type std::lognormal_distribution< _RealType >::min () const [inline]`
 Returns the greatest lower bound value of the distribution.

operator>()

`template<typename _RealType = double>`
`template<typename _UniformRandomNumberGenerator >`
`result_type std::lognormal_distribution< _RealType >::operator() (`
`_UniformRandomNumberGenerator & __urng) [inline]`

Generating functions.

References `std::lognormal_distribution< _RealType >::operator>()`.

Referenced by `std::lognormal_distribution< _RealType >::operator>()`.

param() [1/2]

```
template<typename _RealType = double>
param_type std::lognormal_distribution< _RealType >::param ( ) const [inline]
```

Returns the parameter set of the distribution.

param() [2/2]

```
template<typename _RealType = double>
void std::lognormal_distribution< _RealType >::param (
    const param_type & __param ) [inline]
```

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--------------------------------------------

reset()

```
template<typename _RealType = double>
void std::lognormal_distribution< _RealType >::reset ( ) [inline]
```

Resets the distribution state.

References [std::normal_distribution<_RealType>::reset\(\)](#).

5.672.4 Friends And Related Symbol Documentation**operator<<**

```
template<typename _RealType = double>
template<typename _RealType1 , typename _CharT , typename _Traits >
std::basic_ostream< _CharT, _Traits > & operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::lognormal_distribution< _RealType1 > & __x ) [friend]
```

Inserts a `lognormal_distribution` random number distribution `__x` into the output stream `__os`.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>lognormal_distribution</code> random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

operator==

```
template<typename _RealType = double>
bool operator== (
    const lognormal_distribution< _RealType > & __d1,
    const lognormal_distribution< _RealType > & __d2 ) [friend]
```

Return true if two `lognormal` distributions have the same parameters and the sequences that would be generated are equal.

operator>>

```
template<typename _RealType = double>
template<typename _RealType1 , typename _CharT , typename _Traits >
std::basic_istream< _CharT, _Traits > & operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::lognormal_distribution< _RealType1 > & __x ) [friend]
```

Extracts a lognormal_distribution random number distribution __x from the input stream __is.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A lognormal_distribution random number generator engine.

Returns

The input stream with __x extracted or in an error state.

```

Public Types

- typedef `_Alloc allocator_type`
- typedef `detail::rebind_traits<_Alloc, metadata_type>::reference metadata_reference`
- typedef `null_type metadata_type`

Public Member Functions

- `metadata_type operator() () const`
- `bool operator() (metadata_reference r_metadata) const`

5.677.1 Detailed Description

```
template<typename _Alloc = std::allocator<char>>
class __gnu_pbds::lu_move_to_front_policy<_Alloc>
```

A list-update policy that unconditionally moves elements to the front of the list. A null type means that each link in a list-based container does not actually need metadata.

5.677.2 Member Typedef Documentation

`metadata_reference`

```
template<typename _Alloc = std::allocator<char>>
typedef detail::rebind_traits<_Alloc, metadata_type>::reference __gnu_pbds::lu_move_to_front_policy<
_Alloc>::metadata_reference
```

Reference to metadata on which this functor operates.

`metadata_type`

```
template<typename _Alloc = std::allocator<char>>
typedef null_type __gnu_pbds::lu_move_to_front_policy<_Alloc>::metadata_type
```

Metadata on which this functor operates.

5.677.3 Member Function Documentation

operator>() [1/2]

```
template<typename _Alloc = std::allocator<char>>
metadata_type __gnu_pbds::lu_move_to_front_policy< _Alloc >::operator() ( ) const [inline]
```

Creates a metadata object.

operator>() [2/2]

```
template<typename _Alloc = std::allocator<char>>
bool __gnu_pbds::lu_move_to_front_policy< _Alloc >::operator() (
    metadata_reference r_metadata ) const [inline]
```

Decides whether a metadata object should be moved to the front of the list.

5.680.1 Detailed Description

template<typename _Tp>
class [__gnu_cxx::malloc_allocator](#)<_Tp >

An allocator that uses malloc.

This is precisely the allocator defined in the C++ Standard.

- all allocation calls malloc
- all deallocation calls free

The documentation for this class was generated from the following file:

- [malloc_allocator.h](#)

5.681 std::__debug::map<_Key, _Tp, _Compare, _Allocator > Class Template Reference

5.682.1 Detailed Description

template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>>
class std::map<_Key, _Tp, _Compare, _Alloc >

A standard container made up of (key,value) pairs, which can be retrieved based on a key, in logarithmic time.

Template Parameters

<code>_Key</code>	Type of key objects.
<code>_Tp</code>	Type of mapped objects.
<code>_Compare</code>	Comparison function object type, defaults to <code>less<_Key></code> .
<code>_Alloc</code>	Allocator type, defaults to <code>allocator<pair<const _Key, _Tp>></code> .

Meets the requirements of a [container](#), a [reversible container](#), and an [associative container](#) (using unique keys). For a `map<Key,T>` the `key_type` is `Key`, the `mapped_type` is `T`, and the `value_type` is `std::pair<const Key,T>`.

Maps support bidirectional iterators.

The private tree data is declared exactly the same way for `map` and `multimap`; the distinction is made entirely in how the tree functions are called (`*_unique` versus `*_equal`, same as the standard).

5.682.2 Constructor & Destructor Documentation

`map()` [1/12]

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
std::map<_Key, _Tp, _Compare, _Alloc >::map ( ) [default]
```

Default constructor creates no elements.

map() [2/12]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::map< _Key, _Tp, _Compare, _Alloc >::map (
    const _Compare & __comp,
    const allocator_type & __a = allocator_type() ) [inline], [explicit]
```

Creates a map with no elements.

Parameters

<code>__comp</code>	A comparison object.
<code>__a</code>	An allocator object.

map() [3/12]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::map< _Key, _Tp, _Compare, _Alloc >::map (
    const map< _Key, _Tp, _Compare, _Alloc > & ) [default]
```

Map copy constructor.

Whether the allocator is copied depends on the allocator traits.

map() [4/12]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::map< _Key, _Tp, _Compare, _Alloc >::map (
    map< _Key, _Tp, _Compare, _Alloc > && ) [default]
```

Map move constructor.

The newly-created map contains the exact contents of the moved instance. The moved instance is a valid, but unspecified, map.

map() [5/12]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::map< _Key, _Tp, _Compare, _Alloc >::map (
    initializer_list< value_type > __l,
    const _Compare & __comp = _Compare(),
    const allocator_type & __a = allocator_type() ) [inline]
```

Builds a map from an initializer_list.

Parameters

<code>__l</code>	An initializer_list.
<code>__comp</code>	A comparison object.
<code>__a</code>	An allocator object.

Create a map consisting of copies of the elements in the initializer_list `__l`. This is linear in N if the range is already sorted, and NlogN otherwise (where N is `__l.size()`).

map() [6/12]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::map< _Key, _Tp, _Compare, _Alloc >::map (
    const allocator_type & __a ) [inline], [explicit]
```

Allocator-extended default constructor.

map() [7/12]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::map< _Key, _Tp, _Compare, _Alloc >::map (
    const map< _Key, _Tp, _Compare, _Alloc > & __m,
    const allocator_type & __a ) [inline]
```

Allocator-extended copy constructor.

map() [8/12]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::map< _Key, _Tp, _Compare, _Alloc >::map (
    map< _Key, _Tp, _Compare, _Alloc > && __m,
    const allocator_type & __a ) [inline], [noexcept]
```

Allocator-extended move constructor.

map() [9/12]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::map< _Key, _Tp, _Compare, _Alloc >::map (
    initializer_list< value_type > __l,
    const allocator_type & __a ) [inline]
```

Allocator-extended initializer-list constructor.

map() [10/12]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _InputIterator >
std::map< _Key, _Tp, _Compare, _Alloc >::map (
    _InputIterator __first,
    _InputIterator __last,
    const allocator_type & __a ) [inline]
```

Allocator-extended range constructor.

map() [11/12]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _InputIterator >
std::map< _Key, _Tp, _Compare, _Alloc >::map (
    _InputIterator __first,
    _InputIterator __last ) [inline]
```

Builds a map from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

Create a map consisting of copies of the elements from [`__first`,`__last`). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(`__first`,`__last`)).

map() [12/12]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _InputIterator >
std::map< _Key, _Tp, _Compare, _Alloc >::map (
    _InputIterator __first,
    _InputIterator __last,
    const _Compare & __comp,
    const allocator_type & __a = allocator_type() ) [inline]
```

Builds a map from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__comp</code>	A comparison functor.
<code>__a</code>	An allocator object.

Create a map consisting of copies of the elements from [`__first`,`__last`). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(`__first`,`__last`)).

~map()

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::map< _Key, _Tp, _Compare, _Alloc >::~~map ( ) [default]
```

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

5.682.3 Member Function Documentation**at()**

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
mapped_type & std::map< _Key, _Tp, _Compare, _Alloc >::at (
    const key_type & __k ) [inline]
```

Access to map data.

Parameters

<code>__k</code>	The key for which data should be retrieved.
------------------	---------------------------------------------

Returns

A reference to the data whose key is equivalent to `__k`, if such a data is present in the map.

Exceptions

<code>std::out_of_range</code>	If no such data is present.
--------------------------------	-----------------------------

References `std::map<_Key, _Tp, _Compare, _Alloc>::end()`, `std::map<_Key, _Tp, _Compare, _Alloc>::key_comp()`, and `std::map<_Key, _Tp, _Compare, _Alloc>::lower_bound()`.

begin() [1/2]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
```

```
const_iterator std::map<_Key, _Tp, _Compare, _Alloc>::begin ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first pair in the map. Iteration is done in ascending order according to the keys.

begin() [2/2]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
```

```
iterator std::map<_Key, _Tp, _Compare, _Alloc>::begin ( ) [inline], [noexcept]
```

Returns a read/write iterator that points to the first pair in the map. Iteration is done in ascending order according to the keys.

cbegin()

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
```

```
const_iterator std::map<_Key, _Tp, _Compare, _Alloc>::cbegin ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first pair in the map. Iteration is done in ascending order according to the keys.

cend()

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
```

```
const_iterator std::map<_Key, _Tp, _Compare, _Alloc>::cend ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last pair in the map. Iteration is done in ascending order according to the keys.

clear()

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
```

```
void std::map<_Key, _Tp, _Compare, _Alloc>::clear ( ) [inline], [noexcept]
```

Erases all elements in a map. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

count() [1/2]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
```

```
template<typename _Kt >
auto std::map<_Key, _Tp, _Compare, _Alloc>::count (
    const _Kt & __x ) const -> decltype(_M_t._M_count_tr(__x))    [inline]
```

Finds the number of elements with given key.

Parameters

	Key of (key, value) pairs to be located.
	

Returns

Number of elements with specified key.

This function only makes sense for multimaps; for map the result will either be 0 (not present) or 1 (present).

count() [2/2]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
size_type std::map<_Key, _Tp, _Compare, _Alloc>::count (
    const key_type & __x ) const [inline]
```

Finds the number of elements with given key.

Parameters

	Key of (key, value) pairs to be located.
	

Returns

Number of elements with specified key.

This function only makes sense for multimaps; for map the result will either be 0 (not present) or 1 (present).

crbegin()

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
const_reverse_iterator std::map<_Key, _Tp, _Compare, _Alloc>::crbegin ( ) const [inline],
[noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last pair in the map. Iteration is done in descending order according to the keys.

crend()

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
const_reverse_iterator std::map<_Key, _Tp, _Compare, _Alloc>::crend ( ) const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first pair in the map. Iteration is done in descending order according to the keys.

emplace()

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
```

```
template<typename... _Args>
std::pair< iterator, bool > std::map< _Key, _Tp, _Compare, _Alloc >::emplace (
    _Args &&... __args ) [inline]
```

Attempts to build and insert a `std::pair` into the map.

Parameters

<code>__args</code>	Arguments used to generate a new pair instance (see <code>std::piecewise_construct</code> for passing arguments to each part of the pair constructor).
---------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------

Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to build and insert a (key, value) pair into the map. A map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the map.

Insertion requires logarithmic time.

`emplace_hint()`

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename... _Args>
iterator std::map< _Key, _Tp, _Compare, _Alloc >::emplace_hint (
    const_iterator __pos,
    _Args &&... __args ) [inline]
```

Attempts to build and insert a `std::pair` into the map.

Parameters

<code>__pos</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__args</code>	Arguments used to generate a new pair instance (see <code>std::piecewise_construct</code> for passing arguments to each part of the pair constructor).

Returns

An iterator that points to the element with key of the `std::pair` built from `__args` (may or may not be that `std::pair`).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `emplace()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints for more on *hinting*.

Insertion requires logarithmic time (if the hint is not taken).

Referenced by `std::map< _Key, _Tp, _Compare, _Alloc >::insert_or_assign()`, `std::map< _Key, _Tp, _Compare, _Alloc >::insert_or_assign()`, `std::map< _Key, _Tp, _Compare, _Alloc >::try_emplace()`, and `std::map< _Key, _Tp, _Compare, _Alloc >::try_emplace()`.

`empty()`

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
bool std::map< _Key, _Tp, _Compare, _Alloc >::empty ( ) const [inline], [noexcept]
```

Returns true if the map is empty. (Thus `begin()` would equal `end()`.)

end() [1/2]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
```

```
const_iterator std::map<_Key, _Tp, _Compare, _Alloc>::end ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last pair in the map. Iteration is done in ascending order according to the keys.

end() [2/2]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
```

```
iterator std::map<_Key, _Tp, _Compare, _Alloc>::end ( ) [inline], [noexcept]
```

Returns a read/write iterator that points one past the last pair in the map. Iteration is done in ascending order according to the keys.

Referenced by [std::map<_Key, _Tp, _Compare, _Alloc>::at\(\)](#), [std::map<_Key, _Tp, _Compare, _Alloc>::extract\(\)](#), [std::map<_Key, _Tp, _Compare, _Alloc>::insert_or_assign\(\)](#), [std::map<_Key, _Tp, _Compare, _Alloc>::operator\[\]\(\)](#), and [std::map<_Key, _Tp, _Compare, _Alloc>::try_emplace\(\)](#).

equal_range() [1/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
```

```
template<typename _Kt >
```

```
auto std::map<_Key, _Tp, _Compare, _Alloc>::equal_range (
    const _Kt & __x ) -> decltype(pair<iterator, iterator>(_M_t._M_equal_range_tr(__x)))
```

```
[inline]
```

Finds a subsequence matching given key.

Parameters

	Key of (key, value) pairs to be located.
__x	

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
    c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multimaps.

equal_range() [2/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
```

```
template<typename _Kt >
```

```
auto std::map<_Key, _Tp, _Compare, _Alloc>::equal_range (
    const _Kt & __x ) const -> decltype(pair<const_iterator, const_iterator>(_M_t._M_←
equal_range_tr(__x))) [inline]
```

Finds a subsequence matching given key.

Parameters

	Key of (key, value) pairs to be located.
	

Returns

Pair of read-only (constant) iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),  
              c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multimaps.

equal_range() [3/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =  
std::allocator<std::pair<const _Key, _Tp> >>  
std::pair< iterator, iterator > std::map< _Key, _Tp, _Compare, _Alloc >::equal_range (  
    const key_type & __x ) [inline]
```

Finds a subsequence matching given key.

Parameters

	Key of (key, value) pairs to be located.
	

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),  
              c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multimaps.

equal_range() [4/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =  
std::allocator<std::pair<const _Key, _Tp> >>  
std::pair< const_iterator, const_iterator > std::map< _Key, _Tp, _Compare, _Alloc >::equal_range  
(  
    const key_type & __x ) const [inline]
```

Finds a subsequence matching given key.

Parameters

	Key of (key, value) pairs to be located.
	

Returns

Pair of read-only (constant) iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
              c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multimaps.

erase() [1/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
size_type std::map< _Key, _Tp, _Compare, _Alloc >::erase (
    const key_type & __x ) [inline]
```

Erases elements according to the provided key.

Parameters

<code>__x</code>	Key of element to be erased.
------------------	------------------------------

Returns

The number of elements erased.

This function erases all the elements located by the given key from a map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [2/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::map< _Key, _Tp, _Compare, _Alloc >::erase (
    const_iterator __first,
    const_iterator __last ) [inline]
```

Erases a [first,last) range of elements from a map.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be erased.
<code>__last</code>	Iterator pointing to the end of the range to be erased.

Returns

The iterator `__last`.

This function erases a sequence of elements from a map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [3/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
```

```
iterator std::map< _Key, _Tp, _Compare, _Alloc >::erase (
    const_iterator __position ) [inline]
```

Erases an element from a map.

Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---------------------------------------------------

Returns

An iterator pointing to the element immediately following *position* prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from a map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [4/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
_GLIBCXX_ABI_TAG_CXX11 iterator std::map< _Key, _Tp, _Compare, _Alloc >::erase (
    iterator __position ) [inline]
```

Erases an element from a map.

Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---------------------------------------------------

Returns

An iterator pointing to the element immediately following *position* prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from a map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

extract() [1/2]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
node_type std::map< _Key, _Tp, _Compare, _Alloc >::extract (
    const key_type & __x ) [inline]
```

Extract a node.

extract() [2/2]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
node_type std::map< _Key, _Tp, _Compare, _Alloc >::extract (
    const_iterator __pos ) [inline]
```

Extract a node.

References `std::map< _Key, _Tp, _Compare, _Alloc >::end()`.

find() [1/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Kt >
auto std::map<_Key, _Tp, _Compare, _Alloc >::find (
    const _Kt & __x ) -> decltype(_M_t._M_find_tr(__x))    [inline]
```

Tries to locate an element in a map.

Parameters

<code>__x</code>	Key of (key, value) pair to be located.
------------------	-----------------------------------------

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end (`end()`) iterator.

find() [2/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Kt >
auto std::map<_Key, _Tp, _Compare, _Alloc >::find (
    const _Kt & __x ) const -> decltype(_M_t._M_find_tr(__x))    [inline]
```

Tries to locate an element in a map.

Parameters

<code>__x</code>	Key of (key, value) pair to be located.
------------------	-----------------------------------------

Returns

Read-only (constant) iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns a constant iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end (`end()`) iterator.

find() [3/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::map<_Key, _Tp, _Compare, _Alloc >::find (
    const key_type & __x ) [inline]
```

Tries to locate an element in a map.

Parameters

<code>__x</code>	Key of (key, value) pair to be located.
------------------	-----------------------------------------

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end (end()) iterator.

find() [4/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::map< _Key, _Tp, _Compare, _Alloc >::find (
    const key_type & __x ) const [inline]
```

Tries to locate an element in a map.

Parameters

<code>__x</code>	Key of (key, value) pair to be located.
------------------	-----------------------------------------

Returns

Read-only (constant) iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns a constant iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end (end()) iterator.

get_allocator()

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
allocator_type std::map< _Key, _Tp, _Compare, _Alloc >::get_allocator ( ) const [inline], [noexcept]
```

Get a copy of the memory allocation object.

insert() [1/10]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _InputIterator >
void std::map< _Key, _Tp, _Compare, _Alloc >::insert (
    _InputIterator __first,
    _InputIterator __last ) [inline]
```

Template function that attempts to insert a range of elements.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be inserted.
<code>__last</code>	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

insert() [2/10]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
```

```
template<typename _Pair >
__enable_if_t< is_constructible< value_type, _Pair >::value, pair< iterator, bool > > std::map<
_Key, _Tp, _Compare, _Alloc >::insert (
    _Pair && __x ) [inline]
```

Attempts to insert a std::pair into the map.

Parameters

<code>__x</code>	Pair to be inserted (see std::make_pair for easy creation of pairs).
------------------	----------------------------------------------------------------------

Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the map. A map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the map.

Insertion requires logarithmic time.

insert() [3/10]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::pair< iterator, bool > std::map< _Key, _Tp, _Compare, _Alloc >::insert (
    const value_type & __x ) [inline]
```

Attempts to insert a std::pair into the map.

Parameters

<code>__x</code>	Pair to be inserted (see std::make_pair for easy creation of pairs).
------------------	----------------------------------------------------------------------

Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the map. A map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the map.

Insertion requires logarithmic time.

insert() [4/10]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::map< _Key, _Tp, _Compare, _Alloc >::insert (
    const_iterator __hint,
    node_type && __nh ) [inline]
```

Re-insert an extracted node.

References [std::move\(\)](#).

insert() [5/10]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
```

```
template<typename _Pair >
__enable_if_t< is_constructible< value_type, _Pair >::value, iterator > std::map< _Key, _Tp, _Compare, _Alloc >::insert (
    const_iterator __position,
    _Pair && __x ) [inline]
```

Attempts to insert a `std::pair` into the map.

Parameters

<code>__position</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__x</code>	Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs).

Returns

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `insert()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints for more on *hinting*.

Insertion requires logarithmic time (if the hint is not taken).

`insert()` [6/10]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::map< _Key, _Tp, _Compare, _Alloc >::insert (
    const_iterator __position,
    const value_type & __x ) [inline]
```

Attempts to insert a `std::pair` into the map.

Parameters

<code>__position</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__x</code>	Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs).

Returns

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `insert()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints for more on *hinting*.

Insertion requires logarithmic time (if the hint is not taken).

`insert()` [7/10]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::map< _Key, _Tp, _Compare, _Alloc >::insert (
    const_iterator __position,
    value_type && __x ) [inline]
```

Attempts to insert a `std::pair` into the map.

Parameters

<code>__position</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__x</code>	Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs).

Returns

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `insert()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.↵associative.insert_hints for more on *hinting*.

Insertion requires logarithmic time (if the hint is not taken).

References [std::move\(\)](#).

`insert()` [8/10]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
insert_return_type std::map< _Key, _Tp, _Compare, _Alloc >::insert (
    node_type && __nh ) [inline]
```

Re-insert an extracted node.

References [std::move\(\)](#).

Referenced by [std::map<_Key, _Tp, _Compare, _Alloc>::insert\(\)](#), and [std::map<_Key, _Tp, _Compare, _Alloc>::operator\[\]\(\)](#).

`insert()` [9/10]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
void std::map< _Key, _Tp, _Compare, _Alloc >::insert (
    std::initializer_list< value_type > __list ) [inline]
```

Attempts to insert a list of `std::pairs` into the map.

Parameters

<code>__list</code>	A <code>std::initializer_list<value_type></code> of pairs to be inserted.
---------------------	---------------------------------------------------------------------------------

Complexity similar to that of the range constructor.

References [std::map<_Key, _Tp, _Compare, _Alloc>::insert\(\)](#).

`insert()` [10/10]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::pair< iterator, bool > std::map< _Key, _Tp, _Compare, _Alloc >::insert (
    value_type && __x ) [inline]
```

Attempts to insert a `std::pair` into the map.

Parameters

<code>_↔</code>	Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs).
<code>_X</code>	

Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the map. A map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the map.

Insertion requires logarithmic time.

References [std::move\(\)](#).

insert_or_assign() [1/2]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Obj >
pair< iterator, bool > std::map< _Key, _Tp, _Compare, _Alloc >::insert_or_assign (
    const key_type & __k,
    _Obj && __obj ) [inline]
```

Attempts to insert or assign a `std::pair` into the map.

Parameters

<code>__k</code>	Key to use for finding a possibly existing pair in the map.
<code>__obj</code>	Argument used to generate the .second for a pair instance.

Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the map. A map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the map. If the pair was already in the map, the .second of the pair is assigned from `__obj`.

Insertion requires logarithmic time.

References [std::map< _Key, _Tp, _Compare, _Alloc >::emplace_hint\(\)](#), [std::map< _Key, _Tp, _Compare, _Alloc >::end\(\)](#), [std::forward_as_tuple\(\)](#), [std::map< _Key, _Tp, _Compare, _Alloc >::key_comp\(\)](#), [std::map< _Key, _Tp, _Compare, _Alloc >::lower_bound\(\)](#) and [std::piecewise_construct](#).

insert_or_assign() [2/2]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Obj >
iterator std::map< _Key, _Tp, _Compare, _Alloc >::insert_or_assign (
    const_iterator __hint,
    const key_type & __k,
    _Obj && __obj ) [inline]
```

Attempts to insert or assign a `std::pair` into the map.

Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__k</code>	Key to use for finding a possibly existing pair in the map.
<code>__obj</code>	Argument used to generate the .second for a pair instance.

Returns

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

This function attempts to insert a (key, value) pair into the map. A map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the map. If the pair was already in the map, the .second of the pair is assigned from `__obj`.

Insertion requires logarithmic time.

References [std::map< _Key, _Tp, _Compare, _Alloc >::emplace_hint\(\)](#), [std::forward_as_tuple\(\)](#), and [std::piecewise_construct](#).

key_comp()

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
key_compare std::map< _Key, _Tp, _Compare, _Alloc >::key_comp ( ) const [inline]
```

Returns the key comparison object out of which the map was constructed.

Referenced by [std::map< _Key, _Tp, _Compare, _Alloc >::at\(\)](#), [std::map< _Key, _Tp, _Compare, _Alloc >::insert_or_assign\(\)](#), [std::map< _Key, _Tp, _Compare, _Alloc >::operator\[\]\(\)](#), and [std::map< _Key, _Tp, _Compare, _Alloc >::try_emplace\(\)](#).

lower_bound() [1/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
template<typename _Kt >
auto std::map< _Key, _Tp, _Compare, _Alloc >::lower_bound (
    const _Kt & __x ) -> decltype(iterator(_M_t._M_lower_bound_tr(__x))) [inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

<code>__k</code>	Key of (key, value) pair to be located.
<code>__x</code>	

Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

lower_bound() [2/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
template<typename _Kt >
auto std::map< _Key, _Tp, _Compare, _Alloc >::lower_bound (
    const _Kt & __x ) const -> decltype(const_iterator(_M_t._M_lower_bound_tr(__x)))
[inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

	Key of (key, value) pair to be located.
	

Returns

Read-only (constant) iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

lower_bound() [3/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::map< _Key, _Tp, _Compare, _Alloc >::lower_bound (
    const key_type & __x ) [inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

	Key of (key, value) pair to be located.
	

Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists. Referenced by [std::map< _Key, _Tp, _Compare, _Alloc >::at\(\)](#), [std::map< _Key, _Tp, _Compare, _Alloc >::insert_or_assign\(\)](#), [std::map< _Key, _Tp, _Compare, _Alloc >::operator\[\]\(\)](#), and [std::map< _Key, _Tp, _Compare, _Alloc >::try_emplace\(\)](#).

lower_bound() [4/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::map< _Key, _Tp, _Compare, _Alloc >::lower_bound (
    const key_type & __x ) const [inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

	Key of (key, value) pair to be located.
	

Returns

Read-only (constant) iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

max_size()

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
size_type std::map<_Key, _Tp, _Compare, _Alloc>::max_size ( ) const [inline], [noexcept]
```

Returns the maximum size of the map.

operator=() [1/3]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
map & std::map<_Key, _Tp, _Compare, _Alloc>::operator= (
    const map<_Key, _Tp, _Compare, _Alloc> & ) [default]
```

Map assignment operator.

Whether the allocator is copied depends on the allocator traits.

operator=() [2/3]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
map & std::map<_Key, _Tp, _Compare, _Alloc>::operator= (
    initializer_list<value_type> __l ) [inline]
```

Map list assignment operator.

Parameters

↵	An initializer_list.
_↵	
↵	
_↵	
/	

This function fills a map with copies of the elements in the initializer list __l.

Note that the assignment completely changes the map and that the resulting map's size is the same as the number of elements assigned.

operator=() [3/3]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
map & std::map<_Key, _Tp, _Compare, _Alloc>::operator= (
    map<_Key, _Tp, _Compare, _Alloc> && ) [default]
```

Move assignment operator.

operator[]()

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
```

```
std::allocator<std::pair<const _Key, _Tp> >>
mapped_type & std::map< _Key, _Tp, _Compare, _Alloc >::operator[] (
    const key_type & __k ) [inline]
```

Subscript (`[]`) access to map data.

Parameters

<code>__k</code>	The key for which data should be retrieved.
------------------	---------------------------------------------

Returns

A reference to the data of the (key,data) pair.

Allows for easy lookup with the subscript (`[]`) operator. Returns data associated with the key specified in subscript. If the key does not exist, a pair with that key is created using default values, which is then returned.

Lookup requires logarithmic time.

References `std::map< _Key, _Tp, _Compare, _Alloc >::end()`, `std::map< _Key, _Tp, _Compare, _Alloc >::insert()`, `std::map< _Key, _Tp, _Compare, _Alloc >::key_comp()`, `std::map< _Key, _Tp, _Compare, _Alloc >::lower_bound()`, and `std::piecewise_construct`.

`rbegin()` [1/2]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_reverse_iterator std::map< _Key, _Tp, _Compare, _Alloc >::rbegin ( ) const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last pair in the map. Iteration is done in descending order according to the keys.

`rbegin()` [2/2]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
reverse_iterator std::map< _Key, _Tp, _Compare, _Alloc >::rbegin ( ) [inline], [noexcept]
```

Returns a read/write reverse iterator that points to the last pair in the map. Iteration is done in descending order according to the keys.

`rend()` [1/2]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_reverse_iterator std::map< _Key, _Tp, _Compare, _Alloc >::rend ( ) const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first pair in the map. Iteration is done in descending order according to the keys.

`rend()` [2/2]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
reverse_iterator std::map< _Key, _Tp, _Compare, _Alloc >::rend ( ) [inline], [noexcept]
```

Returns a read/write reverse iterator that points to one before the first pair in the map. Iteration is done in descending order according to the keys.

size()

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
size_type std::map<_Key, _Tp, _Compare, _Alloc>::size ( ) const [inline], [noexcept]
```

Returns the size of the map.

swap()

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
void std::map<_Key, _Tp, _Compare, _Alloc>::swap (
    map<_Key, _Tp, _Compare, _Alloc> & __x ) [inline], [noexcept]
```

Swaps data with another map.

Parameters

<code>__x</code>	A map of the same element and allocator types.
------------------	------------------------------------------------

This exchanges the elements between two maps in constant time. (It is only swapping a pointer, an integer, and an instance of the `Compare` type (which itself is often stateless and empty), so it should be quite fast.) Note that the global `std::swap()` function is specialized such that `std::swap(m1,m2)` will feed to this function.

Whether the allocators are swapped depends on the allocator traits.

try_emplace() [1/2]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename... _Args>
pair< iterator, bool > std::map<_Key, _Tp, _Compare, _Alloc>::try_emplace (
    const key_type & __k,
    _Args &&... __args ) [inline]
```

Attempts to build and insert a `std::pair` into the map.

Parameters

<code>__k</code>	Key to use for finding a possibly existing pair in the map.
<code>__args</code>	Arguments used to generate the .second for a new pair instance.

Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to build and insert a (key, value) pair into the map. A map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the map. If a pair is not inserted, this function has no effect.

Insertion requires logarithmic time.

References `std::map<_Key, _Tp, _Compare, _Alloc>::emplace_hint()`, `std::map<_Key, _Tp, _Compare, _Alloc>::end()`, `std::forward_as_tuple()`, `std::map<_Key, _Tp, _Compare, _Alloc>::key_comp()`, `std::map<_Key, _Tp, _Compare, _Alloc>::lower_bound` and `std::piecewise_construct`.

try_emplace() [2/2]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename... _Args>
iterator std::map< _Key, _Tp, _Compare, _Alloc >::try_emplace (
    const_iterator __hint,
    const key_type & __k,
    _Args &&... __args ) [inline]
```

Attempts to build and insert a `std::pair` into the map.

Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__k</code>	Key to use for finding a possibly existing pair in the map.
<code>__args</code>	Arguments used to generate the .second for a new pair instance.

Returns

An iterator that points to the element with key of the `std::pair` built from `__args` (may or may not be that `std::pair`).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `try_emplace()` does. However, if insertion did not take place, this function has no effect. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.↔associative.insert_hints for more on *hinting*.

Insertion requires logarithmic time (if the hint is not taken).

References `std::map< _Key, _Tp, _Compare, _Alloc >::emplace_hint()`, `std::forward_as_tuple()`, and `std::piecewise_construct`.

upper_bound() [1/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Kt >
auto std::map< _Key, _Tp, _Compare, _Alloc >::upper_bound (
    const _Kt & __x ) -> decltype(iterator(_M.t._M_upper_bound_tr(__x))) [inline]
```

Finds the end of a subsequence matching given key.

Parameters

<code>↔ __x</code>	Key of (key, value) pair to be located.
------------------------	-----------------------------------------

Returns

Iterator pointing to the first element greater than key, or `end()`.

upper_bound() [2/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Kt >
auto std::map< _Key, _Tp, _Compare, _Alloc >::upper_bound (
```

```
const _Kt & __x ) const -> decltype(const_iterator(_M_t._M_upper_bound_tr(__x)))
[inline]
```

Finds the end of a subsequence matching given key.

Parameters

<code>__x</code>	Key of (key, value) pair to be located.
------------------	-----------------------------------------

Returns

Read-only (constant) iterator pointing to first iterator greater than key, or end().

upper_bound() [3/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::map< _Key, _Tp, _Compare, _Alloc >::upper_bound (
    const key_type & __x ) [inline]
```

Finds the end of a subsequence matching given key.

Parameters

<code>__x</code>	Key of (key, value) pair to be located.
------------------	-----------------------------------------

Returns

Iterator pointing to the first element greater than key, or end().

upper_bound() [4/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::map< _Key, _Tp, _Compare, _Alloc >::upper_bound (
    const key_type & __x ) const [inline]
```

Finds the end of a subsequence matching given key.

Parameters

<code>__x</code>	Key of (key, value) pair to be located.
------------------	-----------------------------------------

Returns

Read-only (constant) iterator pointing to first iterator greater than key, or end().

value_comp()

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
value_compare std::map< _Key, _Tp, _Compare, _Alloc >::value_comp ( ) const [inline]
```

Returns a value comparison object, built from the key comparison object out of which the map was constructed. The documentation for this class was generated from the following file:

- [stl_map.h](#)

5.683.1 Detailed Description

template<class _Tp>
class std::mask_array<_Tp>

Reference to selected subset of an array.

A mask_array is a reference to the actual elements of an array specified by a bitmask in the form of an array of bool. The way to get a mask_array is to call operator[](valarray<bool>) on a valarray. The returned mask_array then permits carrying operations out on the referenced subset of elements in the original valarray.

For example, if a mask_array is obtained using the array (false, true, false, true) as an argument, the mask array has two elements referring to array[1] and array[3] in the underlying array.

Parameters

<i>Tp</i>	Element type.
-----------	---------------

5.683.2 Member Function Documentation

operator%=()

```
template<class _Tp>
void std::mask_array<_Tp>::operator%= (
    const valarray<_Tp> & ) const
```

Modulo slice elements by corresponding elements of *v*.

operator&=()

```
template<class _Tp>
void std::mask_array<_Tp>::operator&= (
    const valarray<_Tp> & ) const
```

Logical and slice elements with corresponding elements of *v*.

operator*=()

```
template<class _Tp>
void std::mask_array<_Tp>::operator*= (
    const valarray<_Tp> & ) const
```

Multiply slice elements by corresponding elements of *v*.

operator+=()

```
template<class _Tp>
void std::mask_array<_Tp>::operator+= (
    const valarray<_Tp> & ) const
```

Add corresponding elements of *v* to slice elements.

operator-=()

```
template<class _Tp>
void std::mask_array<_Tp>::operator-= (
    const valarray<_Tp> & ) const
```

Subtract corresponding elements of *v* from slice elements.

operator/=()

```
template<class _Tp >
void std::mask_array< _Tp >::operator/= (
    const valarray< _Tp > & ) const
```

Divide slice elements by corresponding elements of *v*.

operator<<=()

```
template<class _Tp >
void std::mask_array< _Tp >::operator<<= (
    const valarray< _Tp > & ) const
```

Left shift slice elements by corresponding elements of *v*.

operator>>=()

```
template<class _Tp >
void std::mask_array< _Tp >::operator>>= (
    const valarray< _Tp > & ) const
```

Right shift slice elements by corresponding elements of *v*.

operator^=()

```
template<class _Tp >
void std::mask_array< _Tp >::operator^= (
    const valarray< _Tp > & ) const
```

Logical xor slice elements with corresponding elements of *v*.

operator" |= ()

```
template<class _Tp >
void std::mask_array< _Tp >::operator|= (
    const valarray< _Tp > & ) const
```

Logical or slice elements with corresponding elements of *v*.

5.685.1 Detailed Description

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >>
class std::match_results< _Bi_iter, _Alloc >
```

The results of a match or search operation.

A collection of character sequences representing the result of a regular expression match. Storage for the collection is allocated and freed as necessary by the member functions of class template `match_results`.

This class satisfies the Sequence requirements, with the exception that only the operations defined for a const-qualified Sequence are supported.

The `sub_match` object stored at index 0 represents sub-expression 0, i.e. the whole match. In this case the `sub_match` member `matched` is always true. The `sub_match` object stored at index `n` denotes what matched the marked sub-expression `n` within the matched expression. If the sub-expression `n` participated in a regular expression match then the `sub_match` member `matched` evaluates to true, and members `first` and `second` denote the range of characters `[first, second)` which formed that match. Otherwise `matched` is false, and members `first` and `second` point to the end of the sequence that was searched.

5.685.2 Constructor & Destructor Documentation

`match_results()` [1/4]

```
template<typename _Bi_iter , typename _Alloc = allocator<sub_match<_Bi_iter> >>
std::match_results< _Bi_iter, _Alloc >::match_results ( ) [inline]
```

Constructs a default `match_results` container.

Postcondition

`size()` returns 0 and `str()` returns an empty string.

`match_results()` [2/4]

```
template<typename _Bi_iter , typename _Alloc = allocator<sub_match<_Bi_iter> >>
std::match_results< _Bi_iter, _Alloc >::match_results (
    const _Alloc & __a ) [inline], [explicit], [noexcept]
```

Constructs a default `match_results` container.

Postcondition

`size()` returns 0 and `str()` returns an empty string.

`match_results()` [3/4]

```
template<typename _Bi_iter , typename _Alloc = allocator<sub_match<_Bi_iter> >>
std::match_results< _Bi_iter, _Alloc >::match_results (
    const match_results< _Bi_iter, _Alloc > & ) [default]
```

Copy constructs a `match_results`.

`match_results()` [4/4]

```
template<typename _Bi_iter , typename _Alloc = allocator<sub_match<_Bi_iter> >>
std::match_results< _Bi_iter, _Alloc >::match_results (
    match_results< _Bi_iter, _Alloc > && ) [default], [noexcept]
```

Move constructs a `match_results`.

~match_results()

```
template<typename _Bi_iter , typename _Alloc = allocator<sub_match<_Bi_iter> >>
std::match_results<_Bi_iter, _Alloc>::~~match_results ( ) [default]
```

Destroys a `match_results` object.

5.685.3 Member Function Documentation**begin()**

```
template<typename _Bi_iter , typename _Alloc = allocator<sub_match<_Bi_iter> >>
const_iterator std::match_results<_Bi_iter, _Alloc>::begin ( ) const [inline], [noexcept]
```

Gets an iterator to the start of the `sub_match` collection.

References `std::vector<_Tp, _Alloc>::begin()`.

Referenced by `std::match_results<_Bi_iter, _Alloc>::cbegin()`, and `std::operator==()`.

cbegin()

```
template<typename _Bi_iter , typename _Alloc = allocator<sub_match<_Bi_iter> >>
const_iterator std::match_results<_Bi_iter, _Alloc>::cbegin ( ) const [inline], [noexcept]
```

Gets an iterator to the start of the `sub_match` collection.

References `std::match_results<_Bi_iter, _Alloc>::begin()`.

cend()

```
template<typename _Bi_iter , typename _Alloc = allocator<sub_match<_Bi_iter> >>
const_iterator std::match_results<_Bi_iter, _Alloc>::cend ( ) const [inline], [noexcept]
```

Gets an iterator to one-past-the-end of the collection.

References `std::match_results<_Bi_iter, _Alloc>::end()`.

empty()

```
template<typename _Bi_iter , typename _Alloc = allocator<sub_match<_Bi_iter> >>
bool std::match_results<_Bi_iter, _Alloc>::empty ( ) const [inline], [noexcept]
```

Indicates if the `match_results` contains no results.

Return values

<i>true</i>	The <code>match_results</code> object is empty.
<i>false</i>	The <code>match_results</code> object is not empty.

References `std::vector<_Tp, _Alloc>::size()`.

Referenced by `std::operator==()`, `std::match_results<_Bi_iter, _Alloc>::prefix()`, and `std::match_results<_Bi_iter, _Alloc>::suffix()`.

end()

```
template<typename _Bi_iter , typename _Alloc = allocator<sub_match<_Bi_iter> >>
const_iterator std::match_results<_Bi_iter, _Alloc>::end ( ) const [inline], [noexcept]
```

Gets an iterator to one-past-the-end of the collection.

References `std::vector<_Tp, _Alloc>::empty()`, and `std::vector<_Tp, _Alloc>::end()`.

Referenced by `std::match_results<_Bi_iter, _Alloc>::cend()`, and `std::operator==()`.

format() [1/4]

```
template<typename _Bi_iter , typename _Alloc = allocator<sub_match<_Bi_iter> >>
template<typename _Out_iter , typename _St , typename _Sa >
```

```

_Out_iter std::match_results< _Bi_iter, _Alloc >::format (
    _Out_iter __out,
    const basic_string< char_type, _St, _Sa > & __fmt,
    match_flag_type __flags = regex_constants::format_default ) const [inline]

```

Precondition

ready() == true

References [std::basic_string< _CharT, _Traits, _Alloc >::data\(\)](#), [std::match_results< _Bi_iter, _Alloc >::format\(\)](#), and [std::basic_string< _CharT, _Traits, _Alloc >::size\(\)](#).

format() [2/4]

```

template<typename _Bi_iter , typename _Alloc = allocator<sub_match<_Bi_iter> >>
template<typename _Out_iter >
_Out_iter std::match_results< _Bi_iter, _Alloc >::format (
    _Out_iter __out,
    const char_type * __fmt_first,
    const char_type * __fmt_last,
    match_flag_type __flags = regex_constants::format_default ) const

```

Precondition

ready() == true

Referenced by [std::match_results< _Bi_iter, _Alloc >::format\(\)](#), [std::match_results< _Bi_iter, _Alloc >::format\(\)](#), and [std::match_results< _Bi_iter, _Alloc >::format\(\)](#).

format() [3/4]

```

template<typename _Bi_iter , typename _Alloc = allocator<sub_match<_Bi_iter> >>
template<typename _St , typename _Sa >
basic_string< char_type, _St, _Sa > std::match_results< _Bi_iter, _Alloc >::format (
    const basic_string< char_type, _St, _Sa > & __fmt,
    match_flag_type __flags = regex_constants::format_default ) const [inline]

```

Precondition

ready() == true

References [std::back_inserter\(\)](#), and [std::match_results< _Bi_iter, _Alloc >::format\(\)](#).

format() [4/4]

```

template<typename _Bi_iter , typename _Alloc = allocator<sub_match<_Bi_iter> >>
string_type std::match_results< _Bi_iter, _Alloc >::format (
    const char_type * __fmt,
    match_flag_type __flags = regex_constants::format_default ) const [inline]

```

Precondition

ready() == true

References [std::back_inserter\(\)](#), and [std::match_results< _Bi_iter, _Alloc >::format\(\)](#).

get_allocator()

```

template<typename _Bi_iter , typename _Alloc = allocator<sub_match<_Bi_iter> >>
allocator_type std::match_results< _Bi_iter, _Alloc >::get_allocator ( ) const [inline], [noexcept]
Gets a copy of the allocator.

```

References [std::vector< _Tp, _Alloc >::get_allocator\(\)](#).

length()

```
template<typename _Bi_iter , typename _Alloc = allocator<sub_match<_Bi_iter> >>
difference_type std::match_results< _Bi_iter, _Alloc >::length (
    size_type __sub = 0 ) const [inline]
```

Gets the length of the indicated submatch.

Parameters

<code>__sub</code>	indicates the submatch.
--------------------	-------------------------

Precondition

`ready() == true`

This function returns the length of the indicated submatch, or the length of the entire match if `__sub` is zero (the default).

max_size()

```
template<typename _Bi_iter , typename _Alloc = allocator<sub_match<_Bi_iter> >>
size_type std::match_results< _Bi_iter, _Alloc >::max_size ( ) const [inline], [noexcept]
```

Gets the number of matches and submatches.

The number of matches for a given regular expression will be either 0 if there was no match or `mark_count() + 1` if a match was successful. Some matches may be empty.

Returns

the number of matches found.

References `std::vector<_Tp, _Alloc>::max_size()`.

operator=() [1/2]

```
template<typename _Bi_iter , typename _Alloc = allocator<sub_match<_Bi_iter> >>
match_results & std::match_results< _Bi_iter, _Alloc >::operator= (
    const match_results< _Bi_iter, _Alloc > & ) [default]
```

Assigns rhs to *this.

operator=() [2/2]

```
template<typename _Bi_iter , typename _Alloc = allocator<sub_match<_Bi_iter> >>
match_results & std::match_results< _Bi_iter, _Alloc >::operator= (
    match_results< _Bi_iter, _Alloc > && ) [default]
```

Move-assigns rhs to *this.

operator[]()

```
template<typename _Bi_iter , typename _Alloc = allocator<sub_match<_Bi_iter> >>
const_reference std::match_results< _Bi_iter, _Alloc >::operator[] (
    size_type __sub ) const [inline]
```

Gets a `sub_match` reference for the match or submatch.

Parameters

<code>__sub</code>	indicates the submatch.
--------------------	-------------------------

Precondition

`ready() == true`

This function gets a reference to the indicated submatch, or the entire match if `__sub` is zero.

If `__sub >= size()` then this function returns a `sub_match` with a special value indicating no submatch.

References [std::vector<_Tp, _Alloc>::operator\[\]\(\)](#), [std::match_results<_Bi_iter, _Alloc>::ready\(\)](#), and [std::match_results<_Bi_iter, _](#)

position()

```
template<typename _Bi_iter , typename _Alloc = allocator<sub_match<_Bi_iter> >>
difference_type std::match_results<_Bi_iter, _Alloc>::position (
    size_type __sub = 0 ) const [inline]
```

Gets the offset of the beginning of the indicated submatch.

Parameters

<code>__sub</code>	indicates the submatch.
--------------------	-------------------------

Precondition

`ready() == true`

This function returns the offset from the beginning of the target sequence to the beginning of the submatch, unless the value of `__sub` is zero (the default), in which case this function returns the offset from the beginning of the target sequence to the beginning of the match.

References [std::distance\(\)](#).

prefix()

```
template<typename _Bi_iter , typename _Alloc = allocator<sub_match<_Bi_iter> >>
const_reference std::match_results<_Bi_iter, _Alloc>::prefix ( ) const [inline]
```

Gets a `sub_match` representing the match prefix.

Precondition

`ready() == true`

This function gets a reference to a `sub_match` object representing the part of the target range between the start of the target range and the start of the match.

References [std::match_results<_Bi_iter, _Alloc>::empty\(\)](#), and [std::match_results<_Bi_iter, _Alloc>::ready\(\)](#).

Referenced by [std::operator==\(\)](#).

ready()

```
template<typename _Bi_iter , typename _Alloc = allocator<sub_match<_Bi_iter> >>
bool std::match_results<_Bi_iter, _Alloc>::ready ( ) const [inline], [noexcept]
```

Indicates if the `match_results` is ready.

Return values

<code>true</code>	The object has a fully-established result state.
<code>false</code>	The object is not ready.

References [std::vector<_Tp, _Alloc>::empty\(\)](#).

Referenced by [std::operator==\(\)](#), [std::match_results<_Bi_iter, _Alloc>::operator\[\]\(\)](#), [std::match_results<_Bi_iter, _Alloc>::prefix\(\)](#),

and `std::match_results< _Bi_iter, _Alloc >::suffix()`.

size()

```
template<typename _Bi_iter , typename _Alloc = allocator<sub_match<_Bi_iter> >>
size_type std::match_results< _Bi_iter, _Alloc >::size ( ) const [inline], [noexcept]
```

Gets the number of matches and submatches.

The number of matches for a given regular expression will be either 0 if there was no match or `mark_count()` + 1 if a match was successful. Some matches may be empty.

Returns

the number of matches found.

References `std::vector< _Tp, _Alloc >::empty()`, and `std::vector< _Tp, _Alloc >::size()`.

Referenced by `std::operator==()`, and `std::match_results< _Bi_iter, _Alloc >::operator[]()`.

str()

```
template<typename _Bi_iter , typename _Alloc = allocator<sub_match<_Bi_iter> >>
string_type std::match_results< _Bi_iter, _Alloc >::str (
    size_type __sub = 0 ) const [inline]
```

Gets the match or submatch converted to a string type.

Parameters

<code>__sub</code>	indicates the submatch.
--------------------	-------------------------

Precondition

`ready() == true`

This function gets the submatch (or match, if `__sub` is zero) extracted from the target range and converted to the associated string type.

suffix()

```
template<typename _Bi_iter , typename _Alloc = allocator<sub_match<_Bi_iter> >>
const_reference std::match_results< _Bi_iter, _Alloc >::suffix ( ) const [inline]
```

Gets a `sub_match` representing the match suffix.

Precondition

`ready() == true`

This function gets a reference to a `sub_match` object representing the part of the target range between the end of the match and the end of the target range.

References `std::match_results< _Bi_iter, _Alloc >::empty()`, and `std::match_results< _Bi_iter, _Alloc >::ready()`.

Referenced by `std::operator==()`.

swap()

```
template<typename _Bi_iter , typename _Alloc = allocator<sub_match<_Bi_iter> >>
void std::match_results< _Bi_iter, _Alloc >::swap (
    match_results< _Bi_iter, _Alloc > & __that ) [inline], [noexcept]
```

Swaps the contents of two `match_results`.

References `std::swap()`, `std::match_results< _Bi_iter, _Alloc >::swap()`, and `std::vector< _Tp, _Alloc >::swap()`.

Referenced by [std::match_results< _Bi_iter, _Alloc >::swap\(\)](#).

5.693.1 Detailed Description

```
template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f>
class std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f
>
```

A generalized feedback shift register discrete random number generator.

This algorithm avoids multiplication and division and is designed to be friendly to a pipelined architecture. If the parameters are chosen correctly, this generator will produce numbers with a very long period and fairly good apparent entropy, although still not cryptographically strong.

The best way to use this generator is with the predefined `mt19937` class.

This algorithm was originally invented by Makoto Matsumoto and Takuji Nishimura.

Template Parameters

<code>__w</code>	Word size, the number of bits in each element of the state vector.
<code>__n</code>	The degree of recursion.
<code>__m</code>	The period parameter.
<code>__r</code>	The separation point bit index.
<code>__a</code>	The last row of the twist matrix.
<code>__u</code>	The first right-shift tempering matrix parameter.
<code>__d</code>	The first right-shift tempering matrix mask.
<code>__s</code>	The first left-shift tempering matrix parameter.
<code>__b</code>	The first left-shift tempering matrix mask.
<code>__t</code>	The second left-shift tempering matrix parameter.
<code>__c</code>	The second left-shift tempering matrix mask.
<code>__l</code>	The second right-shift tempering matrix parameter.
<code>__f</code>	Initialization multiplier.

5.693.2 Member Typedef Documentation

`result_type`

```
template<typename _UIntType , size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a,
size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, __f>
_UIntType
```

```
typedef _UIntType std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f >::result_type
```

The type of the generated random value.

5.693.3 Constructor & Destructor Documentation

mersenne_twister_engine()

```
template<typename _UIntType , size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a,
size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _↵
UIntType __f>
template<typename _Sseq , typename = _If_seed_seq<_Sseq>>
std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, ↵
__l, __f >::mersenne_twister_engine (
    _Sseq & __q ) [inline], [explicit]
```

Constructs a mersenne_twister_engine random number generator engine seeded from the seed sequence __q.

Parameters

<code>__q</code>	the seed sequence.
------------------	--------------------

5.693.4 Member Function Documentation

discard()

```
template<typename _UIntType , size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a,
size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _↵
UIntType __f>
void std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, ↵
__c, __l, __f >::discard (
    unsigned long long __z )
```

Discard a sequence of random numbers.

max()

```
template<typename _UIntType , size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a,
size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _↵
UIntType __f>
static constexpr result_type std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, ↵
__u, __d, __s, __b, __t, __c, __l, __f >::max ( ) [inline], [static], [constexpr]
```

Gets the largest possible value in the output range.

min()

```
template<typename _UIntType , size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a,
size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _↵
UIntType __f>
static constexpr result_type std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, ↵
__u, __d, __s, __b, __t, __c, __l, __f >::min ( ) [inline], [static], [constexpr]
```

Gets the smallest possible value in the output range.

5.693.5 Friends And Related Symbol Documentation

operator<<

```
template<typename _UIntType , size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a,
size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _↵
UIntType __f>
```

```
template<typename _UIntType1 , size_t __w1, size_t __n1, size_t __m1, size_t __r1, _UIntType1 __a1, size_t __u1, _UIntType1 __d1, size_t __s1, _UIntType1 __b1, size_t __t1, _UIntType1 __c1, size_t __l1, _UIntType1 __f1, typename _CharT , typename _Traits >
```

```
std::basic_ostream< _CharT, _Traits > & operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::mersenne_twister_engine< _UIntType1, __w1, __n1, __m1, __r1, __a1, __u1, __d1, __s1, __b1, __t1, __c1, __l1, __f1 > & __x ) [friend]
```

Inserts the current state of a % mersenne_twister_engine random number generator engine __x into the output stream __os.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A % mersenne_twister_engine random number generator engine.

Returns

The output stream with the state of __x inserted or in an error state.

operator==

```
template<typename _UIntType , size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f>
```

```
bool operator== (
    const mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f > & __lhs,
    const mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f > & __rhs ) [friend]
```

Compares two % mersenne_twister_engine random number generator objects of the same type for equality.

Parameters

<code>__lhs</code>	A % mersenne_twister_engine random number generator object.
<code>__rhs</code>	Another % mersenne_twister_engine random number generator object.

Returns

true if the infinite sequences of generated values would be equal, false otherwise.

operator>>

```
template<typename _UIntType , size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f>
```

```
template<typename _UIntType1 , size_t __w1, size_t __n1, size_t __m1, size_t __r1, _UIntType1 __a1, size_t __u1, _UIntType1 __d1, size_t __s1, _UIntType1 __b1, size_t __t1, _UIntType1 __c1, size_t __l1, _UIntType1 __f1, typename _CharT , typename _Traits >
```

```
std::basic_istream< _CharT, _Traits > & operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::mersenne_twister_engine< _UIntType1, __w1, __n1, __m1, __r1, __a1, __u1, __d1, __s1, __b1, __t1, __c1, __l1, __f1 > & __x ) [friend]
```

Extracts the current state of a % mersenne_twister_engine random number generator engine `__x` from the input stream `__is`.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A % mersenne_twister_engine random number generator engine.

Returns

The input stream with the state of `__x` extracted or in an error state.

5.694.1 Detailed Description

template<typename _CharT>
class std::messages<_CharT>

Primary class template messages.

This facet encapsulates the code to retrieve messages from message catalogs. The only thing defined by the standard for this facet is the interface. All underlying functionality is implementation-defined.

This library currently implements 3 versions of the message facet. The first version (gnu) is a wrapper around gettext, provided by libintl. The second version (ieee) is a wrapper around catgets. The final version (default) does no actual translation. These implementations are only provided for char and wchar_t instantiations.

The messages template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the messages facet.

5.694.2 Member Typedef Documentation

char_type

```
template<typename _CharT >
typedef _CharT std::messages< _CharT >::char_type
Public typedefs.
```

string_type

```
template<typename _CharT >
typedef basic_string<_CharT> std::messages< _CharT >::string_type
Public typedefs.
```

5.694.3 Constructor & Destructor Documentation

messages() [1/2]

```
template<typename _CharT >
std::messages< _CharT >::messages (
    size_t __refs = 0 ) [explicit]
```

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

<code>__refs</code>	Passed to the base facet class.
---------------------	---------------------------------

messages() [2/2]

```
template<typename _CharT >
std::messages< _CharT >::messages (
    __c_locale __cloc,
    const char * __s,
    size_t __refs = 0 ) [explicit]
```

Internal constructor. Not for general use.

This is a constructor for use by the library itself to set up new locales.

Parameters

<code>__cloc</code>	The C locale.
<code>__s</code>	The name of a locale.
<code>__refs</code>	Refcount to pass to the base class.

~messages()

```
template<typename _CharT >
std::messages< _CharT >::~~messages [protected], [virtual]
Destructor.
```

5.694.4 Member Function Documentation

do_get()

```
string std::messages< char >::do_get (
    catalog ,
    int ,
    int ,
    const string & ) const [protected]
```

Specializations for required instantiations.

5.703.1 Detailed Description

```
template<typename _CharT, typename _InIter>
class std::money_get< _CharT, _InIter >
```

Primary class template `money_get`.

This facet encapsulates the code to parse and return a monetary amount from a string.

The `money_get` template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the `money_get` facet.

5.703.2 Member Typedef Documentation

`char_type`

```
template<typename _CharT , typename _InIter >
typedef _CharT std::money_get< _CharT, _InIter >::char_type
Public typedefs.
```

`iter_type`

```
template<typename _CharT , typename _InIter >
typedef _InIter std::money_get< _CharT, _InIter >::iter_type
Public typedefs.
```

`string_type`

```
template<typename _CharT , typename _InIter >
typedef basic_string<_CharT> std::money_get< _CharT, _InIter >::string_type
Public typedefs.
```

5.703.3 Constructor & Destructor Documentation

`money_get()`

```
template<typename _CharT , typename _InIter >
std::money_get< _CharT, _InIter >::money_get (
    size_t __refs = 0 ) [inline], [explicit]
```

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

<code>__refs</code>	Passed to the base facet class.
---------------------	---------------------------------

~money_get()

```
template<typename _CharT , typename _InIter >
virtual std::money_get< _CharT, _InIter >::~~money_get ( ) [inline], [protected], [virtual]
Destructor.
```

5.703.4 Member Function Documentation**do_get()** [1/2]

```
template<typename _CharT , typename _InIter >
_InIter std::money_get< _CharT, _InIter >::do_get (
    iter_type __s,
    iter_type __end,
    bool __intl,
    ios_base & __io,
    ios_base::iostate & __err,
    long double & __units ) const [protected], [virtual]
```

Read and parse a monetary value.

This function reads and parses characters representing a monetary value. This function is a hook for derived classes to change the value returned.

See also

[get\(\)](#) for details.

References [std::basic_string<_CharT, _Traits, _Alloc>::c_str\(\)](#).

Referenced by [std::money_get<_CharT, _InIter>::get\(\)](#), and [std::money_get<_CharT, _InIter>::get\(\)](#).

do_get() [2/2]

```
template<typename _CharT , typename _InIter >
_InIter std::money_get< _CharT, _InIter >::do_get (
    iter_type __s,
    iter_type __end,
    bool __intl,
    ios_base & __io,
    ios_base::iostate & __err,
    string_type & __digits ) const [protected], [virtual]
```

Read and parse a monetary value.

This function reads and parses characters representing a monetary value. This function is a hook for derived classes to change the value returned.

See also

[get\(\)](#) for details.

References [std::ios_base::M_getloc\(\)](#), [std::basic_string<_CharT, _Traits, _Alloc>::resize\(\)](#), and [std::__ctype_abstract_base<_CharT](#)

get() [1/2]

```
template<typename _CharT , typename _InIter >
iter_type std::money_get< _CharT, _InIter >::get (
    iter_type __s,
    iter_type __end,
    bool __intl,
    ios_base & __io,
```

```
ios_base::iostate & __err,
long double & __units ) const [inline]
```

Read and parse a monetary value.

This function reads characters from `__s`, interprets them as a monetary value according to `money_punct` and `ctype` facets retrieved from `io.getloc()`, and returns the result in `units` as an integral value `money_punct::frac_digits()` * the actual amount. For example, the string \$10.01 in a US locale would store 1001 in `units`.

Any characters not part of a valid money amount are not consumed.

If a money value cannot be parsed from the input stream, sets `err=(err|io.failbit)`. If the stream is consumed before finishing parsing, sets `err=(err|io.failbit|io.eofbit)`. `units` is unchanged if parsing fails.

This function works by returning the result of `do_get()`.

Parameters

<code>__s</code>	Start of characters to parse.
<code>__end</code>	End of characters to parse.
<code>__intl</code>	Parameter to use <code>_facet<money_punct<CharT,intl>></code> .
<code>__io</code>	Source of facets and io state.
<code>__err</code>	Error field to set if parsing fails.
<code>__units</code>	Place to store result of parsing.

Returns

Iterator referencing first character beyond valid money amount.

References `std::money_get<_CharT, _InIter>::do_get()`.

get() [2/2]

```
template<typename _CharT , typename _InIter >
iter_type std::money_get< _CharT, _InIter >::get (
    iter_type __s,
    iter_type __end,
    bool __intl,
    ios_base & __io,
    ios_base::iostate & __err,
    string_type & __digits ) const [inline]
```

Read and parse a monetary value.

This function reads characters from `__s`, interprets them as a monetary value according to `money_punct` and `ctype` facets retrieved from `io.getloc()`, and returns the result in `digits`. For example, the string \$10.01 in a US locale would store 1001 in `digits`.

Any characters not part of a valid money amount are not consumed.

If a money value cannot be parsed from the input stream, sets `err=(err|io.failbit)`. If the stream is consumed before finishing parsing, sets `err=(err|io.failbit|io.eofbit)`.

This function works by returning the result of `do_get()`.

Parameters

<code>__s</code>	Start of characters to parse.
<code>__end</code>	End of characters to parse.
<code>__intl</code>	Parameter to use <code>_facet<money_punct<CharT,intl>></code> .
<code>__io</code>	Source of facets and io state.
<code>__err</code>	Error field to set if parsing fails.
<code>__digits</code>	Place to store result of parsing.

Returns

Iterator referencing first character beyond valid money amount.

References [std::money_get< _CharT, _InIter >::do_get\(\)](#).

5.704.1 Detailed Description

```
template<typename _CharT, typename _OutIter>
class std::money_put< _CharT, _OutIter >
```

Primary class template `money_put`.

This facet encapsulates the code to format and output a monetary amount.

The `money_put` template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the `money_put` facet.

5.704.2 Member Typedef Documentation

`char_type`

```
template<typename _CharT , typename _OutIter >
typedef _CharT std::money_put< _CharT, _OutIter >::char_type
Public typedefs.
```

`iter_type`

```
template<typename _CharT , typename _OutIter >
typedef _OutIter std::money_put< _CharT, _OutIter >::iter_type
Public typedefs.
```

`string_type`

```
template<typename _CharT , typename _OutIter >
typedef basic_string<_CharT> std::money_put< _CharT, _OutIter >::string_type
Public typedefs.
```

5.704.3 Constructor & Destructor Documentation

`money_put()`

```
template<typename _CharT , typename _OutIter >
std::money_put< _CharT, _OutIter >::money_put (
    size_t __refs = 0 ) [inline], [explicit]
```

Constructor performs initialization.
This is the constructor provided by the standard.

Parameters

<code>__refs</code>	Passed to the base facet class.
---------------------	---------------------------------

~money_put()

```
template<typename _CharT , typename _OutIter >
virtual std::money_put< _CharT, _OutIter >::~money_put ( ) [inline], [protected], [virtual]
Destructor.
```

5.704.4 Member Function Documentation

do_put() [1/2]

```
template<typename _CharT , typename _OutIter >
_OutIter std::money_put< _CharT, _OutIter >::do_put (
    iter_type __s,
    bool __intl,
    ios_base & __io,
    char_type __fill,
    const string_type & __digits ) const [protected], [virtual]
```

Format and output a monetary value.

This function formats *digits* as a monetary value according to `moneypunct` and `ctype` facets retrieved from `io.getloc()`, and writes the resulting characters to `__s`. For example, the string `1001` in a US locale would write `$10.01` to `__s`. This function is a hook for derived classes to change the value returned.

See also

`put()`.

Parameters

<code>__s</code>	The stream to write to.
<code>__intl</code>	Parameter to use <code>_facet<moneypunct<CharT,intl>></code> .
<code>__io</code>	Source of facets and io state.
<code>__fill</code>	<code>char_type</code> to use for padding.
<code>__digits</code>	Place to store result of parsing.

Returns

Iterator after writing.

do_put() [2/2]

```
template<typename _CharT , typename _OutIter >
_OutIter std::money_put< _CharT, _OutIter >::do_put (
    iter_type __s,
    bool __intl,
    ios_base & __io,
```

```
char_type __fill,
long double __units ) const [protected], [virtual]
```

Format and output a monetary value.

This function formats *units* as a monetary value according to `money_punct` and `ctype` facets retrieved from `io.getloc()`, and writes the resulting characters to `__s`. For example, the value 1001 in a US locale would write \$10.01 to `__s`.

This function is a hook for derived classes to change the value returned.

See also

`put()`.

Parameters

<code>__s</code>	The stream to write to.
<code>__intl</code>	Parameter to use <code>_facet<money_punct<CharT,intl> ></code> .
<code>__io</code>	Source of facets and io state.
<code>__fill</code>	<code>char_type</code> to use for padding.
<code>__units</code>	Place to store result of parsing.

Returns

Iterator after writing.

References `std::ios_base::getloc()`, and `std::__ctype_abstract_base<_CharT >::widen()`.

Referenced by `std::money_put<_CharT, _OutIter >::put()`, and `std::money_put<_CharT, _OutIter >::put()`.

`put()` [1/2]

```
template<typename _CharT , typename _OutIter >
iter_type std::money_put< _CharT, _OutIter >::put (
    iter_type __s,
    bool __intl,
    ios_base & __io,
    char_type __fill,
    const string_type & __digits ) const [inline]
```

Format and output a monetary value.

This function formats *digits* as a monetary value according to `money_punct` and `ctype` facets retrieved from `io.getloc()`, and writes the resulting characters to `__s`. For example, the string 1001 in a US locale would write \$10.01 to `__s`.

This function works by returning the result of `do_put()`.

Parameters

<code>__s</code>	The stream to write to.
<code>__intl</code>	Parameter to use <code>_facet<money_punct<CharT,intl> ></code> .
<code>__io</code>	Source of facets and io state.
<code>__fill</code>	<code>char_type</code> to use for padding.
<code>__digits</code>	Place to store result of parsing.

Returns

Iterator after writing.

References `std::money_put<_CharT, _OutIter >::do_put()`.

put() [2/2]

```
template<typename _CharT , typename _OutIter >
iter_type std::money_put< _CharT, _OutIter >::put (
    iter_type __s,
    bool __intl,
    ios_base & __io,
    char_type __fill,
    long double __units ) const [inline]
```

Format and output a monetary value.

This function formats *units* as a monetary value according to moneypunct and ctype facets retrieved from io.getloc(), and writes the resulting characters to __s. For example, the value 1001 in a US locale would write \$10.01 to __s.

This function works by returning the result of do_put().

Parameters

<code>__s</code>	The stream to write to.
<code>__intl</code>	Parameter to use <code>_facet<moneypunct<CharT,intl>></code> .
<code>__io</code>	Source of facets and io state.
<code>__fill</code>	<code>char_type</code> to use for padding.
<code>__units</code>	Place to store result of parsing.

Returns

Iterator after writing.

5.705.1 Detailed Description

```
template<typename _CharT, bool _Intl>
class std::moneypunct<_CharT, _Intl>
```

Primary class template moneypunct.

This facet encapsulates the punctuation, grouping and other formatting features of money amount string representations.

5.705.2 Member Typedef Documentation

char_type

```
template<typename _CharT, bool _Intl>
typedef _CharT std::moneypunct<_CharT, _Intl>::char_type
```

Public typedefs.

string_type

```
template<typename _CharT, bool _Intl>
typedef basic\_string<_CharT> std::moneypunct<_CharT, _Intl>::string_type
```

Public typedefs.

5.705.3 Constructor & Destructor Documentation

moneypunct() [1/3]

```
template<typename _CharT , bool _Intl>
std::moneypunct< _CharT, _Intl >::moneypunct (
    size_t __refs = 0 ) [inline], [explicit]
```

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

<code>__refs</code>	Passed to the base facet class.
---------------------	---------------------------------

moneypunct() [2/3]

```
template<typename _CharT , bool _Intl>
std::moneypunct< _CharT, _Intl >::moneypunct (
    __cache_type * __cache,
    size_t __refs = 0 ) [inline], [explicit]
```

Constructor performs initialization.

This is an internal constructor.

Parameters

<code>__cache</code>	Cache for optimization.
<code>__refs</code>	Passed to the base facet class.

moneypunct() [3/3]

```
template<typename _CharT , bool _Intl>
std::moneypunct< _CharT, _Intl >::moneypunct (
    __c_locale __cloc,
    const char * __s,
    size_t __refs = 0 ) [inline], [explicit]
```

Internal constructor. Not for general use.

This is a constructor for use by the library itself to set up new locales.

Parameters

<code>__cloc</code>	The C locale.
<code>__s</code>	The name of a locale.
<code>__refs</code>	Passed to the base facet class.

~moneypunct()

```
template<typename _CharT , bool _Intl>
virtual std::moneypunct< _CharT, _Intl >::~~moneypunct ( ) [protected], [virtual]
```

Destructor.

5.705.4 Member Function Documentation

curr_symbol()

```
template<typename _CharT , bool _Intl>
```

```
string_type std::moneypunct< _CharT, _Intl >::curr_symbol ( ) const [inline]
```

Return currency symbol string.

This function returns a string_type to use as a currency symbol. It does so by returning returning moneypunct<char_↵_type>::do_curr_symbol().

Returns

string_type representing a currency symbol.

References [std::moneypunct< _CharT, _Intl >::do_curr_symbol\(\)](#).

decimal_point()

```
template<typename _CharT , bool _Intl>
```

```
char_type std::moneypunct< _CharT, _Intl >::decimal_point ( ) const [inline]
```

Return decimal point character.

This function returns a char_type to use as a decimal point. It does so by returning returning moneypunct<char_↵type>::do_decimal_point().

Returns

char_type representing a decimal point.

References [std::moneypunct< _CharT, _Intl >::do_decimal_point\(\)](#).

do_curr_symbol()

```
template<typename _CharT , bool _Intl>
```

```
virtual string_type std::moneypunct< _CharT, _Intl >::do_curr_symbol ( ) const [inline], [protected], [virtual]
```

Return currency symbol string.

This function returns a string_type to use as a currency symbol. This function is a hook for derived classes to change the value returned.

See also

[curr_symbol\(\)](#) for details.

Returns

string_type representing a currency symbol.

Referenced by [std::moneypunct< _CharT, _Intl >::curr_symbol\(\)](#).

do_decimal_point()

```
template<typename _CharT , bool _Intl>
```

```
virtual char_type std::moneypunct< _CharT, _Intl >::do_decimal_point ( ) const [inline], [protected], [virtual]
```

Return decimal point character.

Returns a char_type to use as a decimal point. This function is a hook for derived classes to change the value returned.

Returns

char_type representing a decimal point.

Referenced by [std::moneypunct< _CharT, _Intl >::decimal_point\(\)](#).

do_frac_digits()

```
template<typename _CharT , bool _Intl>
virtual int std::moneypunct< _CharT, _Intl >::do_frac_digits ( ) const [inline], [protected],
[virtual]
```

Return number of digits in fraction.

This function returns the exact number of digits that make up the fractional part of a money amount. This function is a hook for derived classes to change the value returned.

See also

[frac_digits\(\)](#) for details.

Returns

Number of digits in amount fraction.

Referenced by [std::moneypunct< _CharT, _Intl >::frac_digits\(\)](#).

do_grouping()

```
template<typename _CharT , bool _Intl>
virtual string std::moneypunct< _CharT, _Intl >::do_grouping ( ) const [inline], [protected],
[virtual]
```

Return grouping specification.

Returns a string representing groupings for the integer part of a number. This function is a hook for derived classes to change the value returned.

See also

[grouping\(\)](#) for details.

Returns

String representing grouping specification.

Referenced by [std::moneypunct< _CharT, _Intl >::grouping\(\)](#).

do_neg_format()

```
template<typename _CharT , bool _Intl>
virtual pattern std::moneypunct< _CharT, _Intl >::do_neg_format ( ) const [inline], [protected],
[virtual]
```

Return pattern for money values.

This function returns a pattern describing the formatting of a negative valued money amount. This function is a hook for derived classes to change the value returned.

See also

[neg_format\(\)](#) for details.

Returns

Pattern for money values.

Referenced by [std::moneypunct< _CharT, _Intl >::neg_format\(\)](#).

do_negative_sign()

```
template<typename _CharT , bool _Intl>
virtual string\_type std::moneypunct< _CharT, _Intl >::do_negative_sign ( ) const [inline], [protected],
[virtual]
```

Return negative sign string.

This function returns a `string_type` to use as a sign for negative amounts. This function is a hook for derived classes to change the value returned.

See also

`negative_sign()` for details.

Returns

string_type representing a negative sign.

Referenced by [std::moneypunct<_CharT, _Intl>::negative_sign\(\)](#).

do_pos_format()

```
template<typename _CharT , bool _Intl>
virtual pattern std::moneypunct< _CharT, _Intl >::do_pos_format ( ) const [inline], [protected],
[virtual]
```

Return pattern for money values.

This function returns a pattern describing the formatting of a positive valued money amount. This function is a hook for derived classes to change the value returned.

See also

`pos_format()` for details.

Returns

Pattern for money values.

Referenced by [std::moneypunct<_CharT, _Intl>::pos_format\(\)](#).

do_positive_sign()

```
template<typename _CharT , bool _Intl>
virtual string\_type std::moneypunct< _CharT, _Intl >::do_positive_sign ( ) const [inline], [protected],
[virtual]
```

Return positive sign string.

This function returns a `string_type` to use as a sign for positive amounts. This function is a hook for derived classes to change the value returned.

See also

`positive_sign()` for details.

Returns

string_type representing a positive sign.

Referenced by [std::moneypunct<_CharT, _Intl>::positive_sign\(\)](#).

do_thousands_sep()

```
template<typename _CharT , bool _Intl>
virtual char_type std::moneypunct< _CharT, _Intl >::do_thousands_sep ( ) const [inline], [protected],
[virtual]
```

Return thousands separator character.

Returns a `char_type` to use as a thousands separator. This function is a hook for derived classes to change the value returned.

Returns

char_type representing a thousands separator.

Referenced by `std::moneypunct< _CharT, _Intl >::thousands_sep()`.

frac_digits()

```
template<typename _CharT , bool _Intl>
int std::moneypunct< _CharT, _Intl >::frac_digits ( ) const [inline]
```

Return number of digits in fraction.

This function returns the exact number of digits that make up the fractional part of a money amount. It does so by returning `std::moneypunct<char_type>::do_frac_digits()`.

The fractional part of a money amount is optional. But if it is present, there must be `frac_digits()` digits.

Returns

Number of digits in amount fraction.

References `std::moneypunct< _CharT, _Intl >::do_frac_digits()`.

grouping()

```
template<typename _CharT , bool _Intl>
string std::moneypunct< _CharT, _Intl >::grouping ( ) const [inline]
```

Return grouping specification.

This function returns a string representing groupings for the integer part of an amount. Groupings indicate where thousands separators should be inserted.

Each char in the return string is interpreted as an integer rather than a character. These numbers represent the number of digits in a group. The first char in the string represents the number of digits in the least significant group. If a char is negative, it indicates an unlimited number of digits for the group. If more chars from the string are required to group a number, the last char is used repeatedly.

For example, if the `grouping()` returns `\003\002` and is applied to the number 123456789, this corresponds to 12,34,56,789. Note that if the string was 32, this would put more than 50 digits into the least significant group if the character set is ASCII.

The string is returned by calling `std::moneypunct<char_type>::do_grouping()`.

Returns

string representing grouping specification.

References `std::moneypunct< _CharT, _Intl >::do_grouping()`.

neg_format()

```
template<typename _CharT , bool _Intl>
pattern std::moneypunct< _CharT, _Intl >::neg_format ( ) const [inline]
```

Return pattern for money values.

This function returns a pattern describing the formatting of a positive or negative valued money amount. It does so by returning `std::moneypunct<char_type>::do_pos_format()` or `std::moneypunct<char_type>::do_neg_format()`.

The pattern has 4 fields describing the ordering of symbol, sign, value, and none or space. There must be one of each in the pattern. The none and space enums may not appear in the first field and space may not appear in the final field. The parts of a money string must appear in the order indicated by the fields of the pattern. The symbol field indicates that the value of `curr_symbol()` may be present. The sign field indicates that the value of `positive_sign()` or `negative_sign()` must be present. The value field indicates that the absolute value of the money amount is present. none indicates 0 or more whitespace characters, except at the end, where it permits no whitespace. space indicates that 1 or more whitespace characters must be present.

For example, for the US locale and `pos_format()` pattern {symbol,sign,value,none}, `curr_symbol() == '$'` `positive_sign() == '+'`, and value 10.01, and options set to force the symbol, the corresponding string is `$+10.01`.

Returns

Pattern for money values.

References [std::moneypunct<_CharT, _Intl>::do_neg_format\(\)](#).

negative_sign()

```
template<typename _CharT, bool _Intl>
string_type std::moneypunct<_CharT, _Intl>::negative_sign ( ) const [inline]
```

Return negative sign string.

This function returns a `string_type` to use as a sign for negative amounts. It does so by returning `money_punct<char_type>::do_negative_sign()`.

If the return value contains more than one character, the first character appears in the position indicated by `neg_format()` and the remainder appear at the end of the formatted string.

Returns

string_type representing a negative sign.

References [std::moneypunct<_CharT, _Intl>::do_negative_sign\(\)](#).

pos_format()

```
template<typename _CharT, bool _Intl>
pattern std::moneypunct<_CharT, _Intl>::pos_format ( ) const [inline]
```

Return pattern for money values.

This function returns a pattern describing the formatting of a positive or negative valued money amount. It does so by returning `money_punct<char_type>::do_pos_format()` or `money_punct<char_type>::do_neg_format()`.

The pattern has 4 fields describing the ordering of symbol, sign, value, and none or space. There must be one of each in the pattern. The none and space enums may not appear in the first field and space may not appear in the final field.

The parts of a money string must appear in the order indicated by the fields of the pattern. The symbol field indicates that the value of `curr_symbol()` may be present. The sign field indicates that the value of `positive_sign()` or `negative_sign()` must be present. The value field indicates that the absolute value of the money amount is present. none indicates 0 or more whitespace characters, except at the end, where it permits no whitespace. space indicates that 1 or more whitespace characters must be present.

For example, for the US locale and `pos_format()` pattern {symbol,sign,value,none}, `curr_symbol() == '$'` `positive_sign() == '+'`, and value 10.01, and options set to force the symbol, the corresponding string is `$+10.01`.

Returns

Pattern for money values.

References [std::moneypunct<_CharT, _Intl>::do_pos_format\(\)](#).

positive_sign()

```
template<typename _CharT, bool _Intl>
string_type std::moneypunct<_CharT, _Intl>::positive_sign ( ) const [inline]
```

Return positive sign string.

This function returns a `string_type` to use as a sign for positive amounts. It does so by returning `money_punct<char_type>::do_positive_sign()`.

If the return value contains more than one character, the first character appears in the position indicated by `pos_format()` and the remainder appear at the end of the formatted string.

Returns

string_type representing a positive sign.

References [std::money_punct<_CharT, _Intl>::do_positive_sign\(\)](#).

thousands_sep()

```
template<typename _CharT, bool _Intl>
char_type std::money_punct<_CharT, _Intl>::thousands_sep ( ) const [inline]
```

Return thousands separator character.

This function returns a `char_type` to use as a thousands separator. It does so by returning `money_punct<char_type>::do_thousands_sep()`.

Returns

`char_type` representing a thousands separator.

References [std::money_punct<_CharT, _Intl>::do_thousands_sep\(\)](#).

5.706.1 Detailed Description

```
template<typename _CharT, bool _Intl>
class std::moneypunct_byname< _CharT, _Intl >
```

class moneypunct_byname [22.2.6.4].

5.706.2 Member Function Documentation

curr_symbol()

```
template<typename _CharT , bool _Intl>
string\_type std::moneypunct< _CharT, _Intl >::curr_symbol ( ) const [inline], [inherited]
```

Return currency symbol string.

This function returns a [string_type](#) to use as a currency symbol. It does so by returning returning moneypunct<char←
_type>::do_curr_symbol().

Returns

string_type representing a currency symbol.

References [std::moneypunct< _CharT, _Intl >::do_curr_symbol\(\)](#).

decimal_point()

```
template<typename _CharT, bool _Intl>
char_type std::moneypunct<_CharT, _Intl>::decimal_point ( ) const [inline], [inherited]
```

Return decimal point character.

This function returns a `char_type` to use as a decimal point. It does so by returning `returning moneypunct<char_↵type>::do_decimal_point()`.

Returns

char_type representing a decimal point.

References `std::moneypunct<_CharT, _Intl>::do_decimal_point()`.

do_curr_symbol()

```
template<typename _CharT, bool _Intl>
virtual string_type std::moneypunct<_CharT, _Intl>::do_curr_symbol ( ) const [inline], [protected],
[virtual], [inherited]
```

Return currency symbol string.

This function returns a `string_type` to use as a currency symbol. This function is a hook for derived classes to change the value returned.

See also

`curr_symbol()` for details.

Returns

string_type representing a currency symbol.

Referenced by `std::moneypunct<_CharT, _Intl>::curr_symbol()`.

do_decimal_point()

```
template<typename _CharT, bool _Intl>
virtual char_type std::moneypunct<_CharT, _Intl>::do_decimal_point ( ) const [inline], [protected],
[virtual], [inherited]
```

Return decimal point character.

Returns a `char_type` to use as a decimal point. This function is a hook for derived classes to change the value returned.

Returns

char_type representing a decimal point.

Referenced by `std::moneypunct<_CharT, _Intl>::decimal_point()`.

do_frac_digits()

```
template<typename _CharT, bool _Intl>
virtual int std::moneypunct<_CharT, _Intl>::do_frac_digits ( ) const [inline], [protected],
[virtual], [inherited]
```

Return number of digits in fraction.

This function returns the exact number of digits that make up the fractional part of a money amount. This function is a hook for derived classes to change the value returned.

See also

`frac_digits()` for details.

Returns

Number of digits in amount fraction.

Referenced by [std::moneypunct<_CharT, _Intl>::frac_digits\(\)](#).

do_grouping()

```
template<typename _CharT, bool _Intl>
virtual string std::moneypunct<_CharT, _Intl>::do_grouping ( ) const [inline], [protected],
[virtual], [inherited]
```

Return grouping specification.

Returns a string representing groupings for the integer part of a number. This function is a hook for derived classes to change the value returned.

See also

[grouping\(\)](#) for details.

Returns

String representing grouping specification.

Referenced by [std::moneypunct<_CharT, _Intl>::grouping\(\)](#).

do_neg_format()

```
template<typename _CharT, bool _Intl>
virtual pattern std::moneypunct<_CharT, _Intl>::do_neg_format ( ) const [inline], [protected],
[virtual], [inherited]
```

Return pattern for money values.

This function returns a pattern describing the formatting of a negative valued money amount. This function is a hook for derived classes to change the value returned.

See also

[neg_format\(\)](#) for details.

Returns

Pattern for money values.

Referenced by [std::moneypunct<_CharT, _Intl>::neg_format\(\)](#).

do_negative_sign()

```
template<typename _CharT, bool _Intl>
virtual string_type std::moneypunct<_CharT, _Intl>::do_negative_sign ( ) const [inline], [protected],
[virtual], [inherited]
```

Return negative sign string.

This function returns a `string_type` to use as a sign for negative amounts. This function is a hook for derived classes to change the value returned.

See also

[negative_sign\(\)](#) for details.

Returns

string_type representing a negative sign.

Referenced by [std::moneypunct<_CharT, _Intl>::negative_sign\(\)](#).

do_pos_format()

```
template<typename _CharT, bool _Intl>
virtual pattern std::moneypunct<_CharT, _Intl>::do_pos_format ( ) const [inline], [protected],
[virtual], [inherited]
```

Return pattern for money values.

This function returns a pattern describing the formatting of a positive valued money amount. This function is a hook for derived classes to change the value returned.

See also

`pos_format()` for details.

Returns

Pattern for money values.

Referenced by `std::moneypunct<_CharT, _Intl>::pos_format()`.

do_positive_sign()

```
template<typename _CharT, bool _Intl>
virtual string_type std::moneypunct<_CharT, _Intl>::do_positive_sign ( ) const [inline], [protected],
[virtual], [inherited]
```

Return positive sign string.

This function returns a `string_type` to use as a sign for positive amounts. This function is a hook for derived classes to change the value returned.

See also

`positive_sign()` for details.

Returns

string_type representing a positive sign.

Referenced by `std::moneypunct<_CharT, _Intl>::positive_sign()`.

do_thousands_sep()

```
template<typename _CharT, bool _Intl>
virtual char_type std::moneypunct<_CharT, _Intl>::do_thousands_sep ( ) const [inline], [protected],
[virtual], [inherited]
```

Return thousands separator character.

Returns a `char_type` to use as a thousands separator. This function is a hook for derived classes to change the value returned.

Returns

char_type representing a thousands separator.

Referenced by `std::moneypunct<_CharT, _Intl>::thousands_sep()`.

frac_digits()

```
template<typename _CharT, bool _Intl>
int std::moneypunct<_CharT, _Intl>::frac_digits ( ) const [inline], [inherited]
```

Return number of digits in fraction.

This function returns the exact number of digits that make up the fractional part of a money amount. It does so by returning `std::moneypunct<char_type>::do_frac_digits()`.

The fractional part of a money amount is optional. But if it is present, there must be `frac_digits()` digits.

Returns

Number of digits in amount fraction.

References `std::moneypunct<_CharT, _Intl>::do_frac_digits()`.

grouping()

```
template<typename _CharT, bool _Intl>
string std::moneypunct<_CharT, _Intl>::grouping ( ) const [inline], [inherited]
```

Return grouping specification.

This function returns a string representing groupings for the integer part of an amount. Groupings indicate where thousands separators should be inserted.

Each char in the return string is interpreted as an integer rather than a character. These numbers represent the number of digits in a group. The first char in the string represents the number of digits in the least significant group. If a char is negative, it indicates an unlimited number of digits for the group. If more chars from the string are required to group a number, the last char is used repeatedly.

For example, if the `grouping()` returns `\003\002` and is applied to the number 123456789, this corresponds to 12,34,56,789. Note that if the string was 32, this would put more than 50 digits into the least significant group if the character set is ASCII.

The string is returned by calling `moneypunct<char_type>::do_grouping()`.

Returns

string representing grouping specification.

References `std::moneypunct<_CharT, _Intl>::do_grouping()`.

neg_format()

```
template<typename _CharT, bool _Intl>
pattern std::moneypunct<_CharT, _Intl>::neg_format ( ) const [inline], [inherited]
```

Return pattern for money values.

This function returns a pattern describing the formatting of a positive or negative valued money amount. It does so by returning `moneypunct<char_type>::do_pos_format()` or `moneypunct<char_type>::do_neg_format()`.

The pattern has 4 fields describing the ordering of symbol, sign, value, and none or space. There must be one of each in the pattern. The none and space enums may not appear in the first field and space may not appear in the final field.

The parts of a money string must appear in the order indicated by the fields of the pattern. The symbol field indicates that the value of `curr_symbol()` may be present. The sign field indicates that the value of `positive_sign()` or `negative_sign()` must be present. The value field indicates that the absolute value of the money amount is present. none indicates 0 or more whitespace characters, except at the end, where it permits no whitespace. space indicates that 1 or more whitespace characters must be present.

For example, for the US locale and `pos_format()` pattern {symbol,sign,value,none}, `curr_symbol() == '$'` `positive_sign() == '+'`, and value 10.01, and options set to force the symbol, the corresponding string is `$+10.01`.

Returns

Pattern for money values.

References `std::moneypunct<_CharT, _Intl>::do_neg_format()`.

negative_sign()

```
template<typename _CharT, bool _Intl>
string_type std::moneypunct<_CharT, _Intl>::negative_sign ( ) const [inline], [inherited]
```

Return negative sign string.

This function returns a `string_type` to use as a sign for negative amounts. It does so by returning `moneypunct<char_type>::do_negative_sign()`.

If the return value contains more than one character, the first character appears in the position indicated by `neg_format()` and the remainder appear at the end of the formatted string.

Returns

string_type representing a negative sign.

References [std::moneypunct< _CharT, _Intl >::do_negative_sign\(\)](#).

pos_format()

```
template<typename _CharT , bool _Intl>
pattern std::moneypunct< _CharT, _Intl >::pos_format ( ) const [inline], [inherited]
```

Return pattern for money values.

This function returns a pattern describing the formatting of a positive or negative valued money amount. It does so by returning `moneypunct<char_type>::do_pos_format()` or `moneypunct<char_type>::do_neg_format()`.

The pattern has 4 fields describing the ordering of symbol, sign, value, and none or space. There must be one of each in the pattern. The none and space enums may not appear in the first field and space may not appear in the final field.

The parts of a money string must appear in the order indicated by the fields of the pattern. The symbol field indicates that the value of `curr_symbol()` may be present. The sign field indicates that the value of `positive_sign()` or `negative_sign()` must be present. The value field indicates that the absolute value of the money amount is present. none indicates 0 or more whitespace characters, except at the end, where it permits no whitespace. space indicates that 1 or more whitespace characters must be present.

For example, for the US locale and `pos_format()` pattern {symbol,sign,value,none}, `curr_symbol() == '$'` `positive_sign() == '+'`, and value 10.01, and options set to force the symbol, the corresponding string is `$+10.01`.

Returns

Pattern for money values.

References [std::moneypunct< _CharT, _Intl >::do_pos_format\(\)](#).

positive_sign()

```
template<typename _CharT , bool _Intl>
string_type std::moneypunct< _CharT, _Intl >::positive_sign ( ) const [inline], [inherited]
```

Return positive sign string.

This function returns a *string_type* to use as a sign for positive amounts. It does so by returning `moneypunct<char_type>::do_positive_sign()`.

If the return value contains more than one character, the first character appears in the position indicated by `pos_format()` and the remainder appear at the end of the formatted string.

Returns

string_type representing a positive sign.

References [std::moneypunct< _CharT, _Intl >::do_positive_sign\(\)](#).

thousands_sep()

```
template<typename _CharT , bool _Intl>
char_type std::moneypunct< _CharT, _Intl >::thousands_sep ( ) const [inline], [inherited]
```

Return thousands separator character.

This function returns a *char_type* to use as a thousands separator. It does so by returning `moneypunct<char_type>::do_thousands_sep()`.

Returns

char_type representing a thousands separator.

References [std::moneypunct< _CharT, _Intl >::do_thousands_sep\(\)](#).

5.707.1 Detailed Description

```
template<typename _Iterator>
class std::move_iterator< _Iterator >
```

Class template `move_iterator` is an iterator adapter with the same behavior as the underlying iterator except that its dereference operator implicitly converts the value returned by the underlying iterator's dereference operator to an rvalue reference. Some generic algorithms can be called with move iterators to replace copying with moving.

The documentation for this class was generated from the following file:

- [bits/stl_iterator.h](#)

5.709.1 Detailed Description

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>>
class std::multimap< _Key, _Tp, _Compare, _Alloc >
```

A standard container made up of (key,value) pairs, which can be retrieved based on a key, in logarithmic time.

Template Parameters

<code>_Key</code>	Type of key objects.
<code>_Tp</code>	Type of mapped objects.
<code>_Compare</code>	Comparison function object type, defaults to <code>less<_Key></code> .
<code>_Alloc</code>	Allocator type, defaults to <code>allocator<pair<const _Key, _Tp>></code> .

Meets the requirements of a [container](#), a [reversible container](#), and an [associative container](#) (using equivalent keys). For a `multimap<Key, T>` the `key_type` is `Key`, the `mapped_type` is `T`, and the `value_type` is `std::pair<const Key, T>`.

Multimaps support bidirectional iterators.

The private tree data is declared exactly the same way for `map` and `multimap`; the distinction is made entirely in how the tree functions are called (`*_unique` versus `*_equal`, same as the standard).

5.709.2 Constructor & Destructor Documentation

multimap() [1/12]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
std::multimap<_Key, _Tp, _Compare, _Alloc >::multimap ( ) [default]
```

Default constructor creates no elements.

multimap() [2/12]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
std::multimap<_Key, _Tp, _Compare, _Alloc >::multimap (
    const _Compare & __comp,
    const allocator_type & __a = allocator_type() ) [inline], [explicit]
```

Creates a multimap with no elements.

Parameters

<code>__comp</code>	A comparison object.
<code>__a</code>	An allocator object.

multimap() [3/12]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
std::multimap<_Key, _Tp, _Compare, _Alloc >::multimap (
    const multimap<_Key, _Tp, _Compare, _Alloc > & ) [default]
```

Multimap copy constructor.

Whether the allocator is copied depends on the allocator traits.

multimap() [4/12]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
std::multimap<_Key, _Tp, _Compare, _Alloc >::multimap (
    multimap<_Key, _Tp, _Compare, _Alloc > && ) [default]
```

Multimap move constructor.

The newly-created multimap contains the exact contents of the moved instance. The moved instance is a valid, but unspecified multimap.

multimap() [5/12]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (
    initializer_list< value_type > __l,
    const _Compare & __comp = _Compare(),
    const allocator_type & __a = allocator_type() ) [inline]
```

Builds a multimap from an initializer_list.

Parameters

<code>__l</code>	An initializer_list.
<code>__comp</code>	A comparison functor.
<code>__a</code>	An allocator object.

Create a multimap consisting of copies of the elements from the initializer_list. This is linear in N if the list is already sorted, and NlogN otherwise (where N is `__l.size()`).

multimap() [6/12]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (
    const allocator_type & __a ) [inline], [explicit]
```

Allocator-extended default constructor.

multimap() [7/12]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (
    const multimap< _Key, _Tp, _Compare, _Alloc > & __m,
    const allocator_type & __a ) [inline]
```

Allocator-extended copy constructor.

multimap() [8/12]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (
    multimap< _Key, _Tp, _Compare, _Alloc > && __m,
    const allocator_type & __a ) [inline], [noexcept]
```

Allocator-extended move constructor.

multimap() [9/12]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (
```

```

        initializer_list< value_type > __l,
        const allocator_type & __a ) [inline]

```

Allocator-extended initializer-list constructor.

multimap() [10/12]

```

template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
template<typename _InputIterator >
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (
    _InputIterator __first,
    _InputIterator __last,
    const allocator_type & __a ) [inline]

```

Allocator-extended range constructor.

multimap() [11/12]

```

template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
template<typename _InputIterator >
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (
    _InputIterator __first,
    _InputIterator __last ) [inline]

```

Builds a multimap from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

Create a multimap consisting of copies of the elements from [`__first`,`__last`). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(`__first`,`__last`)).

multimap() [12/12]

```

template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
template<typename _InputIterator >
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (
    _InputIterator __first,
    _InputIterator __last,
    const _Compare & __comp,
    const allocator_type & __a = allocator_type() ) [inline]

```

Builds a multimap from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__comp</code>	A comparison functor.
<code>__a</code>	An allocator object.

Create a multimap consisting of copies of the elements from [`__first`,`__last`). This is linear in N if the range is already

sorted, and NlogN otherwise (where N is distance(__first,__last)).

~multimap()

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
std::multimap< _Key, _Tp, _Compare, _Alloc >::~~multimap ( ) [default]
```

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

5.709.3 Member Function Documentation

begin() [1/2]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::begin ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first pair in the multimap. Iteration is done in ascending order according to the keys.

begin() [2/2]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::begin ( ) [inline], [noexcept]
```

Returns a read/write iterator that points to the first pair in the multimap. Iteration is done in ascending order according to the keys.

cbegin()

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::cbegin ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first pair in the multimap. Iteration is done in ascending order according to the keys.

cend()

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::cend ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last pair in the multimap. Iteration is done in ascending order according to the keys.

clear()

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
void std::multimap< _Key, _Tp, _Compare, _Alloc >::clear ( ) [inline], [noexcept]
```

Erases all elements in a multimap. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

count() [1/2]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
```

```
template<typename _Kt >
auto std::multimap<_Key, _Tp, _Compare, _Alloc >::count (
    const _Kt & __x ) const -> decltype(_M_t._M_count_tr(__x))    [inline]
```

Finds the number of elements with given key.

Parameters

 <code>__x</code>	Key of (key, value) pairs to be located.
----------------------------------------------------------------------------------------------------	------------------------------------------

Returns

Number of elements with specified key.

count() [2/2]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
size_type std::multimap<_Key, _Tp, _Compare, _Alloc >::count (
    const key_type & __x ) const    [inline]
```

Finds the number of elements with given key.

Parameters

 <code>__x</code>	Key of (key, value) pairs to be located.
----------------------------------------------------------------------------------------------------	------------------------------------------

Returns

Number of elements with specified key.

crbegin()

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_reverse_iterator std::multimap<_Key, _Tp, _Compare, _Alloc >::crbegin ( ) const    [inline],
[noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last pair in the multimap. Iteration is done in descending order according to the keys.

crend()

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_reverse_iterator std::multimap<_Key, _Tp, _Compare, _Alloc >::crend ( ) const    [inline],
[noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first pair in the multimap. Iteration is done in descending order according to the keys.

emplace()

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
```

```
template<typename... _Args>
iterator std::multimap<_Key, _Tp, _Compare, _Alloc >::emplace (
    _Args &&... __args ) [inline]
```

Build and insert a `std::pair` into the multimap.

Parameters

<code>__args</code>	Arguments used to generate a new pair instance (see <code>std::piecewise_construct</code> for passing arguments to each part of the pair constructor).
---------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------

Returns

An iterator that points to the inserted (key,value) pair.

This function builds and inserts a (key, value) pair into the multimap. Contrary to a `std::map` the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted.

Insertion requires logarithmic time.

`emplace_hint()`

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename... _Args>
iterator std::multimap<_Key, _Tp, _Compare, _Alloc >::emplace_hint (
    const_iterator __pos,
    _Args &&... __args ) [inline]
```

Builds and inserts a `std::pair` into the multimap.

Parameters

<code>__pos</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__args</code>	Arguments used to generate a new pair instance (see <code>std::piecewise_construct</code> for passing arguments to each part of the pair constructor).

Returns

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a `std::map` the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints

Insertion requires logarithmic time (if the hint is not taken).

`empty()`

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
bool std::multimap<_Key, _Tp, _Compare, _Alloc >::empty ( ) const [inline], [noexcept]
```

Returns true if the multimap is empty.

end() [1/2]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>>
```

```
const_iterator std::multimap<_Key, _Tp, _Compare, _Alloc>::end ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last pair in the multimap. Iteration is done in ascending order according to the keys.

end() [2/2]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>>
```

```
iterator std::multimap<_Key, _Tp, _Compare, _Alloc>::end ( ) [inline], [noexcept]
```

Returns a read/write iterator that points one past the last pair in the multimap. Iteration is done in ascending order according to the keys.

Referenced by [std::multimap<_Key, _Tp, _Compare, _Alloc>::extract\(\)](#).

equal_range() [1/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>>
```

```
template<typename _Kt >
```

```
auto std::multimap<_Key, _Tp, _Compare, _Alloc>::equal_range (
    const _Kt & __x ) -> decltype(pair<iterator, iterator>(_M_t._M_equal_range_tr(__x)))
```

```
[inline]
```

Finds a subsequence matching given key.

Parameters

	Key of (key, value) pairs to be located.
	

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
              c.upper_bound(val))
```

(but is faster than making the calls separately).

equal_range() [2/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>>
```

```
template<typename _Kt >
```

```
auto std::multimap<_Key, _Tp, _Compare, _Alloc>::equal_range (
    const _Kt & __x ) const -> decltype(pair<const_iterator, const_iterator>(_M_t._M_↵
equal_range_tr(__x))) [inline]
```

Finds a subsequence matching given key.

Parameters

	Key of (key, value) pairs to be located.
	

Returns

Pair of read-only (constant) iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),  
              c.upper_bound(val))
```

(but is faster than making the calls separately).

equal_range() [3/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =  
std::allocator<std::pair<const _Key, _Tp> >>  
std::pair< iterator, iterator > std::multimap< _Key, _Tp, _Compare, _Alloc >::equal_range (   
    const key_type & __x ) [inline]
```

Finds a subsequence matching given key.

Parameters

 __x	Key of (key, value) pairs to be located.
------------------------------------------------------------------------------------------	------------------------------------------

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),  
              c.upper_bound(val))
```

(but is faster than making the calls separately).

equal_range() [4/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =  
std::allocator<std::pair<const _Key, _Tp> >>  
std::pair< const_iterator, const_iterator > std::multimap< _Key, _Tp, _Compare, _Alloc >::equal<←  
_range (   
    const key_type & __x ) const [inline]
```

Finds a subsequence matching given key.

Parameters

 __x	Key of (key, value) pairs to be located.
--------------------------------------------------------------------------------------------	------------------------------------------

Returns

Pair of read-only (constant) iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),  
              c.upper_bound(val))
```

(but is faster than making the calls separately).

erase() [1/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =  
std::allocator<std::pair<const _Key, _Tp> >>
```

```
size_type std::multimap<_Key, _Tp, _Compare, _Alloc >::erase (
    const key_type & __x ) [inline]
```

Erases elements according to the provided key.

Parameters

<code>__x</code>	Key of element to be erased.
------------------	------------------------------

Returns

The number of elements erased.

This function erases all elements located by the given key from a multimap. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [2/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap<_Key, _Tp, _Compare, _Alloc >::erase (
    const_iterator __first,
    const_iterator __last ) [inline]
```

Erases a [first,last) range of elements from a multimap.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be erased.
<code>__last</code>	Iterator pointing to the end of the range to be erased .

Returns

The iterator `__last`.

This function erases a sequence of elements from a multimap. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [3/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap<_Key, _Tp, _Compare, _Alloc >::erase (
    const_iterator __position ) [inline]
```

Erases an element from a multimap.

Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---------------------------------------------------

Returns

An iterator pointing to the element immediately following *position* prior to the element being erased. If no such element exists, end() is returned.

This function erases an element, pointed to by the given iterator, from a multimap. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [4/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
_GLIBCXX_ABI_TAG_CXX11 iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::erase (
    iterator __position ) [inline]
```

Erases an element from a multimap.

Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---------------------------------------------------

Returns

An iterator pointing to the element immediately following *position* prior to the element being erased. If no such element exists, end() is returned.

This function erases an element, pointed to by the given iterator, from a multimap. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

extract() [1/2]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
node_type std::multimap< _Key, _Tp, _Compare, _Alloc >::extract (
    const key_type & __x ) [inline]
```

Extract a node.

extract() [2/2]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
node_type std::multimap< _Key, _Tp, _Compare, _Alloc >::extract (
    const_iterator __pos ) [inline]
```

Extract a node.

References [std::multimap< _Key, _Tp, _Compare, _Alloc >::end\(\)](#).

find() [1/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Kt >
auto std::multimap< _Key, _Tp, _Compare, _Alloc >::find (
    const _Kt & __x ) -> decltype(_M_t._M_find_tr(__x)) [inline]
```

Tries to locate an element in a multimap.

Parameters

<code>_↔</code>	Key of (key, value) pair to be located.
<code>_X</code>	

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end (`end()`) iterator.

find() [2/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Kt >
auto std::multimap< _Key, _Tp, _Compare, _Alloc >::find (
    const _Kt & __x ) const -> decltype(_M_t._M_find_tr(__x))    [inline]
```

Tries to locate an element in a multimap.

Parameters

<code>_↔</code>	Key of (key, value) pair to be located.
<code>_X</code>	

Returns

Read-only (constant) iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns a constant iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end (`end()`) iterator.

find() [3/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::find (
    const key_type & __x ) [inline]
```

Tries to locate an element in a multimap.

Parameters

<code>_↔</code>	Key of (key, value) pair to be located.
<code>_X</code>	

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end (end()) iterator.

find() [4/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::find (
    const key_type & __x ) const [inline]
```

Tries to locate an element in a multimap.

Parameters

<code>__x</code>	Key of (key, value) pair to be located.
------------------	-----------------------------------------

Returns

Read-only (constant) iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns a constant iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end (end()) iterator.

get_allocator()

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
allocator_type std::multimap< _Key, _Tp, _Compare, _Alloc >::get_allocator ( ) const [inline],
[noexcept]
```

Get a copy of the memory allocation object.

insert() [1/10]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _InputIterator >
void std::multimap< _Key, _Tp, _Compare, _Alloc >::insert (
    _InputIterator __first,
    _InputIterator __last ) [inline]
```

A template function that attempts to insert a range of elements.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be inserted.
<code>__last</code>	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

insert() [2/10]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
```

```
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Pair >
__enable_if_t< is_constructible< value_type, _Pair >::value, iterator > std::multimap< _Key, _↵
Tp, _Compare, _Alloc >::insert (
    _Pair && __x ) [inline]
```

Inserts a std::pair into the multimap.

Parameters

_↵	Pair to be inserted (see std::make_pair for easy creation of pairs).
_X	

Returns

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a std::map the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted.

Insertion requires logarithmic time.

insert() [3/10]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::insert (
    const value_type & __x ) [inline]
```

Inserts a std::pair into the multimap.

Parameters

_↵	Pair to be inserted (see std::make_pair for easy creation of pairs).
_X	

Returns

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a std::map the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted.

Insertion requires logarithmic time.

Referenced by [std::multimap<_Key, _Tp, _Compare, _Alloc>::insert\(\)](#).

insert() [4/10]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::insert (
    const_iterator __hint,
    node_type && __nh ) [inline]
```

Re-insert an extracted node.

References [std::move\(\)](#).

insert() [5/10]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
```

```
template<typename _Pair >
__enable_if_t< is_constructible< value_type, _Pair && >::value, iterator > std::multimap< _Key,
_Tp, _Compare, _Alloc >::insert (
    const_iterator __position,
    _Pair && __x ) [inline]
```

Inserts a std::pair into the multimap.

Parameters

<code>__position</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__x</code>	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a std::map the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints

Insertion requires logarithmic time (if the hint is not taken).

insert() [6/10]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::insert (
    const_iterator __position,
    const value_type & __x ) [inline]
```

Inserts a std::pair into the multimap.

Parameters

<code>__position</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__x</code>	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a std::map the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints

Insertion requires logarithmic time (if the hint is not taken).

insert() [7/10]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::insert (
    const_iterator __position,
    value_type && __x ) [inline]
```

Inserts a std::pair into the multimap.

Parameters

<code>__position</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__x</code>	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a std::map the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints

Insertion requires logarithmic time (if the hint is not taken).

References [std::move\(\)](#).

insert() [8/10]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
```

```
void std::multimap< _Key, _Tp, _Compare, _Alloc >::insert (
    initializer_list< value_type > __l ) [inline]
```

Attempts to insert a list of std::pairs into the multimap.

Parameters

<code>↔</code>	A std::initializer_list<value_type> of pairs to be inserted.
<code>↔</code>	
<code>↔</code>	
<code>↔</code>	
<code>/</code>	

Complexity similar to that of the range constructor.

References [std::multimap< _Key, _Tp, _Compare, _Alloc >::insert\(\)](#).

insert() [9/10]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
```

```
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::insert (
    node_type && __nh ) [inline]
```

Re-insert an extracted node.

References [std::move\(\)](#).

insert() [10/10]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
```

```
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::insert (
    value_type && __x ) [inline]
```

Inserts a std::pair into the multimap.

Parameters

<code>_↔</code>	Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs).
<code>_X</code>	

Returns

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a `std::map` the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted.

Insertion requires logarithmic time.

References [std::move\(\)](#).

key_comp()

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
```

```
key_compare std::multimap< _Key, _Tp, _Compare, _Alloc >::key_comp ( ) const [inline]
```

Returns the key comparison object out of which the multimap was constructed.

lower_bound() [1/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
```

```
template<typename _Kt >
```

```
auto std::multimap< _Key, _Tp, _Compare, _Alloc >::lower_bound (
    const _Kt & __x ) -> decltype(iterator(_M_t._M_lower_bound_tr(__x))) [inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

<code>_↔</code>	Key of (key, value) pair to be located.
<code>_X</code>	

Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

lower_bound() [2/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
```

```
template<typename _Kt >
```

```
auto std::multimap< _Key, _Tp, _Compare, _Alloc >::lower_bound (
    const _Kt & __x ) const -> decltype(const_iterator(_M_t._M_lower_bound_tr(__x)))
```

```
[inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

	Key of (key, value) pair to be located.
	

Returns

Read-only (constant) iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful the iterator will point to the next greatest element or, if no such greater element exists, to end().

lower_bound() [3/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap<_Key, _Tp, _Compare, _Alloc >::lower_bound (
    const key_type & __x ) [inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

	Key of (key, value) pair to be located.
	

Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

lower_bound() [4/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::multimap<_Key, _Tp, _Compare, _Alloc >::lower_bound (
    const key_type & __x ) const [inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

	Key of (key, value) pair to be located.
	

Returns

Read-only (constant) iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful the iterator will point to the next greatest element or, if no such greater element exists, to end().

max_size()

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
size_type std::multimap< _Key, _Tp, _Compare, _Alloc >::max_size ( ) const [inline], [noexcept]
```

Returns the maximum size of the multimap.

operator=() [1/3]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
multimap & std::multimap< _Key, _Tp, _Compare, _Alloc >::operator= (
    const multimap< _Key, _Tp, _Compare, _Alloc > & ) [default]
```

Multimap assignment operator.

Whether the allocator is copied depends on the allocator traits.

operator=() [2/3]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
multimap & std::multimap< _Key, _Tp, _Compare, _Alloc >::operator= (
    initializer_list< value_type > __l ) [inline]
```

Multimap list assignment operator.

Parameters

↩	An initializer_list.
↩	
↩	
↩	
/	

This function fills a multimap with copies of the elements in the initializer list __l.

Note that the assignment completely changes the multimap and that the resulting multimap's size is the same as the number of elements assigned.

operator=() [3/3]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
multimap & std::multimap< _Key, _Tp, _Compare, _Alloc >::operator= (
    multimap< _Key, _Tp, _Compare, _Alloc > && ) [default]
```

Move assignment operator.

rbegin() [1/2]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
```

```
const_reverse_iterator std::multimap<_Key, _Tp, _Compare, _Alloc>::rbegin ( ) const [inline],
[noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last pair in the multimap. Iteration is done in descending order according to the keys.

rbegin() [2/2]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
```

```
reverse_iterator std::multimap<_Key, _Tp, _Compare, _Alloc>::rbegin ( ) [inline], [noexcept]
```

Returns a read/write reverse iterator that points to the last pair in the multimap. Iteration is done in descending order according to the keys.

rend() [1/2]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
```

```
const_reverse_iterator std::multimap<_Key, _Tp, _Compare, _Alloc>::rend ( ) const [inline],
[noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first pair in the multimap. Iteration is done in descending order according to the keys.

rend() [2/2]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
```

```
reverse_iterator std::multimap<_Key, _Tp, _Compare, _Alloc>::rend ( ) [inline], [noexcept]
```

Returns a read/write reverse iterator that points to one before the first pair in the multimap. Iteration is done in descending order according to the keys.

size()

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
```

```
size_type std::multimap<_Key, _Tp, _Compare, _Alloc>::size ( ) const [inline], [noexcept]
```

Returns the size of the multimap.

swap()

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>>
```

```
void std::multimap<_Key, _Tp, _Compare, _Alloc>::swap (
    multimap<_Key, _Tp, _Compare, _Alloc> & __x ) [inline], [noexcept]
```

Swaps data with another multimap.

Parameters

<code>__x</code>	A multimap of the same element and allocator types.
------------------	-----------------------------------------------------

This exchanges the elements between two multimaps in constant time. (It is only swapping a pointer, an integer, and an instance of the `Compare` type (which itself is often stateless and empty), so it should be quite fast.) Note that the global `std::swap()` function is specialized such that `std::swap(m1,m2)` will feed to this function.

Whether the allocators are swapped depends on the allocator traits.

upper_bound() [1/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Kt >
auto std::multimap< _Key, _Tp, _Compare, _Alloc >::upper_bound (
    const _Kt & __x ) -> decltype(iterator(_M_t._M_upper_bound_tr(__x)))    [inline]
```

Finds the end of a subsequence matching given key.

Parameters

<code>__x</code>	Key of (key, value) pair to be located.
------------------	-----------------------------------------

Returns

Iterator pointing to the first element greater than key, or end().

upper_bound() [2/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
template<typename _Kt >
auto std::multimap< _Key, _Tp, _Compare, _Alloc >::upper_bound (
    const _Kt & __x ) const -> decltype(const_iterator(_M_t._M_upper_bound_tr(__x)))
[inline]
```

Finds the end of a subsequence matching given key.

Parameters

<code>__x</code>	Key of (key, value) pair to be located.
------------------	-----------------------------------------

Returns

Read-only (constant) iterator pointing to first iterator greater than key, or end().

upper_bound() [3/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::upper_bound (
    const key_type & __x ) [inline]
```

Finds the end of a subsequence matching given key.

Parameters

<code>__x</code>	Key of (key, value) pair to be located.
------------------	-----------------------------------------

Returns

Iterator pointing to the first element greater than key, or end().

upper_bound() [4/4]

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
const_iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::upper_bound (
    const key_type & __x ) const [inline]
```

Finds the end of a subsequence matching given key.

Parameters

<code>__x</code>	Key of (key, value) pair to be located.
------------------	-----------------------------------------

Returns

Read-only (constant) iterator pointing to first iterator greater than key, or end().

value_comp()

```
template<typename _Key , typename _Tp , typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >>
value_compare std::multimap< _Key, _Tp, _Compare, _Alloc >::value_comp ( ) const [inline]
```

Returns a value comparison object, built from the key comparison object out of which the multimap was constructed. The documentation for this class was generated from the following files:

- [stl_map.h](#)
- [stl_multimap.h](#)

`struct std::_Rb_tree_merge_helper`

5.713.1 Detailed Description

`template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>`
`class std::multiset< _Key, _Compare, _Alloc >`

A standard container made up of elements, which can be retrieved in logarithmic time.

Template Parameters

<code>_Key</code>	Type of key objects.
<code>_Compare</code>	Comparison function object type, defaults to <code>less<_Key></code> .
<code>_Alloc</code>	Allocator type, defaults to <code>allocator<_Key></code> .

Meets the requirements of a [container](#), a [reversible container](#), and an [associative container](#) (using equivalent keys). For a `multiset<Key>` the `key_type` and `value_type` are `Key`.

Multisets support bidirectional iterators.

The private tree data is declared exactly the same way for set and multiset; the distinction is made entirely in how the tree functions are called (`*_unique` versus `*_equal`, same as the standard).

5.713.2 Constructor & Destructor Documentation

`multiset()` [1/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
std::multiset< _Key, _Compare, _Alloc >::multiset ( ) [default]
```

Default constructor creates no elements.

`multiset()` [2/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
std::multiset< _Key, _Compare, _Alloc >::multiset (  

    const _Compare & __comp,  

    const allocator_type & __a = allocator_type() ) [inline], [explicit]
```

Creates a multiset with no elements.

Parameters

<code>__comp</code>	Comparator to use.
<code>__a</code>	An allocator object.

`multiset()` [3/12]

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```

_Key>>
template<typename _InputIterator >
std::multiset< _Key, _Compare, _Alloc >::multiset (
    _InputIterator __first,
    _InputIterator __last ) [inline]

```

Builds a multiset from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

Create a multiset consisting of copies of the elements from [first,last). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(__first,__last)).

multiset() [4/12]

```

template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename _InputIterator >
std::multiset< _Key, _Compare, _Alloc >::multiset (
    _InputIterator __first,
    _InputIterator __last,
    const _Compare & __comp,
    const allocator_type & __a = allocator_type() ) [inline]

```

Builds a multiset from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__comp</code>	A comparison functor.
<code>__a</code>	An allocator object.

Create a multiset consisting of copies of the elements from [__first,__last). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(__first,__last)).

multiset() [5/12]

```

template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::multiset< _Key, _Compare, _Alloc >::multiset (
    const multiset< _Key, _Compare, _Alloc > & ) [default]

```

Multiset copy constructor.

Whether the allocator is copied depends on the allocator traits.

multiset() [6/12]

```

template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::multiset< _Key, _Compare, _Alloc >::multiset (
    multiset< _Key, _Compare, _Alloc > && ) [default]

```

Multiset move constructor.

The newly-created multiset contains the exact contents of the moved instance. The moved instance is a valid, but unspecified multiset.

multiset() [7/12]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::multiset< _Key, _Compare, _Alloc >::multiset (
    initializer_list< value_type > __l,
    const _Compare & __comp = _Compare(),
    const allocator_type & __a = allocator_type() ) [inline]
```

Builds a multiset from an initializer_list.

Parameters

<code>__l</code>	An initializer_list.
<code>__comp</code>	A comparison functor.
<code>__a</code>	An allocator object.

Create a multiset consisting of copies of the elements from the list. This is linear in N if the list is already sorted, and NlogN otherwise (where N is `__l.size()`).

multiset() [8/12]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::multiset< _Key, _Compare, _Alloc >::multiset (
    const allocator_type & __a ) [inline], [explicit]
```

Allocator-extended default constructor.

multiset() [9/12]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::multiset< _Key, _Compare, _Alloc >::multiset (
    const multiset< _Key, _Compare, _Alloc > & __m,
    const allocator_type & __a ) [inline]
```

Allocator-extended copy constructor.

multiset() [10/12]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::multiset< _Key, _Compare, _Alloc >::multiset (
    multiset< _Key, _Compare, _Alloc > && __m,
    const allocator_type & __a ) [inline], [noexcept]
```

Allocator-extended move constructor.

multiset() [11/12]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::multiset< _Key, _Compare, _Alloc >::multiset (
    initializer_list< value_type > __l,
    const allocator_type & __a ) [inline]
```

Allocator-extended initializer-list constructor.

multiset() [12/12]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename _InputIterator >
std::multiset< _Key, _Compare, _Alloc >::multiset (
    _InputIterator __first,
    _InputIterator __last,
    const allocator_type & __a ) [inline]
```

Allocator-extended range constructor.

~multiset()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::multiset< _Key, _Compare, _Alloc >::~~multiset ( ) [default]
```

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

5.713.3 Member Function Documentation

begin()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::begin ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the multiset. Iteration is done in ascending order according to the keys.

cbegin()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::cbegin ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the multiset. Iteration is done in ascending order according to the keys.

cend()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::cend ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the multiset. Iteration is done in ascending order according to the keys.

clear()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
void std::multiset< _Key, _Compare, _Alloc >::clear ( ) [inline], [noexcept]
```

Erases all elements in a multiset. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

count() [1/2]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename _Kt >
auto std::multiset< _Key, _Compare, _Alloc >::count (
    const _Kt & __x ) const -> decltype(_M_t._M_count_tr(__x))    [inline]
```

Finds the number of elements with given key.

Parameters

<code>_Key</code> <code>__x</code>	Key of elements to be located.
---------------------------------------	--------------------------------

Returns

Number of elements with specified key.

count() [2/2]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
size_type std::multiset< _Key, _Compare, _Alloc >::count (
    const key_type & __x ) const    [inline]
```

Finds the number of elements with given key.

Parameters

<code>_Key</code> <code>__x</code>	Key of elements to be located.
---------------------------------------	--------------------------------

Returns

Number of elements with specified key.

crbegin()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
reverse_iterator std::multiset< _Key, _Compare, _Alloc >::crbegin ( ) const    [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the multiset. Iteration is done in descending order according to the keys.

crend()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
reverse_iterator std::multiset< _Key, _Compare, _Alloc >::crend ( ) const    [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the multiset. Iteration is done in descending order according to the keys.

emplace()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```

_Key>>
template<typename... _Args>
iterator std::multiset<_Key, _Compare, _Alloc>::emplace (
    _Args &&... __args ) [inline]

```

Builds and inserts an element into the multiset.

Parameters

<code>__args</code>	Arguments used to generate the element instance to be inserted.
---------------------	-----------------------------------------------------------------

Returns

An iterator that points to the inserted element.

This function inserts an element into the multiset. Contrary to a `std::set` the multiset does not rely on unique keys and thus multiple copies of the same element can be inserted.

Insertion requires logarithmic time.

`emplace_hint()`

```

template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename... _Args>
iterator std::multiset<_Key, _Compare, _Alloc>::emplace_hint (
    const_iterator __pos,
    _Args &&... __args ) [inline]

```

Builds and inserts an element into the multiset.

Parameters

<code>__pos</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__args</code>	Arguments used to generate the element instance to be inserted.

Returns

An iterator that points to the inserted element.

This function inserts an element into the multiset. Contrary to a `std::set` the multiset does not rely on unique keys and thus multiple copies of the same element can be inserted.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints for more on *hinting*.

Insertion requires logarithmic time (if the hint is not taken).

`empty()`

```

template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
bool std::multiset<_Key, _Compare, _Alloc>::empty ( ) const [inline], [noexcept]

```

Returns true if the set is empty.

`end()`

```

template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>

```

```
iterator std::multiset< _Key, _Compare, _Alloc >::end ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the multiset. Iteration is done in ascending order according to the keys.

Referenced by `std::multiset< _Key, _Compare, _Alloc >::extract()`.

equal_range() [1/4]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename _Kt >
auto std::multiset< _Key, _Compare, _Alloc >::equal_range (
    const _Kt & __x ) -> decltype(pair<iterator, iterator>(_M_t._M_equal_range_tr(__x)))
[inline]
```

Finds a subsequence matching given key.

Parameters

<code>_↵</code>	Key to be located.
<code>_X</code>	

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
              c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multisets.

equal_range() [2/4]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename _Kt >
auto std::multiset< _Key, _Compare, _Alloc >::equal_range (
    const _Kt & __x ) const -> decltype(pair<iterator, iterator>(_M_t._M_equal_range_↵
tr(__x))) [inline]
```

Finds a subsequence matching given key.

Parameters

<code>_↵</code>	Key to be located.
<code>_X</code>	

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
              c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multisets.

equal_range() [3/4]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::pair< iterator, iterator > std::multiset< _Key, _Compare, _Alloc >::equal_range (
    const key_type & __x ) [inline]
```

Finds a subsequence matching given key.

Parameters

<code>_↵</code>	Key to be located.
<code>_X</code>	

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
              c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multisets.

equal_range() [4/4]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::pair< const_iterator, const_iterator > std::multiset< _Key, _Compare, _Alloc >::equal_range
(
    const key_type & __x ) const [inline]
```

Finds a subsequence matching given key.

Parameters

<code>_↵</code>	Key to be located.
<code>_X</code>	

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
              c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multisets.

erase() [1/3]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
size_type std::multiset< _Key, _Compare, _Alloc >::erase (
    const key_type & __x ) [inline]
```

Erases elements according to the provided key.

Parameters

<code>_↔</code>	Key of element to be erased.
<code>_X</code>	

Returns

The number of elements erased.

This function erases all elements located by the given key from a multiset. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [2/3]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↔
_Key>>
_GLIBCXX_ABI_TAG_CXX11 iterator std::multiset< _Key, _Compare, _Alloc >::erase (
    const_iterator __first,
    const_iterator __last ) [inline]
```

Erases a [first,last) range of elements from a multiset.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be erased.
<code>__last</code>	Iterator pointing to the end of the range to be erased.

Returns

The iterator *last*.

This function erases a sequence of elements from a multiset. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [3/3]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↔
_Key>>
_GLIBCXX_ABI_TAG_CXX11 iterator std::multiset< _Key, _Compare, _Alloc >::erase (
    const_iterator __position ) [inline]
```

Erases an element from a multiset.

Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---------------------------------------------------

Returns

An iterator pointing to the element immediately following *position* prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from a multiset. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

extract() [1/2]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
node_type std::multiset< _Key, _Compare, _Alloc >::extract (
    const key_type & __x ) [inline]
```

Extract a node.

extract() [2/2]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
node_type std::multiset< _Key, _Compare, _Alloc >::extract (
    const_iterator __pos ) [inline]
```

Extract a node.

References [std::multiset< _Key, _Compare, _Alloc >::end\(\)](#).

find() [1/4]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
template<typename _Kt >
auto std::multiset< _Key, _Compare, _Alloc >::find (
    const _Kt & __x ) -> decltype(iterator{_M_t._M_find_tr(__x)}) [inline]
```

Tries to locate an element in a set.

Parameters

_↵	Element to be located.
_x	

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

find() [2/4]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
template<typename _Kt >
auto std::multiset< _Key, _Compare, _Alloc >::find (
    const _Kt & __x ) const -> decltype(const_iterator{_M_t._M_find_tr(__x)}) [inline]
```

Tries to locate an element in a set.

Parameters

_↵	Element to be located.
_x	

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (end()) iterator.

find() [3/4]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::find (
    const key_type & __x ) [inline]
```

Tries to locate an element in a set.

Parameters

<code>↵</code> <code>__x</code>	Element to be located.
------------------------------------	------------------------

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (end()) iterator.

find() [4/4]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
const_iterator std::multiset< _Key, _Compare, _Alloc >::find (
    const key_type & __x ) const [inline]
```

Tries to locate an element in a set.

Parameters

<code>↵</code> <code>__x</code>	Element to be located.
------------------------------------	------------------------

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (end()) iterator.

get_allocator()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
allocator_type std::multiset< _Key, _Compare, _Alloc >::get_allocator ( ) const [inline], [noexcept]
Returns the memory allocation object.
```

insert() [1/6]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
```

```

_Key>>
template<typename _InputIterator >
void std::multiset< _Key, _Compare, _Alloc >::insert (
    _InputIterator __first,
    _InputIterator __last ) [inline]

```

A template function that tries to insert a range of elements.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be inserted.
<code>__last</code>	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

insert() [2/6]

```

template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::insert (
    const value_type & __x ) [inline]

```

Inserts an element into the multiset.

Parameters

<code>↵</code> <code>__x</code>	Element to be inserted.
------------------------------------	-------------------------

Returns

An iterator that points to the inserted element.

This function inserts an element into the multiset. Contrary to a `std::set` the multiset does not rely on unique keys and thus multiple copies of the same element can be inserted.

Insertion requires logarithmic time.

Referenced by `std::multiset< _Key, _Compare, _Alloc >::insert()`.

insert() [3/6]

```

template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::insert (
    const_iterator __hint,
    node_type && __nh ) [inline]

```

Re-insert an extracted node.

References `std::move()`.

insert() [4/6]

```

template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::insert (
    const_iterator __position,
    const value_type & __x ) [inline]

```

Inserts an element into the multiset.

Parameters

<code>__position</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__x</code>	Element to be inserted.

Returns

An iterator that points to the inserted element.

This function inserts an element into the multiset. Contrary to a `std::set` the multiset does not rely on unique keys and thus multiple copies of the same element can be inserted.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.↵associative.insert_hints for more on *hinting*.

Insertion requires logarithmic time (if the hint is not taken).

insert() [5/6]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
void std::multiset< _Key, _Compare, _Alloc >::insert (
    initializer_list< value_type > __l ) [inline]
```

Attempts to insert a list of elements into the multiset.

Parameters

<code>↵</code>	A <code>std::initializer_list<value_type></code> of elements to be inserted.
<code>↵</code>	
<code>↵</code>	
<code>↵</code>	
<code>/</code>	

Complexity similar to that of the range constructor.

References [std::multiset< _Key, _Compare, _Alloc >::insert\(\)](#).

insert() [6/6]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::insert (
    node_type && __nh ) [inline]
```

Re-insert an extracted node.

References [std::move\(\)](#).

key_comp()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
key_compare std::multiset< _Key, _Compare, _Alloc >::key_comp ( ) const [inline]
```

Returns the comparison object.

lower_bound() [1/4]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
```

```

_Key>>
template<typename _Kt >
auto std::multiset< _Key, _Compare, _Alloc >::lower_bound (
    const _Kt & __x ) -> decltype(iterator(_M_t._M_lower_bound_tr(__x)))    [inline]

```

Finds the beginning of a subsequence matching given key.

Parameters

<code>_↔</code>	Key to be located.
<code>_X</code>	

Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

lower_bound() [2/4]

```

template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↔
_Key>>
template<typename _Kt >
auto std::multiset< _Key, _Compare, _Alloc >::lower_bound (
    const _Kt & __x ) const -> decltype(iterator(_M_t._M_lower_bound_tr(__x)))    [inline]

```

Finds the beginning of a subsequence matching given key.

Parameters

<code>_↔</code>	Key to be located.
<code>_X</code>	

Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

lower_bound() [3/4]

```

template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↔
_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::lower_bound (
    const key_type & __x ) [inline]

```

Finds the beginning of a subsequence matching given key.

Parameters

<code>_↔</code>	Key to be located.
<code>_X</code>	

Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

lower_bound() [4/4]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
const_iterator std::multiset< _Key, _Compare, _Alloc >::lower_bound (
    const key_type & __x ) const [inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

<code>↵</code>	Key to be located.
<code>__x</code>	

Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

max_size()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
size_type std::multiset< _Key, _Compare, _Alloc >::max_size ( ) const [inline], [noexcept]
```

Returns the maximum size of the set.

operator=() [1/3]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
multiset & std::multiset< _Key, _Compare, _Alloc >::operator= (
    const multiset< _Key, _Compare, _Alloc > & ) [default]
```

Multiset assignment operator.

Whether the allocator is copied depends on the allocator traits.

operator=() [2/3]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
multiset & std::multiset< _Key, _Compare, _Alloc >::operator= (
    initializer_list< value_type > __l ) [inline]
```

Multiset list assignment operator.

Parameters

↵	An initializer_list.
_↵	
↵	
_↵	
/	

This function fills a multiset with copies of the elements in the initializer list __l.

Note that the assignment completely changes the multiset and that the resulting multiset's size is the same as the number of elements assigned.

operator=() [3/3]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
multiset & std::multiset< _Key, _Compare, _Alloc >::operator= (
    multiset< _Key, _Compare, _Alloc > && ) [default]
```

Move assignment operator.

rbegin()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
reverse_iterator std::multiset< _Key, _Compare, _Alloc >::rbegin ( ) const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the multiset. Iteration is done in descending order according to the keys.

rend()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
reverse_iterator std::multiset< _Key, _Compare, _Alloc >::rend ( ) const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the multiset. Iteration is done in descending order according to the keys.

size()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
size_type std::multiset< _Key, _Compare, _Alloc >::size ( ) const [inline], [noexcept]
```

Returns the size of the set.

swap()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
void std::multiset< _Key, _Compare, _Alloc >::swap (
    multiset< _Key, _Compare, _Alloc > & __x ) [inline], [noexcept]
```

Swaps data with another multiset.

Parameters

_↵	A multiset of the same element and allocator types.
_X	

This exchanges the elements between two multisets in constant time. (It is only swapping a pointer, an integer, and an instance of the `Compare` type (which itself is often stateless and empty), so it should be quite fast.) Note that the global `std::swap()` function is specialized such that `std::swap(s1,s2)` will feed to this function.

Whether the allocators are swapped depends on the allocator traits.

upper_bound() [1/4]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename _Kt >
auto std::multiset< _Key, _Compare, _Alloc >::upper_bound (
    const _Kt & __x ) -> decltype(iterator(_M_t._M_upper_bound_tr(__x)))    [inline]
```

Finds the end of a subsequence matching given key.

Parameters

<code>_Key</code>	Key to be located.
<code>__x</code>	

Returns

Iterator pointing to the first element greater than key, or end().

upper_bound() [2/4]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename _Kt >
auto std::multiset< _Key, _Compare, _Alloc >::upper_bound (
    const _Kt & __x ) const -> decltype(iterator(_M_t._M_upper_bound_tr(__x)))    [inline]
```

Finds the end of a subsequence matching given key.

Parameters

<code>_Key</code>	Key to be located.
<code>__x</code>	

Returns

Iterator pointing to the first element greater than key, or end().

upper_bound() [3/4]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
iterator std::multiset< _Key, _Compare, _Alloc >::upper_bound (
    const key_type & __x )    [inline]
```

Finds the end of a subsequence matching given key.

Parameters

<code>_Key</code>	Key to be located.
<code>__x</code>	

Returns

Iterator pointing to the first element greater than key, or end().

upper_bound() [4/4]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
const_iterator std::multiset< _Key, _Compare, _Alloc >::upper_bound (
    const key_type & __x ) const [inline]
```

Finds the end of a subsequence matching given key.

Parameters

<code>__x</code>	Key to be located.
------------------	--------------------

Returns

Iterator pointing to the first element greater than key, or end().

value_comp()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
value_compare std::multiset< _Key, _Compare, _Alloc >::value_comp ( ) const [inline]
```

Returns the comparison object.

The documentation for this class was generated from the following file:

- [stl_multiset.h](#)

5.714 __gnu_parallel::multiway_mergesort_exact_tag Struct Reference

```
#include <tags.h>
```

Inheritance diagram for __gnu_parallel::multiway_mergesort_exact_tag:

Find out desired number of threads.

Returns

Desired number of threads.

Referenced by `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, and `__gnu_parallel::__parallel_sort()`.

`set_num_threads()`

```
void __gnu_parallel::parallel_tag::set_num_threads (
    \_ThreadIndex __num_threads ) [inline], [inherited]
```

Set the desired number of threads.

Parameters

<code>__num_threads</code>	Desired number of threads.

5.720.1 Detailed Description

template<typename _IntType = int>
class std::negative_binomial_distribution<_IntType>

A negative_binomial_distribution random number distribution.

The formula for the negative binomial probability mass function is $p(i) = \binom{n}{i} p^i (1-p)^{t-i}$ where t and p are the parameters of the distribution.

5.720.2 Member Typedef Documentation

result_type

```
template<typename _IntType = int>
typedef _IntType std::negative\_binomial\_distribution< _IntType >::result_type
```

The type of the range of the distribution.

5.720.3 Member Function Documentation

k()

```
template<typename _IntType = int>
_IntType std::negative\_binomial\_distribution< _IntType >::k ( ) const [inline]
```

Return the k parameter of the distribution.

max()

```
template<typename _IntType = int>
result\_type std::negative\_binomial\_distribution< _IntType >::max ( ) const [inline]
```

Returns the least upper bound value of the distribution.
References [std::numeric_limits<_Tp>::max\(\)](#).

min()

```
template<typename _IntType = int>
result\_type std::negative\_binomial\_distribution< _IntType >::min ( ) const [inline]
```

Returns the greatest lower bound value of the distribution.

operator()

```
template<typename _IntType >
template<typename _UniformRandomNumberGenerator >
negative_binomial_distribution< _IntType >::result_type std::negative_binomial_distribution< _↵
_IntType >::operator() (
    _UniformRandomNumberGenerator & __urng )
```

Generating functions.

p()

```
template<typename _IntType = int>
double std::negative_binomial_distribution< _IntType >::p ( ) const [inline]
```

Return the p parameter of the distribution.

param() [1/2]

```
template<typename _IntType = int>
param_type std::negative_binomial_distribution< _IntType >::param ( ) const [inline]
```

Returns the parameter set of the distribution.

param() [2/2]

```
template<typename _IntType = int>
void std::negative_binomial_distribution< _IntType >::param (
    const param_type & __param ) [inline]
```

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--------------------------------------------

reset()

```
template<typename _IntType = int>
void std::negative_binomial_distribution< _IntType >::reset ( ) [inline]
```

Resets the distribution state.
References [std::gamma_distribution< _RealType >::reset\(\)](#).

5.720.4 Friends And Related Symbol Documentation**operator<<**

```
template<typename _IntType = int>
template<typename _IntType1 , typename _CharT , typename _Traits >
std::basic_ostream< _CharT, _Traits > & operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::negative_binomial_distribution< _IntType1 > & __x ) [friend]
```

Inserts a `negative_binomial_distribution` random number distribution `__x` into the output stream `__os`.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>negative_binomial_distribution</code> random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

operator==

```
template<typename _IntType = int>
bool operator== (
    const negative\_binomial\_distribution< _IntType > & __d1,
    const negative\_binomial\_distribution< _IntType > & __d2 ) [friend]
```

Return true if two negative binomial distributions have the same parameters and the sequences that would be generated are equal.

operator>>

```
template<typename _IntType = int>
template<typename _IntType1 , typename _CharT , typename _Traits >
std::basic\_istream< _CharT, _Traits > & operator>> (
    std::basic\_istream< _CharT, _Traits > & __is,
    std::negative\_binomial\_distribution< _IntType1 > & __x ) [friend]
```

Extracts a `negative_binomial_distribution` random number distribution `__x` from the input stream `__is`.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A <code>negative_binomial_distribution</code> random number generator engine.

Returns

The input stream with `__x` extracted or in an error state.

5.727.1 Detailed Description

template<typename _RealType = double>
class std::normal_distribution<_RealType>

A normal continuous distribution for random numbers.
The formula for the normal probability density function is

$$p(x|\mu, \sigma) = \frac{1}{\sigma\sqrt{2\pi}} e^{-\frac{x-\mu}{2\sigma^2}}$$

5.727.2 Member Typedef Documentation

result_type

```
template<typename _RealType = double>
typedef _RealType std::normal_distribution< _RealType >::result_type
```

The type of the range of the distribution.

5.727.3 Constructor & Destructor Documentation

normal_distribution()

```
template<typename _RealType = double>
std::normal_distribution< _RealType >::normal_distribution (
    result_type __mean,
    result_type __stddev = result_type(1) ) [inline], [explicit]
```

Constructs a normal distribution with parameters *mean* and standard deviation.

5.727.4 Member Function Documentation

max()

```
template<typename _RealType = double>
result_type std::normal_distribution< _RealType >::max ( ) const [inline]
```

Returns the least upper bound value of the distribution.

References [std::numeric_limits<_Tp>::max\(\)](#).

mean()

```
template<typename _RealType = double>
_RealType std::normal_distribution< _RealType >::mean ( ) const [inline]
Returns the mean of the distribution.
```

min()

```
template<typename _RealType = double>
result_type std::normal_distribution< _RealType >::min ( ) const [inline]
Returns the greatest lower bound value of the distribution.
References std::numeric\_limits< \_Tp >::lowest\(\).
```

operator>() [1/2]

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator >
result_type std::normal_distribution< _RealType >::operator() (
    _UniformRandomNumberGenerator & __urng ) [inline]

Referenced by [std::normal_distribution< _RealType >::operator>\(\)](#).

operator>() [2/2]

```
template<typename _RealType >
template<typename _UniformRandomNumberGenerator >
normal_distribution< _RealType >::result_type std::normal_distribution< _RealType >::operator()
(
    _UniformRandomNumberGenerator & __urng,
    const param_type & __param )
```

Polar method due to Marsaglia.

Devroye, L. Non-Uniform Random Variates Generation. Springer-Verlag, New York, 1986, Ch. V, Sect. 4.4.

References [std::log\(\)](#), and [std::sqrt\(\)](#).

param() [1/2]

```
template<typename _RealType = double>
param_type std::normal_distribution< _RealType >::param ( ) const [inline]
Returns the parameter set of the distribution.
```

param() [2/2]

```
template<typename _RealType = double>
void std::normal_distribution< _RealType >::param (
    const param_type & __param ) [inline]
```

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--------------------------------------------

reset()

```
template<typename _RealType = double>
void std::normal_distribution<_RealType>::reset ( ) [inline]
```

Resets the distribution state.

Referenced by [std::lognormal_distribution<_RealType>::reset\(\)](#), [std::gamma_distribution<_RealType>::reset\(\)](#), [std::student_t_distribution<_RealType>::reset\(\)](#), [std::binomial_distribution<_IntType>::reset\(\)](#), and [std::poisson_distribution<_IntType>::reset\(\)](#).

stddev()

```
template<typename _RealType = double>
_RealType std::normal_distribution<_RealType>::stddev ( ) const [inline]
```

Returns the standard deviation of the distribution.

5.727.5 Friends And Related Symbol Documentation**operator<<**

```
template<typename _RealType = double>
template<typename _RealType1 , typename _CharT , typename _Traits >
std::basic_ostream<_CharT, _Traits> & operator<< (
    std::basic_ostream<_CharT, _Traits> & __os,
    const std::normal_distribution<_RealType1> & __x ) [friend]
```

Inserts a normal_distribution random number distribution __x into the output stream __os.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A normal_distribution random number distribution.

Returns

The output stream with the state of __x inserted or in an error state.

operator==

```
template<typename _RealType = double>
template<typename _RealType1 >
bool operator== (
    const std::normal_distribution<_RealType1> & __d1,
    const std::normal_distribution<_RealType1> & __d2 ) [friend]
```

Return true if two normal distributions have the same parameters and the sequences that would be generated are equal.

operator>>

```
template<typename _RealType = double>
template<typename _RealType1 , typename _CharT , typename _Traits >
std::basic_istream<_CharT, _Traits> & operator>> (
    std::basic_istream<_CharT, _Traits> & __is,
    std::normal_distribution<_RealType1> & __x ) [friend]
```

Extracts a normal_distribution random number distribution __x from the input stream __is.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A <code>normal_distribution</code> random number generator engine.

Returns

The input stream with `__x` extracted or in an error state.

5.734.1 Detailed Description

`template<typename _CharT, typename _InIter>`
class `std::num_get<_CharT, _InIter>`

Primary class template `num_get`.

This facet encapsulates the code to parse and return a number from a string. It is used by the istream numeric extraction operators.

The `num_get` template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the `num_get` facet.

5.734.2 Member Typedef Documentation

char_type

```
template<typename _CharT , typename _InIter >
typedef _CharT std::num_get< _CharT, _InIter >::char_type
```

Public typedefs.

iter_type

```
template<typename _CharT , typename _InIter >
typedef _InIter std::num_get< _CharT, _InIter >::iter_type
```

Public typedefs.

5.734.3 Constructor & Destructor Documentation

num_get()

```
template<typename _CharT , typename _InIter >
std::num_get< _CharT, _InIter >::num_get (
    size_t __refs = 0 ) [inline], [explicit]
```

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

<code>__refs</code>	Passed to the base facet class.
---------------------	---------------------------------

~num_get()

```
template<typename _CharT , typename _InIter >
virtual std::num_get< _CharT, _InIter >::~num_get ( ) [inline], [protected], [virtual]
```

Destructor.

5.734.4 Member Function Documentation

do_get() [1/11]

```
template<typename _CharT , typename _InIter >
virtual iter_type std::num_get< _CharT, _InIter >::do_get (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    long & __v ) const [inline], [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable `v`. This function is a hook for derived classes to change the value returned.

See also

`get()` for more details.

Parameters

<code>__beg</code>	Start of input stream.
--------------------	------------------------

Parameters

<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

do_get() [2/11]

```
template<typename _CharT , typename _InIter >
virtual iter_type std::num_get< _CharT, _InIter >::do_get (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    long long & __v ) const [inline], [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable `v`. This function is a hook for derived classes to change the value returned.

See also

`get()` for more details.

Parameters

<code>__beg</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

do_get() [3/11]

```
template<typename _CharT , typename _InIter >
virtual iter_type std::num_get< _CharT, _InIter >::do_get (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    unsigned int & __v ) const [inline], [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable `v`. This function is a hook for derived classes to change the value returned.

See also

`get()` for more details.

Parameters

<code>__beg</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

do_get() [4/11]

```
template<typename _CharT , typename _InIter >
virtual iter_type std::num_get< _CharT, _InIter >::do_get (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    unsigned long & __v ) const [inline], [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable `v`. This function is a hook for derived classes to change the value returned.

See also

`get()` for more details.

Parameters

<code>__beg</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

do_get() [5/11]

```
template<typename _CharT , typename _InIter >
virtual iter_type std::num_get< _CharT, _InIter >::do_get (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
```

```
ios_base::iostate & __err,
unsigned long long & __v ) const [inline], [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See also

get() for more details.

Parameters

<code>__beg</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

do_get() [6/11]

```
template<typename _CharT , typename _InIter >
virtual iter_type std::num_get< _CharT, _InIter >::do_get (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    unsigned short & __v ) const [inline], [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See also

get() for more details.

Parameters

<code>__beg</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

do_get() [7/11]

```
template<typename _CharT , typename _InIter >
```

```

_InIter std::num_get< _CharT, _InIter >::do_get (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    bool & __v ) const [protected], [virtual]

```

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See also

[get\(\)](#) for more details.

Parameters

<code>__beg</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

do_get() [11/11]

```
template<typename _CharT , typename _InIter >
_InIter std::num_get< _CharT, _InIter >::do_get (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    void *& __v ) const [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See also

[get\(\)](#) for more details.

Parameters

<code>__beg</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

References [std::ios_base::basefield](#), [std::ios_base::flags\(\)](#), and [std::ios_base::hex](#).

get() [1/11]

```
template<typename _CharT , typename _InIter >
iter_type std::num_get< _CharT, _InIter >::get (
    iter_type __in,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    bool & __v ) const [inline]
```

Numeric parsing.

Parses the input stream into the bool *v*. It does so by calling num_get::do_get().

If ios_base::boolalpha is set, attempts to read ctype<CharT>::trunename() or ctype<CharT>::falsename(). Sets *v* to true or false if successful. Sets err to ios_base::failbit if reading the string fails. Sets err to ios_base::eofbit if the stream is emptied.

If ios_base::boolalpha is not set, proceeds as with reading a long, except if the value is 1, sets *v* to true, if the value is 0, sets *v* to false, and otherwise set err to ios_base::failbit.

Parameters

<code>__in</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

References [std::num_get< _CharT, _InIter >::do_get\(\)](#).

Referenced by [std::basic_istream< _CharT, _Traits >::operator>>\(\)](#).

get() [2/11]

```
template<typename _CharT , typename _InIter >
iter_type std::num_get< _CharT, _InIter >::get (
    iter_type __in,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    double & __v ) const [inline]
```

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling num_get::do_get().

The input characters are parsed like the scanf g specifier. The matching type length modifier is also used.

The decimal point character used is numpunct::decimal_point(). Digit grouping is interpreted according to numpunct::grouping() and numpunct::thousands_sep(). If the pattern of digit groups isn't consistent, sets err to ios_base::failbit.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets err to ios_base::failbit and leaves *v* unaltered. Sets err to ios_base::eofbit if the stream is emptied.

Parameters

<code>__in</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

References [std::num_get< _CharT, _InIter >::do_get\(\)](#).

get() [3/11]

```
template<typename _CharT , typename _InIter >
iter_type std::num_get< _CharT, _InIter >::get (
    iter_type __in,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    float & __v ) const [inline]
```

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling `num_get::do_get()`.

The input characters are parsed like the `scanf g` specifier. The matching type length modifier is also used.

The decimal point character used is `numpunct::decimal_point()`. Digit grouping is interpreted according to `numpunct::grouping()` and `numpunct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets `err` to `ios_base::failbit`. If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets `err` to `ios_base::failbit` and leaves *v* unaltered. Sets `err` to `ios_base::eofbit` if the stream is emptied.

Parameters

<code>__in</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

References `std::num_get< _CharT, _InIter >::do_get()`.

get() [4/11]

```
template<typename _CharT , typename _InIter >
iter_type std::num_get< _CharT, _InIter >::get (
    iter_type __in,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    long & __v ) const [inline]
```

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling `num_get::do_get()`.

Parsing is affected by the flag settings in *io*.

The basic parse is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, parses like the `scanf o` specifier. Else if equal to `ios_base::hex`, parses like `X` specifier. Else if `basefield` equal to 0, parses like the `i` specifier. Otherwise, parses like `d` for signed and `u` for unsigned types. The matching type length modifier is also used. Digit grouping is interpreted according to `numpunct::grouping()` and `numpunct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets `err` to `ios_base::failbit`.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets `err` to `ios_base::failbit` and leaves *v* unaltered. Sets `err` to `ios_base::eofbit` if the stream is emptied.

Parameters

<code>__in</code>	Start of input stream.
-------------------	------------------------

Parameters

<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

References [std::num_get<_CharT, _InIter >::do_get\(\)](#).

get() [5/11]

```
template<typename _CharT , typename _InIter >
iter_type std::num_get< _CharT, _InIter >::get (
    iter_type __in,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    long double & __v ) const [inline]
```

Numeric parsing.

Parses the input stream into the integral variable `v`. It does so by calling `num_get::do_get()`.

The input characters are parsed like the `scanf g` specifier. The matching type length modifier is also used.

The decimal point character used is `num_punct::decimal_point()`. Digit grouping is interpreted according to `num_punct::grouping()` and `num_punct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets `err` to `ios_base::failbit`.

If parsing the string yields a valid value for `v`, `v` is set. Otherwise, sets `err` to `ios_base::failbit` and leaves `v` unaltered. Sets `err` to `ios_base::eofbit` if the stream is emptied.

Parameters

<code>__in</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

References [std::num_get<_CharT, _InIter >::do_get\(\)](#).

get() [6/11]

```
template<typename _CharT , typename _InIter >
iter_type std::num_get< _CharT, _InIter >::get (
    iter_type __in,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    long long & __v ) const [inline]
```

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling `num_get::do_get()`.

Parsing is affected by the flag settings in *io*.

The basic parse is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, parses like the `scanf` `o` specifier. Else if equal to `ios_base::hex`, parses like `X` specifier. Else if `basefield` equal to 0, parses like the `i` specifier. Otherwise, parses like `d` for signed and `u` for unsigned types. The matching type length modifier is also used. Digit grouping is interpreted according to `numpunct::grouping()` and `numpunct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets `err` to `ios_base::failbit`.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets `err` to `ios_base::failbit` and leaves *v* unaltered. Sets `err` to `ios_base::eofbit` if the stream is emptied.

Parameters

<code>__in</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

References `std::num_get< _CharT, _InIter >::do_get()`.

get() [7/11]

```
template<typename _CharT , typename _InIter >
iter_type std::num_get< _CharT, _InIter >::get (
    iter_type __in,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    unsigned int & __v ) const [inline]
```

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling `num_get::do_get()`.

Parsing is affected by the flag settings in *io*.

The basic parse is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, parses like the `scanf` `o` specifier. The matching type length modifier is also used. Digit grouping is interpreted according to `numpunct::grouping()` and `numpunct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets `err` to `ios_base::failbit`.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets `err` to `ios_base::failbit` and leaves *v* unaltered. Sets `err` to `ios_base::eofbit` if the stream is emptied.

Parameters

<code>__in</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

References [std::num_get<_CharT, _InIter >::do_get\(\)](#).

get() [8/11]

```
template<typename _CharT , typename _InIter >
iter_type std::num_get< _CharT, _InIter >::get (
    iter_type __in,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    unsigned long & __v ) const [inline]
```

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling `num_get::do_get()`.

Parsing is affected by the flag settings in *io*.

The basic parse is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, parses like the `scanf` `o` specifier. Else if equal to `ios_base::hex`, parses like `X` specifier. Else if `basefield` equal to 0, parses like the `i` specifier. Otherwise, parses like `d` for signed and `u` for unsigned types. The matching type length modifier is also used. Digit grouping is interpreted according to `numpunct::grouping()` and `numpunct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets `err` to `ios_base::failbit`.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets `err` to `ios_base::failbit` and leaves *v* unaltered.

Sets `err` to `ios_base::eofbit` if the stream is emptied.

Parameters

<code>__in</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

References [std::num_get<_CharT, _InIter >::do_get\(\)](#).

get() [9/11]

```
template<typename _CharT , typename _InIter >
iter_type std::num_get< _CharT, _InIter >::get (
    iter_type __in,
    iter_type __end,

template<typename _CharT, typename _InIter >
iter_type std::num_get< _CharT, _InIter >::get (
    iter_type __in,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    unsigned short & __v ) const [inline]
```

Numeric parsing.

Parses the input stream into the integral variable `v`. It does so by calling `num_get::do_get()`.

Parsing is affected by the flag settings in `io`.

The basic parse is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, parses like the `scanf` `o` specifier. Else if equal to `ios_base::hex`, parses like `X` specifier. Else if `basefield` equal to 0, parses like the `i` specifier. Otherwise, parses like `d` for signed and `u` for unsigned types. The matching type length modifier is also used. Digit grouping is interpreted according to `numpunct::grouping()` and `numpunct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets `err` to `ios_base::failbit`.

If parsing the string yields a valid value for `v`, `v` is set. Otherwise, sets `err` to `ios_base::failbit` and leaves `v` unaltered. Sets `err` to `ios_base::eofbit` if the stream is emptied.

Parameters

<code>__in</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

References [std::num_get<_CharT, _InIter >::do_get\(\)](#).

get() [11/11]

```
template<typename _CharT , typename _InIter >
iter_type std::num_get< _CharT, _InIter >::get (
    iter_type __in,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    void *& __v ) const [inline]
```

Numeric parsing.

Parses the input stream into the pointer variable *v*. It does so by calling num_get::do_get().

The input characters are parsed like the scanf *p* specifier.

Digit grouping is interpreted according to numpunct::grouping() and numpunct::thousands_sep(). If the pattern of digit groups isn't consistent, sets err to ios_base::failbit.

Note that the digit grouping effect for pointers is a bit ambiguous in the standard and shouldn't be relied on. See DR 344.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets err to ios_base::failbit and leaves *v* unaltered. Sets err to ios_base::eofbit if the stream is emptied.

Parameters

<code>__in</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

Returns

Iterator after reading.

5.735.1 Detailed Description

```
template<typename _CharT, typename _OutIter>
class std::num_put< _CharT, _OutIter >
```

Primary class template num_put.

This facet encapsulates the code to convert a number to a string. It is used by the ostream numeric insertion operators. The num_put template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the num_put facet.

5.735.2 Member Typedef Documentation

char_type

```
template<typename _CharT , typename _OutIter >
typedef _CharT std::num_put< _CharT, _OutIter >::char_type
```

Public typedefs.

iter_type

```
template<typename _CharT , typename _OutIter >
typedef _OutIter std::num_put< _CharT, _OutIter >::iter_type
```

Public typedefs.

5.735.3 Constructor & Destructor Documentation

num_put()

```
template<typename _CharT , typename _OutIter >
std::num_put< _CharT, _OutIter >::num_put (
    size_t __refs = 0 ) [inline], [explicit]
```

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

<code>__refs</code>	Passed to the base facet class.
---------------------	---------------------------------

~num_put()

```
template<typename _CharT , typename _OutIter >
virtual std::num_put< _CharT, _OutIter >::~~num_put ( ) [inline], [protected], [virtual]
```

Destructor.

5.735.4 Member Function Documentation

do_put() [1/8]

```
template<typename _CharT , typename _OutIter >
_OutIter std::num_put< _CharT, _OutIter >::do_put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    bool __v ) const [protected], [virtual]
```

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

Returns

Iterator after writing.

do_put() [2/8]

```
template<typename _CharT , typename _OutIter >
virtual iter_type std::num_put< _CharT, _OutIter >::do_put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    long __v ) const [inline], [protected], [virtual]
```

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

Returns

Iterator after writing.

do_put() [3/8]

```
template<typename _CharT , typename _OutIter >
virtual iter_type std::num_put< _CharT, _OutIter >::do_put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    long long __v ) const [inline], [protected], [virtual]
```

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

Returns

Iterator after writing.

do_put() [4/8]

```
template<typename _CharT , typename _OutIter >
virtual iter_type std::num_put< _CharT, _OutIter >::do_put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    unsigned long __v ) const [inline], [protected], [virtual]
```

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

Returns

Iterator after writing.

do_put() [5/8]

```
template<typename _CharT , typename _OutIter >
virtual iter_type std::num_put< _CharT, _OutIter >::do_put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    unsigned long long __v ) const [inline], [protected], [virtual]
```

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

Returns

Iterator after writing.

do_put() [6/8]

```
template<typename _CharT , typename _OutIter >
_OutIter std::num_put< _CharT, _OutIter >::do_put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    const void * __v ) const [protected], [virtual]
```

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

Returns

Iterator after writing.

References [std::ios_base::basefield](#), [std::ios_base::flags\(\)](#), [std::ios_base::hex](#), [std::ios_base::showbase](#), and [std::ios_base::uppercase](#).

do_put() [7/8]

```
template<typename _CharT , typename _OutIter >
_OutIter std::num_put< _CharT, _OutIter >::do_put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    double __v ) const [protected], [virtual]
```

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.

Parameters

<code>__v</code>	Value to format and insert.
------------------	-----------------------------

Returns

Iterator after writing.

do_put() [8/8]

```
template<typename _CharT , typename _OutIter >
_OutIter std::num_put< _CharT, _OutIter >::do_put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    long double __v ) const [protected], [virtual]
```

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

Returns

Iterator after writing.

put() [1/8]

```
template<typename _CharT , typename _OutIter >
iter_type std::num_put< _CharT, _OutIter >::put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    bool __v ) const [inline]
```

Numeric formatting.

Formats the boolean `v` and inserts it into a stream. It does so by calling `num_put::do_put()`.

If `ios_base::boolalpha` is set, writes `ctype<CharT>::truename()` or `ctype<CharT>::falsename()`. Otherwise formats `v` as an int.

Parameters

<code>__s</code>	Stream to write to.
------------------	---------------------

Parameters

 <code>__io</code>	Source of locale and flags.
 <code>__fill</code>	Char_type to use for filling.
 <code>__v</code>	Value to format and insert.

Returns

Iterator after writing.

References [std::num_put<_CharT, _OutIter >::do_put\(\)](#).

Referenced by [std::basic_ostream<_CharT, _Traits >::operator<<\(\)](#).

put() [2/8]

```
template<typename _CharT , typename _OutIter >
iter_type std::num_put< _CharT, _OutIter >::put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    const void * __v ) const [inline]
```

Numeric formatting.

Formats the pointer value `v` and inserts it into a stream. It does so by calling `num_put::do_put()`.

This function formats `v` as an unsigned long with `ios_base::hex` and `ios_base::showbase` set.

Parameters

 <code>__s</code>	Stream to write to.
 <code>__io</code>	Source of locale and flags.
 <code>__fill</code>	Char_type to use for filling.
 <code>__v</code>	Value to format and insert.

Returns

Iterator after writing.

References [std::num_put<_CharT, _OutIter >::do_put\(\)](#).

put() [3/8]

```
template<typename _CharT , typename _OutIter >
iter_type std::num_put< _CharT, _OutIter >::put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    double __v ) const [inline]
```

Numeric formatting.

Formats the floating point value *v* and inserts it into a stream. It does so by calling `num_put::do_put()`.

Formatting is affected by the flag settings in *io*.

The basic format is affected by the value of `io.flags()` & `ios_base::floatfield`. If equal to `ios_base::fixed`, formats like the `printf f` specifier. Else if equal to `ios_base::scientific`, formats like `e` or `E` with `ios_base::uppercase` unset or set respectively. Otherwise, formats like `g` or `G` depending on uppercase. Note that if both fixed and scientific are set, the effect will also be like `g` or `G`.

The output precision is given by `io.precision()`. This precision is capped at `numeric_limits::digits10 + 2` (different for double and long double). The default precision is 6.

If `ios_base::showpos` is set, '+' is output before positive values. If `ios_base::showpoint` is set, a decimal point will always be output.

The decimal point character used is `num_punct::decimal_point()`. Thousands separators are inserted according to `num_punct::grouping()` and `num_punct::thousands_sep()`.

If `io.width()` is non-zero, enough *fill* characters are inserted to make the result at least that wide. If `(io.flags() & ios_base::adjustfield) == ios_base::left`, result is padded at the end. If `ios_base::internal`, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

Returns

Iterator after writing.

References `std::num_put<_CharT, _OutIter>::do_put()`.

put() [4/8]

```
template<typename _CharT, typename _OutIter>
iter_type std::num_put<_CharT, _OutIter>::put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    long __v ) const [inline]
```

Numeric formatting.

Formats the integral value *v* and inserts it into a stream. It does so by calling `num_put::do_put()`.

Formatting is affected by the flag settings in *io*.

The basic format is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, formats like the `printf o` specifier. Else if equal to `ios_base::hex`, formats like `x` or `X` with `ios_base::uppercase` unset or set respectively. Otherwise, formats like `d`, `ld`, `lld` for signed and `u`, `lu`, `llu` for unsigned values. Note that if both oct and hex are set, neither will take effect.

If `ios_base::showpos` is set, '+' is output before positive values. If `ios_base::showbase` is set, '0' precedes octal values (except 0) and '0[xX]' precedes hex values.

The decimal point character used is `num_punct::decimal_point()`. Thousands separators are inserted according to `num_punct::grouping()` and `num_punct::thousands_sep()`.

If `io.width()` is non-zero, enough *fill* characters are inserted to make the result at least that wide. If `(io.flags() & ios_base::adjustfield) == ios_base::left`, result is padded at the end. If `ios_base::internal`, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

Parameters

\leftarrow <code>__s</code>	Stream to write to.
\leftarrow <code>__io</code>	Source of locale and flags.
\leftarrow <code>__fill</code>	Char_type to use for filling.
\leftarrow <code>__v</code>	Value to format and insert.

Returns

Iterator after writing.

References [std::num_put<_CharT, _OutIter >::do_put\(\)](#).

put() [5/8]

```
template<typename _CharT , typename _OutIter >
iter_type std::num_put< _CharT, _OutIter >::put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    long double __v ) const [inline]
```

Numeric formatting.

Formats the floating point value *v* and inserts it into a stream. It does so by calling `num_put::do_put()`.

Formatting is affected by the flag settings in *io*.

The basic format is affected by the value of `io.flags()` & `ios_base::floatfield`. If equal to `ios_base::fixed`, formats like the `printf f` specifier. Else if equal to `ios_base::scientific`, formats like `e` or `E` with `ios_base::uppercase` unset or set respectively. Otherwise, formats like `g` or `G` depending on uppercase. Note that if both fixed and scientific are set, the effect will also be like `g` or `G`.

The output precision is given by `io.precision()`. This precision is capped at `numeric_limits::digits10 + 2` (different for double and long double). The default precision is 6.

If `ios_base::showpos` is set, '+' is output before positive values. If `ios_base::showpoint` is set, a decimal point will always be output.

The decimal point character used is `numput::decimal_point()`. Thousands separators are inserted according to `numput::grouping()` and `numput::thousands_sep()`.

If `io.width()` is non-zero, enough *fill* characters are inserted to make the result at least that wide. If `(io.flags() & ios_base::adjustfield) == ios_base::left`, result is padded at the end. If `ios_base::internal`, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

Parameters

\leftarrow <code>__s</code>	Stream to write to.
\leftarrow <code>__io</code>	Source of locale and flags.
\leftarrow <code>__fill</code>	Char_type to use for filling.
\leftarrow <code>__v</code>	Value to format and insert.

Returns

Iterator after writing.

References [std::num_put<_CharT, _OutIter>::do_put\(\)](#).

put() [6/8]

```
template<typename _CharT, typename _OutIter>
iter_type std::num_put<_CharT, _OutIter>::put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    long long __v ) const [inline]
```

Numeric formatting.

Formats the integral value *v* and inserts it into a stream. It does so by calling `num_put::do_put()`.

Formatting is affected by the flag settings in *io*.

The basic format is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, formats like the `printf` `o` specifier. Else if equal to `ios_base::hex`, formats like `x` or `X` with `ios_base::uppercase` unset or set respectively. Otherwise, formats like `d`, `ld`, `lld` for signed and `u`, `lu`, `llu` for unsigned values. Note that if both `oct` and `hex` are set, neither will take effect.

If `ios_base::showpos` is set, '+' is output before positive values. If `ios_base::showbase` is set, '0' precedes octal values (except 0) and '0[xX]' precedes hex values.

The decimal point character used is `num_punct::decimal_point()`. Thousands separators are inserted according to `num_punct::grouping()` and `num_punct::thousands_sep()`.

If `io.width()` is non-zero, enough *fill* characters are inserted to make the result at least that wide. If `(io.flags() & ios_base::adjustfield) == ios_base::left`, result is padded at the end. If `ios_base::internal`, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

Returns

Iterator after writing.

References [std::num_put<_CharT, _OutIter>::do_put\(\)](#).

put() [7/8]

```
template<typename _CharT, typename _OutIter>
iter_type std::num_put<_CharT, _OutIter>::put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    unsigned long __v ) const [inline]
```

Numeric formatting.

Formats the integral value *v* and inserts it into a stream. It does so by calling num_put::do_put().

Formatting is affected by the flag settings in *io*.

The basic format is affected by the value of io.flags() & ios_base::basefield. If equal to ios_base::oct, formats like the printf o specifier. Else if equal to ios_base::hex, formats like x or X with ios_base::uppercase unset or set respectively. Otherwise, formats like d, ld, lld for signed and u, lu, llu for unsigned values. Note that if both oct and hex are set, neither will take effect.

If ios_base::showpos is set, '+' is output before positive values. If ios_base::showbase is set, '0' precedes octal values (except 0) and '0[xX]' precedes hex values.

The decimal point character used is numpunct::decimal_point(). Thousands separators are inserted according to numpunct::grouping() and numpunct::thousands_sep().

If io.width() is non-zero, enough *fill* characters are inserted to make the result at least that wide. If (io.flags() & ios_base::adjustfield) == ios_base::left, result is padded at the end. If ios_base::internal, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

Returns

Iterator after writing.

References [std::num_put< _CharT, _OutIter >::do_put\(\)](#).

put() [8/8]

```
template<typename _CharT , typename _OutIter >
iter_type std::num_put< _CharT, _OutIter >::put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    unsigned long long __v ) const [inline]
```

Numeric formatting.

Formats the integral value *v* and inserts it into a stream. It does so by calling num_put::do_put().

Formatting is affected by the flag settings in *io*.

The basic format is affected by the value of io.flags() & ios_base::basefield. If equal to ios_base::oct, formats like the printf o specifier. Else if equal to ios_base::hex, formats like x or X with ios_base::uppercase unset or set respectively. Otherwise, formats like d, ld, lld for signed and u, lu, llu for unsigned values. Note that if both oct and hex are set, neither will take effect.

If ios_base::showpos is set, '+' is output before positive values. If ios_base::showbase is set, '0' precedes octal values (except 0) and '0[xX]' precedes hex values.

The decimal point character used is numpunct::decimal_point(). Thousands separators are inserted according to numpunct::grouping() and numpunct::thousands_sep().

If io.width() is non-zero, enough *fill* characters are inserted to make the result at least that wide. If (io.flags() & ios_base::adjustfield) == ios_base::left, result is padded at the end. If ios_base::internal, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

Parameters

<code>_↔_s</code>	Stream to write to.
<code>_↔_io</code>	Source of locale and flags.
<code>_↔_fill</code>	Char_type to use for filling.
<code>_↔_v</code>	Value to format and insert.

Returns

Iterator after writing.

5.736.1 Detailed Description

template<typename `_Tp`>
struct `std::numeric_limits<_Tp>`

Properties of fundamental types.

This class allows a program to obtain information about the representation of a fundamental type on a given platform. For non-fundamental types, the functions will return 0 and the data members will all be `false`.

5.736.2 Member Function Documentation

`denorm_min()`

```
template<typename _Tp>
static constexpr _Tp std::numeric_limits<_Tp>::denorm_min ( ) [inline], [static], [constexpr],
[noexcept]
```

The minimum positive denormalized value. For types where `has_denorm` is `false`, this is the minimum positive normalized value.

epsilon()

```
template<typename _Tp >
static constexpr _Tp std::numeric_limits< _Tp >::epsilon ( ) [inline], [static], [constexpr],
[noexcept]
```

The *machine epsilon*: the difference between 1 and the least value greater than 1 that is representable.

Referenced by [std::generate_canonical\(\)](#), [std::binomial_distribution< _IntType >::operator\(\)\(\)](#), [std::poisson_distribution< _IntType >::operator\(\)\(\)](#), and [std::operator<<\(\)](#).

infinity()

```
template<typename _Tp >
static constexpr _Tp std::numeric_limits< _Tp >::infinity ( ) [inline], [static], [constexpr],
[noexcept]
```

The representation of positive infinity, if `has_infinity`.

lowest()

```
template<typename _Tp >
static constexpr _Tp std::numeric_limits< _Tp >::lowest ( ) [inline], [static], [constexpr],
[noexcept]
```

A finite value `x` such that there is no other finite value `y` where `y < x`.

Referenced by [std::normal_distribution< _RealType >::min\(\)](#), [std::cauchy_distribution< _RealType >::min\(\)](#), [std::student_t_distribution< _RealType >::min\(\)](#), and [std::extreme_value_distribution< _RealType >::min\(\)](#).

max()

```
template<typename _Tp >
static constexpr _Tp std::numeric_limits< _Tp >::max ( ) [inline], [static], [constexpr], [noexcept]
```

The maximum finite value.

Referenced by [std::normal_distribution< _RealType >::max\(\)](#), [std::lognormal_distribution< _RealType >::max\(\)](#), [std::gamma_distribution< _RealType >::max\(\)](#), [std::chi_squared_distribution< _RealType >::max\(\)](#), [std::cauchy_distribution< _RealType >::max\(\)](#), [std::fisher_f_distribution< _RealType >::max\(\)](#), [std::student_t_distribution< _RealType >::max\(\)](#), [std::bernoulli_distribution::max\(\)](#), [std::geometric_distribution< _IntType >::max\(\)](#), [std::negative_binomial_distribution< _IntType >::max\(\)](#), [std::poisson_distribution< _IntType >::max\(\)](#), [std::exponential_distribution< _RealType >::max\(\)](#), [std::weibull_distribution< _RealType >::max\(\)](#), [std::extreme_value_distribution< _RealType >::max\(\)](#), [std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::operator\(\)\(\)](#), [std::binomial_distribution< _IntType >::operator\(\)\(\)](#), [std::poisson_distribution< _IntType >::operator\(\)\(\)](#), and [std::operator<<\(\)](#).

min()

```
template<typename _Tp >
static constexpr _Tp std::numeric_limits< _Tp >::min ( ) [inline], [static], [constexpr], [noexcept]
```

The minimum finite value, or for floating types with denormalization, the minimum positive normalized value.

Referenced by [std::bernoulli_distribution::min\(\)](#), and [std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::operator\(\)\(\)](#).

quiet_NaN()

```
template<typename _Tp >
static constexpr _Tp std::numeric_limits< _Tp >::quiet_NaN ( ) [inline], [static], [constexpr],
[noexcept]
```

The representation of a quiet Not a Number, if `has_quiet_NaN`.

round_error()

```
template<typename _Tp >
static constexpr _Tp std::numeric_limits< _Tp >::round_error ( ) [inline], [static], [constexpr],
[noexcept]
```

The maximum rounding error measurement (see LIA-1).

signaling_NaN()

```
template<typename _Tp >
static constexpr _Tp std::numeric_limits< _Tp >::signaling_NaN ( ) [inline], [static], [constexpr],
[noexcept]
```

The representation of a signaling Not a Number, if has_signaling_NaN.

5.736.3 Member Data Documentation**digits**

```
constexpr int std::__numeric_limits_base::digits [static], [constexpr], [inherited]
```

The number of radix digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of radix digits in the mantissa.

digits10

```
constexpr int std::__numeric_limits_base::digits10 [static], [constexpr], [inherited]
```

The number of base 10 digits that can be represented without change.

has_denorm

```
constexpr float_denorm_style std::__numeric_limits_base::has_denorm [static], [constexpr], [inherited]
```

See std::float_denorm_style for more information.

has_denorm_loss

```
constexpr bool std::__numeric_limits_base::has_denorm_loss [static], [constexpr], [inherited]
```

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result.

has_infinity

```
constexpr bool std::__numeric_limits_base::has_infinity [static], [constexpr], [inherited]
```

True if the type has a representation for positive infinity.

has_quiet_NaN

```
constexpr bool std::__numeric_limits_base::has_quiet_NaN [static], [constexpr], [inherited]
```

True if the type has a representation for a quiet (non-signaling) Not a Number.

has_signaling_NaN

```
constexpr bool std::__numeric_limits_base::has_signaling_NaN [static], [constexpr], [inherited]
```

True if the type has a representation for a signaling Not a Number.

is_bounded

```
constexpr bool std::__numeric_limits_base::is_bounded [static], [constexpr], [inherited]
```

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types.

is_exact

```
constexpr bool std::__numeric_limits_base::is_exact [static], [constexpr], [inherited]
```

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer.

is_iec559

```
constexpr bool std::__numeric_limits_base::is_iec559 [static], [constexpr], [inherited]
```

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

is_integer

```
constexpr bool std::__numeric_limits_base::is_integer [static], [constexpr], [inherited]
```

True if the type is integer.

is_modulo

```
constexpr bool std::__numeric_limits_base::is_modulo [static], [constexpr], [inherited]
```

True if the type is *modulo*. A type is modulo if, for any operation involving +, -, or * on values of that type whose result would fall outside the range [min(),max()], the value returned differs from the true value by an integer multiple of max() - min() + 1. On most machines, this is false for floating types, true for unsigned integers, and true for signed integers. See PR22200 about signed integers.

is_signed

```
constexpr bool std::__numeric_limits_base::is_signed [static], [constexpr], [inherited]
```

True if the type is signed.

is_specialized

```
constexpr bool std::__numeric_limits_base::is_specialized [static], [constexpr], [inherited]
```

This will be true for all fundamental types (which have specializations), and false for everything else.

max_digits10

```
constexpr int std::__numeric_limits_base::max_digits10 [static], [constexpr], [inherited]
```

The number of base 10 digits required to ensure that values which differ are always differentiated.

max_exponent

```
constexpr int std::__numeric_limits_base::max_exponent [static], [constexpr], [inherited]
```

The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

max_exponent10

```
constexpr int std::__numeric_limits_base::max_exponent10 [static], [constexpr], [inherited]
```

The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

min_exponent

```
constexpr int std::__numeric_limits_base::min_exponent [static], [constexpr], [inherited]
```

The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

min_exponent10

```
constexpr int std::__numeric_limits_base::min_exponent10 [static], [constexpr], [inherited]
```

The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

radix

```
constexpr int std::__numeric_limits_base::radix [static], [constexpr], [inherited]
```

For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

round_style

```
constexpr float\_round\_style std::__numeric_limits_base::round_style [static], [constexpr], [inherited]
```

See `std::float_round_style` for more information. This is only meaningful for floating types; integer types will all be `round_toward_zero`.

tinyness_before

```
constexpr bool std::__numeric_limits_base::tinyness_before [static], [constexpr], [inherited]
```

True if tininess is detected before rounding. (see IEC 559)

traps

```
constexpr bool std::__numeric_limits_base::traps [static], [constexpr], [inherited]
```

True if trapping is implemented for this type.

5.755.1 Detailed Description

template<typename _CharT>
class std::numpunct<_CharT>

Primary class template numpunct.

This facet stores several pieces of information related to printing and scanning numbers, such as the decimal point character. It takes a template parameter specifying the char type. The numpunct facet is used by streams for many I/O operations involving numbers.

The numpunct template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from a numpunct facet.

5.755.2 Member Typedef Documentation

char_type

```
template<typename _CharT>
typedef _CharT std::numpunct<_CharT>::char_type
```

Public typedefs.

string_type

```
template<typename _CharT>
typedef basic_string<_CharT> std::numpunct<_CharT>::string_type
```

Public typedefs.

5.755.3 Constructor & Destructor Documentation

numpunct() [1/3]

```
template<typename _CharT>
std::numpunct<_CharT>::numpunct (
    size_t __refs = 0 ) [inline], [explicit]
```

Numpunct constructor.

Parameters

<code>__refs</code>	Refcount to pass to the base class.
---------------------	-------------------------------------

numpunct() [2/3]

```
template<typename _CharT >
std::num_punct< _CharT >::num_punct (
    __cache_type * __cache,
    size_t __refs = 0 ) [inline], [explicit]
```

Internal constructor. Not for general use.

This is a constructor for use by the library itself to set up the predefined locale facets.

Parameters

<code>__cache</code>	<code>__numpunct_cache</code> object.
<code>__refs</code>	RefCount to pass to the base class.

numpyunct() [3/3]

```
template<typename _CharT >
std::num_punct< _CharT >::num_punct (
    __c_locale __cloc,
    size_t __refs = 0 ) [inline], [explicit]
```

Internal constructor. Not for general use.

This is a constructor for use by the library itself to set up new locales.

Parameters

<code>__cloc</code>	The C locale.
<code>__refs</code>	RefCount to pass to the base class.

~numpunct()

```
template<typename _CharT >
virtual std::num\_punct< _CharT >::~~num\_punct ( ) [protected], [virtual]
```

Destructors.

5.755.4 Member Function Documentation

decimal_point()

```
template<typename _CharT >
char_type std::numprint< _CharT >::decimal_point ( ) const [inline]
```

Return decimal point character.

This function returns a `char_type` to use as a decimal point. It does so by returning `returning numpunct<char_type>::do_decimal_point()`.

Returns

char type representing a decimal point.

References `std::numpunct< CharT >::do_decimal_point()`.

do_decimal_point()

```
template<typename _CharT >
virtual char\_type std::num_punct<_CharT>::do_decimal_point ( ) const [inline], [protected], [virtual]
```

Return decimal point character.

Returns a `char_type` to use as a decimal point. This function is a hook for derived classes to change the value returned.

Returns

char_type representing a decimal point.

Referenced by [std::num_punct<_CharT>::decimal_point\(\)](#).

do_falsename()

```
template<typename _CharT >
virtual string\_type std::num_punct<_CharT>::do_falsename ( ) const [inline], [protected], [virtual]
```

Return string representation of bool false.

Returns a `string_type` containing the text representation for false bool variables. This function is a hook for derived classes to change the value returned.

Returns

`string_type` representing printed form of false.

Referenced by [std::num_punct<_CharT>::falsename\(\)](#).

do_grouping()

```
template<typename _CharT >
virtual string std::num_punct<_CharT>::do_grouping ( ) const [inline], [protected], [virtual]
```

Return grouping specification.

Returns a string representing groupings for the integer part of a number. This function is a hook for derived classes to change the value returned.

See also

`grouping()` for details.

Returns

String representing grouping specification.

Referenced by [std::num_punct<_CharT>::grouping\(\)](#).

do_thousands_sep()

```
template<typename _CharT >
virtual char\_type std::num_punct<_CharT>::do_thousands_sep ( ) const [inline], [protected], [virtual]
```

Return thousands separator character.

Returns a `char_type` to use as a thousands separator. This function is a hook for derived classes to change the value returned.

Returns

char_type representing a thousands separator.

Referenced by [std::num_punct<_CharT>::thousands_sep\(\)](#).

do_truename()

```
template<typename _CharT >
```

```
virtual string_type std::num_punct< _CharT >::do_truename ( ) const [inline], [protected], [virtual]
```

Return string representation of bool true.

Returns a string_type containing the text representation for true bool variables. This function is a hook for derived classes to change the value returned.

Returns

string_type representing printed form of true.

Referenced by [std::num_punct< _CharT >::truename\(\)](#).

falsename()

```
template<typename _CharT >
```

```
string_type std::num_punct< _CharT >::false_name ( ) const [inline]
```

Return string representation of bool false.

This function returns a string_type containing the text representation for false bool variables. It does so by calling num_punct<char_type>::do_false_name().

Returns

string_type representing printed form of false.

References [std::num_punct< _CharT >::do_false_name\(\)](#).

grouping()

```
template<typename _CharT >
```

```
string std::num_punct< _CharT >::grouping ( ) const [inline]
```

Return grouping specification.

This function returns a string representing groupings for the integer part of a number. Groupings indicate where thousands separators should be inserted in the integer part of a number.

Each char in the return string is interpreted as an integer rather than a character. These numbers represent the number of digits in a group. The first char in the string represents the number of digits in the least significant group. If a char is negative, it indicates an unlimited number of digits for the group. If more chars from the string are required to group a number, the last char is used repeatedly.

For example, if the grouping() returns "\003\002" and is applied to the number 123456789, this corresponds to 12,34,56,789. Note that if the string was "32", this would put more than 50 digits into the least significant group if the character set is ASCII.

The string is returned by calling num_punct<char_type>::do_grouping().

Returns

string representing grouping specification.

References [std::num_punct< _CharT >::do_grouping\(\)](#).

thousands_sep()

```
template<typename _CharT >
```

```
char_type std::num_punct< _CharT >::thousands_sep ( ) const [inline]
```

Return thousands separator character.

This function returns a char_type to use as a thousands separator. It does so by returning num_punct<char_type>::do_thousands_sep().

Returns

char_type representing a thousands separator.

References [std::num_punct< _CharT >::do_thousands_sep\(\)](#).

truename()

```
template<typename _CharT >
string_type std::numpunct<_CharT>::true_name ( ) const [inline]
```

Return string representation of bool true.

This function returns a string_type containing the text representation for true bool variables. It does so by calling numpunct<char_type>::do_true_name().

Returns

string_type representing printed form of true.

References [std::numpunct<_CharT>::do_true_name\(\)](#).

5.756.1 Detailed Description

```
template<typename _CharT>
class std::numpunct_byname< _CharT >
```

class numpunct_byname [22.2.3.2].

5.756.2 Member Function Documentation

decimal_point()

```
template<typename _CharT >
char_type std::numpunct< _CharT >::decimal_point ( ) const [inline], [inherited]
```

Return decimal point character.

This function returns a char_type to use as a decimal point. It does so by returning `returning numpunct<char_type>::do_decimal_point()`.

Returns

char_type representing a decimal point.

References [`std::num_punct<_CharT>::do_decimal_point\(\)`](#).

do_decimal_point()

```
template<typename _CharT >
virtual char_type std::num_punct<_CharT>::do_decimal_point ( ) const [inline], [protected],
[virtual], [inherited]
```

Return decimal point character.

Returns a *char_type* to use as a decimal point. This function is a hook for derived classes to change the value returned.

Returns

char_type representing a decimal point.

Referenced by [`std::num_punct<_CharT>::decimal_point\(\)`](#).

do_falsename()

```
template<typename _CharT >
virtual string_type std::num_punct<_CharT>::do_falsename ( ) const [inline], [protected], [virtual],
[inherited]
```

Return string representation of bool false.

Returns a *string_type* containing the text representation for false bool variables. This function is a hook for derived classes to change the value returned.

Returns

string_type representing printed form of false.

Referenced by [`std::num_punct<_CharT>::falsename\(\)`](#).

do_grouping()

```
template<typename _CharT >
virtual string std::num_punct<_CharT>::do_grouping ( ) const [inline], [protected], [virtual],
[inherited]
```

Return grouping specification.

Returns a string representing groupings for the integer part of a number. This function is a hook for derived classes to change the value returned.

See also

[`grouping\(\)`](#) for details.

Returns

String representing grouping specification.

Referenced by [`std::num_punct<_CharT>::grouping\(\)`](#).

do_thousands_sep()

```
template<typename _CharT >
virtual char_type std::num_punct<_CharT>::do_thousands_sep ( ) const [inline], [protected],
[virtual], [inherited]
```

Return thousands separator character.

Returns a *char_type* to use as a thousands separator. This function is a hook for derived classes to change the value returned.

Returns

char_type representing a thousands separator.

Referenced by [std::num_punct<_CharT>::thousands_sep\(\)](#).

do_truename()

```
template<typename _CharT >
virtual string_type std::num_punct<_CharT>::do_truename ( ) const [inline], [protected], [virtual],
[inherited]
```

Return string representation of bool true.

Returns a *string_type* containing the text representation for true bool variables. This function is a hook for derived classes to change the value returned.

Returns

string_type representing printed form of true.

Referenced by [std::num_punct<_CharT>::truename\(\)](#).

falsename()

```
template<typename _CharT >
string_type std::num_punct<_CharT>::false_name ( ) const [inline], [inherited]
```

Return string representation of bool false.

This function returns a *string_type* containing the text representation for false bool variables. It does so by calling [num_punct<char_type>::do_false_name\(\)](#).

Returns

string_type representing printed form of false.

References [std::num_punct<_CharT>::do_false_name\(\)](#).

grouping()

```
template<typename _CharT >
string std::num_punct<_CharT>::grouping ( ) const [inline], [inherited]
```

Return grouping specification.

This function returns a string representing groupings for the integer part of a number. Groupings indicate where thousands separators should be inserted in the integer part of a number.

Each char in the return string is interpreted as an integer rather than a character. These numbers represent the number of digits in a group. The first char in the string represents the number of digits in the least significant group. If a char is negative, it indicates an unlimited number of digits for the group. If more chars from the string are required to group a number, the last char is used repeatedly.

For example, if the [grouping\(\)](#) returns `"\003\002"` and is applied to the number 123456789, this corresponds to 12,34,56,789. Note that if the string was `"32"`, this would put more than 50 digits into the least significant group if the character set is ASCII.

The string is returned by calling [num_punct<char_type>::do_grouping\(\)](#).

Returns

string representing grouping specification.

References [std::num_punct<_CharT>::do_grouping\(\)](#).

thousands_sep()

```
template<typename _CharT >
```

```
char_type std::numpunct< _CharT >::thousands_sep ( ) const [inline], [inherited]
```

Return thousands separator character.

This function returns a char_type to use as a thousands separator. It does so by returning returning numpunct<char↵_type>::do_thousands_sep().

Returns

char_type representing a thousands separator.

References [std::numpunct< _CharT >::do_thousands_sep\(\)](#).

truename()

```
template<typename _CharT >
```

```
string_type std::numpunct< _CharT >::trueName ( ) const [inline], [inherited]
```

Return string representation of bool true.

This function returns a string_type containing the text representation for true bool variables. It does so by calling numpunct<char_type>::do_trueName().

Returns

string_type representing printed form of true.

References [std::numpunct< _CharT >::do_trueName\(\)](#).

5.762.1 Detailed Description

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>>
class std::ostream_iterator< _Tp, _CharT, _Traits >
```

Provides output iterator semantics for streams.

This class provides an iterator to write to an ostream. The type Tp is the only type written by this iterator and there must be an operator<<(Tp) defined.

Template Parameters

<code>_Tp</code>	The type to write to the ostream.
<code>_CharT</code>	The ostream char_type.
<code>_Traits</code>	The ostream char_traits.

5.762.2 Member Typedef Documentation

char_type

```
template<typename _Tp , typename _CharT = char, typename _Traits = char_traits<_CharT>>
typedef _CharT std::ostream_iterator< _Tp, _CharT, _Traits >::char_type
Public typedef.
```

difference_type

```
typedef void std::iterator< output_iterator_tag , void , void , void , void >::difference_type
[inherited]
Distance between iterators is represented as this type.
```

iterator_category

```
typedef output_iterator_tag std::iterator< output_iterator_tag , void , void , void , void >↵
::iterator_category [inherited]
One of the tag types.
```

ostream_type

```
template<typename _Tp , typename _CharT = char, typename _Traits = char_traits<_CharT>>
typedef basic_ostream<_CharT, _Traits> std::ostream_iterator< _Tp, _CharT, _Traits >::ostream_↵
type
Public typedef.
```

pointer

```
typedef void std::iterator< output_iterator_tag , void , void , void , void >::pointer [inherited]
This type represents a pointer-to-value_type.
```

reference

```
typedef void std::iterator< output_iterator_tag , void , void , void , void >::reference [inherited]
This type represents a reference-to-value_type.
```

traits_type

```
template<typename _Tp , typename _CharT = char, typename _Traits = char_traits<_CharT>>
typedef _Traits std::ostream_iterator< _Tp, _CharT, _Traits >::traits_type
Public typedef.
```

value_type

```
typedef void std::iterator< output_iterator_tag , void , void , void , void >::value_type [inherited]
The type "pointed to" by the iterator.
```

5.762.3 Constructor & Destructor Documentation**ostream_iterator() [1/3]**

```
template<typename _Tp , typename _CharT = char, typename _Traits = char_traits<_CharT>>
std::ostream_iterator< _Tp, _CharT, _Traits >::ostream_iterator (
    ostream_type & __s ) [inline]
```

Construct from an ostream.

ostream_iterator() [2/3]

```
template<typename _Tp , typename _CharT = char, typename _Traits = char_traits<_CharT>>
std::ostream_iterator< _Tp, _CharT, _Traits >::ostream_iterator (
    ostream_type & __s,
    const _CharT * __c ) [inline]
```

Construct from an ostream.

The delimiter string *c* is written to the stream after every *Tp* written to the stream. The delimiter is not copied, and thus must not be destroyed while this iterator is in use.

Parameters

\leftarrow __s	Underlying ostream to write to.
\leftarrow __c	CharT delimiter string to insert.

ostream_iterator() [3/3]

```
template<typename _Tp , typename _CharT = char, typename _Traits = char_traits<_CharT>>
std::ostream_iterator< _Tp, _CharT, _Traits >::ostream_iterator (
    const ostream_iterator< _Tp, _CharT, _Traits > & __obj ) [inline]
```

Copy constructor.

5.762.4 Member Function Documentation**operator=()**

```
template<typename _Tp , typename _CharT = char, typename _Traits = char_traits<_CharT>>
ostream_iterator & std::ostream_iterator< _Tp, _CharT, _Traits >::operator= (
    const _Tp & __value ) [inline]
```

Writes *value* to underlying ostream using operator<<. If constructed with delimiter string, writes delimiter to ostream. The documentation for this class was generated from the following file:

- [stream_iterator.h](#)

5.763 `std::experimental::fundamentals_v2::ostream_joiner<_DelimT, _CharT, _Traits>` Class Template Reference

5.764.1 Detailed Description

```

template<typename \_CharT, typename \_Traits>
class std::ostreambuf_iterator< \_CharT, \_Traits >

```

Provides output iterator semantics for streambufs.

5.764.2 Member Typedef Documentation

char_type

```
template<typename _CharT , typename _Traits >
typedef _CharT std::ostreambuf_iterator< _CharT, _Traits >::char_type
Public typedefs.
```

difference_type

```
typedef void std::iterator< output_iterator_tag , void , void , void , void >::difference_type
[inherited]
Distance between iterators is represented as this type.
```

iterator_category

```
typedef output_iterator_tag std::iterator< output_iterator_tag , void , void , void , void >←
::iterator_category [inherited]
One of the tag types.
```

ostream_type

```
template<typename _CharT , typename _Traits >
typedef basic_ostream<_CharT, _Traits> std::ostreambuf_iterator< _CharT, _Traits >::ostream_type
Public typedefs.
```

pointer

```
typedef void std::iterator< output_iterator_tag , void , void , void , void >::pointer [inherited]
This type represents a pointer-to-value_type.
```

reference

```
typedef void std::iterator< output_iterator_tag , void , void , void , void >::reference [inherited]
This type represents a reference-to-value_type.
```

streambuf_type

```
template<typename _CharT , typename _Traits >
typedef basic_streambuf<_CharT, _Traits> std::ostreambuf_iterator< _CharT, _Traits >::streambuf←
_type
Public typedefs.
```

traits_type

```
template<typename _CharT , typename _Traits >
typedef _Traits std::ostreambuf_iterator< _CharT, _Traits >::traits_type
Public typedefs.
```

value_type

```
typedef void std::iterator< output_iterator_tag , void , void , void , void >::value_type [inherited]
The type "pointed to" by the iterator.
```

5.764.3 Constructor & Destructor Documentation

ostreambuf_iterator() [1/2]

```
template<typename _CharT , typename _Traits >
std::ostreambuf_iterator< _CharT, _Traits >::ostreambuf_iterator (
    ostream_type & __s ) [inline], [noexcept]
```

Construct output iterator from ostream.

ostreambuf_iterator() [2/2]

```
template<typename _CharT , typename _Traits >
std::ostreambuf_iterator< _CharT, _Traits >::ostreambuf_iterator (
    streambuf_type * __s ) [inline], [noexcept]
```

Construct output iterator from streambuf.

5.764.4 Member Function Documentation

failed()

```
template<typename _CharT , typename _Traits >
bool std::ostreambuf_iterator< _CharT, _Traits >::failed ( ) const [inline], [noexcept]
```

Return true if previous operator=() failed.

operator*()

```
template<typename _CharT , typename _Traits >
ostreambuf_iterator & std::ostreambuf_iterator< _CharT, _Traits >::operator* ( ) [inline]
```

Return *this.

operator++() [1/2]

```
template<typename _CharT , typename _Traits >
ostreambuf_iterator & std::ostreambuf_iterator< _CharT, _Traits >::operator++ ( ) [inline]
```

Return *this.

operator++() [2/2]

```
template<typename _CharT , typename _Traits >
ostreambuf_iterator & std::ostreambuf_iterator< _CharT, _Traits >::operator++ (
    int ) [inline]
```

Return *this.

operator=()

```
template<typename _CharT , typename _Traits >
ostreambuf_iterator & std::ostreambuf_iterator< _CharT, _Traits >::operator= (
    _CharT __c ) [inline]
```

Write character to streambuf. Calls streambuf.sputc().

References [std::basic_streambuf< _CharT, _Traits >::sputc\(\)](#).

The documentation for this class was generated from the following files:

- [iosfwd](#)

- `out_of_range` & `operator=` (const [out_of_range](#) &)=default
- `out_of_range` & `operator=` ([out_of_range](#) &&)=default
- virtual const char * `what` () const noexcept

5.765.1 Detailed Description

This represents an argument whose value is not within the expected range (e.g., boundary checks in `basic_string`).

5.765.2 Member Function Documentation

`what()`

```
virtual const char * std::logic_error::what ( ) const [virtual], [noexcept], [inherited]
```

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

Reimplemented in [std::future_error](#).

The documentation for this class was generated from the following file:

5.767.1 Detailed Description

template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename [_Alloc](#)>

class [__gnu_pbds::detail::ov_tree_map](#)< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >

Ordered-vector tree associative-container.

5.767.2 Member Function Documentation

node_begin() [1/2]

```
template<typename Key , typename Mapped , typename Cmp_Fn , typename Node_And_It_Traits , typename
_Alloc >
```

```
node_iterator \_\_gnu\_pbds::detail::ov\_tree\_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc
>::node_begin ( ) [inline]
```

Returns a node_iterator corresponding to the node at the root of the tree.

node_begin() [2/2]

```
template<typename Key , typename Mapped , typename Cmp_Fn , typename Node_And_It_Traits , typename
_Alloc >
```

```
node_const_iterator \_\_gnu\_pbds::detail::ov\_tree\_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, \_Alloc
>::node_begin ( ) const [inline]
```

Returns a const node_iterator corresponding to the node at the root of the tree.

node_end() [1/2]

```
template<typename Key , typename Mapped , typename Cmp_Fn , typename Node_And_It_Traits , typename
_Alloc >
```

```
node_iterator \_\_gnu\_pbds::detail::ov\_tree\_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc
>::node_end ( ) [inline]
```

Returns a node_iterator corresponding to a node just after a leaf of the tree.

node_end() [2/2]

```
template<typename Key , typename Mapped , typename Cmp_Fn , typename Node_And_It_Traits , typename
_Alloc >
```

```
node_const_iterator \_\_gnu\_pbds::detail::ov\_tree\_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, \_Alloc
>::node_end ( ) const [inline]
```

Returns a const node_iterator corresponding to a node just after a leaf of the tree.

5.779.1 Detailed Description

template<typename _T1, typename _T2>
struct std::pair< _T1, _T2 >

Struct holding two objects of arbitrary type.

Template Parameters

<code>_T1</code>	Type of first object.
<code>_T2</code>	Type of second object.

<https://gcc.gnu.org/onlinedocs/libstdc++/manual/utilities.html>

5.779.2 Member Typedef Documentation

first_type

```
template<typename _T1 , typename _T2 >
typedef _T1 std::pair< _T1, _T2 >::first_type
```

The type of the first member.

second_type

```
template<typename _T1 , typename _T2 >
typedef _T2 std::pair< _T1, _T2 >::second_type
```

The type of the second member.

5.779.3 Constructor & Destructor Documentation

pair() [1/5]

```
template<typename _T1 , typename _T2 >
template<typename _U1 = _T1, typename _U2 = _T2, typename enable_if< __and< __is_implicitly_↔
default_constructible< _U1 >, __is_implicitly_default_constructible< _U2 > > ::value, bool >↔
::type = true>
constexpr std::pair< _T1, _T2 >::pair ( ) [inline], [constexpr]
```

The default constructor creates first and second using their respective default constructors.

pair() [2/5]

```
template<typename _T1 , typename _T2 >
template<typename _U1 = _T1, typename _U2 = _T2, typename enable_if< _PCCP::template _Constructible↔
Pair< _U1, _U2 >() &&_PCCP::template _ImplicitlyConvertiblePair< _U1, _U2 >(), bool >::type =
true>
constexpr std::pair< _T1, _T2 >::pair (
    const _T1 & __a,
    const _T2 & __b ) [inline], [constexpr]
```

Construct from two const lvalues, allowing implicit conversions.

pair() [3/5]

```
template<typename _T1 , typename _T2 >
template<typename _U1 = _T1, typename _U2 = _T2, typename enable_if< _PCCP::template _Constructible↔
Pair< _U1, _U2 >() &&!_PCCP::template _ImplicitlyConvertiblePair< _U1, _U2 >(), bool >::type =
false>
constexpr std::pair< _T1, _T2 >::pair (
    const _T1 & __a,
    const _T2 & __b ) [inline], [explicit], [constexpr]
```

Construct from two const lvalues, disallowing implicit conversions.

pair() [4/5]

```
template<typename _T1 , typename _T2 >
constexpr std::pair< _T1, _T2 >::pair (
    const pair< _T1, _T2 > & ) [constexpr], [default]
```

Copy constructor.

pair() [5/5]

```
template<typename _T1 , typename _T2 >
constexpr std::pair< _T1, _T2 >::pair (
    pair< _T1, _T2 > && ) [constexpr], [default]
```

Move constructor.

5.779.4 Member Function Documentation**swap()**

```
template<typename _T1 , typename _T2 >
constexpr void std::pair< _T1, _T2 >::swap (
    pair< _T1, _T2 > & __p ) [inline], [constexpr], [noexcept]
```

Swap the first members and then the second members.

References [std::pair< _T1, _T2 >::first](#), [std::pair< _T1, _T2 >::second](#), [std::swap\(\)](#), and [std::pair< _T1, _T2 >::swap\(\)](#).

5.782 `__gnu_parallel::parallel_tag` Struct Reference

```
#include <tags.h>
```

Inheritance diagram for `__gnu_parallel::parallel_tag`:

Public Member Functions

- [parallel_tag](#) ()
- [parallel_tag](#) ([_ThreadIndex](#) __num_threads)
- [_ThreadIndex](#) [__get_num_threads](#) ()
- void [set_num_threads](#) ([_ThreadIndex](#) __num_threads)

5.782.1 Detailed Description

Recommends parallel execution at compile time, optionally using a user-specified number of threads.

5.782.2 Constructor & Destructor Documentation

parallel_tag() [1/2]

```
__gnu_parallel::parallel_tag::parallel_tag ( ) [inline]
```

Default constructor. Use default number of threads.

parallel_tag() [2/2]

```
__gnu_parallel::parallel_tag::parallel_tag (
    __ThreadIndex __num_threads ) [inline]
```

Default constructor. Recommend number of threads to use.

Parameters

<code>__num_threads</code>	Desired number of threads.
----------------------------	----------------------------

5.782.3 Member Function Documentation

__get_num_threads()

```
__ThreadIndex __gnu_parallel::parallel_tag::__get_num_threads ( ) [inline]
```

Find out desired number of threads.

Returns

Desired number of threads.

Referenced by [__gnu_parallel::__parallel_sort\(\)](#), [__gnu_parallel::__parallel_sort\(\)](#), [__gnu_parallel::__parallel_sort\(\)](#), [__gnu_parallel::__parallel_sort\(\)](#), [__gnu_parallel::__parallel_sort\(\)](#), [__gnu_parallel::__parallel_sort\(\)](#), and [__gnu_parallel::__parallel_sort\(\)](#).

set_num_threads()

```
void __gnu_parallel::parallel_tag::set_num_threads (
    __ThreadIndex __num_threads ) [inline]
```

Set the desired number of threads.

Parameters

<code>__num_threads</code>	Desired number of threads.

5.804.1 Detailed Description

template<typename Key, typename Mapped, typename Node_And_It_Traits, typename _Alloc>
class [__gnu_pbds::detail::pat_trie_map](#)< Key, Mapped, Node_And_It_Traits, _Alloc >

PATRICIA trie.

This implementation loosely borrows ideas from: 1) Fast Mergeable Integer Maps, Okasaki, Gill 1998 2) Pstset: Sets of integers implemented as Patricia trees, Jean-Christophe Filliatr, 2000

5.804.2 Member Enumeration Documentation

node_type

enum [__gnu_pbds::detail::pat_trie_base::node_type](#) [inherited]

Three types of nodes.

i_node is used by _Inode, leaf_node by _Leaf, and head_node by _Head.

5.804.3 Member Function Documentation

node_begin() [1/2]

```
template<typename Key , typename Mapped , typename Node_And_It_Traits , typename _Alloc >
node_iterator \_\_gnu\_pbds::detail::pat\_trie\_map< Key, Mapped, Node_And_It_Traits, _Alloc >::node↵
_begin ( ) [inline]
```

Returns a node_iterator corresponding to the node at the root of the tree.

node_begin() [2/2]

```
template<typename Key , typename Mapped , typename Node_And_It_Traits , typename _Alloc >
node_const_iterator \_\_gnu\_pbds::detail::pat\_trie\_map< Key, Mapped, Node_And_It_Traits, _Alloc >↵
::node_begin ( ) const [inline]
```

Returns a const node_iterator corresponding to the node at the root of the tree.

node_end() [1/2]

```
template<typename Key , typename Mapped , typename Node_And_It_Traits , typename _Alloc >
node_iterator __gnu_pbds::detail::pat_trie_map< Key, Mapped, Node_And_It_Traits, _Alloc >::node↔
_end ( ) [inline]
```

Returns a node_iterator corresponding to a node just after a leaf of the tree.

node_end() [2/2]

```
template<typename Key , typename Mapped , typename Node_And_It_Traits , typename _Alloc >
node_const_iterator __gnu_pbds::detail::pat_trie_map< Key, Mapped, Node_And_It_Traits, _Alloc >↔
::node_end ( ) const [inline]
```

Returns a const node_iterator corresponding to a node just after a leaf of the tree.

5.808.1 Detailed Description

template<typename _RealType = double>
class std::piecewise_constant_distribution<_RealType>

A `piecewise_constant_distribution` random number distribution.
 The formula for the piecewise constant probability mass function is

5.808.2 Member Typedef Documentation

result_type

```
template<typename _RealType = double>
typedef _RealType std::piecewise\_constant\_distribution< _RealType >::result_type
```

The type of the range of the distribution.

5.808.3 Member Function Documentation

densities()

```
template<typename _RealType = double>
std::vector< double > std::piecewise\_constant\_distribution< _RealType >::densities ( ) const
[inline]
```

Returns a vector of the probability densities.
 References [std::vector](#)< _Tp, _Alloc >::empty().

intervals()

```
template<typename _RealType = double>
std::vector< _RealType > std::piecewise\_constant\_distribution< _RealType >::intervals ( ) const
[inline]
```

Returns a vector of the intervals.
 References [std::vector](#)< _Tp, _Alloc >::empty().

max()

```
template<typename _RealType = double>
result\_type std::piecewise\_constant\_distribution< _RealType >::max ( ) const [inline]
```

Returns the least upper bound value of the distribution.
 References [std::vector](#)< _Tp, _Alloc >::back(), and [std::vector](#)< _Tp, _Alloc >::empty().

min()

```
template<typename _RealType = double>
result_type std::piecewise_constant_distribution< _RealType >::min ( ) const [inline]
```

Returns the greatest lower bound value of the distribution.

References `std::vector< _Tp, _Alloc >::empty()`, and `std::vector< _Tp, _Alloc >::front()`.

operator()()

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator >
result_type std::piecewise_constant_distribution< _RealType >::operator() (
    _UniformRandomNumberGenerator & __urng ) [inline]
```

Generating functions.

References `std::piecewise_constant_distribution< _RealType >::operator()()`.

Referenced by `std::piecewise_constant_distribution< _RealType >::operator()()`.

param() [1/2]

```
template<typename _RealType = double>
param_type std::piecewise_constant_distribution< _RealType >::param ( ) const [inline]
```

Returns the parameter set of the distribution.

param() [2/2]

```
template<typename _RealType = double>
void std::piecewise_constant_distribution< _RealType >::param (
    const param_type & __param ) [inline]
```

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--------------------------------------------

reset()

```
template<typename _RealType = double>
void std::piecewise_constant_distribution< _RealType >::reset ( ) [inline]
```

Resets the distribution state.

5.808.4 Friends And Related Symbol Documentation**operator<<**

```
template<typename _RealType = double>
template<typename _RealType1 , typename _CharT , typename _Traits >
std::basic_ostream< _CharT, _Traits > & operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::piecewise_constant_distribution< _RealType1 > & __x ) [friend]
```

Inserts a `piecewise_constant_distribution` random number distribution `__x` into the output stream `__os`.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>piecewise_constant_distribution</code> random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

operator==

```
template<typename _RealType = double>
bool operator== (
    const piecewise\_constant\_distribution< _RealType > & __d1,
    const piecewise\_constant\_distribution< _RealType > & __d2 ) [friend]
```

Return true if two piecewise constant distributions have the same parameters.

operator>>

```
template<typename _RealType = double>
template<typename _RealType1 , typename _CharT , typename _Traits >
std::basic\_istream< _CharT, _Traits > & operator>> (
    std::basic\_istream< _CharT, _Traits > & __is,
    std::piecewise\_constant\_distribution< _RealType1 > & __x ) [friend]
```

Extracts a `piecewise_constant_distribution` random number distribution `__x` from the input stream `__is`.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A <code>piecewise_constant_distribution</code> random number generator engine.

Returns

The input stream with `__x` extracted or in an error state.

param() [1/2]

```
template<typename _RealType = double>
```

```
param_type std::piecewise_linear_distribution< _RealType >::param ( ) const [inline]
```

Returns the parameter set of the distribution.

param() [2/2]

```
template<typename _RealType = double>
void std::piecewise_linear_distribution< _RealType >::param (
    const param_type & __param ) [inline]
```

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--------------------------------------------

reset()

```
template<typename _RealType = double>
void std::piecewise_linear_distribution< _RealType >::reset ( ) [inline]
```

Resets the distribution state.

5.810.4 Friends And Related Symbol Documentation**operator<<**

```
template<typename _RealType = double>
template<typename _RealType1 , typename _CharT , typename _Traits >
std::basic_ostream< _CharT, _Traits > & operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::piecewise_linear_distribution< _RealType1 > & __x ) [friend]
```

Inserts a `piecewise_linear_distribution` random number distribution `__x` into the output stream `__os`.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>piecewise_linear_distribution</code> random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

operator==

```
template<typename _RealType = double>
bool operator== (
    const piecewise_linear_distribution< _RealType > & __d1,
    const piecewise_linear_distribution< _RealType > & __d2 ) [friend]
```

Return true if two `piecewise_linear_distribution` have the same parameters.

operator>>

template<typename _RealType = double>
template<typename _RealType1 , typename _CharT , typename _Traits >
std::basic_istream< _CharT, _Traits > & operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::piecewise_linear_distribution< _RealType1 > & __x ) [friend]
```

Extracts a `piecewise_linear_distribution` random number distribution `__x` from the input stream `__is`.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A <code>piecewise_linear_distribution</code> random number generator engine.

Returns

The input stream with `__x` extracted or in an error state.

5.817.1 Detailed Description

`template<typename _IntType = int>
class std::poisson_distribution< _IntType >`

A discrete Poisson random number distribution.

The formula for the Poisson probability density function is $p(i|\mu) = \frac{\mu^i}{i!} e^{-\mu}$ where μ is the parameter of the distribution.

5.817.2 Member Typedef Documentation

result_type

```
template<typename _IntType = int>
typedef _IntType std::poisson_distribution< _IntType >::result_type
```

The type of the range of the distribution.

5.817.3 Member Function Documentation

max()

```
template<typename _IntType = int>
result_type std::poisson_distribution< _IntType >::max ( ) const [inline]
```

Returns the least upper bound value of the distribution.
References `std::numeric_limits< _Tp >::max()`.

mean()

```
template<typename _IntType = int>
double std::poisson_distribution< _IntType >::mean ( ) const [inline]
```

Returns the distribution parameter mean.

min()

```
template<typename _IntType = int>
result_type std::poisson_distribution< _IntType >::min ( ) const [inline]
```

Returns the greatest lower bound value of the distribution.

operator>() [1/2]

```
template<typename _IntType = int>
template<typename _UniformRandomNumberGenerator >
result_type std::poisson_distribution< _IntType >::operator() (
    _UniformRandomNumberGenerator & __urng ) [inline]
```

Generating functions.

param() [1/2]

```
template<typename _IntType = int>
param_type std::poisson_distribution< _IntType >::param ( ) const [inline]
```

Returns the parameter set of the distribution.

param() [2/2]

```
template<typename _IntType = int>
void std::poisson_distribution< _IntType >::param (
    const param_type & __param ) [inline]
```

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--------------------------------------------

reset()

```
template<typename _IntType = int>
void std::poisson_distribution< _IntType >::reset ( ) [inline]
```

Resets the distribution state.

References [std::normal_distribution< _RealType >::reset\(\)](#).

5.817.4 Friends And Related Symbol Documentation**operator<<**

```
template<typename _IntType = int>
template<typename _IntType1 , typename _CharT , typename _Traits >
```

```
std::basic_ostream< _CharT, _Traits > & operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::poisson_distribution< _IntType1 > & __x ) [friend]
```

Inserts a poisson_distribution random number distribution __x into the output stream __os.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A poisson_distribution random number distribution.

Returns

The output stream with the state of __x inserted or in an error state.

operator==

```
template<typename _IntType = int>
bool operator== (
    const poisson_distribution< _IntType > & __d1,
    const poisson_distribution< _IntType > & __d2 ) [friend]
```

Return true if two Poisson distributions have the same parameters and the sequences that would be generated are equal.

operator>>

```
template<typename _IntType = int>
template<typename _IntType1 , typename _CharT , typename _Traits >
std::basic_istream< _CharT, _Traits > & operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::poisson_distribution< _IntType1 > & __x ) [friend]
```

Extracts a poisson_distribution random number distribution __x from the input stream __is.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A poisson_distribution random number generator engine.

Returns

The input stream with __x extracted or in an error state.

5.818 std::pmr::pool_options Struct Reference**Public Attributes**

- `size_t` [largest_required_pool_block](#)
- `size_t` [max_blocks_per_chunk](#)

5.818.1 Detailed Description

Parameters for tuning a pool resource's behaviour.

5.818.2 Member Data Documentation

`max_blocks_per_chunk`

`size_t std::pmr::pool_options::max_blocks_per_chunk`

Upper limit on number of blocks in a chunk.

A lower value prevents allocating huge chunks that could remain mostly unused, but means pools will need to replenished more frequently.

The documentation for this struct was generated from the following file:

5.819.1 Detailed Description

```
template<typename _Tv, typename Cmp_Fn = std::less<_Tv>, typename Tag = pairing_heap_tag, typename
_Alloc = std::allocator<char>>
class __gnu_pbds::priority_queue< _Tv, Cmp_Fn, Tag, _Alloc >
```

A priority queue composed of one specific heap policy.

Template Parameters

<code>_Tv</code>	Value type.
<code>Cmp_Fn</code>	Comparison functor.
<code>Tag</code>	Instantiating data structure type, see container_tag.
<code>_Alloc</code>	Allocator type.

Base is dispatched at compile time via Tag, from the following choices: binary_heap_tag, binomial_heap_tag, pairing_heap_tag, rc_binomial_heap_tag, thin_heap_tag

Base choices are: detail::binary_heap, detail::binomial_heap, detail::pairing_heap, detail::rc_binomial_heap, detail::thin_heap.

5.819.2 Constructor & Destructor Documentation

priority_queue() [1/3]

```
template<typename _Tv , typename Cmp_Fn = std::less<_Tv>, typename Tag = pairing_heap_tag, typename
_Alloc = std::allocator<char>>
__gnu_pbds::priority_queue< _Tv, Cmp_Fn, Tag, _Alloc >::priority_queue (
    const cmp_fn & r_cmp_fn ) [inline]
```

Constructor taking some policy objects. r_cmp_fn will be copied by the Cmp_Fn object of the container object.

priority_queue() [2/3]

```
template<typename _Tv , typename Cmp_Fn = std::less<_Tv>, typename Tag = pairing_heap_tag, typename
_Alloc = std::allocator<char>>
template<typename It >
__gnu_pbds::priority_queue< _Tv, Cmp_Fn, Tag, _Alloc >::priority_queue (
    It first_it,
    It last_it ) [inline]
```

Constructor taking __iterators to a range of value_types. The value_types between first_it and last_it will be inserted into the container object.

priority_queue() [3/3]

```
template<typename _Tv , typename Cmp_Fn = std::less<_Tv>, typename Tag = pairing_heap_tag, typename
_Alloc = std::allocator<char>>
template<typename It >

5.820.1 Detailed Description

```
template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _Sequence::value_type>>>
class std::priority_queue< _Tp, _Sequence, _Compare >
```

A standard container automatically sorting its contents.

Template Parameters

<code>_Tp</code>	Type of element.
<code>_Sequence</code>	Type of underlying sequence, defaults to <code>vector<_Tp></code> .
<code>_Compare</code>	Comparison function object type, defaults to <code>less<_Sequence::value_type></code> .

This is not a true container, but an *adaptor*. It holds another container, and provides a wrapper interface to that container. The wrapper is what enforces priority-based sorting and queue behavior. Very few of the standard container/sequence interface requirements are met (e.g., iterators).

The second template parameter defines the type of the underlying sequence/container. It defaults to `std::vector`, but it can be any type that supports `front()`, `push_back`, `pop_back`, and random-access iterators, such as `std::deque` or an appropriate user-defined type.

The third template parameter supplies the means of making priority comparisons. It defaults to `less<value_type>` but can be anything defining a strict weak ordering.

Members not found in *normal* containers are `container_type`, which is a typedef for the second Sequence parameter, and `push`, `pop`, and `top`, which are standard queue operations.

Note

No equality/comparison operators are provided for `priority_queue`.

Sorting of the elements takes place as they are added to, and removed from, the `priority_queue` using the `priority_queue`'s member functions. If you access the elements by other means, and change their data such that the sorting order would be different, the `priority_queue` will not re-sort the elements for you. (How could it know to do so?)

5.820.2 Constructor & Destructor Documentation

`priority_queue()` [1/2]

```
template<typename _Tp , typename _Sequence = vector<_Tp>, typename _Compare = less<typename _Sequence::value_type>>
```

```
template<typename _Seq = _Sequence, typename _Requires = typename enable_if<__and<is_default_constructible<_Compare>, is_default_constructible<_Seq>>::value>::type>
```

```
std::priority_queue<_Tp, _Sequence, _Compare >::priority_queue ( ) [inline]
```

Default constructor creates no elements.

`priority_queue()` [2/2]

```
template<typename _Tp , typename _Sequence = vector<_Tp>, typename _Compare = less<typename _Sequence::value_type>>
```

```
template<typename _InputIterator >
```

```
std::priority_queue<_Tp, _Sequence, _Compare >::priority_queue (
    _InputIterator __first,
    _InputIterator __last,
    const _Compare & __x,
    const _Sequence & __s ) [inline]
```

Builds a queue from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__x</code>	A comparison functor describing a strict weak ordering.
<code>__s</code>	An initial sequence with which to start.

Begins by copying `__s`, inserting a copy of the elements from `[first,last)` into the copy of `__s`, then ordering the copy according to `__x`.

For more information on function objects, see the documentation on [functor base classes](#).

5.820.3 Member Function Documentation

empty()

```
template<typename _Tp , typename _Sequence = vector<_Tp>, typename _Compare = less<typename _↔
Sequence::value_type>>
```

```
bool std::priority_queue< _Tp, _Sequence, _Compare >::empty ( ) const [inline]
```

Returns true if the queue is empty.

Referenced by [__gnu_parallel::multiseq_partition\(\)](#), and [__gnu_parallel::multiseq_selection\(\)](#).

pop()

```
template<typename _Tp , typename _Sequence = vector<_Tp>, typename _Compare = less<typename _↔
Sequence::value_type>>
```

```
void std::priority_queue< _Tp, _Sequence, _Compare >::pop ( ) [inline]
```

Removes first element.

This is a typical queue operation. It shrinks the queue by one. The time complexity of the operation depends on the underlying sequence.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before `pop()` is called.

Referenced by [__gnu_parallel::multiseq_partition\(\)](#), and [__gnu_parallel::multiseq_selection\(\)](#).

push()

```
template<typename _Tp , typename _Sequence = vector<_Tp>, typename _Compare = less<typename _↔
Sequence::value_type>>
```

```
void std::priority_queue< _Tp, _Sequence, _Compare >::push (
    const value_type & __x ) [inline]
```

Add data to the queue.

Parameters

<code>__↔</code>	Data to be added.
<code>__x</code>	

This is a typical queue operation. The time complexity of the operation depends on the underlying sequence.

Referenced by [__gnu_parallel::multiseq_partition\(\)](#), and [__gnu_parallel::multiseq_selection\(\)](#).

size()

```
template<typename _Tp , typename _Sequence = vector<_Tp>, typename _Compare = less<typename _↔
Sequence::value_type>>
```

```
size_type std::priority_queue< _Tp, _Sequence, _Compare >::size ( ) const [inline]
```

Returns the number of elements in the queue.

top()

```
template<typename _Tp , typename _Sequence = vector<_Tp>, typename _Compare = less<typename _↔
Sequence::value_type>>
```

```
const_reference std::priority_queue< _Tp, _Sequence, _Compare >::top ( ) const [inline]
```

Returns a read-only (constant) reference to the data at the first element of the queue.

Referenced by [__gnu_parallel::multiseq_partition\(\)](#), and [__gnu_parallel::multiseq_selection\(\)](#).

- template<typename _Tp1, typename _Seq1 > bool **operator**== (const **queue**< _Tp1, _Seq1 > &, const **queue**< _Tp1, _Seq1 > &)

5.830.1 Detailed Description

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
class std::queue< _Tp, _Sequence >
```

A standard container giving FIFO behavior.

Template Parameters

<code>_Tp</code>	Type of element.
<code>_Sequence</code>	Type of underlying sequence, defaults to <code>deque<_Tp></code> .

Meets many of the requirements of a [container](#), but does not define anything to do with iterators. Very few of the other standard container interfaces are defined.

This is not a true container, but an *adaptor*. It holds another container, and provides a wrapper interface to that container. The wrapper is what enforces strict first-in-first-out queue behavior.

The second template parameter defines the type of the underlying sequence/container. It defaults to `std::deque`, but it can be any type that supports `front`, `back`, `push_back`, and `pop_front`, such as `std::list` or an appropriate user-defined type.

Members not found in *normal* containers are `container_type`, which is a typedef for the second Sequence parameter, and `push` and `pop`, which are standard queue/FIFO operations.

5.830.2 Constructor & Destructor Documentation

queue()

```
template<typename _Tp , typename _Sequence = deque<_Tp>>
template<typename _Seq = _Sequence, typename _Requires = typename enable_if<is_default_constructible<↵
_Seq>::value>::type>
std::queue< _Tp, _Sequence >::queue ( ) [inline]
Default constructor creates no elements.
```

5.830.3 Member Function Documentation

back() [1/2]

```
template<typename _Tp , typename _Sequence = deque<_Tp>>
reference std::queue< _Tp, _Sequence >::back ( ) [inline]
Returns a read/write reference to the data at the last element of the queue.
References std::queue< \_Tp, \_Sequence >::c.
```

back() [2/2]

```
template<typename _Tp , typename _Sequence = deque<_Tp>>
const_reference std::queue< _Tp, _Sequence >::back ( ) const [inline]
Returns a read-only (constant) reference to the data at the last element of the queue.
References std::queue< \_Tp, \_Sequence >::c.
```

empty()

```
template<typename _Tp , typename _Sequence = deque<_Tp>>
bool std::queue< _Tp, _Sequence >::empty ( ) const [inline]
Returns true if the queue is empty.
References std::queue< \_Tp, \_Sequence >::c.
```

front() [1/2]

```
template<typename _Tp , typename _Sequence = deque<_Tp>>
reference std::queue< _Tp, _Sequence >::front ( ) [inline]
Returns a read/write reference to the data at the first element of the queue.
References std::queue< \_Tp, \_Sequence >::c.
```

front() [2/2]

```
template<typename _Tp , typename _Sequence = deque<_Tp>>
const_reference std::queue<_Tp, _Sequence>::front ( ) const [inline]
```

Returns a read-only (constant) reference to the data at the first element of the queue.
References [std::queue<_Tp, _Sequence>::c](#).

pop()

```
template<typename _Tp , typename _Sequence = deque<_Tp>>
void std::queue<_Tp, _Sequence>::pop ( ) [inline]
```

Removes first element.
This is a typical queue operation. It shrinks the queue by one. The time complexity of the operation depends on the underlying sequence.
Note that no data is returned, and if the first element's data is needed, it should be retrieved before `pop()` is called.
References [std::queue<_Tp, _Sequence>::c](#).

push()

```
template<typename _Tp , typename _Sequence = deque<_Tp>>
void std::queue<_Tp, _Sequence>::push (
    const value_type & __x ) [inline]
```

Add data to the end of the queue.

Parameters

<code>__x</code>	Data to be added.
------------------	-------------------

This is a typical queue operation. The function creates an element at the end of the queue and assigns the given data to it. The time complexity of the operation depends on the underlying sequence.
References [std::queue<_Tp, _Sequence>::c](#).

size()

```
template<typename _Tp , typename _Sequence = deque<_Tp>>
size_type std::queue<_Tp, _Sequence>::size ( ) const [inline]
```

Returns the number of elements in the queue.

References [std::queue<_Tp, _Sequence>::c](#).

5.830.4 Member Data Documentation**c**

```
template<typename _Tp , typename _Sequence = deque<_Tp>>
_Sequence std::queue<_Tp, _Sequence>::c [protected]
```

`c` is the underlying container.
Referenced by [std::queue<_Tp, _Sequence>::back\(\)](#), [std::queue<_Tp, _Sequence>::back\(\)](#), [std::queue<_Tp, _Sequence>::empty](#), [std::queue<_Tp, _Sequence>::front\(\)](#), [std::queue<_Tp, _Sequence>::front\(\)](#), [std::operator<\(\)](#), [std::operator==\(\)](#), [std::queue<_Tp, _Sequence>::pop\(\)](#), [std::queue<_Tp, _Sequence>::push\(\)](#), and [std::queue<_Tp, _Sequence>::size\(\)](#).

5.831 __gnu_parallel::quicksort_tag Struct Reference

```
#include <tags.h>
```

Inheritance diagram for __gnu_parallel::quicksort_tag:

Public Member Functions

- `quicksort_tag` (`_ThreadIndex` __num_threads)
- `_ThreadIndex` `__get_num_threads` ()
- void `set_num_threads` (`_ThreadIndex` __num_threads)

5.831.1 Detailed Description

Forces parallel sorting using unbalanced quicksort at compile time.

5.831.2 Member Function Documentation

`__get_num_threads()`

```
_ThreadIndex __gnu_parallel::parallel_tag::__get_num_threads ( ) [inline], [inherited]
```

Find out desired number of threads.

Returns

Desired number of threads.

Referenced by `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, and `__gnu_parallel::__parallel_sort()`.

`set_num_threads()`

```
void __gnu_parallel::parallel_tag::set_num_threads (
    _ThreadIndex __num_threads ) [inline], [inherited]
```

Set the desired number of threads.

Parameters

<code>__num_threads</code>	Desired number of threads.

5.835 `std::range_error` Class Reference

Inheritance diagram for `std::range_error`:

Public Member Functions

- `range_error` (const char *) `_GLIBCXX_TXN_SAFE`
- `range_error` (const [range_error](#) &)=default
- `range_error` (const [string](#) &__arg) `_GLIBCXX_TXN_SAFE`
- `range_error` ([range_error](#) &&)=default
- [range_error](#) & `operator=` (const [range_error](#) &)=default
- [range_error](#) & `operator=` ([range_error](#) &&)=default
- virtual const char * `what` () const noexcept

5.835.1 Detailed Description

Thrown to indicate range errors in internal computations.

5.835.2 Member Function Documentation

`what()`

```
virtual const char * std::runtime_error::what ( ) const [virtual], [noexcept], [inherited]
```

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

Reimplemented in [std::filesystem::filesystem_error](#), and [std::experimental::filesystem::v1::filesystem_error](#).

The documentation for this class was generated from the following file:

- [stdexcept](#)

5.836 `__gnu_pbds::range_invalidation_guarantee` Struct Reference

```
#include <tag_and_trait.hpp>
```

Inheritance diagram for `__gnu_pbds::range_invalidation_guarantee`:

5.836.1 Detailed Description

Signifies an invalidation guarantee that includes all those of its base, and additionally, that any range-type iterator (including the returns of `begin()` and `end()`) is in the correct relative positions to other range-type iterators as long as its corresponding entry has not be erased, regardless of modifications to the container object.

The documentation for this struct was generated from the following file:

- [tag_and_trait.hpp](#)

5.837 `__gnu_pbds::detail::ranged_hash_fn< Key, Hash_Fn, _Alloc, Comb_Hash_Fn, Store_Hash >` Class Template Reference

Inheritance diagram for `__gnu_pbds::detail::ranged_hash_fn< Key, Hash_Fn, _Alloc, Comb_Hash_Fn, Store_Hash >`:

5.837.1 Detailed Description

```
template<typename Key, typename Hash_Fn, typename _Alloc, typename Comb_Hash_Fn, bool Store_Hash>
class __gnu_pbds::detail::ranged_hash_fn< Key, Hash_Fn, _Alloc, Comb_Hash_Fn, Store_Hash >
```

Primary template.

The documentation for this class was generated from the following file:

- [ranged_hash_fn.hpp](#)

5.838 `__gnu_pbds::detail::ranged_hash_fn< Key, Hash_Fn, _Alloc, Comb_Hash_Fn, false >` Class Template Reference

- void **swap** (ranged_hash_fn< Key, Hash_Fn, _Alloc, Comb_Hash_Fn, true > &)

5.839.1 Detailed Description

```
template<typename Key, typename Hash_Fn, typename _Alloc, typename Comb_Hash_Fn>  
class __gnu_pbds::detail::ranged_hash_fn< Key, Hash_Fn, _Alloc, Comb_Hash_Fn, true >
```

Specialization 2 The client supplies a hash function and a ranged hash function, and requests that hash values be stored.

The documentation for this class was generated from the following file:

- [ranged_hash_fn.hpp](#)

5.840 `__gnu_pbds::detail::ranged_hash_fn< Key, null_type, _Alloc, Comb_Hash_Fn, false >` > Class Template Reference

```
#include <ranged_hash_fn.hpp>  
Inherits Comb_Hash_Fn.
```

Protected Types

- typedef Comb_Hash_Fn **comb_hash_fn_base**
- typedef _Alloc::size_type **size_type**

Protected Member Functions

- **ranged_hash_fn** (size_type)
- **ranged_hash_fn** (size_type, const Comb_Hash_Fn &)
- **ranged_hash_fn** (size_type, const [null_type](#) &, const Comb_Hash_Fn &)
- void **swap** (ranged_hash_fn< Key, [null_type](#), _Alloc, Comb_Hash_Fn, false > &)

5.840.1 Detailed Description

```
template<typename Key, typename _Alloc, typename Comb_Hash_Fn>  
class __gnu_pbds::detail::ranged_hash_fn< Key, null_type, _Alloc, Comb_Hash_Fn, false >
```

Specialization 3 The client does not supply a hash function (by specifying `null_type` as the `Hash_Fn` parameter), and requests that hash values not be stored.

The documentation for this class was generated from the following file:

- [ranged_hash_fn.hpp](#)

5.841 `__gnu_pbds::detail::ranged_hash_fn< Key, null_type, _Alloc, Comb_Hash_Fn, true >` > Class Template Reference

```
#include <ranged_hash_fn.hpp>  
Inherits Comb_Hash_Fn.
```

Protected Types

- typedef Comb_Hash_Fn **comb_hash_fn_base**
- typedef _Alloc::size_type **size_type**

Protected Member Functions

5.843.1 Detailed Description

template<typename Key, typename Hash_Fn, typename _Alloc, typename Comb_Probe_Fn, typename Probe_Fn>

class **__gnu_pbds::detail::ranged_probe_fn**< Key, Hash_Fn, _Alloc, Comb_Probe_Fn, Probe_Fn, false >

Specialization 1

The client supplies a probe function and a ranged probe function, and requests that hash values not be stored.

The documentation for this class was generated from the following file:

- [ranged_probe_fn.hpp](#)

5.844 **__gnu_pbds::detail::ranged_probe_fn**< Key, Hash_Fn, _Alloc, Comb_Probe_Fn, Probe_Fn, true > Class Template Reference

#include <ranged_probe_fn.hpp>

Inherits Hash_Fn, Comb_Probe_Fn, and Probe_Fn.

Protected Types

- typedef Comb_Probe_Fn **comb_probe_fn_base**
- typedef [std::pair](#)< size_type, size_type > **comp_hash**
- typedef Hash_Fn **hash_fn_base**
- typedef [rebind_traits](#)< _Alloc, Key >::const_reference **key_const_reference**
- typedef Probe_Fn **probe_fn_base**
- typedef _Alloc::size_type **size_type**

Protected Member Functions

- **ranged_probe_fn** (size_type)
- **ranged_probe_fn** (size_type, const Hash_Fn &)
- **ranged_probe_fn** (size_type, const Hash_Fn &, const Comb_Probe_Fn &)
- **ranged_probe_fn** (size_type, const Hash_Fn &, const Comb_Probe_Fn &, const Probe_Fn &)
- void **notify_resized** (size_type)
- [comp_hash](#) **operator()** (key_const_reference) const

- `size_type operator()` (`key_const_reference`, `size_type`) `const`
- `size_type operator()` (`key_const_reference`, `size_type`, `size_type`) `const`
- `void swap` (`ranged_probe_fn< Key, Hash_Fn, _Alloc, Comb_Probe_Fn, Probe_Fn, true > &`)

5.844.1 Detailed Description

```
template<typename Key, typename Hash_Fn, typename _Alloc, typename Comb_Probe_Fn, typename Probe_Fn>
class __gnu_pbds::detail::ranged_probe_fn< Key, Hash_Fn, _Alloc, Comb_Probe_Fn, Probe_Fn, true >
```

Specialization 2- The client supplies a probe function and a ranged probe function, and requests that hash values not be stored.

The documentation for this class was generated from the following file:

- [ranged_probe_fn.hpp](#)

5.845 `__gnu_pbds::detail::ranged_probe_fn< Key, null_type, _Alloc, Comb_Probe_Fn, null_type, false >` Class Template Reference

```
#include <ranged_probe_fn.hpp>
```

Inherits `Comb_Probe_Fn`.

Protected Types

- `typedef Comb_Probe_Fn comb_probe_fn_base`
- `typedef rebind_traits< _Alloc, Key >::const_reference key_const_reference`
- `typedef _Alloc::size_type size_type`

Protected Member Functions

- `ranged_probe_fn` (`size_type size`)
- `ranged_probe_fn` (`size_type`, `const Comb_Probe_Fn &r_comb_probe_fn`)
- `ranged_probe_fn` (`size_type`, `const null_type &`, `const Comb_Probe_Fn &r_comb_probe_fn`, `const null_type &`)
- `void swap` (`ranged_probe_fn &other`)

5.845.1 Detailed Description

```
template<typename Key, typename _Alloc, typename Comb_Probe_Fn>
class __gnu_pbds::detail::ranged_probe_fn< Key, null_type, _Alloc, Comb_Probe_Fn, null_type, false >
```

Specialization 3 and 4 The client does not supply a hash function or probe function, and requests that hash values not be stored.

The documentation for this class was generated from the following file:

- [ranged_probe_fn.hpp](#)

5.846 `std::rank< typename >` Struct Template Reference

Inheritance diagram for `std::rank< typename >`:

Public Types

- typedef [integral_constant](#)< `std::size_t`, `__v` > **type**
- typedef `std::size_t` **value_type**

Public Member Functions

- constexpr **operator value_type** () const noexcept
- constexpr value_type **operator()** () const noexcept

Static Public Attributes

- static constexpr `std::size_t` **value**

5.846.1 Detailed Description

```
template<typename>
struct std::rank< typename >
```

rank

The documentation for this struct was generated from the following file:

- [type_traits](#)

5.847 `std::ratio< _Num, _Den >` Struct Template Reference

Public Types

- typedef [ratio](#)< `num`, `den` > **type**

Static Public Attributes

- static constexpr `intmax_t` **den**
- static constexpr `intmax_t` **num**

5.847.1 Detailed Description

```
template<intmax_t _Num, intmax_t _Den = 1>
struct std::ratio< _Num, _Den >
```

Provides compile-time rational arithmetic.

This class template represents any finite rational number with a numerator and denominator representable by compile-time constants of type intmax_t. The ratio is simplified when instantiated.

For example:

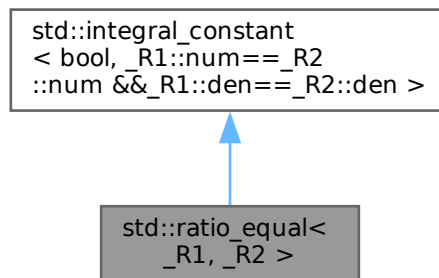

```
std::ratio<7,-21>::num == -1;
std::ratio<7,-21>::den == 3;
```

The documentation for this struct was generated from the following file:

- [ratio](#)

5.854 `std::raw_storage_iterator<_OutputIterator, _Tp>` Class Template Reference

```
#include <stl_raw_storage_iter.h>
```

Inheritance diagram for `std::raw_storage_iterator< _OutputIterator, _Tp >`:

Public Types

- typedef void [difference_type](#)
- typedef [output_iterator_tag](#) [iterator_category](#)
- typedef void [pointer](#)
- typedef void [reference](#)
- typedef void [value_type](#)

Public Member Functions

- [raw_storage_iterator](#) ([_OutputIterator](#) __x)
- [_OutputIterator](#) **base** () const
- [raw_storage_iterator](#) & **operator*** ()
- [raw_storage_iterator](#) & **operator++** ()
- [raw_storage_iterator](#) **operator++** (int)
- [raw_storage_iterator](#) & **operator=** ([_Tp](#) &&__element)
- [raw_storage_iterator](#) & **operator=** (const [_Tp](#) &__element)

Protected Attributes

- [_OutputIterator](#) **_M_iter**

5.854.1 Detailed Description

```
template<class _OutputIterator, class _Tp>
class std::raw_storage_iterator< _OutputIterator, _Tp >
```

This iterator class lets algorithms store their results into uninitialized memory.

5.854.2 Member Typedef Documentation

difference_type

```
typedef void std::iterator< output\_iterator\_tag , void , void , void , void >::difference_type
[inherited]
```

Distance between iterators is represented as this type.

iterator_category

```
typedef output\_iterator\_tag std::iterator< output\_iterator\_tag , void , void , void , void >←  
::iterator_category [inherited]
```

One of the [tag types](#).

pointer

```
typedef void std::iterator< output\_iterator\_tag , void , void , void , void >::pointer [inherited]
```

This type represents a pointer-to-value_type.

reference

```
typedef void std::iterator< output\_iterator\_tag , void , void , void , void >::reference [inherited]
```

This type represents a reference-to-value_type.

value_type

```
typedef void std::iterator< output\_iterator\_tag , void , void , void , void >::value_type [inherited]
```

The type "pointed to" by the iterator.

The documentation for this class was generated from the following file:

- [stl_raw_storage_iter.h](#)

5.855.1 Detailed Description

```
template<class _Key, class _Value, class _KeyOfValue, class _Compare, class _Alloc = std::allocator<_↵
Value>>
```

```
struct __gnu_cxx::rb_tree<_Key, _Value, _KeyOfValue, _Compare, _Alloc >
```

This is an SGI extension.

Todo Needs documentation! See http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵_style.html

5.855.2 Member Function Documentation

`_M_merge_equal()`

```
template<typename _Key , typename _Val , typename _KeyOfValue , typename _Compare , typename _↵
Alloc = allocator<_Val>>
```

```
template<typename _Compare2 >
```

```
void std::_Rb_tree<_Key, _Val, _KeyOfValue, _Compare, _Alloc >::_M_merge_equal (
    _Compatible_tree<_Compare2 > & __src ) [inline], [noexcept], [inherited]
```

Merge from a compatible container into one with equivalent keys.

`_M_merge_unique()`

```
template<typename _Key , typename _Val , typename _KeyOfValue , typename _Compare , typename _↵
Alloc = allocator<_Val>>
```

```
template<typename _Compare2 >
```

```
void std::_Rb_tree<_Key, _Val, _KeyOfValue, _Compare, _Alloc >::_M_merge_unique (
    _Compatible_tree<_Compare2 > & __src ) [inline], [noexcept], [inherited]
```

Merge from a compatible container into one with unique keys.

`_M_reinsert_node_equal()`

```
template<typename _Key , typename _Val , typename _KeyOfValue , typename _Compare , typename _↵
Alloc = allocator<_Val>>
```

```
iterator std::_Rb_tree<_Key, _Val, _KeyOfValue, _Compare, _Alloc >::_M_reinsert_node_equal (
    node_type && __nh ) [inline], [inherited]
```

Re-insert an extracted node.

`_M_reinsert_node_hint_equal()`

```
template<typename _Key , typename _Val , typename _KeyOfValue , typename _Compare , typename _↵
Alloc = allocator<_Val>>
```

```
iterator std::_Rb_tree<_Key, _Val, _KeyOfValue, _Compare, _Alloc >::_M_reinsert_node_hint_equal
(
    const_iterator __hint,
    node_type && __nh ) [inline], [inherited]
```

Re-insert an extracted node.

`_M_reinsert_node_hint_unique()`

```
template<typename _Key , typename _Val , typename _KeyOfValue , typename _Compare , typename _↵
Alloc = allocator<_Val>>
```

```
iterator std::_Rb_tree<_Key, _Val, _KeyOfValue, _Compare, _Alloc >::_M_reinsert_node_hint_unique
(
    const_iterator __hint,
    node_type && __nh ) [inline], [inherited]
```

Re-insert an extracted node.

`_M_reinsert_node_unique()`

```
template<typename _Key , typename _Val , typename _KeyOfValue , typename _Compare , typename _Alloc = allocator<_Val>>
insert_return_type std::_Rb_tree< _Key, _Val, _KeyOfValue, _Compare, _Alloc >::_M_reinsert_node_unique (
    node_type && __nh ) [inline], [inherited]
```

Re-insert an extracted node.

`extract()` [1/2]

```
template<typename _Key , typename _Val , typename _KeyOfValue , typename _Compare , typename _Alloc = allocator<_Val>>
node_type std::_Rb_tree< _Key, _Val, _KeyOfValue, _Compare, _Alloc >::extract (
    const key_type & __k ) [inline], [inherited]
```

Extract a node.

`extract()` [2/2]

```
template<typename _Key , typename _Val , typename _KeyOfValue , typename _Compare , typename _Alloc = allocator<_Val>>
node_type std::_Rb_tree< _Key, _Val, _KeyOfValue, _Compare, _Alloc >::extract (
    const_iterator __pos ) [inline], [inherited]
```

Extract a node.

5.856.1 Detailed Description

`template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _↵
Alloc>`

`class __gnu_pbds::detail::rb_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >`

Red-Black tree.

This implementation uses an idea from the SGI STL (using a *header* node which is needed for efficient iteration).

5.856.2 Member Function Documentation

`node_begin()` [1/2]

```
template<typename Key , typename Mapped , typename Cmp_Fn , typename Node_And_It_Traits , typename  
_Alloc >
```

```
node_iterator __gnu_pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, ↵  
_Alloc >::node_begin ( ) [inline], [inherited]
```

Returns a `node_iterator` corresponding to the node at the root of the tree.

`node_begin()` [2/2]

```
template<typename Key , typename Mapped , typename Cmp_Fn , typename Node_And_It_Traits , typename  
_Alloc >
```

```
node_const_iterator __gnu_pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_↵  
Traits, _Alloc >::node_begin ( ) const [inline], [inherited]
```

Returns a const `node_iterator` corresponding to the node at the root of the tree.

`node_end()` [1/2]

```
template<typename Key , typename Mapped , typename Cmp_Fn , typename Node_And_It_Traits , typename  
_Alloc >
```

```
node_iterator __gnu_pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, ↵  
_Alloc >::node_end ( ) [inline], [inherited]
```

Returns a `node_iterator` corresponding to a node just after a leaf of the tree.

`node_end()` [2/2]

```
template<typename Key , typename Mapped , typename Cmp_Fn , typename Node_And_It_Traits , typename  
_Alloc >
```

```
node_const_iterator __gnu_pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_↵  
Traits, _Alloc >::node_end ( ) const [inline], [inherited]
```

Returns a const `node_iterator` corresponding to a node just after a leaf of the tree.

The documentation for this class was generated from the following file:

5.864 __gnu_cxx::recursive_init_error Class Reference

```
#include <cxxabi.h>
```

Inheritance diagram for `__gnu_cxx::recursive_init_error`:

Public Member Functions

- virtual const char * [what](#) () const noexcept

5.864.1 Detailed Description

Exception thrown by `__cxa_guard_acquire`.

C++ 2011 6.7 [stmt.dcl]/4: If control re-enters the declaration recursively while the variable is being initialized, the behavior is undefined.

Since we already have a library function to handle locking, we might as well check for this situation and throw an exception. We use the second byte of the guard variable to remember that we're in the middle of an initialization.

5.864.2 Member Function Documentation

`what()`

```
virtual const char * std::exception::what ( ) const [virtual], [noexcept], [inherited]
```

Returns a C-style character string describing the general cause of the current error.

Reimplemented in [std::bad_alloc](#), [std::ios_base::failure](#), [std::bad_exception](#), [std::bad_cast](#), [std::bad_typeid](#), [std::bad_any_cast](#), [std::filesystem::filesystem_error](#), [std::bad_weak_ptr](#), [std::bad_function_call](#), [std::experimental::fundamentals_v1::bad_weak_ptr](#), [std::experimental::filesystem_v1::filesystem_error](#), [std::future_error](#), [std::logic_error](#), [std::runtime_error](#), and [std::bad_optional_access](#).

Friends

- class **bitset**

5.867.1 Detailed Description

```
template<size_t _Nb>
class std::bitset<_Nb>::reference
```

This encapsulates the concept of a single bit. An instance of this class is a proxy for an actual bit; this way the individual bit operations are done as faster word-size bitwise instructions.

Most users will never need to use this class directly; conversions to and from bool are automatic and should be transparent. Overloaded operators help to preserve the illusion.

(On a typical system, this *bit reference* is 64 times the size of an actual bit. Ha.)

The documentation for this class was generated from the following file:

5.870.1 Detailed Description

A regular expression exception class.

The regular expression library throws objects of this class on error.

5.870.2 Constructor & Destructor Documentation

regex_error()

```
std::regex_error::regex_error (
    regex\_constants::error\_type __ecode ) [explicit]
```

Constructs a regex_error object.

Parameters

<code>__ecode</code>	the regex error code.
----------------------	-----------------------

5.870.3 Member Function Documentation

`code()`

`regex_constants::error_type` `std::regex_error::code () const` `[inline]`, `[noexcept]`

Gets the regex error code.

Returns

the regex error code.

`what()`

`virtual const char * std::runtime_error::what () const` `[virtual]`, `[noexcept]`, `[inherited]`

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from `std::exception`.

Reimplemented in `std::filesystem::filesystem_error`, and `std::experimental::filesystem::v1::filesystem_error`.

The documentation for this class was generated from the following file:

5.871.1 Detailed Description

`template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>>`

`class std::regex_iterator<_Bi_iter, _Ch_type, _Rx_traits>`

An iterator adaptor that will provide repeated calls of `regex_search` over a range until no more matches remain.

5.871.2 Constructor & Destructor Documentation

regex_iterator() [1/3]

```
template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_iterator ( ) [default]
```

Provides a singular iterator, useful for indicating one-past-the-end of a range.

Referenced by [std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_iterator\(\)](#).

regex_iterator() [2/3]

```
template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_iterator (
    _Bi_iter __a,
    _Bi_iter __b,
    const regex_type & __re,
    regex_constants::match_flag_type __m = regex_constants::match_default ) [inline]
```

Constructs a `regex_iterator`...

Parameters

<code>__a</code>	[IN] The start of a text range to search.
<code>__b</code>	[IN] One-past-the-end of the text range to search.
<code>__re</code>	[IN] The regular expression to match.
<code>__m</code>	[IN] Policy flags for match rules.

References [std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_iterator\(\)](#), and [std::regex_search\(\)](#).

regex_iterator() [3/3]

```
template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_iterator (
    const regex_iterator< _Bi_iter, _Ch_type, _Rx_traits > & ) [default]
```

Copy constructs a `regex_iterator`.

5.871.3 Member Function Documentation

operator!=(())

```
template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
bool std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator!= (
    const regex_iterator< _Bi_iter, _Ch_type, _Rx_traits > & __rhs ) const [inline],
[noexcept]
```

Tests the inequivalence of two `regex_iterator`s.

operator*()

```
template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
```

```

typename _Rx_traits = regex_traits<_Ch_type>>
const value_type & std::regex_iterator<_Bi_iter, _Ch_type, _Rx_traits>::operator* ( ) const
[inline], [noexcept]

```

Dereferences a `regex_iterator`.

operator++() [1/2]

```

template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
regex_iterator & std::regex_iterator<_Bi_iter, _Ch_type, _Rx_traits>::operator++ ( )

```

Increments a `regex_iterator`.

operator++() [2/2]

```

template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
regex_iterator std::regex_iterator<_Bi_iter, _Ch_type, _Rx_traits>::operator++ (
    int ) [inline]

```

Postincrements a `regex_iterator`.

operator->()

```

template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
const value_type * std::regex_iterator<_Bi_iter, _Ch_type, _Rx_traits>::operator-> ( ) const
[inline], [noexcept]

```

Selects a `regex_iterator` member.

operator=()

```

template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
regex_iterator & std::regex_iterator<_Bi_iter, _Ch_type, _Rx_traits>::operator= (
    const regex_iterator<_Bi_iter, _Ch_type, _Rx_traits> & ) [default]

```

Copy assigns one `regex_iterator` to another.

operator==()

```

template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
bool std::regex_iterator<_Bi_iter, _Ch_type, _Rx_traits>::operator== (
    const regex_iterator<_Bi_iter, _Ch_type, _Rx_traits> & ) const [noexcept]

```

Tests the equivalence of two `regex iterators`.

5.872.1 Detailed Description

template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>>>

class std::regex_token_iterator<_Bi_iter, _Ch_type, _Rx_traits>

Iterates over submatches in a range (or *splits* a text string).

The purpose of this iterator is to enumerate all, or all specified, matches of a regular expression within a text range. The dereferenced value of an iterator of this class is a `std::sub_match` object.

5.872.2 Constructor & Destructor Documentation

`regex_token_iterator`() [1/6]

template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>>>

`std::regex_token_iterator`<_Bi_iter, _Ch_type, _Rx_traits>::`regex_token_iterator` () [inline]

Default constructs a `regex_token_iterator`.

A default-constructed `regex_token_iterator` is a singular iterator that will compare equal to the one-past-the-end value for any iterator of the same type.

regex_token_iterator() [2/6]

```
template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator (
    _Bi_iter __a,
    _Bi_iter __b,
    const regex_type & __re,
    int __submatch = 0,
    regex_constants::match_flag_type __m = regex_constants::match_default ) [inline]
```

Constructs a regex_token_iterator...

Parameters

<code>__a</code>	[IN] The start of the text to search.
<code>__b</code>	[IN] One-past-the-end of the text to search.
<code>__re</code>	[IN] The regular expression to search for.
<code>__submatch</code>	[IN] Which submatch to return. There are some special values for this parameter: <ul style="list-style-type: none"> • -1 each enumerated subexpression does NOT match the regular expression (aka field splitting) • 0 the entire string matching the subexpression is returned for each match within the text. • >0 enumerates only the indicated subexpression from a match within the text.
<code>__m</code>	[IN] Policy flags for match rules.

regex_token_iterator() [3/6]

```
template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator (
    _Bi_iter __a,
    _Bi_iter __b,
    const regex_type & __re,
    const std::vector< int > & __submatches,
    regex_constants::match_flag_type __m = regex_constants::match_default ) [inline]
```

Constructs a regex_token_iterator...

Parameters

<code>__a</code>	[IN] The start of the text to search.
<code>__b</code>	[IN] One-past-the-end of the text to search.
<code>__re</code>	[IN] The regular expression to search for.
<code>__submatches</code>	[IN] A list of subexpressions to return for each regular expression match within the text.
<code>__m</code>	[IN] Policy flags for match rules.

regex_token_iterator() [4/6]

```
template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator (
```

```

_Bi_iter __a,
_Bi_iter __b,
const regex_type & __re,
initializer_list< int > __submatches,
regex_constants::match_flag_type __m = regex_constants::match_default ) [inline]

```

Constructs a regex_token_iterator...

Parameters

<code>__a</code>	[IN] The start of the text to search.
<code>__b</code>	[IN] One-past-the-end of the text to search.
<code>__re</code>	[IN] The regular expression to search for.
<code>__submatches</code>	[IN] A list of subexpressions to return for each regular expression match within the text.
<code>__m</code>	[IN] Policy flags for match rules.

regex_token_iterator() [5/6]

```

template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
template<std::size_t _Nm>
std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator (
    _Bi_iter __a,
    _Bi_iter __b,
    const regex_type & __re,
    const int (&) __submatches[_Nm],
    regex_constants::match_flag_type __m = regex_constants::match_default ) [inline]

```

Constructs a regex_token_iterator...

Parameters

<code>__a</code>	[IN] The start of the text to search.
<code>__b</code>	[IN] One-past-the-end of the text to search.
<code>__re</code>	[IN] The regular expression to search for.
<code>__submatches</code>	[IN] A list of subexpressions to return for each regular expression match within the text.
<code>__m</code>	[IN] Policy flags for match rules.

regex_token_iterator() [6/6]

```

template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator (
    const regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits > & __rhs ) [inline]

```

Copy constructs a regex_token_iterator.

Parameters

<code>__rhs</code>	[IN] A regex_token_iterator to copy.
--------------------	--------------------------------------

5.872.3 Member Function Documentation

operator"!=(())

```
template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>>
bool std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator!= (
    const regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits > & __rhs ) const [inline]
```

Compares a regex_token_iterator to another for inequality.

operator*()

```
template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>>
const value_type & std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator* ( )
const [inline]
```

Dereferences a regex_token_iterator.

operator++() [1/2]

```
template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>>
regex_token_iterator & std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator++ (
    )
```

Increments a regex_token_iterator.

operator++() [2/2]

```
template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>>
regex_token_iterator std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator++ (
    int ) [inline]
```

Postincrements a regex_token_iterator.

operator->()

```
template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>>
const value_type * std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator-> ( )
const [inline]
```

Selects a regex_token_iterator member.

operator=()

```
template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>>
regex_token_iterator & std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator= (
    const regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits > & __rhs )
```

Assigns a regex_token_iterator to another.

Parameters

<code>__rhs</code>	[IN] A regex_token_iterator to copy.
--------------------	--------------------------------------

operator==()

```
template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type,
typename _Rx_traits = regex_traits<_Ch_type>>
bool std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator== (
    const regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits > & __rhs ) const
```

Compares a `regex_token_iterator` to another for equality.

5.873.1 Detailed Description

```
template<typename _Ch_type>
class std::regex_traits< _Ch_type >
```

Describes aspects of a regular expression.

A regular expression traits class that satisfies the requirements of section [28.7].

The class `regex` is parameterized around a set of related types and functions used to complete the definition of its semantics. This class satisfies the requirements of such a traits class.

5.873.2 Constructor & Destructor Documentation

regex_traits()

```
template<typename _Ch_type >
std::regex_traits<_Ch_type>::regex_traits ( ) [inline]
```

Constructs a default traits object.

5.873.3 Member Function Documentation

getloc()

```
template<typename _Ch_type >
locale_type std::regex_traits<_Ch_type>::getloc ( ) const [inline]
```

Gets a copy of the current locale in use by the regex_traits object.

imbue()

```
template<typename _Ch_type >
locale_type std::regex_traits<_Ch_type>::imbue (
    locale_type __loc ) [inline]
```

Imbues the regex_traits object with a copy of a new locale.

Parameters

<code>__loc</code>	A locale.
--------------------	-----------

Returns

a copy of the previous locale in use by the regex_traits object.

Note

Calling imbue with a different locale than the one currently in use invalidates all cached data held by *this.

References [std::swap\(\)](#).

isctype()

```
template<typename _Ch_type >
bool std::regex_traits<_Ch_type>::isctype (
    _Ch_type __c,
    char_class_type __f ) const
```

Determines if `c` is a member of an identified class.

Parameters

<code>__c</code>	a character.
<code>__f</code>	a class type (as returned from lookup_classname).

Returns

true if the character `__c` is a member of the classification represented by `__f`, false otherwise.

Exceptions

<code>std::bad_cast</code>	if the current locale does not have a ctype facet.
----------------------------	----------------------------------------------------

length()

```
template<typename _Ch_type >
static std::size_t std::regex\_traits< _Ch_type >::length (
    const char_type * __p ) [inline], [static]
```

Gives the length of a C-style string starting at `__p`.

Parameters

<code>__p</code>	a pointer to the start of a character sequence.
------------------	-------------------------------------------------

Returns

the number of characters between `*__p` and the first default-initialized value of type `char_type`. In other words, uses the C-string algorithm for determining the length of a sequence of characters.

References [std::basic_string< _CharT, _Traits, _Alloc >::length\(\)](#).

lookup_classname()

```
template<typename _Ch_type >
template<typename _Fwd_iter >
char_class_type std::regex\_traits< _Ch_type >::lookup_classname (
    _Fwd_iter __first,
    _Fwd_iter __last,
    bool __icase = false ) const
```

Maps one or more characters to a named character classification.

Parameters

<code>__first</code>	beginning of the character sequence.
<code>__last</code>	one-past-the-end of the character sequence.
<code>__icase</code>	ignores the case of the classification name.

Returns

an unspecified value that represents the character classification named by the character sequence designated by the iterator range `[__first, __last)`. If `icase` is true, the returned mask identifies the classification regardless of the case of the characters to be matched (for example, `[[:lower:]]` is the same as `[[:alpha:]]`), otherwise a case-dependent classification is returned. The value returned shall be independent of the case of the characters in the character sequence. If the name is not recognized then returns a value that compares equal to 0.

At least the following names (or their wide-character equivalent) are supported.

- d
- w
- s

- alnum
- alpha
- blank
- cntrl
- digit
- graph
- lower
- print
- punct
- space
- upper
- xdigit

lookup_collatename()

```
template<typename _Ch_type >
template<typename _Fwd_iter >
string_type std::regex_traits< _Ch_type >::lookup_collatename (
    _Fwd_iter __first,
    _Fwd_iter __last ) const
```

Gets a collation element by name.

Parameters

<code>__first</code>	beginning of the collation element name.
<code>__last</code>	one-past-the-end of the collation element name.

Returns

a sequence of one or more characters that represents the collating element consisting of the character sequence designated by the iterator range [`__first`, `__last`). Returns an empty string if the character sequence is not a valid collating element.

transform()

```
template<typename _Ch_type >
template<typename _Fwd_iter >
string_type std::regex_traits< _Ch_type >::transform (
    _Fwd_iter __first,
    _Fwd_iter __last ) const [inline]
```

Gets a sort key for a character sequence.

Parameters

<code>__first</code>	beginning of the character sequence.
<code>__last</code>	one-past-the-end of the character sequence.

Returns a sort key for the character sequence designated by the iterator range [F1, F2) such that if the character sequence [G1, G2) sorts before the character sequence [H1, H2) then `v.transform(G1, G2) < v.transform(H1, H2)`. What this really does is provide a more efficient way to compare a string to multiple other strings in locales with fancy collation rules and equivalence classes.

Returns

a locale-specific sort key equivalent to the input range.

Exceptions

<code>std::bad_cast</code>	if the current locale does not have a collate facet.
----------------------------	------------------------------------------------------

References `std::basic_string<_CharT, _Traits, _Alloc>::data()`, and `std::basic_string<_CharT, _Traits, _Alloc>::size()`. Referenced by `std::regex_traits<_Ch_type>::transform_primary()`.

transform_primary()

```
template<typename _Ch_type >
template<typename _Fwd_iter >
string_type std::regex_traits<_Ch_type>::transform_primary (
    _Fwd_iter __first,
    _Fwd_iter __last ) const [inline]
```

Gets a sort key for a character sequence, independent of case.

Parameters

<code>__first</code>	beginning of the character sequence.
<code>__last</code>	one-past-the-end of the character sequence.

Effects: if `typeid(use_facet<collate<_Ch_type>>) == typeid(collate_byname<_Ch_type>)` and the form of the sort key returned by `collate_byname<_Ch_type>::transform(__first, __last)` is known and can be converted into a primary sort key then returns that key, otherwise returns an empty string.

Todo Implement this function correctly.

References `std::vector<_Tp, _Alloc>::data()`, `std::vector<_Tp, _Alloc>::size()`, and `std::regex_traits<_Ch_type>::transform()`.

translate()

```
template<typename _Ch_type >
char_type std::regex_traits<_Ch_type>::translate (
    char_type __c ) const [inline]
```

Performs the identity translation.

Parameters

<code>__c</code>	A character to the locale-specific character set.
------------------	---------------------------------------------------

Returns

`__c`.

translate_nocase()

```
template<typename _Ch_type >
char_type std::regex_traits< _Ch_type >::translate_nocase (
    char_type __c ) const [inline]
```

Translates a character into a case-insensitive equivalent.

Parameters

<code>__c</code>	A character to the locale-specific character set.
------------------	---------------------------------------------------

Returns

the locale-specific lower-case equivalent of `__c`.

Exceptions

<code>std::bad_cast</code>	if the imbued locale does not support the ctype facet.
----------------------------	--------------------------------------------------------

value()

```
template<typename _Ch_type >
int std::regex_traits< _Ch_type >::value (
    _Ch_type __ch,
    int __radix ) const
```

Converts a digit to an int.

Parameters

<code>__ch</code>	a character representing a digit.
<code>__radix</code>	the radix if the numeric conversion (limited to 8, 10, or 16).

Returns

the value represented by the digit `__ch` in base `radix` if the character `__ch` is a valid digit in base `radix`; otherwise returns -1.

Protected Attributes

- `_Iterator current`

5.884.1 Detailed Description

```
template<typename _Iterator>
class std::reverse_iterator<_Iterator>
```

Bidirectional and random access iterators have corresponding reverse iterator adaptors that iterate through the data structure in the opposite direction. They have the same signatures as the corresponding iterators. The fundamental relation between a reverse iterator and its corresponding iterator `i` is established by the identity:

```
&*(reverse_iterator(i)) == &(i - 1)
```

This mapping is dictated by the fact that while there is always a pointer past the end of an array, there might not be a valid pointer before the beginning of an array. [24.4.1]/1,2

Reverse iterators can be tricky and surprising at first. Their semantics make sense, however, and the trickiness is a side effect of the requirement that the iterators must be safe.

5.884.2 Member Typedef Documentation

iterator_category

```
typedef iterator_traits<_Iterator>::iterator_category std::iterator< iterator_traits<_Iterator>::iterator_category,
iterator_traits<_Iterator>::value_type, iterator_traits<_Iterator>::difference_type,
iterator_traits<_Iterator>::pointer, iterator_traits<_Iterator>::reference>::iterator_category [inherited]
```

One of the [tag types](#).

value_type

```
typedef iterator_traits<_Iterator>::value_type std::iterator< iterator_traits<_Iterator>::iterator_category,
iterator_traits<_Iterator>::value_type, iterator_traits<_Iterator>::difference_type,
iterator_traits<_Iterator>::pointer, iterator_traits<_Iterator>::reference>::value_type [inherited]
```

The type "pointed to" by the iterator.

5.884.3 Constructor & Destructor Documentation

reverse_iterator() [1/4]

```
template<typename _Iterator>
constexpr std::reverse_iterator<_Iterator>::reverse_iterator ( ) [inline], [constexpr]
```

The default constructor value-initializes member `current`. If it is a pointer, that means it is zero-initialized.

reverse_iterator() [2/4]

```
template<typename _Iterator>
constexpr std::reverse_iterator<_Iterator>::reverse_iterator (
    iterator_type __x ) [inline], [explicit], [constexpr]
```

This iterator will move in the opposite direction that `x` does.

reverse_iterator() [3/4]

```
template<typename _Iterator>
constexpr std::reverse_iterator<_Iterator>::reverse_iterator (
    const reverse_iterator<_Iterator> & __x ) [inline], [constexpr]
```

The copy constructor is normal.

reverse_iterator() [4/4]

```
template<typename _Iterator >
template<typename _Iter >
constexpr std::reverse_iterator< _Iterator >::reverse_iterator (
    const reverse_iterator< _Iter > & __x ) [inline], [constexpr]
```

A reverse_iterator across other types can be copied if the underlying iterator can be converted to the type of current.

5.884.4 Member Function Documentation**base()**

```
template<typename _Iterator >
constexpr iterator_type std::reverse_iterator< _Iterator >::base ( ) const [inline], [constexpr]
```

Returns

current, the iterator used for underlying work.

Referenced by [std::operator==\(\)](#).

operator*()

```
template<typename _Iterator >
constexpr reference std::reverse_iterator< _Iterator >::operator* ( ) const [inline], [constexpr]
```

Returns

A reference to the value at --current

This requires that --current is dereferenceable.

Warning

This implementation requires that for an iterator of the underlying iterator type, x, a reference obtained by *x remains valid after x has been modified or destroyed. This is a bug: <http://gcc.gnu.org/PR51823>

operator+()

```
template<typename _Iterator >
constexpr reverse_iterator std::reverse_iterator< _Iterator >::operator+ (
    difference_type __n ) const [inline], [constexpr]
```

Returns

A reverse_iterator that refers to current - __n

The underlying iterator must be a Random Access Iterator.

operator++() [1/2]

```
template<typename _Iterator >
constexpr reverse_iterator & std::reverse_iterator< _Iterator >::operator++ ( ) [inline], [constexpr]
```

Returns

*this

Decrements the underlying iterator.

operator++() [2/2]

```
template<typename _Iterator >
constexpr reverse_iterator std::reverse_iterator< _Iterator >::operator++ (
    int ) [inline], [constexpr]
```

Returns

The original value of `*this`

Decrements the underlying iterator.

operator+=()

```
template<typename _Iterator >
constexpr reverse_iterator & std::reverse_iterator< _Iterator >::operator+= (
    difference_type __n ) [inline], [constexpr]
```

Returns

`*this`

Moves the underlying iterator backwards `__n` steps. The underlying iterator must be a Random Access Iterator.

operator-()

```
template<typename _Iterator >
constexpr reverse_iterator std::reverse_iterator< _Iterator >::operator- (
    difference_type __n ) const [inline], [constexpr]
```

Returns

A `reverse_iterator` that refers to `current - __n`

The underlying iterator must be a Random Access Iterator.

operator--() [1/2]

```
template<typename _Iterator >
constexpr reverse_iterator & std::reverse_iterator< _Iterator >::operator-- ( ) [inline], [constexpr]
```

Returns

`*this`

Increments the underlying iterator.

operator--() [2/2]

```
template<typename _Iterator >
constexpr reverse_iterator std::reverse_iterator< _Iterator >::operator-- (
    int ) [inline], [constexpr]
```

Returns

A `reverse_iterator` with the previous value of `*this`

Increments the underlying iterator.

operator-=()

```
template<typename _Iterator >
constexpr reverse_iterator & std::reverse_iterator< _Iterator >::operator-= (
    difference_type __n ) [inline], [constexpr]
```

Returns

*this

Moves the underlying iterator forwards `__n` steps. The underlying iterator must be a Random Access Iterator.

operator->()

```
template<typename _Iterator >
constexpr pointer std::reverse_iterator< _Iterator >::operator-> ( ) const [inline], [constexpr]
```

Returns

A pointer to the value at `--current`

This requires that `--current` is dereferenceable.

operator[]()

```
template<typename _Iterator >
constexpr reference std::reverse_iterator< _Iterator >::operator[] (
    difference_type __n ) const [inline], [constexpr]
```

Returns

The value at `current - __n - 1`

The underlying iterator must be a Random Access Iterator.

5.885.1 Detailed Description

template<class `_CharT`, class `_Alloc`>
class `__gnu_cxx::rope<_CharT, _Alloc>`

This is an SGI extension.

Todo Needs documentation! See <http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation-style.html>

The documentation for this class was generated from the following files:

- `rope`
- `ropeimpl.h`

5.886 std::runtime_error Class Reference

Inheritance diagram for `std::runtime_error`:

Public Member Functions

- `runtime_error (const char *) _GLIBCXX_TXN_SAFE`
- `runtime_error (const runtime_error &)=default`
- `runtime_error (const string &__arg) _GLIBCXX_TXN_SAFE`
- `runtime_error (runtime_error &&) noexcept`

- [runtime_error](#) & **operator=** (const [runtime_error](#) &)=default
- [runtime_error](#) & **operator=** ([runtime_error](#) &&) noexcept
- virtual const char * [what](#) () const noexcept

5.886.1 Detailed Description

One of two subclasses of exception.

Runtime errors represent problems outside the scope of a program; they cannot be easily predicted and can generally only be caught as the program executes.

5.886.2 Constructor & Destructor Documentation

runtime_error()

```
std::runtime_error::runtime_error (
    const string & __arg ) [explicit]
```

Takes a character string describing the error.

5.886.3 Member Function Documentation

what()

```
virtual const char * std::runtime_error::what ( ) const [virtual], [noexcept]
```

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

Reimplemented in [std::filesystem::filesystem_error](#), and [std::experimental::filesystem::v1::filesystem_error](#).

The documentation for this class was generated from the following file:

- [stdexcept](#)

5.887 [__gnu_pbds::sample_probe_fn](#) Class Reference

```
#include <sample_probe_fn.hpp>
```

Public Types

Public Member Functions

- [sample_probe_fn](#) ()
- [sample_probe_fn](#) (const [sample_probe_fn](#) &)
- void [swap](#) ([sample_probe_fn](#) &)

Protected Member Functions

- size_type [operator\(\)](#) (key_const_reference r_key, size_type i) const

5.887.1 Detailed Description

A sample probe policy.

5.887.2 Constructor & Destructor Documentation

`sample_probe_fn()` [1/2]

`__gnu_pbds::sample_probe_fn::sample_probe_fn ()`
 Default constructor.

`sample_probe_fn()` [2/2]

`__gnu_pbds::sample_probe_fn::sample_probe_fn (`
 `const sample_probe_fn &)`
 Copy constructor.

5.887.3 Member Function Documentation

`operator()()`

`size_type __gnu_pbds::sample_probe_fn::operator() (`
 `key_const_reference r_key,`
 `size_type i) const [inline], [protected]`
 Returns the i-th offset from the hash value of some key r_key.

`swap()`

`void __gnu_pbds::sample_probe_fn::swap (`
 `sample_probe_fn &) [inline]`

Swaps content.

The documentation for this class was generated from the following file:

5.888.1 Detailed Description

A sample range-hashing functor.

5.888.2 Member Typedef Documentation

size_type

```
typedef std::size_t __gnu_pbds::sample_range_hashing::size_type
```

Size type.

5.888.3 Constructor & Destructor Documentation

sample_range_hashing() [1/2]

```
__gnu_pbds::sample_range_hashing::sample_range_hashing ( )
```

Default constructor.

sample_range_hashing() [2/2]

```
__gnu_pbds::sample_range_hashing::sample_range_hashing (
    const sample_range_hashing & other )
```

Copy constructor.

5.888.4 Member Function Documentation

notify_resized()

```
void __gnu_pbds::sample_range_hashing::notify_resized (
    size_type ) [protected]
```

Notifies the policy object that the container's size has changed to argument's size.

operator>()

```
size_type __gnu_pbds::sample_range_hashing::operator() (
    size_type ) const [inline], [protected]
```

Transforms the `__hash` value hash into a ranged-hash value.

swap()

```
void __gnu_pbds::sample_range_hashing::swap (
    sample_range_hashing & other ) [inline]
```

Swaps content.

5.889.1 Detailed Description

A sample ranged-hash functor.

5.889.2 Constructor & Destructor Documentation**`sample_ranged_hash_fn()` [1/2]**

```
__gnu_pbds::sample_ranged_hash_fn::sample_ranged_hash_fn ( )
```

Default constructor.

`sample_ranged_hash_fn()` [2/2]

```
__gnu_pbds::sample_ranged_hash_fn::sample_ranged_hash_fn (
    const sample_ranged_hash_fn & )
```

Copy constructor.

5.889.3 Member Function Documentation**`notify_resized()`**

```
void __gnu_pbds::sample_ranged_hash_fn::notify_resized (
    size_type ) [protected]
```

Notifies the policy object that the container's `__size` has changed to `size`.

`operator>()`

```
size_type __gnu_pbds::sample_ranged_hash_fn::operator() (
    key_const_reference ) const [inline], [protected]
```

Transforms `key_const_reference` into a position within the table.

`swap()`

```
void __gnu_pbds::sample_ranged_hash_fn::swap (
    sample_ranged_hash_fn & ) [inline]
```

Swaps content.

5.891.1 Detailed Description

A sample resize policy.

5.891.2 Member Typedef Documentation

size_type

```
typedef std::size_t __gnu_pbds::sample_resize_policy::size_type
```

Size type.

5.891.3 Constructor & Destructor Documentation

sample_resize_policy()

```
__gnu_pbds::sample_resize_policy::sample_resize_policy ( )
```

Default constructor.

5.891.4 Member Function Documentation

get_new_size()

```
size_type __gnu_pbds::sample_resize_policy::get_new_size (
    size_type size,
    size_type num_used_e ) const [protected]
```

Queries what the new size should be.

is_resize_needed()

```
bool __gnu_pbds::sample_resize_policy::is_resize_needed ( ) const [inline], [protected]
```

Queries whether a resize is needed.

notify_cleared()

```
void __gnu_pbds::sample_resize_policy::notify_cleared ( ) [protected]
```

Notifies the table was cleared.

notify_erase_search_collision()

```
void __gnu_pbds::sample_resize_policy::notify_erase_search_collision ( ) [inline], [protected]
```

Notifies a search encountered a collision.

notify_erase_search_end()

```
void __gnu_pbds::sample_resize_policy::notify_erase_search_end ( ) [inline], [protected]
```

Notifies a search ended.

notify_erase_search_start()

```
void __gnu_pbds::sample_resize_policy::notify_erase_search_start ( ) [inline], [protected]
```

Notifies a search started.

notify_erased()

```
void __gnu_pbds::sample_resize_policy::notify_erased (
    size_type num_e ) [inline], [protected]
```

Notifies an element was erased.

notify_find_search_collision()

```
void __gnu_pbds::sample_resize_policy::notify_find_search_collision ( ) [inline], [protected]
```

Notifies a search encountered a collision.

notify_find_search_end()

```
void __gnu_pbds::sample_resize_policy::notify_find_search_end ( ) [inline], [protected]
```

Notifies a search ended.

notify_find_search_start()

```
void __gnu_pbds::sample_resize_policy::notify_find_search_start ( ) [inline], [protected]
```

Notifies a search started.

notify_insert_search_collision()

```
void __gnu_pbds::sample_resize_policy::notify_insert_search_collision ( ) [inline], [protected]
```

Notifies a search encountered a collision.

notify_insert_search_end()

```
void __gnu_pbds::sample_resize_policy::notify_insert_search_end ( ) [inline], [protected]
```

Notifies a search ended.

notify_insert_search_start()

```
void __gnu_pbds::sample_resize_policy::notify_insert_search_start ( ) [inline], [protected]
```

Notifies a search started.

notify_inserted()

```
void __gnu_pbds::sample_resize_policy::notify_inserted (
    size_type num_e ) [inline], [protected]
```

Notifies an element was inserted.

notify_resized()

```
void __gnu_pbds::sample_resize_policy::notify_resized (
    size_type new_size ) [protected]
```

Notifies the table was resized to new_size.

sample_range_hashing()

```
__gnu_pbds::sample_resize_policy::sample_range_hashing (
    const sample_resize_policy & other )
```

Copy constructor.

swap()

```
void __gnu_pbds::sample_resize_policy::swap (
    sample_resize_policy & other ) [inline]
```

Swaps content.

5.892.1 Detailed Description

A sample resize trigger policy.

5.892.2 Member Typedef Documentation

`size_type`

`typedef std::size_t __gnu_pbds::sample_resize_trigger::size_type`
Size type.

5.892.3 Constructor & Destructor Documentation

`sample_resize_trigger()`

`__gnu_pbds::sample_resize_trigger::sample_resize_trigger ()`
Default constructor.

5.892.4 Member Function Documentation

`is_grow_needed()`

```
bool __gnu_pbds::sample_resize_trigger::is_grow_needed (
    size\_type size,
    size\_type num_entries ) const [inline], [protected]
```

Queries whether a grow is needed.

`is_resize_needed()`

```
bool __gnu_pbds::sample_resize_trigger::is_resize_needed ( ) const [inline], [protected]
```

Queries whether a resize is needed.

notify_cleared()

```
void __gnu_pbds::sample_resize_trigger::notify_cleared ( ) [protected]
```

Notifies the table was cleared.

notify_erase_search_collision()

```
void __gnu_pbds::sample_resize_trigger::notify_erase_search_collision ( ) [inline], [protected]
```

Notifies a search encountered a collision.

notify_erase_search_end()

```
void __gnu_pbds::sample_resize_trigger::notify_erase_search_end ( ) [inline], [protected]
```

Notifies a search ended.

notify_erase_search_start()

```
void __gnu_pbds::sample_resize_trigger::notify_erase_search_start ( ) [inline], [protected]
```

Notifies a search started.

notify_erased()

```
void __gnu_pbds::sample_resize_trigger::notify_erased (
    size_type num_entries ) [inline], [protected]
```

Notifies an element was erased.

notify_externally_resized()

```
void __gnu_pbds::sample_resize_trigger::notify_externally_resized (
    size_type new_size ) [protected]
```

Notifies the table was resized externally.

notify_find_search_collision()

```
void __gnu_pbds::sample_resize_trigger::notify_find_search_collision ( ) [inline], [protected]
```

Notifies a search encountered a collision.

notify_find_search_end()

```
void __gnu_pbds::sample_resize_trigger::notify_find_search_end ( ) [inline], [protected]
```

Notifies a search ended.

notify_find_search_start()

```
void __gnu_pbds::sample_resize_trigger::notify_find_search_start ( ) [inline], [protected]
```

Notifies a search started.

notify_insert_search_collision()

```
void __gnu_pbds::sample_resize_trigger::notify_insert_search_collision ( ) [inline], [protected]
```

Notifies a search encountered a collision.

notify_insert_search_end()

```
void __gnu_pbds::sample_resize_trigger::notify_insert_search_end ( ) [inline], [protected]
```

Notifies a search ended.

notify_insert_search_start()

`void __gnu_pbds::sample_resize_trigger::notify_insert_search_start () [inline], [protected]`
 Notifies a search started.

notify_inserted()

`void __gnu_pbds::sample_resize_trigger::notify_inserted (
 size_type num_entries) [inline], [protected]`
 Notifies an element was inserted. the total number of entries in the table is `num_entries`.

notify_resized()

`void __gnu_pbds::sample_resize_trigger::notify_resized (
 size_type new_size) [protected]`
 Notifies the table was resized as a result of this object's signifying that a resize is needed.

sample_range_hashing()

`__gnu_pbds::sample_resize_trigger::sample_range_hashing (
 const sample_resize_trigger &)`
 Copy constructor.

swap()

`void __gnu_pbds::sample_resize_trigger::swap (
 sample_resize_trigger &) [inline]`
 Swaps content.
 The documentation for this class was generated from the following file:

5.893.1 Detailed Description

A sample size policy.

5.893.2 Member Typedef Documentation

size_type

`typedef std::size_t __gnu_pbds::sample_size_policy::size_type`
Size type.

5.893.3 Constructor & Destructor Documentation

sample_size_policy()

`__gnu_pbds::sample_size_policy::sample_size_policy ()`
Default constructor.

5.893.4 Member Function Documentation

get_nearest_larger_size()

`size_type __gnu_pbds::sample_size_policy::get_nearest_larger_size (`
`size_type size) const [inline], [protected]`

Given a `__size` size, returns a `__size` that is larger.

get_nearest_smaller_size()

`size_type __gnu_pbds::sample_size_policy::get_nearest_smaller_size (`
`size_type size) const [inline], [protected]`

Given a `__size` size, returns a `__size` that is smaller.

sample_range_hashing()

`__gnu_pbds::sample_size_policy::sample_range_hashing (`
`const sample_size_policy &)`

Copy constructor.

swap()

`void __gnu_pbds::sample_size_policy::swap (`
`sample_size_policy & other) [inline]`

Swaps content.

The documentation for this class was generated from the following file:

5.894 __gnu_pbds::sample_tree_node_update< Const_Node_Iter, Node_Iter, Cmp_Fn, _Alloc > Class Template Reference

`#include <sample_tree_node_update.hpp>`

5.894.1 Detailed Description

`template<typename Const_Node_Iter, typename Node_Iter, typename Cmp_Fn, typename _Alloc>`
`class __gnu_pbds::sample_tree_node_update< Const_Node_Iter, Node_Iter, Cmp_Fn, _Alloc >`

A sample node updatator.

The documentation for this class was generated from the following file:

- [sample_tree_node_update.hpp](#)

5.895 `__gnu_pbds::sample_trie_access_traits` Struct Reference

```
#include <sample_trie_access_traits.hpp>
```

Public Types

- enum { `max_size` }
- typedef `std::string::const_iterator` `const_iterator`
- typedef char `e_type`
- typedef `rebind_traits< _Alloc, key_type >::const_reference` `key_const_reference`
- typedef `std::string` `key_type`
- typedef `std::size_t` `size_type`

Static Public Member Functions

- static `const_iterator` `begin` (`key_const_reference`)
- static `size_type` `e_pos` (`e_type`)
- static `const_iterator` `end` (`key_const_reference`)

5.895.1 Detailed Description

A sample trie element access traits.

5.895.2 Member Typedef Documentation

`e_type`

```
typedef char __gnu_pbds::sample_trie_access_traits::e_type
```

Element type.

5.895.3 Member Function Documentation

`begin()`

```
static const_iterator __gnu_pbds::sample_trie_access_traits::begin (
    key_const_reference ) [inline], [static]
```

Returns a `const_iterator` to the first element of `r_key`.

`e_pos()`

```
static size_type __gnu_pbds::sample_trie_access_traits::e_pos (
    e_type ) [inline], [static]
```

Maps an element to a position.

`end()`

```
static const_iterator __gnu_pbds::sample_trie_access_traits::end (
    key_const_reference ) [inline], [static]
```

Returns a `const_iterator` to the after-last element of `r_key`.

The documentation for this struct was generated from the following file:

- [sample_trie_access_traits.hpp](#)

5.896 `__gnu_pbds::sample_trie_node_update< Node_Cltr, Node_Ltr, _ATraits, _Alloc >` Class Template Reference

```
#include <sample_trie_node_update.hpp>
```

Public Types

- typedef std::size_t **metadata_type**

Protected Member Functions

- [sample_trie_node_update](#) ()
- void [operator](#)() (node_iterator, node_const_iterator) const

5.896.1 Detailed Description

```
template<typename Node_Cltr, typename Node_Itr, typename _ATraits, typename _Alloc>
class __gnu_pbds::sample_trie_node_update< Node_Cltr, Node_Itr, _ATraits, _Alloc >
```

A sample node updatator.

5.896.2 Constructor & Destructor Documentation

sample_trie_node_update()

```
template<typename Node_Cltr , typename Node_Itr , typename _ATraits , typename _Alloc >
__gnu_pbds::sample_trie_node_update< Node_Cltr, Node_Itr, _ATraits, _Alloc >::sample_trie_node_↵
update ( ) [protected]
Default constructor.
```

5.896.3 Member Function Documentation

operator>()()

```
template<typename Node_Cltr , typename Node_Itr , typename _ATraits , typename _Alloc >
void __gnu_pbds::sample_trie_node_update< Node_Cltr, Node_Itr, _ATraits, _Alloc >::operator() (
    node_iterator ,
    node_const_iterator ) const [inline], [protected]
```

Updates the rank of a node through a node_iterator node_it; end_nd_it is the end node iterator.

The documentation for this class was generated from the following file:

- [sample_trie_node_update.hpp](#)

5.897 __gnu_pbds::sample_update_policy Struct Reference

```
#include <sample_update_policy.hpp>
```

Public Member Functions

- [sample_update_policy](#) ()
- [sample_update_policy](#) (const [sample_update_policy](#) &)
- void [swap](#) ([sample_update_policy](#) &other)

Protected Types

- typedef some_metadata_type [metadata_type](#)

Protected Member Functions

- [metadata_type operator](#)() () const
- bool [operator](#)() (metadata_reference) const

5.897.1 Detailed Description

A sample list-update policy.

5.897.2 Member Typedef Documentation

`metadata_type`

```
typedef some_metadata_type __gnu_pbds::sample_update_policy::metadata_type [protected]
```

Metadata on which this functor operates.

5.897.3 Constructor & Destructor Documentation

`sample_update_policy()` [1/2]

```
__gnu_pbds::sample_update_policy::sample_update_policy ( )
```

Default constructor.

`sample_update_policy()` [2/2]

```
__gnu_pbds::sample_update_policy::sample_update_policy (
    const sample_update_policy & )
```

Copy constructor.

5.897.4 Member Function Documentation

`operator>()` [1/2]

```
metadata_type __gnu_pbds::sample_update_policy::operator() ( ) const [protected]
```

Creates a metadata object.

`operator>()` [2/2]

```
bool __gnu_pbds::sample_update_policy::operator() (
    metadata_reference ) const [protected]
```

Decides whether a metadata object should be moved to the front of the list. A list-update based containers object will call this method to decide whether to move a node to the front of the list. The method should return true if the node should be moved to the front of the list.

`swap()`

```
void __gnu_pbds::sample_update_policy::swap (
    sample_update_policy & other ) [inline]
```

Swaps content.

The documentation for this struct was generated from the following file:

- [sample_update_policy.hpp](#)

5.898 `__gnu_parallel::sampling_tag` Struct Reference

```
#include <tags.h>
```

Inheritance diagram for `__gnu_parallel::sampling_tag`:

Public Member Functions

- **sampling_tag** ([_ThreadIndex](#) __num_threads)
- [_ThreadIndex](#) **get_num_threads** ()
- void **set_num_threads** ([_ThreadIndex](#) __num_threads)

5.898.1 Detailed Description

Forces parallel merging with exact splitting, at compile time.

5.898.2 Member Function Documentation

`__get_num_threads()`

[_ThreadIndex](#) `__gnu_parallel::parallel_tag::__get_num_threads ()` [inline], [inherited]

Find out desired number of threads.

Returns

Desired number of threads.

Referenced by `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort()`, and `__gnu_parallel::__parallel_sort()`.

`set_num_threads()`

void `__gnu_parallel::parallel_tag::set_num_threads (`
 [_ThreadIndex](#) __num_threads) [inline], [inherited]

Set the desired number of threads.

Parameters

<code>__num_threads</code>	Desired number of threads.
----------------------------	----------------------------

`bool operator== (const scoped_allocator_adaptor< _OutA1, _InA... > &__a, const scoped_allocator_adaptor< _OutA2, _InA... > &__b) noexcept`

5.899.1 Detailed Description

```
template<typename _OuterAlloc, typename... _InnerAllocs>
class std::scoped_allocator_adaptor< _OuterAlloc, _InnerAllocs >
```

An adaptor to recursively pass an allocator to the objects it constructs.
The documentation for this class was generated from the following file:

- [scoped_allocator](#)

5.900 std::scoped_lock< _MutexTypes > Class Template Reference

Public Member Functions

- `scoped_lock (_MutexTypes &... __m)`
- `scoped_lock (adopt_lock_t, _MutexTypes &... __m) noexcept`
- `scoped_lock (const scoped_lock &)=delete`
- `scoped_lock & operator= (const scoped_lock &)=delete`

5.900.1 Detailed Description

```
template<typename... _MutexTypes>
class std::scoped_lock< _MutexTypes >
```

A scoped lock type for multiple lockable objects.

A `scoped_lock` controls mutex ownership within a scope, releasing ownership in the destructor.

The documentation for this class was generated from the following file:

- [mutex](#)

5.901 `std::seed_seq` Class Reference

5.904 `__gnu_pbds::detail::select_value_type< Key, Mapped >` Struct Template Reference

`#include <types_traits.hpp>`

Public Types

- typedef `std::pair< const Key, Mapped >` **type**

5.904.1 Detailed Description

`template<typename Key, typename Mapped>`
`struct __gnu_pbds::detail::select_value_type< Key, Mapped >`

Choose `value_type` to be a key/value pair or just a key.

The documentation for this struct was generated from the following file:

- [types_traits.hpp](#)

5.905 `__gnu_pbds::detail::select_value_type< Key, null_type >` Struct Template Reference

`#include <types_traits.hpp>`

Public Types

- typedef `Key` **type**

5.905.1 Detailed Description

`template<typename Key>`
`struct __gnu_pbds::detail::select_value_type< Key, null_type >`

Specialization for sets where the key is the `value_type`.

The documentation for this struct was generated from the following file:

- [types_traits.hpp](#)

5.906 `std::basic_istream< _CharT, _Traits >::sentry` Class Reference**Public Types**

- typedef `__istream_type::__ctype_type` **__ctype_type**
- typedef `_Traits::int_type` **__int_type**
- typedef `basic_istream< _CharT, _Traits >` **__istream_type**
- typedef `basic_streambuf< _CharT, _Traits >` **__streambuf_type**
- typedef `_Traits` **traits_type**

Public Member Functions

- `sentry` (`basic_istream< _CharT, _Traits > &__is`, `bool __noskipws=false`)
- `operator bool` () **const**

5.906.1 Detailed Description

```
template<typename _CharT, typename _Traits>
class std::basic_istream< _CharT, _Traits >::sentry
```

Performs setup work for input streams.

Objects of this class are created before all of the standard extractors are run. It is responsible for *exception-safe prefix and suffix operations*, although only prefix actions are currently required by the standard.

5.906.2 Member Typedef Documentation

traits_type

```
template<typename _CharT , typename _Traits >
typedef _Traits std::basic_istream< _CharT, _Traits >::sentry::traits_type
Easy access to dependent types.
```

5.906.3 Constructor & Destructor Documentation

sentry()

```
template<typename _CharT , typename _Traits >
std::basic_istream< _CharT, _Traits >::sentry::sentry (
    basic_istream< _CharT, _Traits > & __is,
    bool __noskipws = false ) [explicit]
```

The constructor performs all the work.

Parameters

<code>__is</code>	The input stream to guard.
<code>__noskipws</code>	Whether to consume whitespace or not.

If the stream state is good (`__is.good()` is true), then the following actions are performed, otherwise the sentry state is false (*not okay*) and failbit is set in the stream state.

The sentry's preparatory actions are:

1. if the stream is tied to an output stream, `is.tie()->flush()` is called to synchronize the output sequence
2. if `__noskipws` is false, and `ios_base::skipws` is set in `is.flags()`, the sentry extracts and discards whitespace characters from the stream. The currently imbued locale is used to determine whether each character is whitespace.

If the stream state is still good, then the sentry state becomes true (*okay*).

References `std::ios_base::badbit`, `std::ios_base::eofbit`, `std::ios_base::failbit`, `std::ios_base::flags()`, `std::basic_ios< _CharT, _Traits >::goodbit`, `std::__ctype_abstract_base< _CharT >::is()`, `std::basic_ios< _CharT, _Traits >::rdbuf()`, `std::basic_ios< _CharT, _Traits >::setstate()`, `std::basic_streambuf< _CharT, _Traits >::sgetc()`, `std::ios_base::skipws`, `std::basic_streambuf< _CharT, _Traits >::snextc()`, and `std::basic_ios< _CharT, _Traits >::tie()`.

5.906.4 Member Function Documentation

operator bool()

```
template<typename _CharT , typename _Traits >
std::basic_istream< _CharT, _Traits >::sentry::operator bool ( ) const [inline], [explicit]
```

Quick status checking.

Returns

The sentry state.

For ease of use, sentries may be converted to booleans. The return value is that of the sentry state (`true == okay`). The documentation for this class was generated from the following files:

- [istream](#)
- [istream.tcc](#)

5.907 `std::basic_ostream< _CharT, _Traits >::sentry` Class Reference

Public Member Functions

- [sentry](#) ([basic_ostream](#)< `_CharT`, `_Traits` > &__os)
- [~sentry](#) ()
- [operator bool](#) () const

5.907.1 Detailed Description

```
template<typename _CharT, typename _Traits>
class std::basic_ostream< _CharT, _Traits >::sentry
```

Performs setup work for output streams.

Objects of this class are created before all of the standard inserters are run. It is responsible for *exception-safe prefix and suffix operations*.

5.907.2 Constructor & Destructor Documentation

sentry()

```
template<typename _CharT , typename _Traits >
std::basic_ostream< _CharT, _Traits >::sentry::sentry (
    basic_ostream< _CharT, _Traits > & __os ) [explicit]
```

The constructor performs preparatory work.

Parameters

<code>__os</code>	The output stream to guard.
-------------------	-----------------------------

If the stream state is good (`__os.good()` is true), then if the stream is tied to another output stream, `is-<tie()->flush()` is called to synchronize the output sequences.

If the stream state is still good, then the sentry state becomes true (*okay*).

References [std::ios_base::failbit](#), [std::basic_ios< _CharT, _Traits >::good\(\)](#), [std::basic_ios< _CharT, _Traits >::setstate\(\)](#), and [std::basic_ios< _CharT, _Traits >::tie\(\)](#).

~sentry()

```
template<typename _CharT , typename _Traits >
std::basic_ostream< _CharT, _Traits >::sentry::~~sentry ( ) [inline]
```

Possibly flushes the stream.

If `ios_base::unitbuf` is set in `os.flags()`, and `std::uncaught_exception()` is true, the sentry destructor calls `flush()` on the output stream.

5.907.3 Member Function Documentation

operator bool()

```
template<typename _CharT , typename _Traits >  
std::basic_ostream< _CharT, _Traits >::sentry::operator bool ( ) const [inline], [explicit]  
Quick status checking.
```

Returns

The sentry state.

For ease of use, sentries may be converted to booleans. The return value is that of the sentry state (true == okay).

5.911.1 Detailed Description

`template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>`
`class std::set< _Key, _Compare, _Alloc >`

A standard container made up of unique keys, which can be retrieved in logarithmic time.

Template Parameters

<code>_Key</code>	Type of key objects.
<code>_Compare</code>	Comparison function object type, defaults to <code>less<_Key></code> .
<code>_Alloc</code>	Allocator type, defaults to <code>allocator<_Key></code> .

Meets the requirements of a [container](#), a [reversible container](#), and an [associative container](#) (using unique keys).

Sets support bidirectional iterators.

The private tree data is declared exactly the same way for set and multiset; the distinction is made entirely in how the tree functions are called (*_unique versus *_equal, same as the standard).

5.911.2 Member Typedef Documentation

`allocator_type`

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
typedef _Alloc std::set< _Key, _Compare, _Alloc >::allocator_type
```

template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
typedef _Key std::set< _Key, _Compare, _Alloc >::value_type
Public typedefs.
```

5.911.3 Constructor & Destructor Documentation**set()** [1/12]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
std::set< _Key, _Compare, _Alloc >::set ( ) [default]
Default constructor creates no elements.
```

set() [2/12]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
std::set< _Key, _Compare, _Alloc >::set (
    const _Compare & __comp,
    const allocator_type & __a = allocator_type() ) [inline], [explicit]
Creates a set with no elements.
```

Parameters

<code>__comp</code>	Comparator to use.
<code>__a</code>	An allocator object.

set() [3/12]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
```

```
template<typename _InputIterator >
std::set<_Key, _Compare, _Alloc >::set (
    _InputIterator __first,
    _InputIterator __last ) [inline]
```

Builds a set from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

Create a set consisting of copies of the elements from [`__first`,`__last`). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(`__first`,`__last`)).

set() [4/12]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename _InputIterator >
std::set<_Key, _Compare, _Alloc >::set (
    _InputIterator __first,
    _InputIterator __last,
    const _Compare & __comp,
    const allocator_type & __a = allocator_type() ) [inline]
```

Builds a set from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__comp</code>	A comparison functor.
<code>__a</code>	An allocator object.

Create a set consisting of copies of the elements from [`__first`,`__last`). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(`__first`,`__last`)).

set() [5/12]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set<_Key, _Compare, _Alloc >::set (
    const set<_Key, _Compare, _Alloc > & ) [default]
```

Set copy constructor.

Whether the allocator is copied depends on the allocator traits.

set() [6/12]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set<_Key, _Compare, _Alloc >::set (
    set<_Key, _Compare, _Alloc > && ) [default]
```

Set move constructor

The newly-created set contains the exact contents of the moved instance. The moved instance is a valid, but unspecified, set.

set() [7/12]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set< _Key, _Compare, _Alloc >::set (
    initializer_list< value_type > __l,
    const _Compare & __comp = _Compare(),
    const allocator_type & __a = allocator_type() ) [inline]
```

Builds a set from an initializer_list.

Parameters

<code>__l</code>	An initializer_list.
<code>__comp</code>	A comparison functor.
<code>__a</code>	An allocator object.

Create a set consisting of copies of the elements in the list. This is linear in N if the list is already sorted, and NlogN otherwise (where N is `__l.size()`).

set() [8/12]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set< _Key, _Compare, _Alloc >::set (
    const allocator_type & __a ) [inline], [explicit]
```

Allocator-extended default constructor.

set() [9/12]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set< _Key, _Compare, _Alloc >::set (
    const set< _Key, _Compare, _Alloc > & __x,
    const allocator_type & __a ) [inline]
```

Allocator-extended copy constructor.

set() [10/12]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set< _Key, _Compare, _Alloc >::set (
    set< _Key, _Compare, _Alloc > && __x,
    const allocator_type & __a ) [inline], [noexcept]
```

Allocator-extended move constructor.

set() [11/12]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set< _Key, _Compare, _Alloc >::set (
    initializer_list< value_type > __l,
    const allocator_type & __a ) [inline]
```

Allocator-extended initializer-list constructor.

set() [12/12]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename _InputIterator >
std::set<_Key, _Compare, _Alloc>::set (
    _InputIterator __first,
    _InputIterator __last,
    const allocator_type & __a ) [inline]
```

Allocator-extended range constructor.

~set()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::set<_Key, _Compare, _Alloc>::~~set ( ) [default]
```

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

5.911.4 Member Function Documentation

begin()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
iterator std::set<_Key, _Compare, _Alloc>::begin ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the set. Iteration is done in ascending order according to the keys.

cbegin()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
iterator std::set<_Key, _Compare, _Alloc>::cbegin ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the set. Iteration is done in ascending order according to the keys.

cend()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
iterator std::set<_Key, _Compare, _Alloc>::cend ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the set. Iteration is done in ascending order according to the keys.

clear()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
void std::set<_Key, _Compare, _Alloc>::clear ( ) [inline], [noexcept]
```

Erases all elements in a set. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

count() [1/2]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>>
template<typename _Kt >
auto std::set< _Key, _Compare, _Alloc >::count (
    const _Kt & __x ) const -> decltype(_M_t._M_count_tr(__x))    [inline]
```

Finds the number of elements.

Parameters

<code>_↵</code>	Element to located.
<code>_X</code>	

Returns

Number of elements with specified key.

This function only makes sense for multisets; for set the result will either be 0 (not present) or 1 (present).

count() [2/2]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>>
size_type std::set< _Key, _Compare, _Alloc >::count (
    const key_type & __x ) const    [inline]
```

Finds the number of elements.

Parameters

<code>_↵</code>	Element to located.
<code>_X</code>	

Returns

Number of elements with specified key.

This function only makes sense for multisets; for set the result will either be 0 (not present) or 1 (present).

crbegin()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>>
reverse_iterator std::set< _Key, _Compare, _Alloc >::crbegin ( ) const    [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the last element in the set. Iteration is done in descending order according to the keys.

crend()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>>
reverse_iterator std::set< _Key, _Compare, _Alloc >::crend ( ) const    [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last pair in the set. Iteration is done in descending order according to the keys.

emplace()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename... _Args>
std::pair< iterator, bool > std::set< _Key, _Compare, _Alloc >::emplace (
    _Args &&... __args ) [inline]
```

Attempts to build and insert an element into the set.

Parameters

<code>__args</code>	Arguments used to generate an element.
---------------------	----------------------------------------

Returns

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to build and insert an element into the set. A set relies on unique keys and thus an element is only inserted if it is not already present in the set.

Insertion requires logarithmic time.

emplace_hint()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename... _Args>
iterator std::set< _Key, _Compare, _Alloc >::emplace_hint (
    const_iterator __pos,
    _Args &&... __args ) [inline]
```

Attempts to insert an element into the set.

Parameters

<code>__pos</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__args</code>	Arguments used to generate the element to be inserted.

Returns

An iterator that points to the element with key equivalent to the one generated from `__args` (may or may not be the element itself).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `emplace()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints

Insertion requires logarithmic time (if the hint is not taken).

empty()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
bool std::set< _Key, _Compare, _Alloc >::empty ( ) const [inline], [noexcept]
```

Returns true if the set is empty.

end()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
iterator std::set< _Key, _Compare, _Alloc >::end ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the set. Iteration is done in ascending order according to the keys.

Referenced by [std::set< _Key, _Compare, _Alloc >::extract\(\)](#).

equal_range() [1/4]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
template<typename _Kt >
```

```
auto std::set< _Key, _Compare, _Alloc >::equal_range (
    const _Kt & __x ) -> decltype(pair<iterator, iterator>(_M_t._M_equal_range_tr(__x)))
```

```
[inline]
```

Finds a subsequence matching given key.

Parameters

<code>_Key</code>	Key to be located.
<code>__x</code>	

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
              c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multisets.

equal_range() [2/4]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
```

```
template<typename _Kt >
```

```
auto std::set< _Key, _Compare, _Alloc >::equal_range (
    const _Kt & __x ) const -> decltype(pair<iterator, iterator>(_M_t._M_equal_range_tr(__x))) [inline]
```

Finds a subsequence matching given key.

Parameters

<code>_Key</code>	Key to be located.
<code>__x</code>	

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
              c.upper_bound(val))
```

(but is faster than making the calls separately).
This function probably only makes sense for multisets.

equal_range() [3/4]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::pair< iterator, iterator > std::set< _Key, _Compare, _Alloc >::equal_range (
    const key_type & __x ) [inline]
```

Finds a subsequence matching given key.

Parameters

<code>_↔</code> <code>_X</code>	Key to be located.
------------------------------------	--------------------

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
              c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multisets.

equal_range() [4/4]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::pair< const_iterator, const_iterator > std::set< _Key, _Compare, _Alloc >::equal_range (
    const key_type & __x ) const [inline]
```

Finds a subsequence matching given key.

Parameters

<code>_↔</code> <code>_X</code>	Key to be located.
------------------------------------	--------------------

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
              c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multisets.

erase() [1/3]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
size_type std::set< _Key, _Compare, _Alloc >::erase (
    const key_type & __x ) [inline]
```

Erases elements according to the provided key.

Parameters

<code>__key</code>	Key of element to be erased.
--------------------	------------------------------

Returns

The number of elements erased.

This function erases all the elements located by the given key from a set. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [2/3]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
_GLIBCXX_ABI_TAG_CXX11 iterator std::set< _Key, _Compare, _Alloc >::erase (
    const_iterator __first,
    const_iterator __last ) [inline]
```

Erases a [`__first`,`__last`) range of elements from a set.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be erased.
<code>__last</code>	Iterator pointing to the end of the range to be erased.

Returns

The iterator `__last`.

This function erases a sequence of elements from a set. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [3/3]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
_GLIBCXX_ABI_TAG_CXX11 iterator std::set< _Key, _Compare, _Alloc >::erase (
    const_iterator __position ) [inline]
```

Erases an element from a set.

Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---------------------------------------------------

Returns

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from a set. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

extract() [1/2]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
node_type std::set< _Key, _Compare, _Alloc >::extract (
    const key_type & __x ) [inline]
```

Extract a node.

extract() [2/2]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
node_type std::set< _Key, _Compare, _Alloc >::extract (
    const_iterator __pos ) [inline]
```

Extract a node.

References [std::set<_Key, _Compare, _Alloc >::end\(\)](#).

find() [1/4]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
template<typename _Kt >
auto std::set< _Key, _Compare, _Alloc >::find (
    const _Kt & __x ) -> decltype(iterator{_M_t._M_find_tr(__x)}) [inline]
```

Tries to locate an element in a set.

Parameters

_↵	Element to be located.
_x	

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ([end\(\)](#)) iterator.

find() [2/4]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
template<typename _Kt >
auto std::set< _Key, _Compare, _Alloc >::find (
    const _Kt & __x ) const -> decltype(const_iterator{_M_t._M_find_tr(__x)}) [inline]
```

Tries to locate an element in a set.

Parameters

_↵	Element to be located.
_x	

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (end()) iterator.

find() [3/4]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
iterator std::set< _Key, _Compare, _Alloc >::find (
    const key_type & __x ) [inline]
```

Tries to locate an element in a set.

Parameters

<code>↵</code> <code>__x</code>	Element to be located.
------------------------------------	------------------------

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (end()) iterator.

find() [4/4]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
const_iterator std::set< _Key, _Compare, _Alloc >::find (
    const key_type & __x ) const [inline]
```

Tries to locate an element in a set.

Parameters

<code>↵</code> <code>__x</code>	Element to be located.
------------------------------------	------------------------

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (end()) iterator.

get_allocator()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
allocator_type std::set< _Key, _Compare, _Alloc >::get_allocator ( ) const [inline], [noexcept]
```

Returns the allocator object with which the set was constructed.

insert() [1/6]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
```

```

_Key>>
template<typename _InputIterator >
void std::set< _Key, _Compare, _Alloc >::insert (
    _InputIterator __first,
    _InputIterator __last ) [inline]

```

A template function that attempts to insert a range of elements.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be inserted.
<code>__last</code>	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

insert() [2/6]

```

template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
std::pair< iterator, bool > std::set< _Key, _Compare, _Alloc >::insert (
    const value_type & __x ) [inline]

```

Attempts to insert an element into the set.

Parameters

<code>↵</code>	Element to be inserted.
<code>__x</code>	

Returns

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to insert an element into the set. A set relies on unique keys and thus an element is only inserted if it is not already present in the set.

Insertion requires logarithmic time.

References `std::pair< _T1, _T2 >::first`, and `std::pair< _T1, _T2 >::second`.

Referenced by `std::set< _Key, _Compare, _Alloc >::insert()`.

insert() [3/6]

```

template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
iterator std::set< _Key, _Compare, _Alloc >::insert (
    const_iterator __hint,
    node_type && __nh ) [inline]

```

Re-insert an extracted node.

References `std::move()`.

insert() [4/6]

```

template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
iterator std::set< _Key, _Compare, _Alloc >::insert (
    const_iterator __position,
    const value_type & __x ) [inline]

```

Attempts to insert an element into the set.

Parameters

<code>__position</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__x</code>	Element to be inserted.

Returns

An iterator that points to the element with key of `__x` (may or may not be the element passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `insert()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints

Insertion requires logarithmic time (if the hint is not taken).

`insert()` [5/6]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
void std::set< _Key, _Compare, _Alloc >::insert (
    initializer_list< value_type > __l ) [inline]
```

Attempts to insert a list of elements into the set.

Parameters

<code>↔</code>	A <code>std::initializer_list<value_type></code> of elements to be inserted.
<code>↔</code>	
<code>↔</code>	
<code>↔</code>	
<code>/</code>	

Complexity similar to that of the range constructor.

References `std::set< _Key, _Compare, _Alloc >::insert()`.

`insert()` [6/6]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
insert_return_type std::set< _Key, _Compare, _Alloc >::insert (
    node_type && __nh ) [inline]
```

Re-insert an extracted node.

References `std::move()`.

`key_comp()`

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
key_compare std::set< _Key, _Compare, _Alloc >::key_comp ( ) const [inline]
```

Returns the comparison object with which the set was constructed.

lower_bound() [1/4]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename _Kt >
auto std::set<_Key, _Compare, _Alloc>::lower_bound (
    const _Kt & __x ) -> decltype(iterator(_M_t._M_lower_bound_tr(__x)))    [inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

<code>_↔</code>	Key to be located.
<code>_X</code>	

Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

lower_bound() [2/4]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename _Kt >
auto std::set<_Key, _Compare, _Alloc>::lower_bound (
    const _Kt & __x ) const -> decltype(const_iterator(_M_t._M_lower_bound_tr(__x)))
[inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

<code>_↔</code>	Key to be located.
<code>_X</code>	

Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

lower_bound() [3/4]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
iterator std::set<_Key, _Compare, _Alloc>::lower_bound (
    const key_type & __x ) [inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

<code>_↵</code>	Key to be located.
<code>_X</code>	

Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

lower_bound() [4/4]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
const_iterator std::set< _Key, _Compare, _Alloc >::lower_bound (
    const key_type & __x ) const [inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

<code>_↵</code>	Key to be located.
<code>_X</code>	

Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

max_size()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
size_type std::set< _Key, _Compare, _Alloc >::max_size ( ) const [inline], [noexcept]
```

Returns the maximum size of the set.

operator=() [1/3]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
set & std::set< _Key, _Compare, _Alloc >::operator= (
    const set< _Key, _Compare, _Alloc > & ) [default]
```

Set assignment operator.

Whether the allocator is copied depends on the allocator traits.

operator=() [2/3]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
```

```
set & std::set<_Key, _Compare, _Alloc >::operator= (
    initializer_list< value_type > __l ) [inline]
```

Set list assignment operator.

Parameters

↔	An initializer_list.
_↔	
↔	
_↔	
/	

This function fills a set with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the set and that the resulting set's size is the same as the number of elements assigned.

operator=() [3/3]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↔
_Key>>
```

```
set & std::set<_Key, _Compare, _Alloc >::operator= (
    set<_Key, _Compare, _Alloc > && ) [default]
```

Move assignment operator.

rbegin()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↔
_Key>>
```

```
reverse_iterator std::set<_Key, _Compare, _Alloc >::rbegin ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the last element in the set. Iteration is done in descending order according to the keys.

rend()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↔
_Key>>
```

```
reverse_iterator std::set<_Key, _Compare, _Alloc >::rend ( ) const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last pair in the set. Iteration is done in descending order according to the keys.

size()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↔
_Key>>
```

```
size_type std::set<_Key, _Compare, _Alloc >::size ( ) const [inline], [noexcept]
```

Returns the size of the set.

swap()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↔
_Key>>
```

```
void std::set<_Key, _Compare, _Alloc >::swap (
    set<_Key, _Compare, _Alloc > & __x ) [inline], [noexcept]
```

Swaps data with another set.

Parameters

<code>_↔</code>	A set of the same element and allocator types.
<code>_X</code>	

This exchanges the elements between two sets in constant time. (It is only swapping a pointer, an integer, and an instance of the `Compare` type (which itself is often stateless and empty), so it should be quite fast.) Note that the global `std::swap()` function is specialized such that `std::swap(s1,s2)` will feed to this function.

Whether the allocators are swapped depends on the allocator traits.

upper_bound() [1/4]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↔
_Key>>
template<typename _Kt >
auto std::set< _Key, _Compare, _Alloc >::upper_bound (
    const _Kt & __x ) -> decltype(iterator(_M_t._M_upper_bound_tr(__x)))    [inline]
```

Finds the end of a subsequence matching given key.

Parameters

<code>_↔</code>	Key to be located.
<code>_X</code>	

Returns

Iterator pointing to the first element greater than key, or end().

upper_bound() [2/4]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↔
_Key>>
template<typename _Kt >
auto std::set< _Key, _Compare, _Alloc >::upper_bound (
    const _Kt & __x ) const -> decltype(iterator(_M_t._M_upper_bound_tr(__x)))    [inline]
```

Finds the end of a subsequence matching given key.

Parameters

<code>_↔</code>	Key to be located.
<code>_X</code>	

Returns

Iterator pointing to the first element greater than key, or end().

upper_bound() [3/4]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↔
_Key>>
iterator std::set< _Key, _Compare, _Alloc >::upper_bound (
    const key_type & __x )    [inline]
```

Finds the end of a subsequence matching given key.

Parameters

<code>_↵</code>	Key to be located.
<code>_X</code>	

Returns

Iterator pointing to the first element greater than key, or end().

upper_bound() [4/4]

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
const_iterator std::set< _Key, _Compare, _Alloc >::upper_bound (
    const key_type & __x ) const [inline]
```

Finds the end of a subsequence matching given key.

Parameters

<code>_↵</code>	Key to be located.
<code>_X</code>	

Returns

Iterator pointing to the first element greater than key, or end().

value_comp()

```
template<typename _Key , typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<↵
_Key>>
value_compare std::set< _Key, _Compare, _Alloc >::value_comp ( ) const [inline]
```

Returns the comparison object with which the set was constructed.

5.912.1 Detailed Description

```
template<typename _Res>
class std::shared_future<_Res>
```

Primary template for shared_future.

5.912.2 Member Typedef Documentation

`_Ptr`

```
template<typename _Res>
using std::__future_base::_Ptr = unique_ptr<_Res, _Result_base::_Deleter> [inherited]
A unique_ptr for result objects.
```

5.912.3 Constructor & Destructor Documentation

`shared_future()` [1/3]

```
template<typename _Res>
std::shared_future<_Res>::shared_future (
    const shared_future<_Res> & __sf ) [inline], [noexcept]
Copy constructor.
```

`shared_future()` [2/3]

```
template<typename _Res>
std::shared_future<_Res>::shared_future (
    future<_Res> && __uf ) [inline], [noexcept]
Construct from a future rvalue.
```

`shared_future()` [3/3]

```
template<typename _Res>
std::shared_future<_Res>::shared_future (
    shared_future<_Res> && __sf ) [inline], [noexcept]
Construct from a shared_future rvalue.
```

5.912.4 Member Function Documentation

`_M_get_result()`

```
template<typename _Res>
__result_type std::__basic_future<_Res>::_M_get_result ( ) const [inline], [protected], [inherited]
Wait for the state to be ready and rethrow any stored exception.
```

get()

```
template<typename _Res >
const _Res & std::shared_future<_Res >::get ( ) const [inline]
```

Retrieving the value.

```
template<typename _Res >
std::shared_future<_Res &>::shared_future (
    shared_future<_Res &> && __sf ) [inline], [noexcept]
```

Construct from a `shared_future` rvalue.

5.913.4 Member Function Documentation

_M_get_result()

```
__result_type std::__basic_future< _Res & >::_M_get_result ( ) const [inline], [protected],
[inherited]
```

Wait for the state to be ready and rethrow any stored exception.

get()

```
template<typename _Res >
_Res & std::shared_future< _Res & >::get ( ) const [inline]
```

Retrieving the value.

5.917.1 Detailed Description

template<typename _Tp>
class std::shared_ptr< _Tp >

A smart pointer with reference-counted copy semantics.

A `shared_ptr` object is either empty or *owns* a pointer passed to the constructor. Copies of a `shared_ptr` share ownership of the same pointer. When the last `shared_ptr` that owns the pointer is destroyed or reset, the owned pointer is freed (either by `delete` or by invoking a custom deleter that was passed to the constructor).

A `shared_ptr` also stores another pointer, which is usually (but not always) the same pointer as it owns. The stored pointer can be retrieved by calling the `get()` member function.

The equality and relational operators for `shared_ptr` only compare the stored pointer returned by `get()`, not the owned pointer. To test whether two `shared_ptr` objects share ownership of the same pointer see `std::shared_ptr::owner_before` and `std::owner_less`.

5.917.2 Member Typedef Documentation

element_type

`template<typename _Tp >`
`using std::shared_ptr< _Tp >::element_type = typename __shared_ptr<_Tp>::element_type`

The type pointed to by the stored pointer, `remove_extent_t<_Tp>`

weak_type

`template<typename _Tp >`
`using std::shared_ptr< _Tp >::weak_type = weak_ptr<_Tp>`

The corresponding `weak_ptr` type for this `shared_ptr`.

5.917.3 Constructor & Destructor Documentation

shared_ptr() [1/13]

```
template<typename _Tp >
constexpr std::shared_ptr< _Tp >::shared_ptr ( ) [inline], [constexpr], [noexcept]
Construct an empty shared_ptr.
```

Postcondition

use_count()==0 && get()==0

shared_ptr() [2/13]

```
template<typename _Tp >
std::shared_ptr< _Tp >::shared_ptr (
    const shared_ptr< _Tp > & ) [default], [noexcept]
Copy constructor.
```

shared_ptr() [3/13]

```
template<typename _Tp >
template<typename _Yp , typename = _Constructible<_Yp*>>
std::shared_ptr< _Tp >::shared_ptr (
    _Yp * __p ) [inline], [explicit]
Construct a shared_ptr that owns the pointer __p.
```

Parameters

\leftrightarrow __p	A pointer that is convertible to element_type*.
--------------------------	-------------------------------------------------

Postcondition

use_count() == 1 && get() == __p

Exceptions

<i>std::bad_alloc</i> , in	which case delete __p is called.
----------------------------	----------------------------------

shared_ptr() [4/13]

```
template<typename _Tp >
template<typename _Yp , typename _Deleter , typename = _Constructible<_Yp*, _Deleter>>
std::shared_ptr< _Tp >::shared_ptr (
    _Yp * __p,
    _Deleter __d ) [inline]
Construct a shared_ptr that owns the pointer __p and the deleter __d.
```

Parameters

\leftrightarrow __p	A pointer.
--------------------------	------------

Parameters

\leftrightarrow __d	A deleter.
--------------------------	------------

Postcondition

use_count() == 1 && get() == __p

Exceptions

<i>std::bad_alloc</i> , in	which case __d(__p) is called.
----------------------------	--------------------------------

Requirements: _Deleter's copy constructor and destructor must not throw
__shared_ptr will release __p by calling __d(__p)

shared_ptr() [5/13]

```
template<typename _Tp >
template<typename _Deleter >
std::shared_ptr< _Tp >::shared_ptr (
    nullptr_t __p,
    _Deleter __d ) [inline]
```

Construct a shared_ptr that owns a null pointer and the deleter __d.

Parameters

\leftrightarrow __p	A null pointer constant.
\leftrightarrow __d	A deleter.

Postcondition

use_count() == 1 && get() == __p

Exceptions

<i>std::bad_alloc</i> , in	which case __d(__p) is called.
----------------------------	--------------------------------

Requirements: _Deleter's copy constructor and destructor must not throw
The last owner will call __d(__p)

shared_ptr() [6/13]

```
template<typename _Tp >
template<typename _Yp , typename _Deleter , typename _Alloc , typename = _Constructible<_Yp*,  $\leftrightarrow$ 
_Deleter, _Alloc>>
std::shared_ptr< _Tp >::shared_ptr (
    _Yp * __p,
    _Deleter __d,
```

```
_Alloc __a ) [inline]
```

Construct a `shared_ptr` that owns the pointer `__p` and the deleter `__d`.

Parameters

<code>__p</code>	A pointer.
<code>__d</code>	A deleter.
<code>__a</code>	An allocator.

Postcondition

```
use_count() == 1 && get() == __p
```

Exceptions

<code>std::bad_alloc</code> , in	which case <code>__d(__p)</code> is called.
----------------------------------	---------------------------------------------

Requirements: `_Deleter`'s copy constructor and destructor must not throw `_Alloc`'s copy constructor and destructor must not throw.

`__shared_ptr` will release `__p` by calling `__d(__p)`

`shared_ptr()` [7/13]

```
template<typename _Tp >
template<typename _Deleter , typename _Alloc >
std::shared_ptr< _Tp >::shared_ptr (
    nullptr_t __p,
    _Deleter __d,
    _Alloc __a ) [inline]
```

Construct a `shared_ptr` that owns a null pointer and the deleter `__d`.

Parameters

<code>__p</code>	A null pointer constant.
<code>__d</code>	A deleter.
<code>__a</code>	An allocator.

Postcondition

```
use_count() == 1 && get() == __p
```

Exceptions

<code>std::bad_alloc</code> , in	which case <code>__d(__p)</code> is called.
----------------------------------	---------------------------------------------

Requirements: _Deleter's copy constructor and destructor must not throw _Alloc's copy constructor and destructor must not throw.

The last owner will call __d(__p)

shared_ptr() [8/13]

```
template<typename _Tp >
template<typename _Yp >
std::shared_ptr< _Tp >::shared_ptr (
    const shared_ptr< _Yp > & __r,
    element_type * __p ) [inline], [noexcept]
```

Constructs a shared_ptr instance that stores __p and shares ownership with __r.

Parameters

\leftarrow __r	A shared_ptr.
\leftarrow __p	A pointer that will remain valid while *__r is valid.

Postcondition

```
get() == __p && use_count() == __r.use_count()
```

This can be used to construct a shared_ptr to a sub-object of an object managed by an existing shared_ptr. The complete object will remain valid while any shared_ptr owns it, even if they don't store a pointer to the complete object.

```
shared_ptr<pair<int,int>> pii(new pair<int,int>());
shared_ptr<int> pi(pii, &pii->first);
assert(pii.use_count() == 2);
```

shared_ptr() [9/13]

```
template<typename _Tp >
template<typename _Yp , typename = _Constructible<const shared_ptr<_Yp>&>>
std::shared_ptr< _Tp >::shared_ptr (
    const shared_ptr< _Yp > & __r ) [inline], [noexcept]
```

If __r is empty, constructs an empty shared_ptr; otherwise construct a shared_ptr that shares ownership with __r.

Parameters

\leftarrow \leftarrow \leftarrow \leftarrow __r	A shared_ptr.
---------------------------------------------------------------------	---------------

Postcondition

```
get() == __r.get() && use_count() == __r.use_count()
```

shared_ptr() [10/13]

```
template<typename _Tp >
std::shared_ptr< _Tp >::shared_ptr (
```

```
shared_ptr< _Tp > && __r ) [inline], [noexcept]
```

Move-constructs a shared_ptr instance from __r.

Parameters

↩	A shared_ptr rvalue.
↩	
↩	
↩	
<i>r</i>	

Postcondition

*this contains the old value of __r, __r is empty.

shared_ptr() [11/13]

```
template<typename _Tp >
template<typename _Yp , typename = _Constructible<shared_ptr<_Yp>>>
std::shared_ptr< _Tp >::shared_ptr (
    shared_ptr< _Yp > && __r ) [inline], [noexcept]
```

Move-constructs a shared_ptr instance from __r.

Parameters

↩	A shared_ptr rvalue.
↩	
↩	
↩	
<i>r</i>	

Postcondition

*this contains the old value of __r, __r is empty.

shared_ptr() [12/13]

```
template<typename _Tp >
template<typename _Yp , typename = _Constructible<const weak_ptr<_Yp>>>
std::shared_ptr< _Tp >::shared_ptr (
    const weak_ptr< _Yp > & __r ) [inline], [explicit]
```

Constructs a shared_ptr that shares ownership with __r and stores a copy of the pointer stored in __r.

Parameters

↩	A weak_ptr.
↩	
↩	
↩	
<i>r</i>	

Postcondition

```
use_count() == __r.use_count()
```

Exceptions

<i>bad_weak_ptr</i>	when <code>__r.expired()</code> , in which case the constructor has no effect.
---------------------	--------------------------------------------------------------------------------

shared_ptr() [13/13]

```
template<typename _Tp >
constexpr std::shared_ptr< _Tp >::shared_ptr (
    nullptr_t ) [inline], [constexpr], [noexcept]
```

Construct an empty `shared_ptr`.

Postcondition

```
use_count() == 0 && get() == nullptr
```

5.917.4 Member Function Documentation**get()**

```
template<typename _Tp , _Lock_policy _Lp>
element_type * std::__shared_ptr< _Tp, _Lp >::get ( ) const [inline], [noexcept], [inherited]
```

Return the stored pointer.

operator bool()

```
template<typename _Tp , _Lock_policy _Lp>
std::__shared_ptr< _Tp, _Lp >::operator bool ( ) const [inline], [explicit], [noexcept], [inherited]
```

Return true if the stored pointer is not null.

owner_before() [1/2]

```
template<typename _Tp , _Lock_policy _Lp>
template<typename _Tp1 >
bool std::__shared_ptr< _Tp, _Lp >::owner_before (
    __shared_ptr< _Tp1, _Lp > const & __rhs ) const [inline], [noexcept], [inherited]
```

Define an ordering based on ownership.

This function defines a strict weak ordering between two `shared_ptr` or `weak_ptr` objects, such that one object is less than the other unless they share ownership of the same pointer, or are both empty.

owner_before() [2/2]

```
template<typename _Tp , _Lock_policy _Lp>
template<typename _Tp1 >
bool std::__shared_ptr< _Tp, _Lp >::owner_before (
    __weak_ptr< _Tp1, _Lp > const & __rhs ) const [inline], [noexcept], [inherited]
```

Define an ordering based on ownership.

This function defines a strict weak ordering between two `shared_ptr` or `weak_ptr` objects, such that one object is less than the other unless they share ownership of the same pointer, or are both empty.

swap()

```
template<typename _Tp , _Lock_policy _Lp>
void std::__shared_ptr< _Tp, _Lp >::swap (
    __shared_ptr< _Tp, _Lp > & __other ) [inline], [noexcept], [inherited]
```

Exchange both the owned pointer and the stored pointer.

unique()

```
template<typename _Tp , _Lock_policy _Lp>
bool std::__shared_ptr< _Tp, _Lp >::unique ( ) const [inline], [noexcept], [inherited]
```

Return true if use_count() == 1.

use_count()

```
template<typename _Tp , _Lock_policy _Lp>
long std::__shared_ptr< _Tp, _Lp >::use_count ( ) const [inline], [noexcept], [inherited]
```

If *this owns a pointer, return the number of owners, otherwise zero.

5.919.1 Detailed Description

```
template<typename _RandomNumberEngine, size_t __k>
class std::shuffle_order_engine<_RandomNumberEngine, __k>
```

Produces random numbers by reordering random numbers from some base engine.

The values from the base engine are stored in a sequence of size `__k` and shuffled by an algorithm that depends on those values.

5.919.2 Member Typedef Documentation

result_type

```
template<typename _RandomNumberEngine , size_t __k>
typedef _RandomNumberEngine::result_type std::shuffle_order_engine< _RandomNumberEngine, __k >↔
::result_type
```

The type of the generated random value.

5.919.3 Constructor & Destructor Documentation

shuffle_order_engine() [1/5]

```
template<typename _RandomNumberEngine , size_t __k>
std::shuffle_order_engine< _RandomNumberEngine, __k >::shuffle_order_engine ( ) [inline]
```

Constructs a default shuffle_order_engine engine.

The underlying engine is default constructed as well.

shuffle_order_engine() [2/5]

```
template<typename _RandomNumberEngine , size_t __k>
std::shuffle_order_engine< _RandomNumberEngine, __k >::shuffle_order_engine (
    const _RandomNumberEngine & __rng ) [inline], [explicit]
```

Copy constructs a shuffle_order_engine engine.

Copies an existing base class random number generator.

Parameters

<code>__rng</code>	An existing (base class) engine object.
--------------------	-----------------------------------------

shuffle_order_engine() [3/5]

```
template<typename _RandomNumberEngine , size_t __k>
std::shuffle_order_engine< _RandomNumberEngine, __k >::shuffle_order_engine (
    _RandomNumberEngine && __rng ) [inline], [explicit]
```

Move constructs a shuffle_order_engine engine.

Copies an existing base class random number generator.

Parameters

<code>__rng</code>	An existing (base class) engine object.
--------------------	-----------------------------------------

shuffle_order_engine() [4/5]

```
template<typename _RandomNumberEngine , size_t __k>
std::shuffle_order_engine< _RandomNumberEngine, __k >::shuffle_order_engine (
    result_type __s ) [inline], [explicit]
```

Seed constructs a shuffle_order_engine engine.

Constructs the underlying generator engine seeded with `__s`.

Parameters

<code>↔</code>	A seed value for the base class engine.
<code>_s</code>	

shuffle_order_engine() [5/5]

```
template<typename _RandomNumberEngine , size_t __k>
template<typename _Sseq , typename = _If_seed_seq<_Sseq>>
std::shuffle_order_engine< _RandomNumberEngine, __k >::shuffle_order_engine (
    _Sseq & __q ) [inline], [explicit]
```

Generator construct a shuffle_order_engine engine.

Parameters

<code>__q</code>	A seed sequence.
------------------	------------------

5.919.4 Member Function Documentation**base()**

```
template<typename _RandomNumberEngine , size_t __k>
const _RandomNumberEngine & std::shuffle_order_engine< _RandomNumberEngine, __k >::base ( ) const
[inline], [noexcept]
```

Gets a const reference to the underlying generator engine object.

discard()

```
template<typename _RandomNumberEngine , size_t __k>
void std::shuffle_order_engine< _RandomNumberEngine, __k >::discard (
    unsigned long long __z ) [inline]
```

Discard a sequence of random numbers.

max()

```
template<typename _RandomNumberEngine , size_t __k>
static constexpr result_type std::shuffle_order_engine< _RandomNumberEngine, __k >::max ( ) [inline],
[static], [constexpr]
```

Gets the maximum value in the generated random number range.

min()

```
template<typename _RandomNumberEngine , size_t __k>
static constexpr result_type std::shuffle_order_engine< _RandomNumberEngine, __k >::min ( ) [inline],
[static], [constexpr]
```

Gets the minimum value in the generated random number range.

operator()()

```
template<typename _RandomNumberEngine , size_t __k>
shuffle_order_engine< _RandomNumberEngine, __k >::result_type std::shuffle_order_engine< __
_RandomNumberEngine, __k >::operator()
```

Gets the next value in the generated random number sequence.

References [std::max\(\)](#), and [std::min\(\)](#).

seed() [1/3]

```
template<typename _RandomNumberEngine , size_t __k>
void std::shuffle_order_engine< _RandomNumberEngine, __k >::seed ( ) [inline]
```

Reseeds the `shuffle_order_engine` object with the default seed for the underlying base class generator engine.

seed() [2/3]

```
template<typename _RandomNumberEngine , size_t __k>
template<typename _Sseq >
_If_seed_seq< _Sseq > std::shuffle_order_engine< _RandomNumberEngine, __k >::seed (
    _Sseq & __q ) [inline]
```

Reseeds the `shuffle_order_engine` object with the given seed sequence.

Parameters

<code>__q</code>	A seed generator function.
------------------	----------------------------

seed() [3/3]

```
template<typename _RandomNumberEngine , size_t __k>
void std::shuffle_order_engine< _RandomNumberEngine, __k >::seed (
    result_type __s ) [inline]
```

Reseeds the `shuffle_order_engine` object with the default seed for the underlying base class generator engine.

5.919.5 Friends And Related Symbol Documentation

operator<<

```
template<typename _RandomNumberEngine , size_t __k>
template<typename _RandomNumberEngine1 , size_t __k1, typename _CharT , typename _Traits >
std::basic_ostream< _CharT, _Traits > & operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::shuffle_order_engine< _RandomNumberEngine1, __k1 > & __x ) [friend]
```

Inserts the current state of a `shuffle_order_engine` random number generator engine `__x` into the output stream `__os`.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>shuffle_order_engine</code> random number generator engine.

Returns

The output stream with the state of `__x` inserted or in an error state.

operator==

```
template<typename _RandomNumberEngine , size_t __k>
bool operator== (
    const shuffle_order_engine< _RandomNumberEngine, __k > & __lhs,
    const shuffle_order_engine< _RandomNumberEngine, __k > & __rhs ) [friend]
```

Compares two `shuffle_order_engine` random number generator objects of the same type for equality.

Parameters

<code>__lhs</code>	A <code>shuffle_order_engine</code> random number generator object.
<code>__rhs</code>	Another <code>shuffle_order_engine</code> random number generator object.

Returns

true if the infinite sequences of generated values would be equal, false otherwise.

operator>>

```
template<typename _RandomNumberEngine , size_t __k>
template<typename _RandomNumberEngine1 , size_t __k1, typename _CharT , typename _Traits >
std::basic_istream< _CharT, _Traits > & operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::shuffle_order_engine< _RandomNumberEngine1, __k1 > & __x ) [friend]
```

Extracts the current state of a % subtract_with_carry_engine random number generator engine __x from the input stream __is.

Parameters

 <code>__is</code>	An input stream.
 <code>__x</code>	A shuffle_order_engine random number generator engine.

Returns

The input stream with the state of __x extracted or in an error state.

5.920 std::slice Class Reference

```
#include <slice_array.h>
```

Public Member Functions

- [slice](#) ()
- [slice](#) (size_t __o, size_t __d, size_t __s)
- size_t [size](#) () const
- size_t [start](#) () const
- size_t [stride](#) () const

5.920.1 Detailed Description

Class defining one-dimensional subset of an array.

The slice class represents a one-dimensional subset of an array, specified by three parameters: start offset, size, and stride. The start offset is the index of the first element of the array that is part of the subset. The size is the total number of elements in the subset. Stride is the distance between each successive array element to include in the subset.

For example, with an array of size 10, and a slice with offset 1, size 3 and stride 2, the subset consists of array elements 1, 3, and 5.

The documentation for this class was generated from the following file:

5.921.1 Detailed Description

template<typename _Tp>
class std::slice_array<_Tp>

Reference to one-dimensional subset of an array.

A slice_array is a reference to the actual elements of an array specified by a slice. The way to get a slice_array is to call operator[](slice) on a valarray. The returned slice_array then permits carrying operations out on the referenced subset of elements in the original valarray. For example, operator+=(valarray) will add values to the subset of elements in the underlying valarray this slice_array refers to.

Parameters

<i>Tp</i>	Element type.
-----------	---------------

5.921.2 Member Function Documentation

operator%=()

```
template<typename _Tp>
void std::slice_array<_Tp>::operator%= (
    const valarray<_Tp> & ) const
```

Modulo slice elements by corresponding elements of *v*.

operator&=()

```
template<typename _Tp>
void std::slice_array<_Tp>::operator&= (
    const valarray<_Tp> & ) const
```

Logical and slice elements with corresponding elements of *v*.

operator*=()

```
template<typename _Tp>
void std::slice_array<_Tp>::operator*= (
    const valarray<_Tp> & ) const
```

Multiply slice elements by corresponding elements of *v*.

operator+=()

```
template<typename _Tp>
void std::slice_array<_Tp>::operator+= (
    const valarray<_Tp> & ) const
```

Add corresponding elements of *v* to slice elements.

operator-=()

```
template<typename _Tp>
void std::slice_array<_Tp>::operator-= (
    const valarray<_Tp> & ) const
```

Subtract corresponding elements of *v* from slice elements.

operator/=()

```
template<typename _Tp >
void std::slice_array< _Tp >::operator/= (
    const valarray< _Tp > & ) const
```

Divide slice elements by corresponding elements of *v*.

operator<<=()

```
template<typename _Tp >
void std::slice_array< _Tp >::operator<<= (
    const valarray< _Tp > & ) const
```

Left shift slice elements by corresponding elements of *v*.

operator>>=()

```
template<typename _Tp >
void std::slice_array< _Tp >::operator>>= (
    const valarray< _Tp > & ) const
```

Right shift slice elements by corresponding elements of *v*.

operator^=()

```
template<typename _Tp >
void std::slice_array< _Tp >::operator^= (
    const valarray< _Tp > & ) const
```

Logical xor slice elements with corresponding elements of *v*.

operator" |= ()

```
template<typename _Tp >
void std::slice_array< _Tp >::operator|= (
    const valarray< _Tp > & ) const
```

Logical or slice elements with corresponding elements of *v*.

5.925.1 Detailed Description

template<typename Key, typename Mapped, typename Cmp_Fn, typename Node_And_It_Traits, typename _Alloc>

class `__gnu_pbds::detail::splay_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >`

Splay tree.

5.925.2 Member Function Documentation

node_begin() [1/2]

```
template<typename Key , typename Mapped , typename Cmp_Fn , typename Node_And_It_Traits , typename
_Alloc >
```

```
node_iterator __gnu_pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, ↵
_Alloc >::node_begin ( ) [inline], [inherited]
```

Returns a `node_iterator` corresponding to the node at the root of the tree.

node_begin() [2/2]

```
template<typename Key , typename Mapped , typename Cmp_Fn , typename Node_And_It_Traits , typename
_Alloc >
```

```
node_const_iterator __gnu_pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_↵
Traits, _Alloc >::node_begin ( ) const [inline], [inherited]
```

Returns a const `node_iterator` corresponding to the node at the root of the tree.

node_end() [1/2]

```
template<typename Key , typename Mapped , typename Cmp_Fn , typename Node_And_It_Traits , typename
_Alloc >
```

```
node_iterator __gnu_pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, ↵
_Alloc >::node_end ( ) [inline], [inherited]
```

Returns a `node_iterator` corresponding to a node just after a leaf of the tree.

node_end() [2/2]

```
template<typename Key , typename Mapped , typename Cmp_Fn , typename Node_And_It_Traits , typename
_Alloc >
```

```
node_const_iterator __gnu_pbds::detail::bin_search_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_↵
Traits, _Alloc >::node_end ( ) const [inline], [inherited]
```

Returns a const `node_iterator` corresponding to a node just after a leaf of the tree.

5.928.1 Detailed Description

```
template<typename _Tp, typename _Sequence = deque<_Tp>>
class std::stack<_Tp, _Sequence>
```

A standard container giving FILO behavior.

Template Parameters

<code>_Tp</code>	Type of element.
<code>_Sequence</code>	Type of underlying sequence, defaults to <code>deque<_Tp></code> .

Meets many of the requirements of a [container](#), but does not define anything to do with iterators. Very few of the other standard container interfaces are defined.

This is not a true container, but an *adaptor*. It holds another container, and provides a wrapper interface to that container. The wrapper is what enforces strict first-in-last-out stack behavior.

The second template parameter defines the type of the underlying sequence/container. It defaults to `std::deque`, but it can be any type that supports `back`, `push_back`, and `pop_back`, such as `std::list`, `std::vector`, or an appropriate user-defined type.

Members not found in *normal* containers are `container_type`, which is a typedef for the second `Sequence` parameter, and `push`, `pop`, and `top`, which are standard stack/FILO operations.

5.928.2 Constructor & Destructor Documentation

`stack()`

```
template<typename _Tp , typename _Sequence = deque<_Tp>>
template<typename _Seq = _Sequence, typename _Requires = typename enable_if<is_default_constructible<↔
_Seq>::value>::type>
std::stack<_Tp, _Sequence>::stack ( ) [inline]
```

Default constructor creates no elements.

5.928.3 Member Function Documentation

`empty()`

```
template<typename _Tp , typename _Sequence = deque<_Tp>>
bool std::stack<_Tp, _Sequence>::empty ( ) const [inline]
```

Returns true if the stack is empty.

`pop()`

```
template<typename _Tp , typename _Sequence = deque<_Tp>>
void std::stack<_Tp, _Sequence>::pop ( ) [inline]
```

Removes first element.

This is a typical stack operation. It shrinks the stack by one. The time complexity of the operation depends on the underlying sequence.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before `pop()` is called.

`push()`

```
template<typename _Tp , typename _Sequence = deque<_Tp>>
void std::stack<_Tp, _Sequence>::push (
    const value_type & __x ) [inline]
```

Add data to the top of the stack.

Parameters

<code>_↔</code>	Data to be added.
<code>_X</code>	

This is a typical stack operation. The function creates an element at the top of the stack and assigns the given data to it. The time complexity of the operation depends on the underlying sequence.

size()

```
template<typename _Tp , typename _Sequence = deque<_Tp>>
size_type std::stack< _Tp, _Sequence >::size ( ) const [inline]
```

Returns the number of elements in the stack.

top() [1/2]

```
template<typename _Tp , typename _Sequence = deque<_Tp>>
reference std::stack< _Tp, _Sequence >::top ( ) [inline]
```

Returns a read/write reference to the data at the first element of the stack.

top() [2/2]

```
template<typename _Tp , typename _Sequence = deque<_Tp>>
const_reference std::stack< _Tp, _Sequence >::top ( ) const [inline]
```

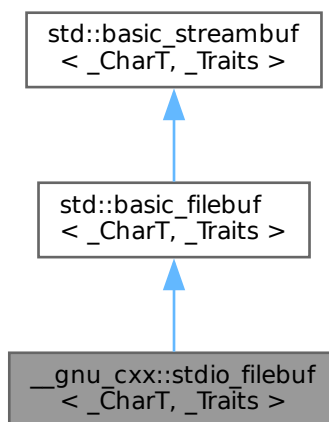

Returns a read-only (constant) reference to the data at the first element of the stack.
The documentation for this class was generated from the following file:

5.929.1 Detailed Description

template<typename _CharT, typename _Traits = std::char_traits<_CharT>>
class `__gnu_cxx::stdio_filebuf<_CharT, _Traits>`

Provides a layer of compatibility for C/POSIX.

This GNU extension provides extensions for working with standard C FILE*'s and POSIX file descriptors. It must be instantiated by the user with the type of character used in the file stream, e.g., `stdio_filebuf<char>`.

5.929.2 Constructor & Destructor Documentation

`stdio_filebuf()` [1/3]

```
template<typename _CharT , typename _Traits = std::char_traits<_CharT>>
__gnu_cxx::stdio_filebuf<_CharT, _Traits>::stdio_filebuf ( ) [inline]
deferred initialization
```

`stdio_filebuf()` [2/3]

```
template<typename _CharT , typename _Traits >
__gnu_cxx::stdio_filebuf<_CharT, _Traits>::stdio_filebuf (
    int __fd,
    std::ios_base::openmode __mode,
    size_t __size = static_cast<size_t>( BUFSIZ ) )
```

Parameters

<code>__fd</code>	An open file descriptor.
<code>__mode</code>	Same meaning as in a standard filebuf.
<code>__size</code>	Optimal or preferred size of internal buffer, in chars.

This constructor associates a file stream buffer with an open POSIX file descriptor. The file descriptor will be automati-

cally closed when the `stdio_filebuf` is closed/destroyed.

`stdio_filebuf()` [3/3]

```
template<typename _CharT , typename _Traits >
__gnu_cxx::stdio_filebuf< _CharT, _Traits >::stdio_filebuf (
    std::__c_file * __f,
    std::ios_base::openmode __mode,
    size_t __size = static_cast<size_t>( BUFSIZ ) )
```

Parameters

<code>__f</code>	An open <code>FILE*</code> .
<code>__mode</code>	Same meaning as in a standard filebuf.
<code>__size</code>	Optimal or preferred size of internal buffer, in chars. Defaults to system's <code>BUFSIZ</code> .

This constructor associates a file stream buffer with an open C `FILE*`. The `FILE*` will not be automatically closed when the `stdio_filebuf` is closed/destroyed.

`~stdio_filebuf()`

```
template<typename _CharT , typename _Traits >
__gnu_cxx::stdio_filebuf< _CharT, _Traits >::~~stdio_filebuf [virtual]
```

Closes the external data stream if the file descriptor constructor was used.

5.929.3 Member Function Documentation

`_M_create_pback()`

```
template<typename _CharT , typename _Traits >
void std::basic_filebuf< _CharT, _Traits >::_M_create_pback ( ) [inline], [protected], [inherited]
```

Initializes pback buffers, and moves normal buffers to safety. Assumptions: `_M_in_cur` has already been moved back

`_M_destroy_pback()`

```
template<typename _CharT , typename _Traits >
void std::basic_filebuf< _CharT, _Traits >::_M_destroy_pback ( ) throw ( ) [inline], [protected], [inherited]
```

Deactivates pback buffer contents, and restores normal buffer. Assumptions: The pback buffer has only moved forward.

`_M_set_buffer()`

```
template<typename _CharT , typename _Traits >
void std::basic_filebuf< _CharT, _Traits >::_M_set_buffer (
    streamsize __off ) [inline], [protected], [inherited]
```

This function sets the pointers of the internal buffer, both get and put areas. Typically:

`__off == egptr() - eback()` upon underflow/uflow (**read** mode); `__off == 0` upon overflow (**write** mode); `__off == -1` upon open, setbuf, seekoff/pos (**uncommitted** mode).

NB: `egptr() - pbase() == _M_buf_size - 1`, since `_M_buf_size` reflects the actual allocated memory and the last cell is reserved for the overflow char of a full put area.

Referenced by `std::basic_filebuf< _CharT, _Traits >::close()`.

close()

```
template<typename _CharT , typename _Traits >
basic_filebuf< _CharT, _Traits >::__filebuf_type * std::basic_filebuf< _CharT, _Traits >::close
[inherited]
```

Closes the currently associated file.

Returns

`this` on success, NULL on failure

If no file is currently open, this function immediately fails.

If a *put buffer area* exists, `overflow(eof)` is called to flush all the characters. The file is then closed.

If any operations fail, this function also fails.

References [std::basic_filebuf<_CharT, _Traits>::_M_mode](#), [std::basic_filebuf<_CharT, _Traits>::_M_pback_init](#), [std::basic_filebuf<_CharT, _Traits>::_M_reading](#), and [std::basic_filebuf<_CharT, _Traits>::_M_set_buffer\(\)](#).

eback()

```
template<typename _CharT , typename _Traits >
char_type * std::basic_streambuf< _CharT, _Traits >::eback ( ) const [inline], [protected],
[inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- `eback()` returns the beginning pointer for the input sequence
- `gptr()` returns the next pointer for the input sequence
- `egptr()` returns the end pointer for the input sequence

egptr()

```
template<typename _CharT , typename _Traits >
char_type * std::basic_streambuf< _CharT, _Traits >::egptr ( ) const [inline], [protected],
[inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- `eback()` returns the beginning pointer for the input sequence
- `gptr()` returns the next pointer for the input sequence
- `egptr()` returns the end pointer for the input sequence

Referenced by [std::wbuffer_convert<_Codecvt, _Elem, _Tr>::underflow\(\)](#).

epptr()

```
template<typename _CharT , typename _Traits >
char_type * std::basic_streambuf< _CharT, _Traits >::epptr ( ) const [inline], [protected],
[inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- `pbase()` returns the beginning pointer for the output sequence
- `pptr()` returns the next pointer for the output sequence
- `epptr()` returns the end pointer for the output sequence

fd()

```
template<typename _CharT , typename _Traits = std::char_traits<_CharT>>
int __gnu_cxx::stdio_filebuf< _CharT, _Traits >::fd ( ) [inline]
```

Returns

The underlying file descriptor.

Once associated with an external data stream, this function can be used to access the underlying POSIX file descriptor. Note that there is no way for the library to track what you do with the descriptor, so be careful.

file()

```
template<typename _CharT , typename _Traits = std::char_traits<_CharT>>
std::__c_file * __gnu_cxx::stdio_filebuf< _CharT, _Traits >::file ( ) [inline]
```

Returns

The underlying FILE*.

This function can be used to access the underlying "C" file pointer. Note that there is no way for the library to track what you do with the file, so be careful.

gbump()

```
template<typename _CharT , typename _Traits >
void std::basic_streambuf< _CharT, _Traits >::gbump (
    int __n ) [inline], [protected], [inherited]
```

Moving the read position.

Parameters

<code>__n</code>	The delta by which to move.
------------------	-----------------------------

This just advances the read position without returning any data.

getloc()

```
template<typename _CharT , typename _Traits >
locale std::basic_streambuf< _CharT, _Traits >::getloc ( ) const [inline], [inherited]
```

Locale access.

Returns

The current locale in effect.

If `pubimbue(loc)` has been called, then the most recent `loc` is returned. Otherwise the global locale in effect at the time of construction is returned.

gptr()

```
template<typename _CharT , typename _Traits >
char_type * std::basic_streambuf< _CharT, _Traits >::gptr ( ) const [inline], [protected], [inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- `eback()` returns the beginning pointer for the input sequence

- `gptr()` returns the next pointer for the input sequence
- `egptr()` returns the end pointer for the input sequence

Referenced by `std::wbuffer_convert<_Codecvt, _Elem, _Tr>::underflow()`.

`imbue()`

```
template<typename _CharT , typename _Traits >
void std::basic_filebuf< _CharT, _Traits >::imbue (
    const locale & __loc ) [protected], [virtual], [inherited]
```

Changes translations.

Parameters

<code>__loc</code>	A new locale.
--------------------	---------------

Translations done during I/O which depend on the current locale are changed by this call. The standard adds, *Between invocations of this function a class derived from `streambuf` can safely cache results of calls to locale functions and to members of facets so obtained.*

Note

Base class version does nothing.

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

References `std::ios_base::cur`.

`in_avail()`

```
template<typename _CharT , typename _Traits >
streamsize std::basic_streambuf< _CharT, _Traits >::in_avail ( ) [inline], [inherited]
```

Looking ahead into the stream.

Returns

The number of characters available.

If a read position is available, returns the number of characters available for reading before the buffer must be refilled. Otherwise returns the derived `showmanyc()`.

`is_open()`

```
template<typename _CharT , typename _Traits >
bool std::basic_filebuf< _CharT, _Traits >::is_open ( ) const throw ( ) [inline], [inherited]
```

Returns true if the external file is open.

`open()` [1/3]

```
template<typename _CharT , typename _Traits >
template<typename _Path >
_If_fs_path< _Path, __filebuf_type * > std::basic_filebuf< _CharT, _Traits >::open (
    const _Path & __s,
    ios_base::openmode __mode ) [inline], [inherited]
```

Opens an external file.

Parameters

<code>__s</code>	The name of the file, as a filesystem::path.
<code>__mode</code>	The open mode flags.

Returns

`this` on success, NULL on failure

open() [2/3]

```
template<typename _CharT , typename _Traits >
basic_filebuf< _CharT, _Traits >::__filebuf_type * std::basic_filebuf< _CharT, _Traits >::open (
    const char * __s,
    ios_base::openmode __mode ) [inherited]
```

Opens an external file.

Parameters

<code>__s</code>	The name of the file.
<code>__mode</code>	The open mode flags.

Returns

`this` on success, NULL on failure

If a file is already open, this function immediately fails. Otherwise it tries to open the file named `__s` using the flags given in `__mode`.

Table 92, adapted here, gives the relation between openmode combinations and the equivalent `fopen()` flags. (NB: lines app, in|out|app, in|app, binary|app, binary|in|out|app, and binary|in|app per DR 596)

ios_base Flag combination					stdio equivalent
binary	in	out	trunc	app	
		+			w
		+		+	a
				+	a
		+	+		w
	+				r
	+	+			r+
	+	+	+		w+
	+	+		+	a+
	+			+	a+
+		+			wb
+		+		+	ab
+				+	ab
+		+	+		wb
+	+				rb
+	+	+			r+b
+	+	+	+		w+b
+	+	+		+	a+b
+	+			+	a+b

References `std::ios_base::ate`, `std::ios_base::end`, and `std::basic_filebuf<_CharT, _Traits>::open()`.

Referenced by `std::basic_filebuf<_CharT, _Traits>::open()`.

open() [3/3]

```
template<typename _CharT, typename _Traits>
__filebuf_type * std::basic_filebuf<_CharT, _Traits>::open (
    const std::string & __s,
    ios_base::openmode __mode ) [inline], [inherited]
```

Opens an external file.

Parameters

<code>__s</code>	The name of the file.
<code>__mode</code>	The open mode flags.

Returns

`this` on success, `NULL` on failure

overflow()

```
template<typename _CharT, typename _Traits>
basic_filebuf<_CharT, _Traits>::int_type std::basic_filebuf<_CharT, _Traits>::overflow (
    int_type __c = _Traits::eof() ) [protected], [virtual], [inherited]
```

Consumes data from the buffer; writes to the controlled sequence.

Parameters

<code>__c</code>	An additional character to consume.
------------------	-------------------------------------

Returns

`eof()` to indicate failure, something else (usually `__c`, or `not_eof()`)

Informally, this function is called when the output buffer is full (or does not exist, as buffering need not actually be done). If a buffer exists, it is *consumed*, with *some effect* on the controlled sequence. (Typically, the buffer is written out to the sequence verbatim.) In either case, the character `c` is also written out, if `__c` is not `eof()`.

For a formal definition of this function, see a good text such as Langer & Kreft, or [27.5.2.4.5]/3-7.

A functioning output streambuf can be created by overriding only this function (no buffer area will be used).

Note

Base class version does nothing, returns `eof()`.

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

References `std::ios_base::app`, `std::ios_base::cur`, and `std::ios_base::out`.

pbackfail()

```
template<typename _CharT, typename _Traits>
basic_filebuf<_CharT, _Traits>::int_type std::basic_filebuf<_CharT, _Traits>::pbackfail (
    int_type __c = _Traits::eof() ) [protected], [virtual], [inherited]
```

Tries to back up the input sequence.

Parameters

<code>_↔</code>	The character to be inserted back into the sequence.
<code>_c</code>	

Returns

`eof()` on failure, *some other value* on success

Postcondition

The constraints of `gptr()`, `eback()`, and `pptr()` are the same as for `underflow()`.

Note

Base class version does nothing, returns `eof()`.

Reimplemented from [std::basic_streambuf<_CharT, _Traits>](#).

References [std::ios_base::cur](#), and [std::ios_base::in](#).

pbase()

```
template<typename _CharT , typename _Traits >
char_type * std::basic_streambuf< _CharT, _Traits >::pbase ( ) const [inline], [protected],
[inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- `pbase()` returns the beginning pointer for the output sequence
- `pptr()` returns the next pointer for the output sequence
- `eptr()` returns the end pointer for the output sequence

pbump()

```
template<typename _CharT , typename _Traits >
void std::basic_streambuf< _CharT, _Traits >::pbump (
    int __n ) [inline], [protected], [inherited]
```

Moving the write position.

Parameters

<code>_↔</code>	The delta by which to move.
<code>_n</code>	

This just advances the write position without returning any data.

pptr()

```
template<typename _CharT , typename _Traits >
char_type * std::basic_streambuf< _CharT, _Traits >::pptr ( ) const [inline], [protected], [inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- `pbase()` returns the beginning pointer for the output sequence
- `pptr()` returns the next pointer for the output sequence
- `epptr()` returns the end pointer for the output sequence

pubimbue()

```
template<typename _CharT , typename _Traits >
locale std::basic_streambuf< _CharT, _Traits >::pubimbue (
    const locale & __loc ) [inline], [inherited]
```

Entry point for `imbue()`.

Parameters

<code>__loc</code>	The new locale.
--------------------	-----------------

Returns

The previous locale.

Calls the derived `imbue(__loc)`.

pubseekoff()

```
template<typename _CharT , typename _Traits >
pos_type std::basic_streambuf< _CharT, _Traits >::pubseekoff (
    off_type __off,
    ios_base::seekdir __way,
    ios_base::openmode __mode = ios_base::in | ios_base::out ) [inline], [inherited]
```

Alters the stream position.

Parameters

<code>__off</code>	Offset.
<code>__way</code>	Value for <code>ios_base::seekdir</code> .
<code>__mode</code>	Value for <code>ios_base::openmode</code> .

Calls virtual `seekoff` function.

pubseekpos()

```
template<typename _CharT , typename _Traits >
pos_type std::basic_streambuf< _CharT, _Traits >::pubseekpos (
    pos_type __sp,
    ios_base::openmode __mode = ios_base::in | ios_base::out ) [inline], [inherited]
```

Alters the stream position.

Parameters

<code>__sp</code>	Position
<code>__mode</code>	Value for <code>ios_base::openmode</code> .

Calls virtual seekpos function.

pubsetbuf()

```
template<typename _CharT , typename _Traits >
basic_streambuf * std::basic_streambuf< _CharT, _Traits >::pubsetbuf (
    char_type * __s,
    streamsize __n ) [inline], [inherited]
```

Entry points for derived buffer functions.

The public versions of `pubfoo` dispatch to the protected derived `foo` member functions, passing the arguments (if any) and returning the result unchanged.

pubsync()

```
template<typename _CharT , typename _Traits >
int std::basic_streambuf< _CharT, _Traits >::pubsync ( ) [inline], [inherited]
```

Calls virtual sync function.

Referenced by `std::wbuffer_convert< _Codecvt, _Elem, _Tr >::sync()`, and `std::basic_istream< _CharT, _Traits >::sync()`.

sbumpc()

```
template<typename _CharT , typename _Traits >
int_type std::basic_streambuf< _CharT, _Traits >::sbumpc ( ) [inline], [inherited]
```

Getting the next character.

Returns

The next character, or eof.

If the input read position is available, returns that character and increments the read pointer, otherwise calls and returns `ufLOW()`.

Referenced by `std::basic_istream< char >::getline()`, `std::istreambuf_iterator< _CharT, _Traits >::operator++()`, and `std::istreambuf_iterator< _CharT, _Traits >::operator++()`.

seekoff()

```
template<typename _CharT , typename _Traits >
basic_filebuf< _CharT, _Traits >::pos_type std::basic_filebuf< _CharT, _Traits >::seekoff (
    off_type ,
    ios_base::seekdir ,
    ios_base::openmode = ios_base::in | ios_base::out ) [protected], [virtual], [inherited]
```

Alters the stream positions.

Each derived class provides its own appropriate behavior.

Note

Base class version does nothing, returns a `pos_type` that represents an invalid stream position.

Reimplemented from `std::basic_streambuf< _CharT, _Traits >`.

References `std::ios_base::cur`.

seekpos()

```
template<typename _CharT , typename _Traits >
basic_filebuf< _CharT, _Traits >::pos_type std::basic_filebuf< _CharT, _Traits >::seekpos (
    pos_type ,
    ios_base::openmode = ios_base::in | ios_base::out ) [protected], [virtual], [inherited]
```

Alters the stream positions.

Each derived class provides its own appropriate behavior.

Note

Base class version does nothing, returns a `pos_type` that represents an invalid stream position.

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

References `std::ios_base::beg`.

setbuf()

```
template<typename _CharT, typename _Traits>
basic_filebuf<_CharT, _Traits>::__streambuf_type * std::basic_filebuf<_CharT, _Traits>↵
::setbuf (
    char_type * __s,
    streamsize __n ) [protected], [virtual], [inherited]
```

Manipulates the buffer.

Parameters

<code>↵ __s</code>	Pointer to a buffer area.
<code>↵ __n</code>	Size of <code>__s</code> .

Returns

`this`

If no file has been opened, and both `__s` and `__n` are zero, then the stream becomes unbuffered. Otherwise, `__s` is used as a buffer; see <https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.↵html#io.streambuf.buffering> for more.

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

setg()

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf<_CharT, _Traits>::setg (
    char_type * __gbeg,
    char_type * __gnext,
    char_type * __gend ) [inline], [protected], [inherited]
```

Setting the three read area pointers.

Parameters

<code>__gbeg</code>	A pointer.
<code>__gnext</code>	A pointer.
<code>__gend</code>	A pointer.

Postcondition

`__gbeg == eback()`, `__gnext == gptr()`, and `__gend == egptr()`

Referenced by `std::wbuffer_convert<_Codecvt, _Elem, _Tr>::wbuffer_convert()`.

setp()

```
template<typename _CharT, typename _Traits>
```

```
void std::basic_streambuf< _CharT, _Traits >::setp (
    char_type * __pbeg,
    char_type * __pend ) [inline], [protected], [inherited]
```

Setting the three write area pointers.

Parameters

<code>__pbeg</code>	A pointer.
<code>__pend</code>	A pointer.

Postcondition

`__pbeg == pbase()`, `__pbeg == pptr()`, and `__pend == epptr()`

Referenced by [std::wbuffer_convert< _Codecvt, _Elem, _Tr >::wbuffer_convert\(\)](#).

sgetc()

```
template<typename _CharT , typename _Traits >
int_type std::basic_streambuf< _CharT, _Traits >::sgetc ( ) [inline], [inherited]
```

Getting the next character.

Returns

The next character, or eof.

If the input read position is available, returns that character, otherwise calls and returns `underflow()`. Does not move the read position after fetching the character.

Referenced by [std::basic_istream< _CharT, _Traits >::sentry::sentry\(\)](#), [std::basic_istream< _CharT, _Traits >::get\(\)](#), [std::basic_istream< _CharT, _Traits >::get\(\)](#), [std::basic_istream< char >::getline\(\)](#), [std::basic_istream< _CharT, _Traits >::ignore\(\)](#), [std::istreambuf_iterator< _CharT, _Traits >::operator++\(\)](#), [std::istreambuf_iterator< _CharT, _Traits >::operator++\(\)](#), and [std::basic_istream< char >::seekg\(\)](#).

sgetn()

```
template<typename _CharT , typename _Traits >
streamsize std::basic_streambuf< _CharT, _Traits >::sgetn (
    char_type * __s,
    streamsize __n ) [inline], [inherited]
```

Entry point for `xsgetn`.

Parameters

<code>__s</code>	A buffer area.
<code>__n</code>	A count.

Returns `xsgetn(__s,__n)`. The effect is to fill `__s[0]` through `__s[__n-1]` with characters from the input sequence, if possible.

showmanyc()

```
template<typename _CharT , typename _Traits >
streamsize std::basic_filebuf< _CharT, _Traits >::showmanyc [protected], [virtual], [inherited]
```

Investigating the data available.

Returns

An estimate of the number of characters available in the input sequence, or -1.

If it returns a positive value, then successive calls to `underflow()` will not return `traits::eof()` until at least that number of characters have been supplied. If `showmanyc()` returns -1, then calls to `underflow()` or `uflow()` will fail. [27.5.2.4.3]/1

Note

Base class version does nothing, returns zero.

The standard adds that *the intention is not only that the calls [to `underflow` or `uflow`] will not return `eof()` but that they will return immediately.*

The standard adds that *the morphemes of `showmanyc` are **es-how-many-see**, not **show-manic**.*

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

References `std::ios_base::binary`, and `std::ios_base::in`.

`snextc()`

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::snextc ( ) [inline], [inherited]
Getting the next character.
```

Returns

The next character, or eof.

Calls `sbumpc()`, and if that function returns `traits::eof()`, so does this function. Otherwise, `sgetc()`.

Referenced by `std::basic_istream<_CharT, _Traits>::sentry::sentry()`, `std::basic_istream<_CharT, _Traits>::get()`, `std::basic_istream<char>::getline()`, `std::basic_istream<char>::putback()`, and `std::basic_istream<char>::seekg()`.

`sputbackc()`

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::sputbackc (
    char_type __c ) [inline], [inherited]
```

Pushing characters back into the input stream.

Parameters

<code>__c</code>	The character to push back.
------------------	-----------------------------

Returns

The previous character, if possible.

Similar to `sungetc()`, but `__c` is pushed onto the stream instead of *the previous character*. If successful, the next character fetched from the input stream will be `__c`.

Referenced by `std::basic_istream<_CharT, _Traits>::putback()`.

`sputc()`

```
template<typename _CharT, typename _Traits>
```

```
int_type std::basic_streambuf< _CharT, _Traits >::sputc (
    char_type __c ) [inline], [inherited]
```

Entry point for all single-character output functions.

Parameters

\leftarrow __c	A character to output.
---------------------	------------------------

Returns

__c, if possible.

One of two public output functions.

If a write position is available for the output sequence (i.e., the buffer is not full), stores __c in that position, increments the position, and returns `traits::to_int_type(__c)`. If a write position is not available, returns `overflow(↵__c)`.

Referenced by `std::ostreambuf_iterator< _CharT, _Traits >::operator=()`, and `std::wbuffer_convert< _Codecvt, _Elem, _Tr >::overflow()`.

sputn()

```
template<typename _CharT , typename _Traits >
streamsize std::basic_streambuf< _CharT, _Traits >::sputn (
    const char_type * __s,
    streamsize __n ) [inline], [inherited]
```

Entry point for all single-character output functions.

Parameters

\leftarrow __s	A buffer read area.
\leftarrow __n	A count.

One of two public output functions.

Returns `xsputn(__s,__n)`. The effect is to write `__s[0]` through `__s[__n-1]` to the output sequence, if possible.

sungetc()

```
template<typename _CharT , typename _Traits >
int_type std::basic_streambuf< _CharT, _Traits >::sungetc ( ) [inline], [inherited]
```

Moving backwards in the input stream.

Returns

The previous character, if possible.

If a putback position is available, this function decrements the input pointer and returns that character. Otherwise, calls and returns `pbckfail()`. The effect is to *unget* the last character *gotten*.

Referenced by `std::basic_istream< _CharT, _Traits >::unget()`.

sync()

```
template<typename _CharT , typename _Traits >
int std::basic_filebuf< _CharT, _Traits >::sync [protected], [virtual], [inherited]
```

Synchronizes the buffer arrays with the controlled sequences.

Returns

-1 on failure.

Each derived class provides its own appropriate behavior, including the definition of *failure*.

Note

Base class version does nothing, returns zero.

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

uflow()

```
template<typename _CharT , typename _Traits >
virtual int_type std::basic_streambuf< _CharT, _Traits >::uflow ( ) [inline], [protected], [virtual],
[inherited]
```

Fetches more data from the controlled sequence.

Returns

The first character from the *pending sequence*.

Informally, this function does the same thing as `underflow()`, and in fact is required to call that function. It also returns the new character, like `underflow()` does. However, this function also moves the read position forward by one.

Reimplemented in `__gnu_cxx::stdio_sync_filebuf<_CharT, _Traits>`.

underflow()

```
template<typename _CharT , typename _Traits >
basic_filebuf< _CharT, _Traits >::int_type std::basic_filebuf< _CharT, _Traits >::underflow
[protected], [virtual], [inherited]
```

Fetches more data from the controlled sequence.

Returns

The first character from the *pending sequence*.

Informally, this function is called when the input buffer is exhausted (or does not exist, as buffering need not actually be done). If a buffer exists, it is *refilled*. In either case, the next available character is returned, or `traits::eof()` to indicate a null pending sequence.

For a formal definition of the pending sequence, see a good text such as Langer & Kreft, or [27.5.2.4.3]/7-14.

A functioning input streambuf can be created by overriding only this function (no buffer area will be used). For an example, see <https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.html>

Note

Base class version does nothing, returns `eof()`.

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

References `std::ios_base::in`.

xsggetn()

```
template<typename _CharT , typename _Traits >
streamsize std::basic_filebuf< _CharT, _Traits >::xsggetn (
    char_type * __s,
    streamsize __n ) [protected], [virtual], [inherited]
```

Multiple character extraction.

Parameters

<code>__s</code>	A buffer area.
<code>__n</code>	Maximum number of characters to assign.

Returns

The number of characters assigned.

Fills `__s[0]` through `__s[__n-1]` with characters from the input sequence, as if by `sbumpc()`. Stops when either `__n` characters have been copied, or when `traits::eof()` would be copied.

It is expected that derived classes provide a more efficient implementation by overriding this definition.

Reimplemented from [std::basic_streambuf<_CharT, _Traits>](#).

References [std::ios_base::in](#).

xspn()

```
template<typename _CharT , typename _Traits >
streamsize std::basic_filebuf< _CharT, _Traits >::xspn (
    const char_type * __s,
    streamsize __n ) [protected], [virtual], [inherited]
```

Multiple character insertion.

Parameters

<code>__s</code>	A buffer area.
<code>__n</code>	Maximum number of characters to write.

Returns

The number of characters written.

Writes `__s[0]` through `__s[__n-1]` to the output sequence, as if by `sputc()`. Stops when either `n` characters have been copied, or when `sputc()` would return `traits::eof()`.

It is expected that derived classes provide a more efficient implementation by overriding this definition.

Reimplemented from [std::basic_streambuf<_CharT, _Traits>](#).

References [std::ios_base::app](#), [std::min\(\)](#), and [std::ios_base::out](#).

5.929.4 Member Data Documentation**M_buf**

```
template<typename _CharT , typename _Traits >
char_type* std::basic_filebuf< _CharT, _Traits >::M_buf [protected], [inherited]
```

Pointer to the beginning of internal buffer.

M_buf_locale

```
template<typename _CharT , typename _Traits >
locale std::basic_streambuf< _CharT, _Traits >::M_buf_locale [protected], [inherited]
```

Current locale setting.

Referenced by [std::basic_filebuf<_CharT, _Traits>::basic_filebuf\(\)](#).

`_M_buf_size`

```
template<typename _CharT , typename _Traits >
```

```
size_t std::basic_filebuf<_CharT, _Traits>::_M_buf_size [protected], [inherited]
```

Actual size of internal buffer. This number is equal to the size of the put area + 1 position, reserved for the overflow char of a full area.

`_M_ext_buf`

```
template<typename _CharT , typename _Traits >
```

```
char* std::basic_filebuf<_CharT, _Traits>::_M_ext_buf [protected], [inherited]
```

Buffer for external characters. Used for input when `codecvt::always_noconv()` == false. When valid, this corresponds to `eback()`.

`_M_ext_buf_size`

```
template<typename _CharT , typename _Traits >
```

```
streamsize std::basic_filebuf<_CharT, _Traits>::_M_ext_buf_size [protected], [inherited]
```

Size of buffer held by `_M_ext_buf`.

`_M_ext_next`

```
template<typename _CharT , typename _Traits >
```

```
const char* std::basic_filebuf<_CharT, _Traits>::_M_ext_next [protected], [inherited]
```

Pointers into the buffer held by `_M_ext_buf` that delimit a subsequence of bytes that have been read but not yet converted. When valid, `_M_ext_next` corresponds to `egptr()`.

`_M_in_beg`

```
template<typename _CharT , typename _Traits >
```

```
char_type* std::basic_streambuf<_CharT, _Traits>::_M_in_beg [protected], [inherited]
```

Start of get area.

`_M_in_cur`

```
template<typename _CharT , typename _Traits >
```

```
char_type* std::basic_streambuf<_CharT, _Traits>::_M_in_cur [protected], [inherited]
```

Current read area.

`_M_in_end`

```
template<typename _CharT , typename _Traits >
```

```
char_type* std::basic_streambuf<_CharT, _Traits>::_M_in_end [protected], [inherited]
```

End of get area.

`_M_mode`

```
template<typename _CharT , typename _Traits >
```

```
ios_base::openmode std::basic_filebuf<_CharT, _Traits>::_M_mode [protected], [inherited]
```

Place to stash in || out || in | out settings for current filebuf.

Referenced by `std::basic_filebuf<_CharT, _Traits>::close()`.

`_M_out_beg`

```
template<typename _CharT , typename _Traits >
```

```
char_type* std::basic_streambuf<_CharT, _Traits>::_M_out_beg [protected], [inherited]
```

Start of put area.

`_M_out_cur`

```
template<typename _CharT , typename _Traits >
char_type* std::basic\_streambuf< _CharT, _Traits >::_M_out_cur [protected], [inherited]
Current put area.
```

`_M_out_end`

```
template<typename _CharT , typename _Traits >
char_type* std::basic\_streambuf< _CharT, _Traits >::_M_out_end [protected], [inherited]
End of put area.
```

`_M_pback`

```
template<typename _CharT , typename _Traits >
char_type std::basic\_filebuf< _CharT, _Traits >::_M_pback [protected], [inherited]
Necessary bits for putback buffer management.
```

Note

pbacks of over one character are not currently supported.

`_M_pback_cur_save`

```
template<typename _CharT , typename _Traits >
char_type* std::basic\_filebuf< _CharT, _Traits >::_M_pback_cur_save [protected], [inherited]
Necessary bits for putback buffer management.
```

Note

pbacks of over one character are not currently supported.

`_M_pback_end_save`

```
template<typename _CharT , typename _Traits >
char_type* std::basic\_filebuf< _CharT, _Traits >::_M_pback_end_save [protected], [inherited]
Necessary bits for putback buffer management.
```

Note

pbacks of over one character are not currently supported.

`_M_pback_init`

```
template<typename _CharT , typename _Traits >
bool std::basic\_filebuf< _CharT, _Traits >::_M_pback_init [protected], [inherited]
Necessary bits for putback buffer management.
```

Note

pbacks of over one character are not currently supported.

Referenced by [std::basic_filebuf< _CharT, _Traits >::close\(\)](#).

`_M_reading`

```
template<typename _CharT, typename _Traits>
bool std::basic_filebuf<_CharT, _Traits>::_M_reading [protected], [inherited]
_M_reading == false && _M_writing == false for uncommitted mode; _M_reading == true for read mode; _M_writing
== true for write mode;
NB: _M_reading == true && _M_writing == true is unused.
Referenced by std::basic_filebuf<_CharT, _Traits>::close().
The documentation for this class was generated from the following file:
```

- `stdio_filebuf.h`

5.930 `__gnu_cxx::stdio_sync_filebuf<_CharT, _Traits>` Class Template Reference

```
#include <stdio_sync_filebuf.h>
```

Inheritance diagram for `__gnu_cxx::stdio_sync_filebuf<_CharT, _Traits>`:

Public Types

5.930.1 Detailed Description

`template<typename _CharT, typename _Traits = std::char_traits<_CharT>>`
`class __gnu_cxx::stdio_sync_filebuf<_CharT, _Traits>`

Provides a layer of compatibility for C.

This GNU extension provides extensions for working with standard C FILE*'s. It must be instantiated by the user with the type of character used in the file stream, e.g., `stdio_filebuf<char>`.

5.930.2 Member Function Documentation

`eback()`

```
template<typename _CharT , typename _Traits >
char_type * std::basic_streambuf<_CharT, _Traits>::eback ( ) const [inline], [protected],
[inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- `eback()` returns the beginning pointer for the input sequence
- `gptr()` returns the next pointer for the input sequence
- `egptr()` returns the end pointer for the input sequence

`egptr()`

```
template<typename _CharT , typename _Traits >
char_type * std::basic_streambuf<_CharT, _Traits>::egptr ( ) const [inline], [protected],
[inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- `eback()` returns the beginning pointer for the input sequence
- `gptr()` returns the next pointer for the input sequence
- `egptr()` returns the end pointer for the input sequence

Referenced by `std::wbuffer_convert<_Codecvt, _Elem, _Tr>::underflow()`.

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- `eback()` returns the beginning pointer for the input sequence
- `gptr()` returns the next pointer for the input sequence
- `egptr()` returns the end pointer for the input sequence

Referenced by `std::wbuffer_convert<_Codecv, _Elem, _Tr>::underflow()`.

`imbue()`

```
template<typename _CharT, typename _Traits>
virtual void std::basic_streambuf<_CharT, _Traits>::imbue (
    const locale & __loc) [inline], [protected], [virtual], [inherited]
```

Changes translations.

Parameters

<code>__loc</code>	A new locale.
--------------------	---------------

Translations done during I/O which depend on the current locale are changed by this call. The standard adds, *Between invocations of this function a class derived from streambuf can safely cache results of calls to locale functions and to members of facets so obtained.*

Note

Base class version does nothing.

Reimplemented in `std::basic_filebuf<_CharT, _Traits>`, `std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>`, `std::basic_filebuf<_CharT, std::char_traits<_CharT>>`, and `std::basic_filebuf<char_type, traits_type>`.

`in_avail()`

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf<_CharT, _Traits>::in_avail ( ) [inline], [inherited]
```

Looking ahead into the stream.

Returns

The number of characters available.

If a read position is available, returns the number of characters available for reading before the buffer must be refilled. Otherwise returns the derived `showmanyc()`.

`overflow()`

```
template<typename _CharT, typename _Traits = std::char_traits<_CharT>>
virtual int_type __gnu_cxx::stdio_sync_filebuf<_CharT, _Traits>::overflow (
    int_type __c = traits_type::eof() ) [inline], [protected], [virtual]
```

Consumes data from the buffer; writes to the controlled sequence.

Parameters

<code>__c</code>	An additional character to consume.
------------------	-------------------------------------

Returns

`eof()` to indicate failure, something else (usually `__c`, or `not_eof()`)

Informally, this function is called when the output buffer is full (or does not exist, as buffering need not actually be done). If a buffer exists, it is *consumed*, with *some effect* on the controlled sequence. (Typically, the buffer is written out to the sequence verbatim.) In either case, the character `c` is also written out, if `__c` is not `eof()`.

For a formal definition of this function, see a good text such as Langer & Kreft, or [27.5.2.4.5]/3-7.

A functioning output streambuf can be created by overriding only this function (no buffer area will be used).

Note

Base class version does nothing, returns `eof()`.

Reimplemented from [std::basic_streambuf<_CharT, _Traits>](#).

pbackfail()

```
template<typename _CharT , typename _Traits = std::char_traits<_CharT>>
virtual int_type __gnu_cxx::stdio_sync_filebuf< _CharT, _Traits >::pbackfail (
    int_type __c = traits_type::eof() ) [inline], [protected], [virtual]
```

Tries to back up the input sequence.

Parameters

<code>__c</code>	The character to be inserted back into the sequence.
------------------	------------------------------------------------------

Returns

`eof()` on failure, *some other value* on success

Postcondition

The constraints of `gptr()`, `eback()`, and `pptr()` are the same as for `underflow()`.

Note

Base class version does nothing, returns `eof()`.

Reimplemented from [std::basic_streambuf<_CharT, _Traits>](#).

pbase()

```
template<typename _CharT , typename _Traits >
char_type * std::basic_streambuf< _CharT, _Traits >::pbase ( ) const [inline], [protected],
[inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- `pbase()` returns the beginning pointer for the output sequence
- `pptr()` returns the next pointer for the output sequence
- `epptr()` returns the end pointer for the output sequence

pbump()

```
template<typename _CharT , typename _Traits >
void std::basic_streambuf< _CharT, _Traits >::pbump (
    int __n ) [inline], [protected], [inherited]
```

Moving the write position.

Parameters

<code>__n</code>	The delta by which to move.
------------------	-----------------------------

This just advances the write position without returning any data.

pptr()

```
template<typename _CharT , typename _Traits >
char_type * std::basic_streambuf< _CharT, _Traits >::pptr ( ) const [inline], [protected], [inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- `pbase()` returns the beginning pointer for the output sequence
- `pptr()` returns the next pointer for the output sequence
- `eptr()` returns the end pointer for the output sequence

pubimbue()

```
template<typename _CharT , typename _Traits >
locale std::basic_streambuf< _CharT, _Traits >::pubimbue (
    const locale & __loc ) [inline], [inherited]
```

Entry point for imbue().

Parameters

<code>__loc</code>	The new locale.
--------------------	-----------------

Returns

The previous locale.

Calls the derived `imbue(__loc)`.

pubseekoff()

```
template<typename _CharT , typename _Traits >
pos_type std::basic_streambuf< _CharT, _Traits >::pubseekoff (
    off_type __off,
    ios_base::seekdir __way,
    ios_base::openmode __mode = ios_base::in | ios_base::out ) [inline], [inherited]
```

Alters the stream position.

Parameters

<code>__off</code>	Offset.
--------------------	---------

Parameters

<code>__way</code>	Value for <code>ios_base::seekdir</code> .
<code>__mode</code>	Value for <code>ios_base::openmode</code> .

Calls virtual seekoff function.

pubseekpos()

```
template<typename _CharT , typename _Traits >
pos_type std::basic_streambuf< _CharT, _Traits >::pubseekpos (
    pos_type __sp,
    ios_base::openmode __mode = ios_base::in | ios_base::out ) [inline], [inherited]
```

Alters the stream position.

Parameters

<code>__sp</code>	Position
<code>__mode</code>	Value for <code>ios_base::openmode</code> .

Calls virtual seekpos function.

pubsetbuf()

```
template<typename _CharT , typename _Traits >
basic_streambuf * std::basic_streambuf< _CharT, _Traits >::pubsetbuf (
    char_type * __s,
    streamsize __n ) [inline], [inherited]
```

Entry points for derived buffer functions.

The public versions of `pubfoo` dispatch to the protected derived `foo` member functions, passing the arguments (if any) and returning the result unchanged.

pubsync()

```
template<typename _CharT , typename _Traits >
int std::basic_streambuf< _CharT, _Traits >::pubsync ( ) [inline], [inherited]
```

Calls virtual sync function.

Referenced by `std::wbuffer_convert< _Codecvt, _Elem, _Tr >::sync()`, and `std::basic_istream< _CharT, _Traits >::sync()`.

sbumpc()

```
template<typename _CharT , typename _Traits >
int_type std::basic_streambuf< _CharT, _Traits >::sbumpc ( ) [inline], [inherited]
```

Getting the next character.

Returns

The next character, or eof.

If the input read position is available, returns that character and increments the read pointer, otherwise calls and returns `uflow()`.

Referenced by `std::basic_istream< char >::getline()`, `std::istreambuf_iterator< _CharT, _Traits >::operator++()`, and `std::istreambuf_iterator< _CharT, _Traits >::operator++()`.

seekoff()

```
template<typename _CharT , typename _Traits >
virtual pos_type std::basic_streambuf< _CharT, _Traits >::seekoff (
    off_type ,
    ios_base::seekdir ,
    ios_base::openmode = ios_base::in | ios_base::out ) [inline], [protected], [virtual],
[inherited]
```

Alters the stream positions.

Each derived class provides its own appropriate behavior.

Note

Base class version does nothing, returns a `pos_type` that represents an invalid stream position.

Reimplemented in `std::basic_filebuf<_CharT, _Traits>`, `std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>`, `std::basic_filebuf<_CharT, std::char_traits<_CharT>>`, `std::basic_filebuf<char_type, traits_type>`, and `std::basic_stringbuf<_CharT, traits_type, _Alloc>`.

seekpos()

```
template<typename _CharT , typename _Traits >
virtual pos_type std::basic_streambuf< _CharT, _Traits >::seekpos (
    pos_type ,
    ios_base::openmode = ios_base::in | ios_base::out ) [inline], [protected], [virtual],
[inherited]
```

Alters the stream positions.

Each derived class provides its own appropriate behavior.

Note

Base class version does nothing, returns a `pos_type` that represents an invalid stream position.

Reimplemented in `std::basic_filebuf<_CharT, _Traits>`, `std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>`, `std::basic_filebuf<_CharT, std::char_traits<_CharT>>`, `std::basic_filebuf<char_type, traits_type>`, and `std::basic_stringbuf<_CharT, traits_type, _Alloc>`.

setbuf()

```
template<typename _CharT , typename _Traits >
virtual basic_streambuf< char_type, _Traits > * std::basic_streambuf< _CharT, _Traits >::setbuf
(
    char_type * ,
    streamsize ) [inline], [protected], [virtual], [inherited]
```

Manipulates the buffer.

Each derived class provides its own appropriate behavior. See the next-to-last paragraph of <https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.html#io.streambuf.buffering> for more on this function.

Note

Base class version does nothing, returns `this`.

Reimplemented in `std::basic_filebuf<_CharT, _Traits>`, `std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>`, `std::basic_filebuf<_CharT, std::char_traits<_CharT>>`, `std::basic_filebuf<char_type, traits_type>`, and `std::basic_stringbuf<_CharT, traits_type, _Alloc>`.

setg()

```
template<typename _CharT , typename _Traits >
void std::basic_streambuf< _CharT, _Traits >::setg (
    char_type * __gbeg,
```

```
char_type * __gnext,
char_type * __gend ) [inline], [protected], [inherited]
```

Setting the three read area pointers.

Parameters

<code>__gbeg</code>	A pointer.
<code>__gnext</code>	A pointer.
<code>__gend</code>	A pointer.

Postcondition

`__gbeg == eback()`, `__gnext == gptr()`, and `__gend == egptr()`

Referenced by `std::wbuffer_convert<_Codecvt, _Elem, _Tr>::wbuffer_convert()`.

setp()

```
template<typename _CharT, typename _Traits>
void std::basic_streambuf<_CharT, _Traits>::setp (
    char_type * __pbeg,
    char_type * __pend ) [inline], [protected], [inherited]
```

Setting the three write area pointers.

Parameters

<code>__pbeg</code>	A pointer.
<code>__pend</code>	A pointer.

Postcondition

`__pbeg == pbase()`, `__pbeg == pptr()`, and `__pend == ep_ptr()`

Referenced by `std::wbuffer_convert<_Codecvt, _Elem, _Tr>::wbuffer_convert()`.

sgetc()

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::sgetc ( ) [inline], [inherited]
```

Getting the next character.

Returns

The next character, or eof.

If the input read position is available, returns that character, otherwise calls and returns `underflow()`. Does not move the read position after fetching the character.

Referenced by `std::basic_istream<_CharT, _Traits>::sentry::sentry()`, `std::basic_istream<_CharT, _Traits>::get()`, `std::basic_istream<_CharT, _Traits>::get()`, `std::basic_istream<char>::getline()`, `std::basic_istream<_CharT, _Traits>::ignore()`, `std::istreambuf_iterator<_CharT, _Traits>::operator++()`, `std::istreambuf_iterator<_CharT, _Traits>::operator++()`, and `std::basic_istream<char>::seekg()`.

sgetn()

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf<_CharT, _Traits>::sgetn (
```

```
char_type * __s,
streamsize __n ) [inline], [inherited]
```

Entry point for `xsgetn`.

Parameters

<code>__s</code>	A buffer area.
<code>__n</code>	A count.

Returns `xsgetn(__s, __n)`. The effect is to fill `__s[0]` through `__s[__n-1]` with characters from the input sequence, if possible.

`showmanyc()`

```
template<typename _CharT, typename _Traits>
virtual streamsize std::basic_streambuf<_CharT, _Traits>::showmanyc ( ) [inline], [protected],
[virtual], [inherited]
```

Investigating the data available.

Returns

An estimate of the number of characters available in the input sequence, or -1.

If it returns a positive value, then successive calls to `underflow()` will not return `traits::eof()` until at least that number of characters have been supplied. If `showmanyc()` returns -1, then calls to `underflow()` or `uflow()` will fail. [27.5.2.4.3]/1

Note

Base class version does nothing, returns zero.

The standard adds that *the intention is not only that the calls [to `underflow` or `uflow`] will not return `eof()` but that they will return immediately.*

The standard adds that *the morphemes of `showmanyc` are **es-how-many-see**, not **show-manic**.*

Reimplemented in `std::basic_filebuf<_CharT, _Traits>`, `std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>`, `std::basic_filebuf<_CharT, std::char_traits<_CharT>>`, `std::basic_filebuf<char_type, traits_type>`, and `std::basic_stringbuf<_CharT, _Traits>`.

`snextc()`

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::snextc ( ) [inline], [inherited]
```

Getting the next character.

Returns

The next character, or eof.

Calls `sgetc()`, and if that function returns `traits::eof()`, so does this function. Otherwise, `sgetc()`.

Referenced by `std::basic_istream<_CharT, _Traits>::sentry::sentry()`, `std::basic_istream<_CharT, _Traits>::get()`, `std::basic_istream<char>::getline()`, `std::basic_istream<char>::putback()`, and `std::basic_istream<char>::seekg()`.

`sputbackc()`

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::sputbackc (
char_type __c ) [inline], [inherited]
```

Pushing characters back into the input stream.

Parameters

<code>__c</code>	The character to push back.
------------------	-----------------------------

Returns

The previous character, if possible.

Similar to `sungetc()`, but `__c` is pushed onto the stream instead of *the previous character*. If successful, the next character fetched from the input stream will be `__c`.

Referenced by `std::basic_istream<_CharT, _Traits>::putback()`.

sputc()

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::sputc (
    char_type __c ) [inline], [inherited]
```

Entry point for all single-character output functions.

Parameters

<code>__c</code>	A character to output.
------------------	------------------------

Returns

`__c`, if possible.

One of two public output functions.

If a write position is available for the output sequence (i.e., the buffer is not full), stores `__c` in that position, increments the position, and returns `traits::to_int_type(__c)`. If a write position is not available, returns `overflow(__c)`.

Referenced by `std::ostreambuf_iterator<_CharT, _Traits>::operator=()`, and `std::wbuffer_convert<_Codecvt, _Elem, _Tr>::overflow()`.

sputn()

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf<_CharT, _Traits>::sputn (
    const char_type * __s,
    streamsize __n ) [inline], [inherited]
```

Entry point for all single-character output functions.

Parameters

<code>__s</code>	A buffer read area.
<code>__n</code>	A count.

One of two public output functions.

Returns `xputn(__s, __n)`. The effect is to write `__s[0]` through `__s[__n-1]` to the output sequence, if possible.

sungetc()

```
template<typename _CharT , typename _Traits >
int_type std::basic_streambuf<_CharT, _Traits>::sungetc ( ) [inline], [inherited]
```

Moving backwards in the input stream.

Returns

The previous character, if possible.

If a putback position is available, this function decrements the input pointer and returns that character. Otherwise, calls and returns `pbackfail()`. The effect is to *unget* the last character *gotten*.

Referenced by `std::basic_istream<_CharT, _Traits>::unget()`.

sync()

```
template<typename _CharT , typename _Traits = std::char_traits<_CharT>>
virtual int __gnu_cxx::stdio_sync_filebuf<_CharT, _Traits>::sync ( ) [inline], [protected],
[virtual]
```

Synchronizes the buffer arrays with the controlled sequences.

Returns

-1 on failure.

Each derived class provides its own appropriate behavior, including the definition of *failure*.

Note

Base class version does nothing, returns zero.

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

uflow()

```
template<typename _CharT , typename _Traits = std::char_traits<_CharT>>
virtual int_type __gnu_cxx::stdio_sync_filebuf<_CharT, _Traits>::uflow ( ) [inline], [protected],
[virtual]
```

Fetches more data from the controlled sequence.

Returns

The first character from the *pending sequence*.

Informally, this function does the same thing as `underflow()`, and in fact is required to call that function. It also returns the new character, like `underflow()` does. However, this function also moves the read position forward by one.

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

underflow()

```
template<typename _CharT , typename _Traits = std::char_traits<_CharT>>
virtual int_type __gnu_cxx::stdio_sync_filebuf<_CharT, _Traits>::underflow ( ) [inline], [protected],
[virtual]
```

Fetches more data from the controlled sequence.

Returns

The first character from the *pending sequence*.

Informally, this function is called when the input buffer is exhausted (or does not exist, as buffering need not actually be done). If a buffer exists, it is *refilled*. In either case, the next available character is returned, or `traits::eof()` to indicate a null pending sequence.

For a formal definition of the pending sequence, see a good text such as Langer & Kreft, or [27.5.2.4.3]/7-14.

A functioning input streambuf can be created by overriding only this function (no buffer area will be used). For an example, see <https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.html>

Note

Base class version does nothing, returns `eof()`.

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

xsggetn()

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf<_CharT, _Traits>::xsggetn (
    char_type * __s,
    streamsize __n) [protected], [virtual], [inherited]
```

Multiple character extraction.

Parameters

<code>__s</code>	A buffer area.
<code>__n</code>	Maximum number of characters to assign.

Returns

The number of characters assigned.

Fills `__s[0]` through `__s[__n-1]` with characters from the input sequence, as if by `sbumpc()`. Stops when either `__n` characters have been copied, or when `traits::eof()` would be copied.

It is expected that derived classes provide a more efficient implementation by overriding this definition.

Reimplemented in `std::basic_filebuf<_CharT, _Traits>`, `std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>`, `std::basic_filebuf<_CharT, std::char_traits<_CharT>>`, and `std::basic_filebuf<char_type, traits_type>`.

References `std::min()`.

xsputn()

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf<_CharT, _Traits>::xsputn (
    const char_type * __s,
    streamsize __n) [protected], [virtual], [inherited]
```

Multiple character insertion.

Parameters

<code>__s</code>	A buffer area.
<code>__n</code>	Maximum number of characters to write.

Returns

The number of characters written.

Writes `__s[0]` through `__s[__n-1]` to the output sequence, as if by `sputc()`. Stops when either *n* characters have been copied, or when `sputc()` would return `traits::eof()`.

It is expected that derived classes provide a more efficient implementation by overriding this definition.

Reimplemented in `std::basic_filebuf<_CharT, _Traits>`, `std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>`, `std::basic_filebuf<_CharT, std::char_traits<_CharT>>`, and `std::basic_filebuf<char_type, traits_type>`.

References `std::min()`.

5.930.3 Member Data Documentation**`_M_buf_locale`**

```
template<typename _CharT, typename _Traits>
```

```
locale std::basic\_streambuf<\_CharT, \_Traits>::\_M\_buf\_locale [protected], [inherited]
```

Current locale setting.

Referenced by `std::basic_filebuf<_CharT, _Traits>::basic_filebuf()`.

`_M_in_beg`

```
template<typename _CharT, typename _Traits>
```

```
char_type* std::basic\_streambuf<\_CharT, \_Traits>::\_M\_in\_beg [protected], [inherited]
```

Start of get area.

`_M_in_cur`

```

5.937.1 Detailed Description

`template<typename _RealType = double>`
class `std::student_t_distribution<_RealType>`

A `student_t_distribution` random number distribution.
 The formula for the normal probability mass function is:

$$p(x|n) = \frac{1}{\sqrt{(n\pi)}} \frac{\Gamma((n+1)/2)}{\Gamma(n/2)} \left(1 + \frac{x^2}{n}\right)^{-(n+1)/2}$$

5.937.2 Member Typedef Documentation

`result_type`

`template<typename _RealType = double>`
`typedef _RealType std::student_t_distribution<_RealType>::result_type`
 The type of the range of the distribution.

5.937.3 Member Function Documentation

`max()`

`template<typename _RealType = double>`
`result_type std::student_t_distribution<_RealType>::max () const [inline]`
 Returns the least upper bound value of the distribution.
 References `std::numeric_limits<_Tp>::max()`.

`min()`

`template<typename _RealType = double>`
`result_type std::student_t_distribution<_RealType>::min () const [inline]`
 Returns the greatest lower bound value of the distribution.
 References `std::numeric_limits<_Tp>::lowest()`.

operator()()

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator >
result_type std::student_t_distribution< _RealType >::operator() (
    _UniformRandomNumberGenerator & __urng ) [inline]
```

Generating functions.

References [std::sqrt\(\)](#).

param() [1/2]

```
template<typename _RealType = double>
param_type std::student_t_distribution< _RealType >::param ( ) const [inline]
```

Returns the parameter set of the distribution.

param() [2/2]

```
template<typename _RealType = double>
void std::student_t_distribution< _RealType >::param (
    const param_type & __param ) [inline]
```

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--------------------------------------------

reset()

```
template<typename _RealType = double>
void std::student_t_distribution< _RealType >::reset ( ) [inline]
```

Resets the distribution state.

References [std::normal_distribution< _RealType >::reset\(\)](#), and [std::gamma_distribution< _RealType >::reset\(\)](#).

5.937.4 Friends And Related Symbol Documentation**operator<<**

```
template<typename _RealType = double>
template<typename _RealType1 , typename _CharT , typename _Traits >
std::basic_ostream< _CharT, _Traits > & operator<< (
    std::basic_ostream< _CharT, _Traits > & __os,
    const std::student_t_distribution< _RealType1 > & __x ) [friend]
```

Inserts a `student_t_distribution` random number distribution `__x` into the output stream `__os`.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>student_t_distribution</code> random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

operator==

```
template<typename _RealType = double>
bool operator== (
    const student_t_distribution< _RealType > & __d1,
    const student_t_distribution< _RealType > & __d2 ) [friend]
```

Return true if two Student t distributions have the same parameters and the sequences that would be generated are equal.

operator>>

```
template<typename _RealType = double>
template<typename _RealType1 , typename _CharT , typename _Traits >
std::basic_istream< _CharT, _Traits > & operator>> (
    std::basic_istream< _CharT, _Traits > & __is,
    std::student_t_distribution< _RealType1 > & __x ) [friend]
```

Extracts a student_t_distribution random number distribution __x from the input stream __is.

Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A student_t_distribution random number generator engine.

Returns

The input stream with __x extracted or in an error state.

5.938.1 Detailed Description

template<typename _Bilter>
class std::sub_match<_Bilter >

A sequence of characters matched by a particular marked sub-expression.

An object of this class is essentially a pair of iterators marking a matched subexpression within a regular expression pattern match. Such objects can be converted to and compared with std::basic_string objects of a similar base character type as the pattern matched by the regular expression.

The iterators that make up the pair are the usual half-open interval referencing the actual original pattern matched.

5.938.2 Member Typedef Documentation

first_type

typedef _Bilter [std::pair](#)<_Bilter, _Bilter>::first_type [inherited]
 The type of the first member.

second_type

typedef _Bilter [std::pair](#)<_Bilter, _Bilter>::second_type [inherited]
 The type of the second member.

5.938.3 Member Function Documentation

compare() [1/3]

```
template<typename _BiIter >
int std::sub\_match<_BiIter>::compare (
    const string\_type & __s ) const [inline]
```

Compares this sub_match to a string.

Parameters

_ ↔	A string to compare to this sub_match.
_s	

Return values

<i>negative</i>	This matched sequence will collate before __s .
<i>zero</i>	This matched sequence is equivalent to __s .
<i>positive</i>	This matched sequence will collate after __s .

compare() [2/3]

```
template<typename _BiIter >
int std::sub_match< _BiIter >::compare (
    const sub_match< _BiIter > & __s ) const [inline]
```

Compares this and another matched sequence.

Parameters

<code>__s</code>	Another matched sequence to compare to this one.
------------------	--------------------------------------------------

Return values

<i>negative</i>	This matched sequence will collate before <code>__s</code> .
<i>zero</i>	This matched sequence is equivalent to <code>__s</code> .
<i>positive</i>	This matched sequence will collate after <code>__s</code> .

Referenced by [std::sub_match< _Biliter >::operator!=\(\)](#), [std::sub_match< _Biliter >::operator<\(\)](#), [std::sub_match< _Biliter >::operator<=\(\)](#), [std::sub_match< _Biliter >::operator<=\(\)](#), [std::sub_match< _Biliter >::operator==\(\)](#), [std::sub_match< _Biliter >::operator==\(\)](#), [std::sub_match< _Biliter >::operator==\(\)](#), [std::sub_match< _Biliter >::operator>\(\)](#), and [std::sub_match< _Biliter >::operator>=\(\)](#).

compare() [3/3]

```
template<typename _BiIter >
int std::sub_match< _BiIter >::compare (
    const value_type * __s ) const [inline]
```

Compares this `sub_match` to a string.

Parameters

<code>__s</code>	A string to compare to this <code>sub_match</code> .
------------------	------------------------------------------------------

Return values

<i>negative</i>	This matched sequence will collate before <code>__s</code> .
<i>zero</i>	This matched sequence is equivalent to <code>__s</code> .
<i>positive</i>	This matched sequence will collate after <code>__s</code> .

length()

```
template<typename _BiIter >
difference_type std::sub_match< _BiIter >::length ( ) const [inline], [noexcept]
```

Gets the length of the matching sequence.

References [std::distance\(\)](#), [std::pair< _Biliter, _Biliter >::first](#), and [std::pair< _Biliter, _Biliter >::second](#).

operator string_type()

```
template<typename _BiIter >
```

```
std::sub_match<_Bilter >::operator string_type ( ) const [inline]
```

Gets the matching sequence as a string.

Returns

the matching sequence as a string.

This is the implicit conversion operator. It is identical to the str() member function except that it will want to pop up in unexpected places and cause a great deal of confusion and cursing from the unwary.

References [std::sub_match<_Bilter >::str\(\)](#).

str()

```
template<typename _Bilter >
```

```
string_type std::sub_match<_Bilter >::str ( ) const [inline]
```

Gets the matching sequence as a string.

Returns

the matching sequence as a string.

References [std::pair<_Bilter, _Bilter >::first](#), and [std::pair<_Bilter, _Bilter >::second](#).

Referenced by [std::sub_match<_Bilter >::operator string_type\(\)](#).

swap()

```
constexpr void std::pair<_Bilter, _Bilter >::swap (
```

```
pair<_Bilter, _Bilter > & __p ) [inline], [constexpr], [noexcept], [inherited]
```

Swap the first members and then the second members.

5.938.4 Friends And Related Symbol Documentation

make_pair()

```
constexpr pair<typename __decay_and_strip<_Bilter >::__type, typename __decay_and_strip<_Bil↵
```

```
Iter >::__type > make_pair (
```

```
_Bilter && __x,
```

```
_Bilter && __y ) [related]
```

A convenience wrapper for creating a pair from two objects.

Parameters

$_x$	The first object.
$_y$	The second object.

Returns

A newly-constructed `pair<>` object of the appropriate type.

The C++98 standard says the objects are passed by reference-to-const, but C++03 says they are passed by value (this was LWG issue #181).

Since C++11 they have been passed by forwarding reference and then forwarded to the new members of the pair. To create a pair with a member of reference type, pass a `reference_wrapper` to this function.

`operator"!=()`

```
constexpr bool operator!= (
    const pair< _BiIter , _BiIter > & __x,
    const pair< _BiIter , _BiIter > & __y ) [related]
```

Uses `operator==` to find the result.

`operator<()`

```
constexpr bool operator< (
    const pair< _BiIter , _BiIter > & __x,
    const pair< _BiIter , _BiIter > & __y ) [related]
```

Defines a lexicographical order for pairs.

For two pairs of the same type, `P` is ordered before `Q` if `P.first` is less than `Q.first`, or if `P.first` and `Q.first` are equivalent (neither is less than the other) and `P.second` is less than `Q.second`.

`operator<=()`

```
constexpr bool operator<= (
    const pair< _BiIter , _BiIter > & __x,
    const pair< _BiIter , _BiIter > & __y ) [related]
```

Uses `operator<` to find the result.

`operator==(())`

```
constexpr bool operator== (
    const pair< _BiIter , _BiIter > & __x,
    const pair< _BiIter , _BiIter > & __y ) [related]
```

Two pairs of the same type are equal iff their members are equal.

`operator>()`

```
constexpr bool operator> (
    const pair< _BiIter , _BiIter > & __x,
    const pair< _BiIter , _BiIter > & __y ) [related]
```

Uses `operator<` to find the result.

`operator>=()`

```
constexpr bool operator>= (
    const pair< _BiIter , _BiIter > & __x,
    const pair< _BiIter , _BiIter > & __y ) [related]
```

Uses `operator<` to find the result.

swap()

```
constexpr enable_if< __and< __is_swappable< _BiIter >, __is_swappable< _BiIter > >::value >↵
::type swap (
    pair< _BiIter , _BiIter > & __x,
    pair< _BiIter , _BiIter > & __y ) [related]
```

Swap overload for pairs. Calls `std::pair::swap()`.

Note

This `std::swap` overload is not declared in C++03 mode, which has performance implications, e.g. see <https://gcc.gnu.org/PR38466>

5.938.5 Member Data Documentation**first**

```
_BiIter std::pair< _BiIter , _BiIter >::first [inherited]
```

The first member.

second

```
_BiIter std::pair< _BiIter , _BiIter >::second [inherited]
```

The second member.

5.939.1 Detailed Description

template<typename _UIntType, size_t __w, size_t __s, size_t __r>
class [std::subtract_with_carry_engine](#)< _UIntType, __w, __s, __r >

The Marsaglia-Zaman generator.

This is a model of a Generalized Fibonacci discrete random number generator, sometimes referred to as the SWC generator.

A discrete random number generator that produces pseudorandom numbers using:

$$x_i \leftarrow (x_{i-s} - x_{i-r} - carry_{i-1}) \bmod m$$

The size of the state is r and the maximum period of the generator is $(m^r - m^s - 1)$.

5.939.2 Member Typedef Documentation

result_type

template<typename _UIntType, size_t __w, size_t __s, size_t __r>
 typedef _UIntType [std::subtract_with_carry_engine](#)< _UIntType, __w, __s, __r >::result_type
 The type of the generated random value.

5.939.3 Constructor & Destructor Documentation

subtract_with_carry_engine() [1/2]

template<typename _UIntType, size_t __w, size_t __s, size_t __r>
[std::subtract_with_carry_engine](#)< _UIntType, __w, __s, __r >::subtract_with_carry_engine ([result_type](#) __sd) [inline], [explicit]

Constructs an explicitly seeded [subtract_with_carry_engine](#) random number generator.

References [std::subtract_with_carry_engine](#)< _UIntType, __w, __s, __r >::seed().

subtract_with_carry_engine() [2/2]

template<typename _UIntType, size_t __w, size_t __s, size_t __r>
 template<typename _Sseq, typename = _If_seed_seq<_Sseq>>
[std::subtract_with_carry_engine](#)< _UIntType, __w, __s, __r >::subtract_with_carry_engine ([_Sseq](#) & __q) [inline], [explicit]

Constructs a [subtract_with_carry_engine](#) random number engine seeded from the seed sequence __q.

Parameters

<code>__q</code>	the seed sequence.
------------------	--------------------

References [std::subtract_with_carry_engine<_UIntType, __w, __s, __r>::seed\(\)](#).

5.939.4 Member Function Documentation

discard()

```
template<typename _UIntType , size_t __w, size_t __s, size_t __r>
void std::subtract_with_carry_engine<_UIntType, __w, __s, __r>::discard (
    unsigned long long __z ) [inline]
```

Discard a sequence of random numbers.

max()

```
template<typename _UIntType , size_t __w, size_t __s, size_t __r>
static constexpr result_type std::subtract_with_carry_engine<_UIntType, __w, __s, __r>::max ( )
[inline], [static], [constexpr]
```

Gets the inclusive maximum value of the range of random integers returned by this generator.

min()

```
template<typename _UIntType , size_t __w, size_t __s, size_t __r>
static constexpr result_type std::subtract_with_carry_engine<_UIntType, __w, __s, __r>::min ( )
[inline], [static], [constexpr]
```

Gets the inclusive minimum value of the range of random integers returned by this generator.

operator()()

```
template<typename _UIntType , size_t __w, size_t __s, size_t __r>
subtract_with_carry_engine<_UIntType, __w, __s, __r>::result_type std::subtract_with_carry_engine<
_UIntType, __w, __s, __r>::operator()
```

Gets the next random number in the sequence.

seed() [1/2]

```
template<typename _UIntType , size_t __w, size_t __s, size_t __r>
template<typename _Sseq >
_If_seed_seq<_Sseq> std::subtract_with_carry_engine<_UIntType, __w, __s, __r>::seed (
    _Sseq & __q )
```

Seeds the initial state x_0 of the % subtract_with_carry_engine random number generator.

seed() [2/2]

```
template<typename _UIntType , size_t __w, size_t __s, size_t __r>
void std::subtract_with_carry_engine<_UIntType, __w, __s, __r>::seed (
    result_type __sd = default_seed )
```

Seeds the initial state x_0 of the random number generator.

N1688[4.19] modifies this as follows. If `__value == 0`, sets value to 19780503. In any case, with a linear congruential generator `lcg(i)` having parameters $m_{lcg} = 2147483563$, $a_{lcg} = 40014$, $c_{lcg} = 0$, and $lcg(0) = value$, sets $x_{-r} \dots x_{-1}$ to $lcg(1) \bmod m \dots lcg(r) \bmod m$ respectively. If $x_{-1} = 0$ set carry to 1, otherwise sets carry to 0.

Referenced by [std::subtract_with_carry_engine<_UIntType, __w, __s, __r>::subtract_with_carry_engine\(\)](#), and [std::subtract_with_carry_engine<_UIntType, __w, __s, __r>::subtract_with_carry_engine\(\)](#).

5.939.5 Friends And Related Symbol Documentation

operator<<

```
template<typename _UIntType , size_t __w, size_t __s, size_t __r>
template<typename _UIntType1 , size_t __w1, size_t __s1, size_t __r1, typename _CharT , typename
 Traits >
std::basic_ostream< _CharT, Traits > & operator<< (
    std::basic_ostream< _CharT, Traits > & __os,
    const std::subtract_with_carry_engine< _UIntType1, __w1, __s1, __r1 > & __x ) [friend]
```

Inserts the current state of a % subtract_with_carry_engine random number generator engine __x into the output stream __os.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A % subtract_with_carry_engine random number generator engine.

Returns

The output stream with the state of __x inserted or in an error state.

operator==

```
template<typename _UIntType , size_t __w, size_t __s, size_t __r>
bool operator== (
    const std::subtract_with_carry_engine< _UIntType, __w, __s, __r > & __lhs,
    const std::subtract_with_carry_engine< _UIntType, __w, __s, __r > & __rhs ) [friend]
```

Compares two % subtract_with_carry_engine random number generator objects of the same type for equality.

Parameters

<code>__lhs</code>	A % subtract_with_carry_engine random number generator object.
<code>__rhs</code>	Another % subtract_with_carry_engine random number generator object.

Returns

true if the infinite sequences of generated values would be equal, false otherwise.

operator>>

```
template<typename _UIntType , size_t __w, size_t __s, size_t __r>
template<typename _UIntType1 , size_t __w1, size_t __s1, size_t __r1, typename _CharT , typename
 Traits >
std::basic_istream< _CharT, Traits > & operator>> (
    std::basic_istream< _CharT, Traits > & __is,
    std::subtract_with_carry_engine< _UIntType1, __w1, __s1, __r1 > & __x ) [friend]
```

Extracts the current state of a % subtract_with_carry_engine random number generator engine __x from the input stream __is.

Parameters

<code>__is</code>	An input stream.
-------------------	------------------

Parameters

<code>__X</code>	A % subtract_with_carry_engine random number generator engine.
------------------	----------------------------------------------------------------

Returns

The input stream with the state of `__X` extracted or in an error state.

5.940 `__gnu_cxx::subtractive_rng` Class Reference

Inheritance diagram for `__gnu_cxx::subtractive_rng`:

Public Types

- typedef unsigned int [argument_type](#)
- typedef unsigned int [result_type](#)

Public Member Functions

- [subtractive_rng](#) ()
- [subtractive_rng](#) (unsigned int __seed)
- void **_M_initialize** (unsigned int __seed)
- unsigned int [operator\(\)](#) (unsigned int __limit)

5.940.1 Detailed Description

The `subtractive_rng` class is documented on [SGI's site](#). Note that this code assumes that `int` is 32 bits.

5.940.2 Member Typedef Documentation

argument_type

typedef unsigned int [std::unary_function](#)< unsigned int , unsigned int >::argument_type [inherited]
`argument_type` is the type of the argument

result_type

typedef unsigned int [std::unary_function](#)< unsigned int , unsigned int >::result_type [inherited]
 result_type is the return type

5.940.3 Constructor & Destructor Documentation**subtractive_rng()** [1/2]

```
__gnu_cxx::subtractive_rng::subtractive_rng (
    unsigned int __seed ) [inline]
```

Ctor allowing you to initialize the seed.

subtractive_rng() [2/2]

```
__gnu_cxx::subtractive_rng::subtractive_rng ( ) [inline]
```

Default ctor; initializes its state with some number you don't see.

5.940.4 Member Function Documentation**operator()()**

```
unsigned int __gnu_cxx::subtractive_rng::operator() (
    unsigned int __limit ) [inline]
```

Returns a number less than the argument.

- `~temporary_buffer` ()
- iterator `begin` ()
- iterator `end` ()
- size_type `requested_size` () const
- size_type `size` () const

Protected Attributes

- pointer `_M_buffer`
- size_type `_M_len`
- size_type `_M_original_len`

5.945.1 Detailed Description

template<class _ForwardIterator, class _Tp = typename std::iterator_traits<_ForwardIterator>::value_type>
struct `__gnu_cxx::temporary_buffer<_ForwardIterator, _Tp>`

This class provides similar behavior and semantics of the standard functions `get_temporary_buffer()` and `return_temporary_buffer()`, but encapsulated in a type vaguely resembling a standard container.

By default, a `temporary_buffer<Iter>` stores space for objects of whatever type the `Iter` iterator points to. It is constructed from a typical `[first,last)` range, and provides the `begin()`, `end()`, `size()` functions, as well as `requested_size()`. For non-trivial types, copies of `*first` will be used to initialize the storage.

`malloc` is used to obtain underlying storage.

Like `get_temporary_buffer()`, not all the requested memory may be available. Ideally, the created buffer will be large enough to hold a copy of `[first,last)`, but if `size()` is less than `requested_size()`, then this didn't happen.

5.945.2 Constructor & Destructor Documentation

`temporary_buffer()`

```
template<class _ForwardIterator , class _Tp = typename std::iterator_traits<_ForwardIterator>←
::value_type>
```

```
__gnu_cxx::temporary_buffer< _ForwardIterator, _Tp >::temporary_buffer (
    _ForwardIterator __first,
    _ForwardIterator __last ) [inline]
```

Requests storage large enough to hold a copy of [first,last).

`~temporary_buffer()`

```
template<class _ForwardIterator , class _Tp = typename std::iterator_traits<_ForwardIterator>←
::value_type>
```

```
__gnu_cxx::temporary_buffer< _ForwardIterator, _Tp >::~~temporary_buffer ( ) [inline]
```

Destroys objects and frees storage.

5.945.3 Member Function Documentation

`begin()`

```
template<typename _ForwardIterator , typename _Tp >
iterator std::_Temporary_buffer< _ForwardIterator, _Tp >::begin ( ) [inline], [inherited]
```

As per Table mumble.

`end()`

```
template<typename _ForwardIterator , typename _Tp >
iterator std::_Temporary_buffer< _ForwardIterator, _Tp >::end ( ) [inline], [inherited]
```

As per Table mumble.

`requested_size()`

```
template<typename _ForwardIterator , typename _Tp >
size_type std::_Temporary_buffer< _ForwardIterator, _Tp >::requested_size ( ) const [inline],
[inherited]
```

Returns the size requested by the constructor; may be >size().

`size()`

```
template<typename _ForwardIterator , typename _Tp >
size_type std::_Temporary_buffer< _ForwardIterator, _Tp >::size ( ) const [inline], [inherited]
```

As per Table mumble.

5.956.1 Detailed Description

template<typename _CharT, typename _InIter>

class std::time_get<_CharT, _InIter>

Primary class template time_get.

This facet encapsulates the code to parse and return a date or time from a string. It is used by the istream numeric extraction operators.

The time_get template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the time_get facet.

5.956.2 Member Typedef Documentation**char_type**

```
template<typename _CharT , typename _InIter >
typedef _CharT std::time_get<_CharT, _InIter>::char_type
```

Public typedefs.

iter_type

```
template<typename _CharT , typename _InIter >
typedef _InIter std::time_get< _CharT, _InIter >::iter_type
Public typedefs.
```

5.956.3 Constructor & Destructor Documentation

time_get()

```
template<typename _CharT , typename _InIter >
std::time_get< _CharT, _InIter >::time_get (
    size_t __refs = 0 ) [inline], [explicit]
```

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

<code>__refs</code>	Passed to the base facet class.
---------------------	---------------------------------

~time_get()

```
template<typename _CharT , typename _InIter >
virtual std::time_get< _CharT, _InIter >::~~time_get ( ) [inline], [protected], [virtual]
Destructor.
```

5.956.4 Member Function Documentation

date_order()

```
template<typename _CharT , typename _InIter >
dateorder std::time_get< _CharT, _InIter >::date_order ( ) const [inline]
```

Return preferred order of month, day, and year.

This function returns an enum from `time_base::dateorder` giving the preferred ordering if the format `x` given to `time_↵put::put()` only uses month, day, and year. If the format `x` for the associated locale uses other fields, this function returns `time_base::dateorder::noorder`.

NOTE: The library always returns `noorder` at the moment.

Returns

A member of `time_base::dateorder`.

References `std::time_get< _CharT, _InIter >::do_date_order()`.

do_date_order()

```
template<typename _CharT , typename _InIter >
_GLIBCXX_END_NAMESPACE_LDBL_OR_CXX11 time_base::dateorder std::time_get< _CharT, _InIter >::do_↵
date_order [protected], [virtual]
```

Return preferred order of month, day, and year.

This function returns an enum from `time_base::dateorder` giving the preferred ordering if the format `x` given to `time_↵put::put()` only uses month, day, and year. This function is a hook for derived classes to change the value returned.

Returns

A member of `time_base::dateorder`.

Referenced by `std::time_get< _CharT, _InIter >::date_order()`.

do_get()

```
template<typename _CharT , typename _InIter >
_InIter std::time_get< _CharT, _InIter >::do_get (
    iter_type __s,
    iter_type __end,
    ios_base & __f,
    ios_base::iostate & __err,
    tm * __tm,
    char __format,
    char __modifier ) const [inline], [protected]
```

Parse input string according to format.

This function parses the string according to the provided format and optional modifier. This function is a hook for derived classes to change the value returned.

See also

[get\(\)](#) for more details.

Parameters

<code>__s</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__f</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.
<code>__format</code>	Format specifier.
<code>__modifier</code>	Format modifier.

Returns

Iterator to first char not parsed.

References [std::ios_base::M_getloc\(\)](#), [std::ios_base::eofbit](#), [std::ios_base::goodbit](#), and [std::__ctype_abstract_base< _CharT >::widen\(\)](#).
Referenced by [std::time_get< _CharT, _InIter >::get\(\)](#).

do_get_date()

```
template<typename _CharT , typename _InIter >
_InIter std::time_get< _CharT, _InIter >::do_get_date (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm ) const [protected], [virtual]
```

Parse input date string.

This function parses a date according to the format *X* and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

[get_date\(\)](#) for details.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond date string.

References [std::ios_base::_M_getloc\(\)](#), and [std::ios_base::eofbit](#).

Referenced by [std::time_get<_CharT, _InIter>::get_date\(\)](#).

do_get_monthname()

```
template<typename _CharT , typename _InIter >
_InIter std::time_get< _CharT, _InIter >::do_get_monthname (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm ) const [protected], [virtual]
```

Parse input month string.

This function parses a month name and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

[get_monthname\(\)](#) for details.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond month name.

References [std::ios_base::_M_getloc\(\)](#), [std::ios_base::eofbit](#), [std::ios_base::failbit](#), and [std::ios_base::goodbit](#).

Referenced by [std::time_get<_CharT, _InIter>::get_monthname\(\)](#).

do_get_time()

```
template<typename _CharT , typename _InIter >
_InIter std::time_get< _CharT, _InIter >::do_get_time (
    iter_type __beg,
    iter_type __end,
```

```

ios_base & __io,
ios_base::iostate & __err,
tm * __tm ) const [protected], [virtual]

```

Parse input time string.

This function parses a time according to the format *x* and puts the results into a user-supplied struct *tm*. This function is a hook for derived classes to change the value returned.

See also

`get_time()` for details.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct <i>tm</i> to fill in.

Returns

Iterator to first char beyond time string.

References `std::ios_base::_M_getloc()`, and `std::ios_base::eofbit`.

Referenced by `std::time_get<_CharT, _InIter >::get_time()`.

do_get_weekday()

```

template<typename _CharT , typename _InIter >
_InIter std::time_get<_CharT, _InIter >::do_get_weekday (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm ) const [protected], [virtual]

```

Parse input weekday string.

This function parses a weekday name and puts the results into a user-supplied struct *tm*. This function is a hook for derived classes to change the value returned.

See also

`get_weekday()` for details.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct <i>tm</i> to fill in.

Returns

Iterator to first char beyond weekday name.

References [std::ios_base::M_getloc\(\)](#), [std::ios_base::eofbit](#), [std::ios_base::failbit](#), and [std::ios_base::goodbit](#).

Referenced by [std::time_get<_CharT, _InIter>::get_weekday\(\)](#).

do_get_year()

```
template<typename _CharT, typename _InIter >
_InIter std::time_get<_CharT, _InIter>::do_get_year (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm ) const [protected], [virtual]
```

Parse input year string.

This function reads up to 4 characters to parse a year string and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

[get_year\(\)](#) for details.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond year.

References [std::ios_base::eofbit](#), [std::ios_base::failbit](#), and [std::ios_base::goodbit](#).

Referenced by [std::time_get<_CharT, _InIter>::get_year\(\)](#).

get() [1/2]

```
template<typename _CharT, typename _InIter >
iter_type std::time_get<_CharT, _InIter>::get (
    iter_type __s,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm,
    char __format,
    char __modifier = 0 ) const [inline]
```

Parse input string according to format.

This function calls [time_get::do_get](#) with the provided parameters.

See also

do_get() and get().

Parameters

<code>__s</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.
<code>__format</code>	Format specifier.
<code>__modifier</code>	Format modifier.

Returns

Iterator to first char not parsed.

References [std::time_get< _CharT, _InIter >::do_get\(\)](#).

get() [2/2]

```
template<typename _CharT , typename _InIter >
_InIter std::time_get< _CharT, _InIter >::get (
    iter_type __s,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm,
    const char_type * __fmt,
    const char_type * __fmtend ) const [inline]
```

Parse input string according to format.

This function parses the input string according to a provided format string. It does the inverse of `time_put::put`. The format string follows the format specified for `strptime(3)/strptime(3)`. The actual parsing is done by `time_get::do_get`.

Parameters

<code>__s</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.
<code>__fmt</code>	Start of the format string.
<code>__fmtend</code>	End of the format string.

Returns

Iterator to first char not parsed.

References [std::ios_base::_M_getloc\(\)](#), [std::ios_base::eofbit](#), [std::ios_base::failbit](#), [std::ios_base::goodbit](#), [std::__ctype_abstract_base< _CharT >::narrow\(\)](#), [std::__ctype_abstract_base< _CharT >::tolower\(\)](#), and [std::__ctype_abstract_base< _CharT >::widen\(\)](#).

get_date()

```
template<typename _CharT , typename _InIter >
iter_type std::time_get< _CharT, _InIter >::get_date (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm ) const [inline]
```

Parse input date string.

This function parses a date according to the format *x* and puts the results into a user-supplied struct *tm*. The result is returned by calling `time_get::do_get_date()`.

If there is a valid date string according to format *x*, *tm* will be filled in accordingly and the returned iterator will point to the first character beyond the date string. If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct <i>tm</i> to fill in.

Returns

Iterator to first char beyond date string.

References `std::time_get< _CharT, _InIter >::do_get_date()`.

get_monthname()

```
template<typename _CharT , typename _InIter >
iter_type std::time_get< _CharT, _InIter >::get_monthname (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm ) const [inline]
```

Parse input month string.

This function parses a month name and puts the results into a user-supplied struct *tm*. The result is returned by calling `time_get::do_get_monthname()`.

Parsing starts by parsing an abbreviated month name. If a valid abbreviation is followed by a character that would lead to the full month name, parsing continues until the full name is found or an error occurs. Otherwise parsing finishes at the end of the abbreviated name.

If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct <i>tm</i> to fill in.

Returns

Iterator to first char beyond month name.

References [std::time_get< _CharT, _InIter >::do_get_monthname\(\)](#).

get_time()

```
template<typename _CharT , typename _InIter >
iter_type std::time_get< _CharT, _InIter >::get_time (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm ) const [inline]
```

Parse input time string.

This function parses a time according to the format *X* and puts the results into a user-supplied struct tm. The result is returned by calling `time_get::do_get_time()`.

If there is a valid time string according to format *X*, *tm* will be filled in accordingly and the returned iterator will point to the first character beyond the time string. If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond time string.

References [std::time_get< _CharT, _InIter >::do_get_time\(\)](#).

get_weekday()

```
template<typename _CharT , typename _InIter >
iter_type std::time_get< _CharT, _InIter >::get_weekday (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm ) const [inline]
```

Parse input weekday string.

This function parses a weekday name and puts the results into a user-supplied struct tm. The result is returned by calling `time_get::do_get_weekday()`.

Parsing starts by parsing an abbreviated weekday name. If a valid abbreviation is followed by a character that would lead to the full weekday name, parsing continues until the full name is found or an error occurs. Otherwise parsing finishes at the end of the abbreviated name.

If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond weekday name.

References [std::time_get<_CharT, _InIter>::do_get_weekday\(\)](#).

get_year()

```
template<typename _CharT , typename _InIter >
iter_type std::time_get< _CharT, _InIter >::get_year (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm ) const [inline]
```

Parse input year string.

This function reads up to 4 characters to parse a year string and puts the results into a user-supplied struct tm. The result is returned by calling `time_get::do_get_year()`.

4 consecutive digits are interpreted as a full year. If there are exactly 2 consecutive digits, the library interprets this as the number of years since 1900.

If an error occurs before the end, `err` |= `ios_base::failbit`. If parsing reads all the characters, `err` |= `ios_base::eofbit`.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond year.

References [std::time_get<_CharT, _InIter>::do_get_year\(\)](#).

5.957.1 Detailed Description

```
template<typename _CharT, typename _InIter>
class std::time_get_byname< _CharT, _InIter >
```

class `time_get_byname` [22.2.5.2].

5.957.2 Member Function Documentation

`date_order()`

```
template<typename _CharT , typename _InIter >
```

```
dateorder std::time\_get< _CharT, _InIter >::date_order ( ) const [inline], [inherited]
```

Return preferred order of month, day, and year.

This function returns an enum from `time_base::dateorder` giving the preferred ordering if the format `x` given to `time_put::put()` only uses month, day, and year. If the format `x` for the associated locale uses other fields, this function returns `time_base::dateorder::noorder`.

NOTE: The library always returns `noorder` at the moment.

Returns

A member of `time_base::dateorder`.

References [std::time_get< _CharT, _InIter >::do_date_order\(\)](#).

do_date_order()

```
template<typename _CharT, typename _InIter>
_GLIBCXX_END_NAMESPACE_LDBL_OR_CXX11 time_base::dateorder std::time_get<_CharT, _InIter>::do_date_order [protected], [virtual], [inherited]
```

Return preferred order of month, day, and year.

This function returns an enum from time_base::dateorder giving the preferred ordering if the format x given to time_get::put() only uses month, day, and year. This function is a hook for derived classes to change the value returned.

Returns

A member of time_base::dateorder.

Referenced by [std::time_get<_CharT, _InIter>::date_order\(\)](#).

do_get()

```
template<typename _CharT, typename _InIter>
_InIter std::time_get<_CharT, _InIter>::do_get (
    iter_type __s,
    iter_type __end,
    ios_base & __f,
    ios_base::iostate & __err,
    tm * __tm,
    char __format,
    char __modifier) const [inline], [protected], [inherited]
```

Parse input string according to format.

This function parses the string according to the provided format and optional modifier. This function is a hook for derived classes to change the value returned.

See also

[get\(\)](#) for more details.

Parameters

<i>__s</i>	Start of string to parse.
<i>__end</i>	End of string to parse.
<i>__f</i>	Source of the locale.
<i>__err</i>	Error flags to set.
<i>__tm</i>	Pointer to struct tm to fill in.
<i>__format</i>	Format specifier.
<i>__modifier</i>	Format modifier.

Returns

Iterator to first char not parsed.

References [std::ios_base::_M_getloc\(\)](#), [std::ios_base::eofbit](#), [std::ios_base::goodbit](#), and [std::__ctype_abstract_base<_CharT>::widen\(\)](#).

Referenced by [std::time_get<_CharT, _InIter>::get\(\)](#).

do_get_date()

```
template<typename _CharT, typename _InIter>
_InIter std::time_get<_CharT, _InIter>::do_get_date (
```

```

iter_type __beg,
iter_type __end,
ios_base & __io,
ios_base::iostate & __err,
tm * __tm ) const [protected], [virtual], [inherited]

```

Parse input date string.

This function parses a date according to the format *X* and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

`get_date()` for details.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond date string.

References `std::ios_base::_M_getloc()`, and `std::ios_base::eofbit`.

Referenced by `std::time_get<_CharT, _InIter>::get_date()`.

do_get_monthname()

```

template<typename _CharT, typename _InIter>
_InIter std::time_get<_CharT, _InIter>::do_get_monthname (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm ) const [protected], [virtual], [inherited]

```

Parse input month string.

This function parses a month name and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

`get_monthname()` for details.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond month name.

References [std::ios_base::_M_getloc\(\)](#), [std::ios_base::eofbit](#), [std::ios_base::failbit](#), and [std::ios_base::goodbit](#).

Referenced by [std::time_get<_CharT, _InIter>::get_monthname\(\)](#).

do_get_time()

```
template<typename _CharT, typename _InIter>
_InIter std::time_get<_CharT, _InIter>::do_get_time (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm ) const [protected], [virtual], [inherited]
```

Parse input time string.

This function parses a time according to the format *x* and puts the results into a user-supplied struct *tm*. This function is a hook for derived classes to change the value returned.

See also

[get_time\(\)](#) for details.

Parameters

__beg	Start of string to parse.
__end	End of string to parse.
__io	Source of the locale.
__err	Error flags to set.
__tm	Pointer to struct <i>tm</i> to fill in.

Returns

Iterator to first char beyond time string.

References [std::ios_base::_M_getloc\(\)](#), and [std::ios_base::eofbit](#).

Referenced by [std::time_get<_CharT, _InIter>::get_time\(\)](#).

do_get_weekday()

```
template<typename _CharT, typename _InIter>
_InIter std::time_get<_CharT, _InIter>::do_get_weekday (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm ) const [protected], [virtual], [inherited]
```

Parse input weekday string.

This function parses a weekday name and puts the results into a user-supplied struct *tm*. This function is a hook for derived classes to change the value returned.

See also

[get_weekday\(\)](#) for details.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond weekday name.

References [std::ios_base::_M_getloc\(\)](#), [std::ios_base::eofbit](#), [std::ios_base::failbit](#), and [std::ios_base::goodbit](#).

Referenced by [std::time_get<_CharT, _InIter>::get_weekday\(\)](#).

do_get_year()

```
template<typename _CharT , typename _InIter >
_InIter std::time_get< _CharT, _InIter >::do_get_year (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm ) const [protected], [virtual], [inherited]
```

Parse input year string.

This function reads up to 4 characters to parse a year string and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

[get_year\(\)](#) for details.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond year.

References [std::ios_base::eofbit](#), [std::ios_base::failbit](#), and [std::ios_base::goodbit](#).

Referenced by [std::time_get<_CharT, _InIter>::get_year\(\)](#).

get() [1/2]

```
template<typename _CharT , typename _InIter >
iter_type std::time_get< _CharT, _InIter >::get (
    iter_type __s,
    iter_type __end,
```

```

ios_base & __io,
ios_base::iostate & __err,
tm * __tm,
char __format,
char __modifier = 0 ) const [inline], [inherited]

```

Parse input string according to format.

This function calls time_get::do_get with the provided parameters.

See also

do_get() and get().

Parameters

<code>__s</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.
<code>__format</code>	Format specifier.
<code>__modifier</code>	Format modifier.

Returns

Iterator to first char not parsed.

References [std::time_get<_CharT, _InIter >::do_get\(\)](#).

get() [2/2]

```

template<typename _CharT , typename _InIter >
_InIter std::time_get<_CharT, _InIter >::get (
    iter_type __s,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm,
    const char_type * __fmt,
    const char_type * __fmtend ) const [inline], [inherited]

```

Parse input string according to format.

This function parses the input string according to a provided format string. It does the inverse of time_put::put. The format string follows the format specified for strftime(3)/strptime(3). The actual parsing is done by time_get::do_get.

Parameters

<code>__s</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.
<code>__fmt</code>	Start of the format string.
<code>__fmtend</code>	End of the format string.

Returns

Iterator to first char not parsed.

References [std::ios_base::_M_getloc\(\)](#), [std::ios_base::eofbit](#), [std::ios_base::failbit](#), [std::ios_base::goodbit](#), [std::__ctype_abstract_base<_CharT>::narrow\(\)](#), [std::__ctype_abstract_base<_CharT>::tolower\(\)](#), and [std::__ctype_abstract_base<_CharT>::toupper\(\)](#).

get_date()

```
template<typename _CharT , typename _InIter >
iter_type std::time_get< _CharT, _InIter >::get_date (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm ) const [inline], [inherited]
```

Parse input date string.

This function parses a date according to the format *x* and puts the results into a user-supplied struct *tm*. The result is returned by calling `time_get::do_get_date()`.

If there is a valid date string according to format *x*, *tm* will be filled in accordingly and the returned iterator will point to the first character beyond the date string. If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct <i>tm</i> to fill in.

Returns

Iterator to first char beyond date string.

References [std::time_get<_CharT, _InIter>::do_get_date\(\)](#).

get_monthname()

```
template<typename _CharT , typename _InIter >
iter_type std::time_get< _CharT, _InIter >::get_monthname (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm ) const [inline], [inherited]
```

Parse input month string.

This function parses a month name and puts the results into a user-supplied struct *tm*. The result is returned by calling `time_get::do_get_monthname()`.

Parsing starts by parsing an abbreviated month name. If a valid abbreviation is followed by a character that would lead to the full month name, parsing continues until the full name is found or an error occurs. Otherwise parsing finishes at the end of the abbreviated name.

If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond month name.

References [std::time_get<_CharT, _InIter >::do_get_monthname\(\)](#).

get_time()

```
template<typename _CharT , typename _InIter >
iter_type std::time_get<_CharT, _InIter >::get_time (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm ) const [inline], [inherited]
```

Parse input time string.

This function parses a time according to the format *X* and puts the results into a user-supplied struct tm. The result is returned by calling `time_get::do_get_time()`.

If there is a valid time string according to format *X*, *tm* will be filled in accordingly and the returned iterator will point to the first character beyond the time string. If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond time string.

References [std::time_get<_CharT, _InIter >::do_get_time\(\)](#).

get_weekday()

```
template<typename _CharT , typename _InIter >
iter_type std::time_get<_CharT, _InIter >::get_weekday (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm ) const [inline], [inherited]
```

Parse input weekday string.

This function parses a weekday name and puts the results into a user-supplied struct tm. The result is returned by calling `time_get::do_get_weekday()`.

Parsing starts by parsing an abbreviated weekday name. If a valid abbreviation is followed by a character that would lead to the full weekday name, parsing continues until the full name is found or an error occurs. Otherwise parsing finishes at the end of the abbreviated name.

If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond weekday name.

References [std::time_get<_CharT, _InIter>::do_get_weekday\(\)](#).

get_year()

```
template<typename _CharT, typename _InIter>
iter_type std::time_get<_CharT, _InIter>::get_year (
    iter_type __beg,
    iter_type __end,
    ios_base & __io,
    ios_base::iostate & __err,
    tm * __tm ) const [inline], [inherited]
```

Parse input year string.

This function reads up to 4 characters to parse a year string and puts the results into a user-supplied struct tm. The result is returned by calling `time_get::do_get_year()`.

4 consecutive digits are interpreted as a full year. If there are exactly 2 consecutive digits, the library interprets this as the number of years since 1900.

If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond year.

References [std::time_get< _CharT, _InIter >::do_get_year\(\)](#).

5.959.1 Detailed Description

template<typename _CharT, typename _OutIter>
class std::time_put<_CharT, _OutIter>

Primary class template time_put.

This facet encapsulates the code to format and output dates and times according to formats used by strftime().

The time_put template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the time_put facet.

5.959.2 Member Typedef Documentation

char_type

```
template<typename _CharT , typename _OutIter >
typedef _CharT std::time_put< _CharT, _OutIter >::char_type
```

Public typedefs.

iter_type

```
template<typename _CharT , typename _OutIter >
typedef _OutIter std::time_put< _CharT, _OutIter >::iter_type
```

Public typedefs.

5.959.3 Constructor & Destructor Documentation

time_put()

```
template<typename _CharT , typename _OutIter >
std::time_put< _CharT, _OutIter >::time_put (
    size_t __refs = 0 ) [inline], [explicit]
```

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

<code>__refs</code>	Passed to the base facet class.
---------------------	---------------------------------

~time_put()

```
template<typename _CharT , typename _OutIter >
virtual std::time_put< _CharT, _OutIter >::~~time_put ( ) [inline], [protected], [virtual]
```

Destructor.

5.959.4 Member Function Documentation

do_put()

```
template<typename _CharT , typename _OutIter >
_OutIter std::time_put< _CharT, _OutIter >::do_put (
```

```

iter_type __s,
ios_base & __io,
char_type __fill,
const tm * __tm,
char __format,
char __mod ) const [protected], [virtual]

```

Format and output a time or date.

This function formats the data in struct tm according to the provided format char and optional modifier. This function is a hook for derived classes to change the value returned.

See also

`put()` for more details.

Parameters

<code>__s</code>	The stream to write to.
<code>__io</code>	Source of locale.
<code>__fill</code>	<code>char_type</code> to use for padding.
<code>__tm</code>	Struct tm with date and time info to format.
<code>__format</code>	Format char.
<code>__mod</code>	Optional modifier char.

Returns

Iterator after writing.

References `std::ios_base::_M_getloc()`, and `std::__ctype_abstract_base<_CharT>::widen()`.

Referenced by `std::time_put<_CharT, _OutIter>::put()`.

put() [1/2]

```

template<typename _CharT , typename _OutIter >
iter_type std::time_put<_CharT, _OutIter >::put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    const tm * __tm,
    char __format,
    char __mod = 0 ) const [inline]

```

Format and output a time or date.

This function formats the data in struct tm according to the provided format char and optional modifier. The format and modifier are interpreted as by `strftime()`. It does so by returning `time_put::do_put()`.

Parameters

<code>__s</code>	The stream to write to.
<code>__io</code>	Source of locale.
<code>__fill</code>	<code>char_type</code> to use for padding.
<code>__tm</code>	Struct tm with date and time info to format.
<code>__format</code>	Format char.
<code>__mod</code>	Optional modifier char.

Returns

Iterator after writing.

References [std::time_put< _CharT, _OutIter >::do_put\(\)](#).

put() [2/2]

```
template<typename _CharT , typename _OutIter >
_OutIter std::time_put< _CharT, _OutIter >::put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    const tm * __tm,
    const _CharT * __beg,
    const _CharT * __end ) const
```

Format and output a time or date.

This function formats the data in struct tm according to the provided format string. The format string is interpreted as by strftime().

Parameters

<code>__s</code>	The stream to write to.
<code>__io</code>	Source of locale.
<code>__fill</code>	char_type to use for padding.
<code>__tm</code>	Struct tm with date and time info to format.
<code>__beg</code>	Start of format string.
<code>__end</code>	End of format string.

Returns

Iterator after writing.

5.960.1 Detailed Description

```
template<typename _CharT, typename _OutIter>
class std::time_put_byname<_CharT, _OutIter>
```

class time_put_byname [22.2.5.4].

5.960.2 Member Function Documentation

do_put()

```
template<typename _CharT, typename _OutIter>
_OutIter std::time_put<_CharT, _OutIter>::do_put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    const tm * __tm,
    char __format,
    char __mod) const [protected], [virtual], [inherited]
```

Format and output a time or date.

This function formats the data in struct tm according to the provided format char and optional modifier. This function is a hook for derived classes to change the value returned.

See also

put() for more details.

Parameters

<code>__s</code>	The stream to write to.
<code>__io</code>	Source of locale.
<code>__fill</code>	char_type to use for padding.
<code>__tm</code>	Struct tm with date and time info to format.
<code>__format</code>	Format char.
<code>__mod</code>	Optional modifier char.

Returns

Iterator after writing.

References [std::ios_base::M_getloc\(\)](#), and [std::__ctype_abstract_base<_CharT>::widen\(\)](#).

Referenced by [std::time_put<_CharT, _OutIter>::put\(\)](#).

put() [1/2]

```
template<typename _CharT, typename _OutIter>
iter_type std::time_put<_CharT, _OutIter>::put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    const tm * __tm,
    char __format,
    char __mod = 0) const [inline], [inherited]
```

Format and output a time or date.

This function formats the data in struct tm according to the provided format char and optional modifier. The format and modifier are interpreted as by strftime(). It does so by returning time_put::do_put().

Parameters

<code>__s</code>	The stream to write to.
<code>__io</code>	Source of locale.
<code>__fill</code>	<code>char_type</code> to use for padding.
<code>__tm</code>	Struct <code>tm</code> with date and time info to format.
<code>__format</code>	Format char.
<code>__mod</code>	Optional modifier char.

Returns

Iterator after writing.

References [std::time_put< _CharT, _OutIter >::do_put\(\)](#).

put() [2/2]

```
template<typename _CharT , typename _OutIter >
_OutIter std::time_put< _CharT, _OutIter >::put (
    iter_type __s,
    ios_base & __io,
    char_type __fill,
    const tm * __tm,
    const _CharT * __beg,
    const _CharT * __end ) const [inherited]
```

Format and output a time or date.

This function formats the data in struct `tm` according to the provided format string. The format string is interpreted as by `strftime()`.

Parameters

<code>__s</code>	The stream to write to.
<code>__io</code>	Source of locale.
<code>__fill</code>	<code>char_type</code> to use for padding.
<code>__tm</code>	Struct <code>tm</code> with date and time info to format.
<code>__beg</code>	Start of format string.
<code>__end</code>	End of format string.

Returns

Iterator after writing.

5.964.1 Detailed Description

```
template<typename Key, typename Mapped, typename Cmp_Fn = std::less<Key>, typename Tag = rb_
tree_tag, template< typename Node_Cltr, typename Node_Itr, typename Cmp_Fn_, typename _Alloc_ > class
Node_Update = null_node_update, typename _Alloc = std::allocator<char>>
class __gnu_pbds::tree< Key, Mapped, Cmp_Fn, Tag, Node_Update, _Alloc >
```

A tree-based container.

Template Parameters

<i>Key</i>	Key type.
<i>Mapped</i>	Map type.
<i>Cmp_Fn</i>	Comparison functor.
<i>Tag</i>	Instantiating data structure type, see container_tag.
<i>Node_Update</i>	Updates tree internal-nodes, restores invariants when invalidated. XXX See design::tree-based-containersnode invariants.
<i>_Alloc</i>	Allocator type.

Base tag choices are: `ov_tree_tag`, `rb_tree_tag`, `splay_tree_tag`.

Base is `basic_branch`.

5.964.2 Member Typedef Documentation

`cmp_fn`

```
template<typename Key , typename Mapped , typename Cmp_Fn = std::less<Key>, typename Tag = rb_
_tree_tag, template< typename Node_CItr, typename Node_Itr, typename Cmp_Fn_, typename _Alloc_ >
class Node_Update = null_node_update, typename _Alloc = std::allocator<char>>
typedef Cmp_Fn __gnu_pbds::tree< Key, Mapped, Cmp_Fn, Tag, Node_Update, _Alloc >::cmp_fn
Comparison functor type.
```

5.964.3 Constructor & Destructor Documentation

`tree()` [1/3]

```
template<typename Key , typename Mapped , typename Cmp_Fn = std::less<Key>, typename Tag = rb_
_tree_tag, template< typename Node_CItr, typename Node_Itr, typename Cmp_Fn_, typename _Alloc_ >
class Node_Update = null_node_update, typename _Alloc = std::allocator<char>>
__gnu_pbds::tree< Key, Mapped, Cmp_Fn, Tag, Node_Update, _Alloc >::tree (
    const cmp_fn & c ) [inline]
```

Constructor taking some policy objects. `r_cmp_fn` will be copied by the `Cmp_Fn` object of the container object.

`tree()` [2/3]

```
template<typename Key , typename Mapped , typename Cmp_Fn = std::less<Key>, typename Tag = rb_
_tree_tag, template< typename Node_CItr, typename Node_Itr, typename Cmp_Fn_, typename _Alloc_ >
class Node_Update = null_node_update, typename _Alloc = std::allocator<char>>
template<typename It >
__gnu_pbds::tree< Key, Mapped, Cmp_Fn, Tag, Node_Update, _Alloc >::tree (
    It first,
    It last ) [inline]
```

Constructor taking `__iterators` to a range of `value_types`. The `value_types` between `first_it` and `last_it` will be inserted into the container object.

tree() [3/3]

```
template<typename Key , typename Mapped , typename Cmp_Fn = std::less<Key>, typename Tag = rb←
_tree_tag, template< typename Node_CItr, typename Node_Itr, typename Cmp_Fn_, typename _Alloc_ >
class Node_Update = null_node_update, typename _Alloc = std::allocator<char>>>
template<typename It >
__gnu_pbds::tree< Key, Mapped, Cmp_Fn, Tag, Node_Update, _Alloc >::tree (
    It first,
    It last,
    const cmp_fn & c ) [inline]
```

Constructor taking __iterators to a range of value_types and some policy objects The value_types between first_it and last_it will be inserted into the container object. r_cmp_fn will be copied by the cmp_fn object of the container object. 5.969.1 Detailed Description

template<typename Node_CItr, typename Node_Itr, typename Cmp_Fn, typename _Alloc>
class `__gnu_pbds::tree_order_statistics_node_update`< Node_CItr, Node_Itr, Cmp_Fn, _Alloc >

Functor updating ranks of entrees.

5.969.2 Member Function Documentation

find_by_order() [1/2]

```
template<typename Node_CItr , typename Node_Itr , typename Cmp_Fn , typename _Alloc >
iterator \_\_gnu\_pbds::tree\_order\_statistics\_node\_update< Node_CItr, Node_Itr, Cmp_Fn, _Alloc >↵
::find_by_order (
    size_type ) [inline]
```

Finds an entry by `__order`. Returns an iterator to the entry with the `__order` order, or an iterator to the container object's end if order is at least the size of the container object.

find_by_order() [2/2]

```
template<typename Node_CItr , typename Node_Itr , typename Cmp_Fn , typename _Alloc >
const_iterator \_\_gnu\_pbds::tree\_order\_statistics\_node\_update< Node_CItr, Node_Itr, Cmp_Fn, _Alloc
>::find_by_order (
    size_type ) const [inline]
```

Finds an entry by `__order`. Returns a `const_iterator` to the entry with the `__order` order, or a `const_iterator` to the container object's end if order is at least the size of the container object.

operator()()

```
template<typename Node_CItr , typename Node_Itr , typename Cmp_Fn , typename _Alloc >
void \_\_gnu\_pbds::tree\_order\_statistics\_node\_update< Node_CItr, Node_Itr, Cmp_Fn, _Alloc >::operator()
(
```

```
node_iterator ,
node_const_iterator ) const [inline], [protected]
```

Updates the rank of a node through a node_iterator node_it; end_nd_it is the end node iterator.

order_of_key()

```
template<typename Node_CIter , typename Node_Itr , typename Cmp_Fn , typename _Alloc >
size_type __gnu_pbds::tree_order_statistics_node_update< Node_CIter, Node_Itr, Cmp_Fn, _Alloc >↵
::order_of_key (
    key_const_reference ) const [inline]
```

Returns the order of a key within a sequence. For exapmle, if r_key is the smallest key, this method will return 0; if r_key is a key between the smallest and next key, this method will return 1; if r_key is a key larger than the largest key, this method will return the size of r_c.

5.972 `__gnu_pbds::detail::tree_traits< Key, Mapped, Cmp_Fn, Node_Update, ov_tree_tag, _Alloc >` Struct Template Reference

```
#include <traits.hpp>
```

Public Types

- typedef [tree_node_metadata_dispatch](#)< Key, Mapped, Cmp_Fn, Node_Update, _Alloc >::type **metadata_type**
- typedef [ov_tree_node_const_it](#)< value_type, metadata_type, _Alloc > **node_const_iterator**
- typedef [ov_tree_node_it](#)< value_type, metadata_type, _Alloc > **node_iterator**
- typedef Node_Update< [node_const_iterator](#), [node_iterator](#), Cmp_Fn, _Alloc > **node_update**
- typedef `__gnu_pbds::null_node_update`< [node_const_iterator](#), [node_iterator](#), Cmp_Fn, _Alloc > * **null_node**↔
_update_pointer

5.972.1 Detailed Description

```
template<typename Key, typename Mapped, class Cmp_Fn, template< typename Node_Cltr, class Node_Itr,
class Cmp_Fn_, typename _Alloc > class Node_Update, typename _Alloc>
struct __gnu_pbds::detail::tree_traits< Key, Mapped, Cmp_Fn, Node_Update, ov_tree_tag, _Alloc >
```

Tree traits.

5.972.2 Member Typedef Documentation

node_const_iterator

```
template<typename Key , typename Mapped , class Cmp_Fn , template< typename Node_Cltr, class
Node_Itr, class Cmp_Fn_, typename _Alloc > class Node_Update, typename _Alloc >
typedef ov\_tree\_node\_const\_it< value_type, metadata_type, _Alloc> __gnu_pbds::detail::tree_traits<
Key, Mapped, Cmp_Fn, Node_Update, ov\_tree\_tag, _Alloc >::node_const_iterator
```

This is an iterator to an iterator: it iterates over nodes, and de-referencing it returns one of the tree's iterators.

5.978.1 Detailed Description

```
template<typename Key, typename Mapped, typename _ATraits = typename detail::default_trie_access_traits<Key>::type, typename Tag = pat_trie_tag, template< typename Node_Cltr, typename Node_Ltr, typename _ATraits_, typename _Alloc_ > class Node_Update = null_node_update, typename _Alloc = std::allocator<char>>>
```

```
class __gnu_pbds::trie< Key, Mapped, _ATraits, Tag, Node_Update, _Alloc >
```

A trie-based container.

Template Parameters

<i>Key</i>	Key type.
<i>Mapped</i>	Map type.
<i>_ATraits</i>	Element access traits.
<i>Tag</i>	Instantiating data structure type, see <code>container_tag</code> .
<i>Node_Update</i>	Updates trie internal-nodes, restores invariants when invalidated. XXX See <code>design::tree-based-containersnode</code> invariants.
<i>_Alloc</i>	Allocator type.

Base tag choice is `pat_trie_tag`.

Base is `basic_branch`.

5.978.2 Member Typedef Documentation

`access_traits`

```
template<typename Key , typename Mapped , typename _ATraits = typename detail::default_trie_↵
access_traits<Key>::type, typename Tag = pat_trie_tag, template< typename Node_CItr, typename
Node_Itr, typename _ATraits_, typename _Alloc_ > class Node_Update = null_node_update, typename
_Alloc = std::allocator<char>>>
typedef _ATraits \_\_gnu\_pbds::trie< Key, Mapped, _ATraits, Tag, Node_Update, _Alloc >::access_↵
traits
```

Element access traits type.

5.978.3 Constructor & Destructor Documentation

`trie()` [1/3]

```
template<typename Key , typename Mapped , typename _ATraits = typename detail::default_trie_↵
access_traits<Key>::type, typename Tag = pat_trie_tag, template< typename Node_CItr, typename
Node_Itr, typename _ATraits_, typename _Alloc_ > class Node_Update = null_node_update, typename
_Alloc = std::allocator<char>>>
\_\_gnu\_pbds::trie< Key, Mapped, _ATraits, Tag, Node_Update, _Alloc >::trie (
    const access\_traits & t ) [inline]
```

Constructor taking some policy objects. `r_access_traits` will be copied by the `_ATraits` object of the container object.

`trie()` [2/3]

```
template<typename Key , typename Mapped , typename _ATraits = typename detail::default_trie_↵
access_traits<Key>::type, typename Tag = pat_trie_tag, template< typename Node_CItr, typename
Node_Itr, typename _ATraits_, typename _Alloc_ > class Node_Update = null_node_update, typename
_Alloc = std::allocator<char>>>
template<typename It >
\_\_gnu\_pbds::trie< Key, Mapped, _ATraits, Tag, Node_Update, _Alloc >::trie (
    It first,
    It last ) [inline]
```

Constructor taking `__iterators` to a range of `value_types`. The `value_types` between `first_it` and `last_it` will be inserted into the container object.

`trie()` [3/3]

```
template<typename Key , typename Mapped , typename _ATraits = typename detail::default_trie_↵
access_traits<Key>::type, typename Tag = pat_trie_tag, template< typename Node_CItr, typename
Node_Itr, typename _ATraits_, typename _Alloc_ > class Node_Update = null_node_update, typename
_Alloc = std::allocator<char>>>
template<typename It >
\_\_gnu\_pbds::trie< Key, Mapped, _ATraits, Tag, Node_Update, _Alloc >::trie (
    It first,
    It last,
    const access\_traits & t ) [inline]
```

Constructor taking `__iterators` to a range of `value_types` and some policy objects. The `value_types` between `first_it` and `last_it` will be inserted into the container object.

    node_const_iterator ) const [inline], [protected]
```

Updates the rank of a node through a node_iterator node_it; end_nd_it is the end node iterator.

order_of_key()

```
template<typename Node_CItr , typename Node_Itr , typename _ATraits , typename _Alloc >
size_type __gnu_pbds::trie_order_statistics_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc
>::order_of_key (
    key_const_reference ) const [inline]
```

Returns the order of a key within a sequence. For exapmle, if r_key is the smallest key, this method will return 0; if r_key is a key between the smallest and next key, this method will return 1; if r_key is a key larger than the largest key, this method will return the size of r_c.

order_of_prefix()

```
template<typename Node_CItr , typename Node_Itr , typename _ATraits , typename _Alloc >
size_type __gnu_pbds::trie_order_statistics_node_update< Node_CItr, Node_Itr, _ATraits, _Alloc
>::order_of_prefix (
    a_const_iterator ,
    a_const_iterator ) const [inline]
```

Returns the order of a prefix within a sequence. For exapmle, if [b, e] is the smallest prefix, this method will return 0; if r_key is a key between the smallest and next key, this method will return 1; if r_key is a key larger than the largest key, this method will return the size of r_c.

5.985.1 Detailed Description

```
template<typename Node_Citr, typename Node_Itr, typename _ATraits, typename _Alloc>
class __gnu_pbds::trie_prefix_search_node_update< Node_Citr, Node_Itr, _ATraits, _Alloc >
```

A node updatator that allows tries to be searched for the range of values that match a certain prefix.

5.985.2 Member Typedef Documentation

`a_const_iterator`

```
template<typename Node_Citr , typename Node_Itr , typename _ATraits , typename _Alloc >
typedef access_traits::const_iterator __gnu_pbds::trie_prefix_search_node_update< Node_Citr,
Node_Itr, _ATraits, _Alloc >::a_const_iterator
Const element iterator.
```

`access_traits`

```
template<typename Node_Citr , typename Node_Itr , typename _ATraits , typename _Alloc >
typedef _ATraits __gnu_pbds::trie_prefix_search_node_update< Node_Citr, Node_Itr, _ATraits, _↵
Alloc >::access_traits
Element access traits.
```

`allocator_type`

```
template<typename Node_Citr , typename Node_Itr , typename _ATraits , typename _Alloc >
typedef _Alloc __gnu_pbds::trie_prefix_search_node_update< Node_Citr, Node_Itr, _ATraits, _Alloc
>::allocator_type
_Alloc type.
```

`size_type`

```
template<typename Node_Citr , typename Node_Itr , typename _ATraits , typename _Alloc >
typedef allocator_type::size_type __gnu_pbds::trie_prefix_search_node_update< Node_Citr, Node_↵
Itr, _ATraits, _Alloc >::size_type
Size type.
```

5.985.3 Member Function Documentation

`operator>()`

```
template<typename Node_Citr , typename Node_Itr , typename _ATraits , typename _Alloc >
void __gnu_pbds::trie_prefix_search_node_update< Node_Citr, Node_Itr, _ATraits, _Alloc >::operator()
(
    node_iterator node_it,
    node_const_iterator end_nd_it ) const    [inline], [protected]
```

Called to update a node's metadata.

`prefix_range()` [1/4]

```
template<typename Node_Citr , typename Node_Itr , typename _ATraits , typename _Alloc >
std::pair< iterator, iterator > __gnu_pbds::trie_prefix_search_node_update< Node_Citr, Node_Itr,
_ATraits, _Alloc >::prefix_range (
```

```

    a_const_iterator ,
    a_const_iterator )

```

Finds the iterator range corresponding to all values whose prefixes match [b, e).

prefix_range() [2/4]

```

template<typename Node_CIter , typename Node_Itr , typename _ATraits , typename _Alloc >
std::pair< const_iterator, const_iterator > __gnu_pbds::trie_prefix_search_node_update< Node_↵
CIter, Node_Itr, _ATraits, _Alloc >::prefix_range (
    a_const_iterator ,
    a_const_iterator ) const

```

Finds the const iterator range corresponding to all values whose prefixes match [b, e).

prefix_range() [3/4]

```

template<typename Node_CIter , typename Node_Itr , typename _ATraits , typename _Alloc >
std::pair< iterator, iterator > __gnu_pbds::trie_prefix_search_node_update< Node_CIter, Node_Itr,
_ATraits, _Alloc >::prefix_range (
    key_const_reference )

```

Finds the iterator range corresponding to all values whose prefixes match r_key.

prefix_range() [4/4]

```

template<typename Node_CIter , typename Node_Itr , typename _ATraits , typename _Alloc >
std::pair< const_iterator, const_iterator > __gnu_pbds::trie_prefix_search_node_update< Node_↵
CIter, Node_Itr, _ATraits, _Alloc >::prefix_range (
    key_const_reference ) const

```

Finds the const iterator range corresponding to all values whose prefixes match r_key.

5.986.1 Detailed Description

```
template<typename String = std::string, typename String::value_type Min_E_Val = detail::__numeric_
traits<typename String::value_type>::__min, typename String::value_type Max_E_Val = detail::__numeric_
traits<typename String::value_type>::__max, bool Reverse = false, typename _Alloc = std::allocator<char>>
struct __gnu_pbds::trie_string_access_traits< String, Min_E_Val, Max_E_Val, Reverse, _Alloc >
```

Element access traits for string types.

Template Parameters

<i>String</i>	String type.
<i>Min_E_Val</i>	Minimal element value.
<i>Max_E_Val</i>	Maximum element value.
<i>Reverse</i>	Reverse iteration should be used. Default: false.
<i>_Alloc</i>	Allocator type.

5.986.2 Member Typedef Documentation

`const_iterator`

```
template<typename String = std::string, typename String::value_type Min_E_Val = detail::__
numeric_traits<typename String::value_type>::__min, typename String::value_type Max_E_Val = detail__
::__numeric_traits<typename String::value_type>::__max, bool Reverse = false, typename _Alloc =
std::allocator<char>>
typedef detail::__conditional_type<Reverse,typenameString::const_reverse_iterator,typenameString__
::const_iterator>::__type __gnu_pbds::trie_string_access_traits< String, Min_E_Val, Max_E_Val,
Reverse, _Alloc >::const_iterator
```

Element const iterator type.

`e_type`

```
template<typename String = std::string, typename String::value_type Min_E_Val = detail::__
numeric_traits<typename String::value_type>::__min, typename String::value_type Max_E_Val = detail__
::__numeric_traits<typename String::value_type>::__max, bool Reverse = false, typename _Alloc =
std::allocator<char>>
typedef std::iterator_traits<const_iterator>::value_type __gnu_pbds::trie_string_access_traits<
String, Min_E_Val, Max_E_Val, Reverse, _Alloc >::e_type
```

Element type.

5.986.3 Member Function Documentation

`begin()`

```
template<typename String = std::string, typename String::value_type Min_E_Val = detail::__
numeric_traits<typename String::value_type>::__min, typename String::value_type Max_E_Val = detail__
::__numeric_traits<typename String::value_type>::__max, bool Reverse = false, typename _Alloc =
std::allocator<char>>
static const_iterator __gnu_pbds::trie_string_access_traits< String, Min_E_Val, Max_E_Val, Reverse,
_Alloc >::begin (
    key_const_reference ) [inline], [static]
```

Returns a `const_iterator` to the first element of `key_const_reference` agumnet.

e_pos()

```
template<typename String = std::string, typename String::value_type Min_E_Val = detail::__↵
numeric_traits<typename String::value_type>::__min, typename String::value_type Max_E_Val = detail↵
::__numeric_traits<typename String::value_type>::__max, bool Reverse = false, typename _Alloc =

5.994.1 Detailed Description

`template<typename _T1, typename _T2>`
class `std::tuple< _T1, _T2 >`

Partial specialization, 2-element tuple. Includes construction and assignment from a pair.
The documentation for this class was generated from the following file:

- [tuple](#)

5.995 std::tuple_element< _Int, _Tp > Struct Template Reference

5.995.1 Detailed Description

`template<std::size_t _Int, typename _Tp>`
struct `std::tuple_element< _Int, _Tp >`

`tuple_element`

Gives the type of the *ith* element of a given tuple type.

The documentation for this struct was generated from the following file:

- [array](#)

5.996 std::tuple_element< 0, pair< _Tp1, _Tp2 > > Struct Template Reference

Public Types

- `typedef _Tp1 type`

5.996.1 Detailed Description

`template<class _Tp1, class _Tp2>`
struct `std::tuple_element< 0, pair< _Tp1, _Tp2 > >`

Partial specialization for `std::pair`.

The documentation for this struct was generated from the following file:

- [utility](#)

5.997 `std::tuple_element< 0, tuple< _Head, _Tail... > >` Struct Template Reference**Public Types**

- `typedef _Head type`

5.997.1 Detailed Description

```
template<typename _Head, typename... _Tail>
struct std::tuple_element< 0, tuple< _Head, _Tail... > >
```

Basis case for `tuple_element`: The first element is the one we're seeking.
 The documentation for this struct was generated from the following file:

- [tuple](#)

5.998 `std::tuple_element< 1, pair< _Tp1, _Tp2 > >` Struct Template Reference**Public Types**

- `typedef _Tp2 type`

5.998.1 Detailed Description

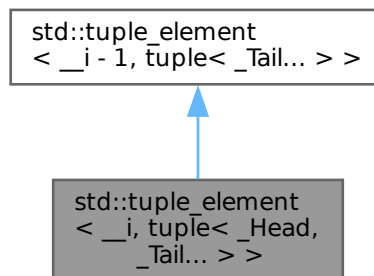

```
template<class _Tp1, class _Tp2>
struct std::tuple_element< 1, pair< _Tp1, _Tp2 > >
```

Partial specialization for `std::pair`.
 The documentation for this struct was generated from the following file:

- [utility](#)

5.999 `std::tuple_element< __i, tuple< _Head, _Tail... > >` Struct Template Reference

Inheritance diagram for `std::tuple_element< __i, tuple< _Head, _Tail... > >`:

5.999.1 Detailed Description

```
template<size_t __i, typename _Head, typename... _Tail>
struct std::tuple_element< __i, tuple< _Head, _Tail... > >
```

Recursive case for tuple_element: strip off the first element in the tuple and retrieve the (i-1)th element of the remaining tuple.

The documentation for this struct was generated from the following file:

- [tuple](#)

5.1000 std::tuple_element< __i, tuple<> > Struct Template Reference

5.1000.1 Detailed Description

```
template<size_t __i>
struct std::tuple_element< __i, tuple<> >
```

Error case for tuple_element: invalid index.

The documentation for this struct was generated from the following file:

- [tuple](#)

5.1001 std::tuple_element< _Int, array< _Tp, _Nm > > Struct Template Reference

Public Types

- typedef `_Tp` `type`

5.1001.1 Detailed Description

```
template<std::size_t _Int, typename _Tp, std::size_t _Nm>
struct std::tuple_element< _Int, array< _Tp, _Nm > >
```

Partial specialization for std::array.

The documentation for this struct was generated from the following file:

- [array](#)

5.1002 std::tuple_size< _Tp > Struct Template Reference

Inherited by std::tuple_size< const __enable_if_has_tuple_size< _Tp > >, std::tuple_size< const volatile __enable_if_has_tuple_size< _Tp > >, and std::tuple_size< volatile __enable_if_has_tuple_size< _Tp > >.

5.1002.1 Detailed Description

```
template<typename _Tp>
struct std::tuple_size< _Tp >
```

tuple_size

Finds the size of a given tuple type.

The documentation for this struct was generated from the following file:

- [array](#)

- **bool operator==** (const [type_info](#) &__arg) const noexcept

Protected Member Functions

- **type_info** (const char *__n)

Protected Attributes

- `const char * __name`

5.1008.1 Detailed Description

Part of RTTI.

The `type_info` class describes type information generated by an implementation.

5.1008.2 Constructor & Destructor Documentation

`~type_info()`

```
virtual std::type_info::~~type_info ( ) [virtual]
```

Destructor first. Being the first non-inline virtual function, this controls in which translation unit the vtable is emitted. The compiler makes use of that information to know where to emit the runtime-mandated `type_info` structures in the new-abi.

5.1008.3 Member Function Documentation

`name()`

```
const char * std::type_info::name ( ) const [inline], [noexcept]
```

Returns an *implementation-defined* byte string; this is not portable between compilers!

The documentation for this class was generated from the following file:

- [typeinfo](#)

5.1009 __gnu_pbds::detail::types_traits< Key, Mapped, _Alloc, Store_Hash > Struct Template Reference

5.1013.1 Detailed Description

Recommends parallel execution using static load-balancing at compile time.

5.1013.2 Member Function Documentation

`__get_num_threads()`

[`_ThreadIndex __gnu_parallel::parallel_tag::__get_num_threads\(\)`](#) `[inline]`, `[inherited]`

Find out desired number of threads.

Returns

Desired number of threads.

Referenced by [`__gnu_parallel::__parallel_sort\(\)`](#), [`__gnu_parallel::__parallel_sort\(\)`](#), [`__gnu_parallel::__parallel_sort\(\)`](#), [`__gnu_parallel::__parallel_sort\(\)`](#), [`__gnu_parallel::__parallel_sort\(\)`](#), [`__gnu_parallel::__parallel_sort\(\)`](#), and [`__gnu_parallel::__parallel_sort\(\)`](#).

`set_num_threads()`

void [`__gnu_parallel::parallel_tag::set_num_threads\(_ThreadIndex __num_threads\)`](#) `[inline]`, `[inherited]`

Set the desired number of threads.

Parameters

<code>__num_threads</code>	Desired number of threads.
----------------------------	----------------------------

5.1014 `std::underflow_error` Class Reference

Inheritance diagram for `std::underflow_error`:

Public Member Functions

- `underflow_error` (const char *) `_GLIBCXX_TXN_SAFE`
- `underflow_error` (const [string](#) & __arg) `_GLIBCXX_TXN_SAFE`
- `underflow_error` (const [underflow_error](#) &)=default
- `underflow_error` ([underflow_error](#) &&)=default
- `underflow_error` & `operator=` (const [underflow_error](#) &)=default
- `underflow_error` & `operator=` ([underflow_error](#) &&)=default
- virtual const char * `what` () const noexcept

5.1014.1 Detailed Description

Thrown to indicate arithmetic underflow.

5.1014.2 Member Function Documentation

`what()`

```
virtual const char * std::runtime_error::what ( ) const [virtual], [noexcept], [inherited]
```

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

Reimplemented in [std::filesystem::filesystem_error](#), and [std::experimental::filesystem::v1::filesystem_error](#).

5.1016.1 Detailed Description

template<typename _IntType = int>
class std::uniform_int_distribution< _IntType >

Uniform discrete distribution for random numbers. A discrete random distribution on the range $[min, max]$ with equal probability throughout the range.

5.1016.2 Member Typedef Documentation

result_type

```
template<typename _IntType = int>
typedef _IntType std::uniform_int_distribution< _IntType >::result_type
```

The type of the range of the distribution.

5.1016.3 Constructor & Destructor Documentation

uniform_int_distribution() [1/2]

```
template<typename _IntType = int>
std::uniform_int_distribution< _IntType >::uniform_int_distribution ( ) [inline]
```

Constructs a uniform distribution object.

uniform_int_distribution() [2/2]

```
template<typename _IntType = int>
std::uniform_int_distribution< _IntType >::uniform_int_distribution (
    _IntType __a,
    _IntType __b = __gnu_cxx::__int_traits<_IntType>::__max ) [inline], [explicit]
```

Constructs a uniform distribution object.

5.1016.4 Member Function Documentation

max()

```
template<typename _IntType = int>
result_type std::uniform_int_distribution< _IntType >::max ( ) const [inline]
```

Returns the inclusive upper bound of the distribution range.

min()

```
template<typename _IntType = int>
result_type std::uniform_int_distribution< _IntType >::min ( ) const [inline]
```

Returns the inclusive lower bound of the distribution range.

operator>()()

```
template<typename _IntType = int>
template<typename _UniformRandomBitGenerator >
result_type std::uniform_int_distribution< _IntType >::operator() (
    _UniformRandomBitGenerator & __urng ) [inline]
```

Generating functions.

References [std::uniform_int_distribution< _IntType >::operator>\(\)\(\)](#).

Referenced by [std::uniform_int_distribution< _IntType >::operator>\(\)\(\)](#).

param() [1/2]

```
template<typename _IntType = int>
param_type std::uniform_int_distribution< _IntType >::param ( ) const [inline]
```

Returns the parameter set of the distribution.
Referenced by [std::operator>>\(\)](#).

param() [2/2]

```
template<typename _IntType = int>
void std::uniform_int_distribution< _IntType >::param (
    const param_type & __param ) [inline]
```

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--------------------------------------------

reset()

```
template<typename _IntType = int>
void std::uniform_int_distribution< _IntType >::reset ( ) [inline]
```

Resets the distribution state.
Does nothing for the uniform integer distribution.

5.1016.5 Friends And Related Symbol Documentation**operator==**

```
template<typename _IntType = int>
bool operator== (
    const uniform_int_distribution< _IntType > & __d1,
    const uniform_int_distribution< _IntType > & __d2 ) [friend]
```

Return true if two uniform integer distributions have the same parameters.

5.1017.1 Detailed Description

`template<typename _RealType = double>`
class `std::uniform_real_distribution<_RealType>`

Uniform continuous distribution for random numbers.

A continuous random distribution on the range [min, max) with equal probability throughout the range. The URNG should be real-valued and deliver number in the range [0, 1).

5.1017.2 Member Typedef Documentation

result_type

`template<typename _RealType = double>`
`typedef _RealType std::uniform_real_distribution<_RealType>::result_type`
 The type of the range of the distribution.

5.1017.3 Constructor & Destructor Documentation

uniform_real_distribution() [1/2]

`template<typename _RealType = double>`
`std::uniform_real_distribution<_RealType>::uniform_real_distribution () [inline]`
 Constructs a `uniform_real_distribution` object.
 The lower bound is set to 0.0 and the upper bound to 1.0

uniform_real_distribution() [2/2]

`template<typename _RealType = double>`
`std::uniform_real_distribution<_RealType>::uniform_real_distribution (`
`_RealType __a,`
`_RealType __b = _RealType(1)) [inline], [explicit]`

Constructs a `uniform_real_distribution` object.

Parameters

\leftrightarrow <code>_a</code>	[IN] The lower bound of the distribution.
\leftrightarrow <code>_b</code>	[IN] The upper bound of the distribution.

5.1017.4 Member Function Documentation

`max()`

```
template<typename _RealType = double>
result_type std::uniform_real_distribution< _RealType >::max ( ) const [inline]
```

Returns the inclusive upper bound of the distribution range.

`min()`

```
template<typename _RealType = double>
result_type std::uniform_real_distribution< _RealType >::min ( ) const [inline]
```

Returns the inclusive lower bound of the distribution range.

`operator>()()`

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator >
result_type std::uniform_real_distribution< _RealType >::operator() (
    _UniformRandomNumberGenerator & __urng ) [inline]
```

Generating functions.

References [std::uniform_real_distribution< _RealType >::operator>\(\)](#).

Referenced by [std::uniform_real_distribution< _RealType >::operator>\(\)](#).

`param()` [1/2]

```
template<typename _RealType = double>
param_type std::uniform_real_distribution< _RealType >::param ( ) const [inline]
```

Returns the parameter set of the distribution.

Referenced by [std::operator>>\(\)](#).

`param()` [2/2]

```
template<typename _RealType = double>
void std::uniform_real_distribution< _RealType >::param (
    const param_type & __param ) [inline]
```

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--------------------------------------------

reset()

```
template<typename _RealType = double>
void std::uniform_real_distribution<_RealType>::reset ( ) [inline]
```

Resets the distribution state.

Does nothing for the uniform real distribution.

5.1017.5 Friends And Related Symbol Documentation**operator==**

```
template<typename _RealType = double>
bool operator== (
    const uniform_real_distribution<_RealType> & __d1,
    const uniform_real_distribution<_RealType> & __d2 ) [friend]
```

Return true if two uniform real distributions have the same parameters.

Related Symbols

(Note that these are not member symbols.)

- `template<typename _Mutex >`
`void swap (unique_lock< _Mutex > &__x, unique_lock< _Mutex > &__y) noexcept`

5.1018.1 Detailed Description

template<typename _Mutex>
class std::unique_lock< _Mutex >

A movable scoped lock type.

A `unique_lock` controls mutex ownership within a scope. Ownership of the mutex can be delayed until after construction and can be transferred to another `unique_lock` by move construction or move assignment. If a mutex lock is owned when the destructor runs ownership will be released.

5.1018.2 Friends And Related Symbol Documentation

swap()

```
template<typename _Mutex >
void swap (
    unique_lock< _Mutex > & __x,
    unique_lock< _Mutex > & __y ) [related]
```

Swap overload for `unique_lock` objects.

The documentation for this class was generated from the following file:

- [unique_lock.h](#)

5.1019.1 Detailed Description

`template<typename _Tp, typename _Dp = default_delete<_Tp>>`
`class std::unique_ptr< _Tp, _Dp >`

20.7.1.2 unique_ptr for single objects.

5.1019.2 Constructor & Destructor Documentation

unique_ptr() [1/7]

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
template<typename _Del = _Dp, typename = _DeleterConstraint<_Del>>
constexpr std::unique_ptr< _Tp, _Dp >::unique_ptr ( ) [inline], [constexpr], [noexcept]
```

Default constructor, creates a unique_ptr that owns nothing.

unique_ptr() [2/7]

```
template<typename _Tp, typename _Dp = default_delete<_Tp>>
template<typename _Del = _Dp, typename = _DeleterConstraint<_Del>>
std::unique_ptr< _Tp, _Dp >::unique_ptr (
    pointer __p ) [inline], [explicit], [noexcept]
```

Takes ownership of a pointer.

Parameters

<code>__p</code>	A pointer to an object of <code>element_type</code>
------------------	-----------------------------------------------------

The deleter will be value-initialized.

unique_ptr() [3/7]

```
template<typename _Tp , typename _Dp = default_delete<_Tp>>
template<typename _Del = deleter_type, typename = _Require<is_copy_constructible<_Del>>>
std::unique_ptr< _Tp, _Dp >::unique_ptr (
    pointer __p,
    const deleter_type & __d ) [inline], [noexcept]
```

Takes ownership of a pointer.

Parameters

 <i>_p</i>	A pointer to an object of element_type
 <i>_d</i>	A reference to a deleter.

The deleter will be initialized with __d

unique_ptr() [4/7]

```
template<typename _Tp , typename _Dp = default_delete<_Tp>>
template<typename _Del = deleter_type, typename = _Require<is_move_constructible<_Del>>>
std::unique_ptr< _Tp, _Dp >::unique_ptr (
    pointer __p,
    __enable_if_t<!is_lvalue_reference< _Del >::value, _Del && > __d ) [inline], [noexcept]
```

Takes ownership of a pointer.

Parameters

 <i>_p</i>	A pointer to an object of element_type
 <i>_d</i>	An rvalue reference to a (non-reference) deleter.

The deleter will be initialized with std::move (__d)

unique_ptr() [5/7]

```
template<typename _Tp , typename _Dp = default_delete<_Tp>>
template<typename _Del = _Dp, typename = _DeleterConstraint<_Del>>
constexpr std::unique_ptr< _Tp, _Dp >::unique_ptr (
    nullptr_t ) [inline], [constexpr], [noexcept]
```

Creates a unique_ptr that owns nothing.

unique_ptr() [6/7]

```
template<typename _Tp , typename _Dp = default_delete<_Tp>>
std::unique_ptr< _Tp, _Dp >::unique_ptr (
    unique_ptr< _Tp, _Dp > && ) [default]
```

Move constructor.

unique_ptr() [7/7]

```
template<typename _Tp , typename _Dp = default_delete<_Tp>>
template<typename _Up , typename _Ep , typename = _Require< __safe_conversion_up<_Up, _Ep>,
```

```
typename conditional<is_reference<_Dp>::value, is_same<_Ep, _Dp>, is_convertible<_Ep, _Dp>><←
::type>>
```

```
std::unique_ptr< _Tp, _Dp >::unique_ptr (
    unique_ptr< _Up, _Ep > && __u ) [inline], [noexcept]
```

Converting constructor from another type.

Requires that the pointer owned by `__u` is convertible to the type of pointer owned by this object, `__u` does not own an array, and `__u` has a compatible deleter type.

~unique_ptr()

```
template<typename _Tp , typename _Dp = default_delete<_Tp>>
std::unique_ptr< _Tp, _Dp >::~~unique_ptr ( ) [inline], [noexcept]
```

Destructor, invokes the deleter if the stored pointer is not null.

References `std::unique_ptr< _Tp, _Dp >::get_deleter()`, and `std::move()`.

5.1019.3 Member Function Documentation

get()

```
template<typename _Tp , typename _Dp = default_delete<_Tp>>
pointer std::unique_ptr< _Tp, _Dp >::get ( ) const [inline], [noexcept]
```

Return the stored pointer.

Referenced by `std::unique_ptr< _Tp, _Dp >::operator bool()`, `std::unique_ptr< _Tp[], _Dp >::operator bool()`, `std::unique_ptr< _Tp, _Dp >::operator!=()`, `std::unique_ptr< _Tp, _Dp >::operator*`, `std::unique_ptr< _Tp, _Dp >::operator->()`, `std::unique_ptr< _Tp, _Dp >::operator<()`, `std::unique_ptr< _Tp, _Dp >::operator<()`, `std::unique_ptr< _Tp, _Dp >::operator<()`, `std::unique_ptr< _Tp, _Dp >::operator==()`, `std::unique_ptr< _Tp, _Dp >::operator>()`, `std::unique_ptr< _Tp, _Dp >::operator>()`, and `std::unique_ptr< _Tp[], _Dp >::operator[]()`.

get_deleter() [1/2]

```
template<typename _Tp , typename _Dp = default_delete<_Tp>>
const deleter_type & std::unique_ptr< _Tp, _Dp >::get_deleter ( ) const [inline], [noexcept]
```

Return a reference to the stored deleter.

get_deleter() [2/2]

```
template<typename _Tp , typename _Dp = default_delete<_Tp>>
deleter_type & std::unique_ptr< _Tp, _Dp >::get_deleter ( ) [inline], [noexcept]
```

Return a reference to the stored deleter.

Referenced by `std::unique_ptr< _Tp[], _Dp >::~~unique_ptr()`, `std::unique_ptr< _Tp, _Dp >::~~unique_ptr()`, `std::unique_ptr< _Tp, _Dp >::operator bool()`, and `std::unique_ptr< _Tp[], _Dp >::operator=()`.

operator bool()

```
template<typename _Tp , typename _Dp = default_delete<_Tp>>
std::unique_ptr< _Tp, _Dp >::operator bool ( ) const [inline], [explicit], [noexcept]
```

Return true if the stored pointer is not null.

References `std::unique_ptr< _Tp, _Dp >::get()`.

operator*()

```
template<typename _Tp , typename _Dp = default_delete<_Tp>>
add_lvalue_reference< element_type >::type std::unique_ptr< _Tp, _Dp >::operator* ( ) const
[inline]
```

Dereference the stored pointer.

References `std::unique_ptr< _Tp, _Dp >::get()`.

operator->()

```
template<typename _Tp , typename _Dp = default_delete<_Tp>>
pointer std::unique_ptr< _Tp, _Dp >::operator-> ( ) const [inline], [noexcept]
```

Return the stored pointer.

References [std::unique_ptr<_Tp, _Dp>::get\(\)](#).

operator=() [1/3]

```
template<typename _Tp , typename _Dp = default_delete<_Tp>>
unique_ptr & std::unique_ptr< _Tp, _Dp >::operator= (
    nullptr_t ) [inline], [noexcept]
```

Reset the unique_ptr to empty, invoking the deleter if necessary.

References [std::unique_ptr<_Tp, _Dp>::reset\(\)](#).

operator=() [2/3]

```
template<typename _Tp , typename _Dp = default_delete<_Tp>>
unique_ptr & std::unique_ptr< _Tp, _Dp >::operator= (
    unique_ptr< _Tp, _Dp > && ) [default]
```

Move assignment operator.

Invokes the deleter if this object owns a pointer.

operator=() [3/3]

```
template<typename _Tp , typename _Dp = default_delete<_Tp>>
template<typename _Up , typename _Ep >
enable_if< __and< __safe_conversion_up< _Up, _Ep >, is_assignable< deleter_type &, _Ep && >
>::value, unique_ptr & >::type std::unique_ptr< _Tp, _Dp >::operator= (
    unique_ptr< _Up, _Ep > && __u ) [inline], [noexcept]
```

Assignment from another type.

Parameters

 _Tp	The object to transfer ownership from, which owns a convertible pointer to a non-array object.
_u	

Invokes the deleter if this object owns a pointer.

References [std::unique_ptr<_Tp, _Dp>::get_deleter\(\)](#), and [std::unique_ptr<_Tp, _Dp>::reset\(\)](#).

release()

```
template<typename _Tp , typename _Dp = default_delete<_Tp>>
pointer std::unique_ptr< _Tp, _Dp >::release ( ) [inline], [noexcept]
```

Release ownership of any stored pointer.

reset()

```
template<typename _Tp , typename _Dp = default_delete<_Tp>>
void std::unique_ptr< _Tp, _Dp >::reset (
    pointer __p = pointer() ) [inline], [noexcept]
```

Replace the stored pointer.

Parameters

<code>_p</code>	The new pointer to store.
-----------------	---------------------------

The deleter will be invoked if a pointer is already owned.

References [std::move\(\)](#).

Referenced by [std::unique_ptr< _Tp, _Dp >::operator=\(\)](#), [std::unique_ptr< _Tp\[\], _Dp >::operator=\(\)](#), [std::unique_ptr< _Tp, _Dp >::operator=\(\)](#) and [std::unique_ptr< _Tp\[\], _Dp >::operator=\(\)](#).

swap()

```
template<typename _Tp , typename _Dp = default_delete<_Tp>>
void std::unique_ptr< _Tp, _Dp >::swap (
    unique_ptr< _Tp, _Dp > & __u ) [inline], [noexcept]
```

Exchange the pointer and deleter with another object.

5.1020.1 Detailed Description

template<typename _Tp, typename _Dp>
class std::unique_ptr< _Tp[], _Dp >

20.7.1.3 unique_ptr for array objects with a runtime length

5.1020.2 Constructor & Destructor Documentation

unique_ptr() [1/6]

```
template<typename _Tp , typename _Dp >
template<typename _Del = _Dp, typename = _DeleterConstraint<_Del>>
constexpr std::unique_ptr< _Tp[], _Dp >::unique_ptr ( ) [inline], [constexpr], [noexcept]
```

Default constructor, creates a unique_ptr that owns nothing.

unique_ptr() [2/6]

```
template<typename _Tp , typename _Dp >
template<typename _Up , typename _Vp = _Dp, typename = _DeleterConstraint<_Vp>, typename = typename
enable_if< __safe_conversion_raw<_Up>::value, bool>::type>
std::unique_ptr< _Tp[], _Dp >::unique_ptr (
    _Up __p ) [inline], [explicit], [noexcept]
```

Takes ownership of a pointer.

Parameters

_↵ _p	A pointer to an array of a type safely convertible to an array of <code>element_type</code>
---------------------------	---------------------------------------------------------------------------------------------

The deleter will be value-initialized.

unique_ptr() [3/6]

```
template<typename _Tp , typename _Dp >
template<typename _Up , typename _Del = deleter_type, typename = _Require<__safe_conversion_
raw<_Up>, is_copy_constructible<_Del>>>
std::unique_ptr< _Tp[], _Dp >::unique_ptr (
    _Up __p,
    const deleter_type & __d ) [inline], [noexcept]
```

Takes ownership of a pointer.

Parameters

<code>__p</code>	A pointer to an array of a type safely convertible to an array of <code>element_type</code>
<code>__d</code>	A reference to a deleter.

The deleter will be initialized with `__d`

unique_ptr() [4/6]

```
template<typename _Tp , typename _Dp >
template<typename _Up , typename _Del = deleter_type, typename = _Require<__safe_conversion_
raw<_Up>, is_move_constructible<_Del>>>
std::unique_ptr< _Tp[], _Dp >::unique_ptr (
    _Up __p,
    __enable_if_t<!is_lvalue_reference< _Del >::value, _Del && > __d ) [inline], [noexcept]
```

Takes ownership of a pointer.

Parameters

<code>__p</code>	A pointer to an array of a type safely convertible to an array of <code>element_type</code>
<code>__d</code>	A reference to a deleter.

The deleter will be initialized with `std::move(__d)`

unique_ptr() [5/6]

```
template<typename _Tp , typename _Dp >
std::unique_ptr< _Tp[], _Dp >::unique_ptr (
    unique_ptr< _Tp[], _Dp > && ) [default]
```

Move constructor.

unique_ptr() [6/6]

```
template<typename _Tp , typename _Dp >
template<typename _Del = _Dp, typename = _DeleterConstraint<_Del>>
constexpr std::unique_ptr< _Tp[], _Dp >::unique_ptr (
    nullptr_t ) [inline], [constexpr], [noexcept]
```

Creates a `unique_ptr` that owns nothing.

~unique_ptr()

```
template<typename _Tp , typename _Dp >
std::unique_ptr<_Tp[], _Dp >::~~unique_ptr ( ) [inline]
Destructor, invokes the deleter if the stored pointer is not null.
References std::unique\_ptr<\_Tp, \_Dp>::get\_deleter\(\).
```

5.1020.3 Member Function Documentation**get()**

```
template<typename _Tp , typename _Dp >
pointer std::unique\_ptr<\_Tp\[\], \_Dp>::get \( \) const [inline], [noexcept]
Return the stored pointer.
```

get_deleter() [1/2]

```
template<typename _Tp , typename _Dp >
const deleter_type & std::unique\_ptr<\_Tp\[\], \_Dp>::get\_deleter \( \) const [inline], [noexcept]
Return a reference to the stored deleter.
```

get_deleter() [2/2]

```
template<typename _Tp , typename _Dp >
deleter_type & std::unique\_ptr<\_Tp\[\], \_Dp>::get\_deleter \( \) [inline], [noexcept]
Return a reference to the stored deleter.
```

operator bool()

```
template<typename _Tp , typename _Dp >
std::unique\_ptr<\_Tp\[\], \_Dp>::operator bool \( \) const [inline], [explicit], [noexcept]
Return true if the stored pointer is not null.
References std::unique\_ptr<\_Tp, \_Dp>::get\(\).
```

operator=() [1/3]

```
template<typename _Tp , typename _Dp >
unique\_ptr & std::unique\_ptr<\_Tp\[\], \_Dp>::operator= \(
    nullptr\_t \) [inline], [noexcept]
Reset the unique_ptr to empty, invoking the deleter if necessary.
References std::unique\_ptr<\_Tp, \_Dp>::reset\(\).
```

operator=() [2/3]

```
template<typename _Tp , typename _Dp >
unique\_ptr & std::unique\_ptr<\_Tp\[\], \_Dp>::operator= \(
    unique\_ptr<\_Tp\[\], \_Dp> && \) [default]
Move assignment operator.
Invokes the deleter if this object owns a pointer.
```

operator=() [3/3]

```
template<typename _Tp , typename _Dp >
template<typename _Up , typename _Ep >
enable\_if<\_\_and<\_\_safe\_conversion\_up<\_Up, \_Ep>, is\_assignable<deleter\_type &, \_Ep &&>
```

```
>::value, unique_ptr & >::type std::unique_ptr< _Tp[], _Dp >::operator= (
    unique_ptr< _Up, _Ep > && __u ) [inline], [noexcept]
```

Assignment from another type.

Parameters

<code>__u</code>	The object to transfer ownership from, which owns a convertible pointer to an array object.
------------------	---------------------------------------------------------------------------------------------

Invokes the deleter if this object owns a pointer.

References [std::unique_ptr< _Tp, _Dp >::get_deleter\(\)](#), and [std::unique_ptr< _Tp, _Dp >::reset\(\)](#).

operator[]()

```
template<typename _Tp , typename _Dp >
std::add_lvalue_reference< element_type >::type std::unique_ptr< _Tp[], _Dp >::operator[] (
    size_t __i ) const [inline]
```

Access an element of owned array.

References [std::unique_ptr< _Tp, _Dp >::get\(\)](#).

release()

```
template<typename _Tp , typename _Dp >
pointer std::unique_ptr< _Tp[], _Dp >::release ( ) [inline], [noexcept]
```

Release ownership of any stored pointer.

reset()

```
template<typename _Tp , typename _Dp >
template<typename _Up , typename = _Require< __or_<is_same<_Up, pointer>, __and_<is_same<pointer,
element_type*>, is_pointer<_Up>, is_convertible< typename remove_pointer<_Up>::type(*)[], element_
_type(*)[] > > > >>
void std::unique_ptr< _Tp[], _Dp >::reset (
    _Up __p ) [inline], [noexcept]
```

Replace the stored pointer.

Parameters

<code>__p</code>	The new pointer to store.
------------------	---------------------------

The deleter will be invoked if a pointer is already owned.

References [std::move\(\)](#).

swap()

```
template<typename _Tp , typename _Dp >
void std::unique_ptr< _Tp[], _Dp >::swap (
    unique_ptr< _Tp[], _Dp > & __u ) [inline], [noexcept]
```

Exchange the pointer and deleter with another object.

Friends

- template<typename _Key1, typename _Tp1, typename _Hash1, typename _Pred1, typename _Alloc1 >
bool **operator==** (const unordered_map<_Key1, _Tp1, _Hash1, _Pred1, _Alloc1 > &, const unordered_map<_Key1, _Tp1, _Hash1, _Pred1, _Alloc1 > &)
- template<typename , typename , typename >
class std::_Hash_merge_helper

5.1022.1 Detailed Description

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
class std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >
```

A standard container composed of unique keys (containing at most one of each key value) that associates values of another type with the keys.

Template Parameters

<code>_Key</code>	Type of key objects.
<code>_Tp</code>	Type of mapped objects.
<code>_Hash</code>	Hashing function object type, defaults to <code>hash<_Value></code> .
<code>_Pred</code>	Predicate function object type, defaults to <code>equal_to<_Value></code> .
<code>_Alloc</code>	Allocator type, defaults to <code>std::allocator<std::pair<const _Key, _Tp>></code> .

Meets the requirements of a [container](#), and [unordered associative container](#)

The resulting value type of the container is `std::pair<const _Key, _Tp>`.

Base is `_Hashtable`, dispatched at compile time via template alias `__umap_hashtable`.

Public typedefs.

5.1022.3 Constructor & Destructor Documentation

unordered_map() [1/7]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map ( ) [default]
```

Default constructor.

unordered_map() [2/7]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map (
    size_type __n,
    const hasher & __hf = hasher(),
```

```
const key_equal & __eq1 = key_equal(),
const allocator_type & __a = allocator_type() ) [inline], [explicit]
```

Default constructor creates no elements.

Parameters

<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eq1</code>	A key equality functor.
<code>__a</code>	An allocator object.

`unordered_map()` [3/7]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename _InputIterator >
std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map (
    _InputIterator __first,
    _InputIterator __last,
    size_type __n = 0,
    const hasher & __hf = hasher(),
    const key_equal & __eq1 = key_equal(),
    const allocator_type & __a = allocator_type() ) [inline]
```

Builds an `unordered_map` from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eq1</code>	A key equality functor.
<code>__a</code>	An allocator object.

Create an `unordered_map` consisting of copies of the elements from `[__first,__last)`. This is linear in N (where N is `distance(__first,__last)`).

`unordered_map()` [4/7]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map (
    const unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc > & ) [default]
```

Copy constructor.

`unordered_map()` [5/7]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map (
    unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc > && ) [default]
```

Move constructor.

unordered_map() [6/7]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map (
    const allocator_type & __a ) [inline], [explicit]
```

Creates an unordered_map with no elements.

Parameters

<code>↔ _a</code>	An allocator object.
-----------------------	----------------------

unordered_map() [7/7]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_map (
    initializer_list< value_type > __l,
    size_type __n = 0,
    const hasher & __hf = hasher(),
    const key_equal & __eq1 = key_equal(),
    const allocator_type & __a = allocator_type() ) [inline]
```

Builds an unordered_map from an initializer_list.

Parameters

<code>__l</code>	An initializer_list.
<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eq1</code>	A key equality functor.
<code>__a</code>	An allocator object.

Create an unordered_map consisting of copies of the elements in the list. This is linear in N (where N is `__l.size()`).

5.1022.4 Member Function Documentation**at()** [1/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
mapped_type & std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::at (
    const key_type & __k ) [inline]
```

Access to unordered_map data.

Parameters

<code>↔ _k</code>	The key for which data should be retrieved.
-----------------------	---------------------------------------------

Returns

A reference to the data whose key is equal to `__k`, if such a data is present in the `unordered_map`.

Exceptions

<code>std::out_of_range</code>	If no such data is present.
--------------------------------	-----------------------------

at() [2/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>  
const mapped_type & std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::at (   
    const key_type & __k ) const [inline]
```

Access to `unordered_map` data.

Parameters

<code>↵ _k</code>	The key for which data should be retrieved.
-----------------------	---------------------------------------------

Returns

A reference to the data whose key is equal to `__k`, if such a data is present in the `unordered_map`.

Exceptions

<code>std::out_of_range</code>	If no such data is present.
--------------------------------	-----------------------------

begin() [1/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>  
const_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::begin ( ) const [inline],  
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the `unordered_map`.

begin() [2/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>  
iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::begin ( ) [inline], [noexcept]
```

Returns a read/write iterator that points to the first element in the `unordered_map`.

begin() [3/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>  
local_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::begin (   
    size_type __n ) [inline]
```

Returns a read/write iterator pointing to the first bucket element.

Parameters

<code>_↵</code>	The bucket index.
<code>_n</code>	

Returns

A read/write local iterator.

begin() [4/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_local_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::begin (
    size_type __n ) const [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

<code>_↵</code>	The bucket index.
<code>_n</code>	

Returns

A read-only local iterator.

bucket_count()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
size_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::bucket_count ( ) const [inline],
[noexcept]
```

Returns the number of buckets of the unordered_map.

cbegin() [1/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::cbegin ( ) const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered_map.

cbegin() [2/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_local_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::cbegin (
    size_type __n ) const [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

<code>_↵</code>	The bucket index.
<code>_n</code>	

Returns

A read-only local iterator.

cend() [1/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::cend ( ) const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered_map.

Referenced by `std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::insert_or_assign()`, and `std::unordered_map< _Key, _Tp, _Hash`

cend() [2/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_local_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::cend (
    size_type __n ) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

<code>_↵</code>	The bucket index.
<code>_n</code>	

Returns

A read-only local iterator.

clear()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
void std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::clear ( ) [inline], [noexcept]
```

Erases all elements in an unordered_map. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

count()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
size_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::count (
    const key_type & __x ) const [inline]
```

Finds the number of elements.

Parameters

<code>_↵</code>	Key to count.
<code>_x</code>	

Returns

Number of elements with specified key.

This function only makes sense for unordered_multimap; for unordered_map the result will either be 0 (not present) or 1 (present).

emplace()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename... _Args>
std::pair< iterator, bool > std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::emplace (
    _Args &&... __args ) [inline]
```

Attempts to build and insert a std::pair into the unordered_map.

Parameters

<code>__args</code>	Arguments used to generate a new pair instance (see std::piecewise_construct for passing arguments to each part of the pair constructor).
---------------------	-------------------------------------------------------------------------------------------------------------------------------------------

Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to build and insert a (key, value) pair into the unordered_map. An unordered_map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the unordered_map. Insertion requires amortized constant time.

emplace_hint()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename... _Args>
iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::emplace_hint (
    const_iterator __pos,
    _Args &&... __args ) [inline]
```

Attempts to build and insert a std::pair into the unordered_map.

Parameters

<code>__pos</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__args</code>	Arguments used to generate a new pair instance (see std::piecewise_construct for passing arguments to each part of the pair constructor).

Returns

An iterator that points to the element with key of the std::pair built from __args (may or may not be that std::pair).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument emplace() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.↵associative.insert_hints for more on *hinting*.

Insertion requires amortized constant time.

empty()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
bool std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::empty ( ) const [inline], [noexcept]
```

Returns true if the unordered_map is empty.

end() [1/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
const_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::end ( ) const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered_map.

end() [2/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::end ( ) [inline], [noexcept]
```

Returns a read/write iterator that points one past the last element in the unordered_map.
Referenced by `std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::extract()`.

end() [3/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
local_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::end (
    size_type __n ) [inline]
```

Returns a read/write iterator pointing to one past the last bucket elements.

Parameters

<code>_↔</code>	The bucket index.
<code>_n</code>	

Returns

A read/write local iterator.

end() [4/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
const_local_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::end (
    size_type __n ) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

<code>_↔</code>	The bucket index.
<code>_n</code>	

Returns

A read-only local iterator.

equal_range() [1/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
std::pair< iterator, iterator > std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::equal_↵
range (
    const key_type & __x ) [inline]
```

Finds a subsequence matching given key.

Parameters

↵ _X	Key to be located.
-----------------------	--------------------

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for unordered_multimap.

equal_range() [2/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
std::pair< const_iterator, const_iterator > std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc
>::equal_range (
    const key_type & __x ) const [inline]
```

Finds a subsequence matching given key.

Parameters

↵ _X	Key to be located.
-----------------------	--------------------

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for unordered_multimap.

erase() [1/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
size_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (
    const key_type & __x ) [inline]
```

Erases elements according to the provided key.

Parameters

<code>_↔</code>	Key of element to be erased.
<code>_X</code>	

Returns

The number of elements erased.

This function erases all the elements located by the given key from an `unordered_map`. For an `unordered_map` the result of this function can only be 0 (not present) or 1 (present). Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [2/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (
    const_iterator __first,
    const_iterator __last ) [inline]
```

Erases a [`__first`,`__last`) range of elements from an `unordered_map`.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be erased.
<code>__last</code>	Iterator pointing to the end of the range to be erased.

Returns

The iterator `__last`.

This function erases a sequence of elements from an `unordered_map`. Note that this function only erases the elements, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [3/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (
    const_iterator __position ) [inline]
```

Erases an element from an `unordered_map`.

Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---------------------------------------------------

Returns

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an `unordered_map`. Note that this function only

erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [4/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (
    iterator __position ) [inline]
```

Erases an element from an unordered_map.

Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---------------------------------------------------

Returns

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an unordered_map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

extract() [1/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
node_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::extract (
    const key_type & __key ) [inline]
```

Extract a node.

extract() [2/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
node_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::extract (
    const_iterator __pos ) [inline]
```

Extract a node.

References `std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::end()`.

find() [1/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::find (
    const key_type & __x ) [inline]
```

Tries to locate an element in an unordered_map.

Parameters

<code>__x</code>	Key to be located.
------------------	--------------------

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (end()) iterator.

find() [2/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::find (
    const key_type & __x ) const [inline]
```

Tries to locate an element in an unordered_map.

Parameters

<code>_↵</code>	Key to be located.
<code>_X</code>	

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (end()) iterator.

get_allocator()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
allocator_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::get_allocator ( ) const
[inline], [noexcept]
```

Returns the allocator object used by the unordered_map.

hash_function()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
hasher std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::hash_function ( ) const [inline]
```

Returns the hash functor object with which the unordered_map was constructed.

insert() [1/10]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename _InputIterator >
void std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    _InputIterator __first,
    _InputIterator __last ) [inline]
```

A template function that attempts to insert a range of elements.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be inserted.
<code>__last</code>	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

insert() [2/10]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename _Pair >
__enable_if_t< is_constructible< value_type, _Pair && >::value, pair< iterator, bool > > std::unordered_map<
_Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    _Pair && __x ) [inline]
```

Attempts to insert a std::pair into the unordered_map.

Parameters

<code>↵</code> <code>__x</code>	Pair to be inserted (see std::make_pair for easy creation of pairs).
------------------------------------	----------------------------------------------------------------------

Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the unordered_map. An unordered_map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the unordered_map. Insertion requires amortized constant time.

insert() [3/10]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::pair< iterator, bool > std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    const value_type & __x ) [inline]
```

Attempts to insert a std::pair into the unordered_map.

Parameters

<code>↵</code> <code>__x</code>	Pair to be inserted (see std::make_pair for easy creation of pairs).
------------------------------------	----------------------------------------------------------------------

Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the unordered_map. An unordered_map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the unordered_map. Insertion requires amortized constant time.

insert() [4/10]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename _Pair >
__enable_if_t< is_constructible< value_type, _Pair && >::value, iterator > std::unordered_map<
_Key, _Tp, _Hash, _Pred, _Alloc >::insert (
```

```
const_iterator __hint,
_Pair && __x ) [inline]
```

Attempts to insert a `std::pair` into the `unordered_map`.

Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__x</code>	Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs).

Returns

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `insert()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints for more on *hinting*.

Insertion requires amortized constant time.

`insert()` [5/10]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    const_iterator __hint,
    const value_type & __x ) [inline]
```

Attempts to insert a `std::pair` into the `unordered_map`.

Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__x</code>	Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs).

Returns

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `insert()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints for more on *hinting*.

Insertion requires amortized constant time.

`insert()` [6/10]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    const_iterator __hint,
    value_type && __x ) [inline]
```

Attempts to insert a `std::pair` into the `unordered_map`.

Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__x</code>	Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs).

Returns

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `insert()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints for more on *hinting*.

Insertion requires amortized constant time.

References [std::move\(\)](#).

insert() [7/10]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    const_iterator ,
    node_type && __nh ) [inline]
```

Re-insert an extracted node.

References [std::move\(\)](#).

insert() [8/10]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
void std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    initializer_list< value_type > __l ) [inline]
```

Attempts to insert a list of elements into the `unordered_map`.

Parameters

<code>↵</code>	A <code>std::initializer_list<value_type></code> of elements to be inserted.
<code>__↵</code>	
<code>↵</code>	
<code>__↵</code>	
<code>/</code>	

Complexity similar to that of the range constructor.

insert() [9/10]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
insert_return_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    node_type && __nh ) [inline]
```

Re-insert an extracted node.

References [std::move\(\)](#).

insert() [10/10]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
std::pair< iterator, bool > std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    value_type && __x ) [inline]
```

Attempts to insert a `std::pair` into the `unordered_map`.

Parameters

<code>__x</code>	Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs).
------------------	-----------------------------------------------------------------------------------

Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the `unordered_map`. An `unordered_map` relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the `unordered_map`.

Insertion requires amortized constant time.

References [std::move\(\)](#).

insert_or_assign() [1/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
template<typename _Obj >
pair< iterator, bool > std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::insert_or_assign (
    const key_type & __k,
    _Obj && __obj ) [inline]
```

Attempts to insert a `std::pair` into the `unordered_map`.

Parameters

<code>__k</code>	Key to use for finding a possibly existing pair in the map.
<code>__obj</code>	Argument used to generate the .second for a pair instance.

Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the `unordered_map`. An `unordered_map` relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the `unordered_map`. If the pair was already in the `unordered_map`, the .second of the pair is assigned from `__obj`.

Insertion requires amortized constant time.

References [std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::cend\(\)](#).

insert_or_assign() [2/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
template<typename _Obj >
iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::insert_or_assign (
```

```
const_iterator __hint,
const key_type & __k,
_Obj && __obj ) [inline]
```

Attempts to insert a std::pair into the unordered_map.

Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__k</code>	Key to use for finding a possibly existing pair in the unordered_map.
<code>__obj</code>	Argument used to generate the .second for a pair instance.

Returns

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument insert() does.

If the pair was already in the unordered map, the .second of the pair is assigned from `__obj`. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints for more on *hinting*.

Insertion requires amortized constant time.

key_eq()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
key_equal std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::key_eq ( ) const [inline]
```

Returns the key comparison object with which the unordered_map was constructed.

load_factor()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
float std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::load_factor ( ) const [inline],
[noexcept]
```

Returns the average number of elements per bucket.

max_bucket_count()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
size_type std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::max_bucket_count ( ) const [inline],
[noexcept]
```

Returns the maximum number of buckets of the unordered_map.

max_load_factor() [1/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
float std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::max_load_factor ( ) const [inline],
[noexcept]
```

Returns a positive number that the unordered_map tries to keep the load factor less than or equal to.

max_load_factor() [2/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
void std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::max_load_factor (
    float __z ) [inline]
```

Change the unordered_map maximum load factor.

Parameters

<code>↵</code> <code>__z</code>	The new maximum load factor.
------------------------------------	------------------------------

max_size()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
size_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::max_size ( ) const [inline],
[noexcept]
```

Returns the maximum size of the unordered_map.

operator=() [1/3]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
unordered_map & std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::operator= (
    const unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc > & ) [default]
```

Copy assignment operator.

operator=() [2/3]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
unordered_map & std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::operator= (
    initializer_list< value_type > __l ) [inline]
```

Unordered_map list assignment operator.

Parameters

<code>↵</code> <code>↵</code> <code>↵</code> <code>↵</code> <code>/</code>	An initializer_list.
----------------------------------------------------------------------------------------	----------------------

This function fills an unordered_map with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the unordered_map and that the resulting unordered_map's size is the same as the number of elements assigned.

operator=() [3/3]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
unordered_map & std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::operator= (
```

```
unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc > && ) [default]
```

Move assignment operator.

operator[]() [1/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
mapped_type & std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::operator[] (
    const key_type & __k ) [inline]
```

Subscript ([]) access to unordered_map data.

Parameters

<code>↵ _k</code>	The key for which data should be retrieved.
-----------------------	---------------------------------------------

Returns

A reference to the data of the (key,data) pair.

Allows for easy lookup with the subscript ([]) operator. Returns data associated with the key specified in subscript. If the key does not exist, a pair with that key is created using default values, which is then returned. Lookup requires constant time.

operator[]() [2/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
mapped_type & std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::operator[] (
    key_type && __k ) [inline]
```

Subscript ([]) access to unordered_map data.

Parameters

<code>↵ _k</code>	The key for which data should be retrieved.
-----------------------	---------------------------------------------

Returns

A reference to the data of the (key,data) pair.

Allows for easy lookup with the subscript ([]) operator. Returns data associated with the key specified in subscript. If the key does not exist, a pair with that key is created using default values, which is then returned. Lookup requires constant time.

References [std::move\(\)](#).

rehash()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
void std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::rehash (
    size_type __n ) [inline]
```

May rehash the unordered_map.

Parameters

<code>_↔ _n</code>	The new number of buckets.
------------------------	----------------------------

Rehash will occur only if the new number of buckets respect the `unordered_map` maximum load factor.

reserve()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
void std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::reserve (
    size_type __n ) [inline]
```

Prepare the `unordered_map` for a specified number of elements.

Parameters

<code>_↔ _n</code>	Number of elements required.
------------------------	------------------------------

Same as `rehash(ceil(n / max_load_factor()))`.

size()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
size_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::size ( ) const [inline], [noexcept]
```

Returns the size of the `unordered_map`.

swap()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
void std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::swap (
    unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc > & __x ) [inline], [noexcept]
```

Swaps data with another `unordered_map`.

Parameters

<code>_↔ _x</code>	An <code>unordered_map</code> of the same element and allocator types.
------------------------	------------------------------------------------------------------------

This exchanges the elements between two `unordered_map` in constant time. Note that the global `std::swap()` function is specialized such that `std::swap(m1,m2)` will feed to this function.

try_emplace() [1/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
template<typename... _Args>
pair< iterator, bool > std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::try_emplace (
    const key_type & __k,
    _Args &&... __args ) [inline]
```

Attempts to build and insert a `std::pair` into the `unordered_map`.

Parameters

<code>__k</code>	Key to use for finding a possibly existing pair in the unordered_map.
<code>__args</code>	Arguments used to generate the .second for a new pair instance.

Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to build and insert a (key, value) pair into the unordered_map. An unordered_map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the unordered_map. If a pair is not inserted, this function has no effect.

Insertion requires amortized constant time.

References [std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::cend\(\)](#).

try_emplace() [2/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
template<typename... _Args>
iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::try_emplace (
    const_iterator __hint,
    const key_type & __k,
    _Args &&... __args ) [inline]
```

Attempts to build and insert a std::pair into the unordered_map.

Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__k</code>	Key to use for finding a possibly existing pair in the unordered_map.
<code>__args</code>	Arguments used to generate the .second for a new pair instance.

Returns

An iterator that points to the element with key of the std::pair built from `__args` (may or may not be that std::pair).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `emplace()` does. However, if insertion did not take place, this function has no effect. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.↵associative.insert_hints for more on *hinting*.

Insertion requires amortized constant time.

- template<typename , typename , typename >
class **std::_Hash_merge_helper**

5.1024.1 Detailed Description

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>,
typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
class std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >
```

A standard container composed of equivalent keys (possibly containing multiple of each key value) that associates values of another type with the keys.

Template Parameters

<code>_Key</code>	Type of key objects.
<code>_Tp</code>	Type of mapped objects.
<code>_Hash</code>	Hashing function object type, defaults to <code>hash<_Value></code> .
<code>_Pred</code>	Predicate function object type, defaults to <code>equal_to<_Value></code> .
<code>_Alloc</code>	Allocator type, defaults to <code>std::allocator<std::pair<const _Key, _Tp>></code> .

Meets the requirements of a [container](#), and [unordered associative container](#)

The resulting value type of the container is `std::pair<const _Key, _Tp>`.

Base is `_Hashtable`, dispatched at compile time via template alias `__ummap_hashtable`.

5.1024.3 Constructor & Destructor Documentation**unordered_multimap() [1/7]**

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap ( ) [default]
Default constructor.
```

unordered_multimap() [2/7]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap (
    size_type __n,
    const hasher & __hf = hasher(),
    const key_equal & __eq1 = key_equal(),
    const allocator_type & __a = allocator_type() ) [inline], [explicit]
```

Default constructor creates no elements.

Parameters

<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eq1</code>	A key equality functor.
<code>__a</code>	An allocator object.

unordered_multimap() [3/7]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename _InputIterator >
std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap (
    _InputIterator __first,
    _InputIterator __last,
    size_type __n = 0,
    const hasher & __hf = hasher(),
    const key_equal & __eq1 = key_equal(),
    const allocator_type & __a = allocator_type() ) [inline]
```

Builds an unordered_multimap from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__n</code>	Minimal initial number of buckets.

Parameters

<code>__hf</code>	A hash functor.
<code>__eqf</code>	A key equality functor.
<code>__a</code>	An allocator object.

Create an `unordered_multimap` consisting of copies of the elements from `[__first, __last)`. This is linear in `N` (where `N` is `distance(__first, __last)`).

unordered_multimap() [4/7]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap (
    const unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc > & ) [default]
```

Copy constructor.

unordered_multimap() [5/7]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap (
    unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc > && ) [default]
```

Move constructor.

unordered_multimap() [6/7]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap (
    const allocator_type & __a ) [inline], [explicit]
```

Creates an `unordered_multimap` with no elements.

Parameters

<code>__a</code>	An allocator object.
------------------	----------------------

unordered_multimap() [7/7]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap (
    initializer_list< value_type > __l,
    size_type __n = 0,
    const hasher & __hf = hasher(),
    const key_equal & __eqf = key_equal(),
    const allocator_type & __a = allocator_type() ) [inline]
```

Builds an `unordered_multimap` from an `initializer_list`.

Parameters

<code>__l</code>	An <code>initializer_list</code> .
------------------	------------------------------------

Parameters

<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eqf</code>	A key equality functor.
<code>__a</code>	An allocator object.

Create an `unordered_multimap` consisting of copies of the elements in the list. This is linear in `N` (where `N` is `__l.size()`).

5.1024.4 Member Function Documentation**`begin()` [1/4]**

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>  
const_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::begin ( ) const [inline],  
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the `unordered_multimap`.

`begin()` [2/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>  
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::begin ( ) [inline], [noexcept]
```

Returns a read/write iterator that points to the first element in the `unordered_multimap`.

`begin()` [3/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>  
local_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::begin (   
    size_type __n ) [inline]
```

Returns a read/write iterator pointing to the first bucket element.

Parameters

<code>__↵</code>	The bucket index.
<code>__n</code>	

Returns

A read/write local iterator.

`begin()` [4/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>  
const_local_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::begin (   
    size_type __n ) const [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

<code>_↔</code>	The bucket index.
<code>_n</code>	

Returns

A read-only local iterator.

bucket_count()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
size_type std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::bucket_count ( ) const
[inline], [noexcept]
```

Returns the number of buckets of the unordered_multimap.

cbegin() [1/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::cbegin ( ) const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered_multimap.

cbegin() [2/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_local_iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::cbegin (
size_type __n ) const [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

<code>_↔</code>	The bucket index.
<code>_n</code>	

Returns

A read-only local iterator.

cend() [1/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::cend ( ) const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered_multimap.

Referenced by [std::unordered_multimap<_Key,_Tp,_Hash,_Pred,_Alloc>::insert\(\)](#).

cend() [2/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
```

```
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_local_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::cend (
    size_type __n ) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

Returns

A read-only local iterator.

clear()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::clear ( ) [inline], [noexcept]
```

Erases all elements in an `unordered_multimap`. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

count()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
size_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::count (
    const key_type & __x ) const [inline]
```

Finds the number of elements.

Parameters

<code>__x</code>	Key to count.
------------------	---------------

Returns

Number of elements with specified key.

emplace()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename... _Args>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::emplace (
    _Args &&... __args ) [inline]
```

Attempts to build and insert a `std::pair` into the `unordered_multimap`.

Parameters

<code>__args</code>	Arguments used to generate a new pair instance (see <code>std::piecewise_construct</code> for passing arguments to each part of the pair constructor).
---------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------

Returns

An iterator that points to the inserted pair.

This function attempts to build and insert a (key, value) pair into the unordered_multimap. Insertion requires amortized constant time.

emplace_hint()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename... _Args>
iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::emplace_hint (
    const_iterator __pos,
    _Args &&... __args ) [inline]
```

Attempts to build and insert a std::pair into the unordered_multimap.

Parameters

<code>__pos</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__args</code>	Arguments used to generate a new pair instance (see std::piecewise_construct for passing arguments to each part of the pair constructor).

Returns

An iterator that points to the element with key of the std::pair built from `__args`.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.↵associative.insert_hints for more on *hinting*.

Insertion requires amortized constant time.

empty()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
bool std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::empty ( ) const [inline], [noexcept]
```

Returns true if the unordered_multimap is empty.

end() [1/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::end ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered_multimap.

end() [2/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::end ( ) [inline], [noexcept]
```

Returns a read/write iterator that points one past the last element in the unordered_multimap.

Referenced by [std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::extract\(\)](#).

end() [3/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
local_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::end (
    size_type __n ) [inline]
```

Returns a read/write iterator pointing to one past the last bucket elements.

Parameters

<code>_↔</code>	The bucket index.
<code>_n</code>	

Returns

A read/write local iterator.

end() [4/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_local_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::end (
    size_type __n ) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

<code>_↔</code>	The bucket index.
<code>_n</code>	

Returns

A read-only local iterator.

equal_range() [1/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
std::pair< iterator, iterator > std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >↔
::equal_range (
    const key_type & __x ) [inline]
```

Finds a subsequence matching given key.

Parameters

<code>_↔</code>	Key to be located.
<code>_x</code>	

Returns

Pair of iterators that possibly points to the subsequence matching given key.

equal_range() [2/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
std::pair< const_iterator, const_iterator > std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _↵
Alloc >::equal_range (
    const key_type & __x ) const [inline]
```

Finds a subsequence matching given key.

Parameters

<code>_↵</code> <code>_X</code>	Key to be located.
------------------------------------	--------------------

Returns

Pair of iterators that possibly points to the subsequence matching given key.

erase() [1/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
size_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (
    const key_type & __x ) [inline]
```

Erases elements according to the provided key.

Parameters

<code>_↵</code> <code>_X</code>	Key of elements to be erased.
------------------------------------	-------------------------------

Returns

The number of elements erased.

This function erases all the elements located by the given key from an unordered_multimap. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [2/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (
    const_iterator __first,
    const_iterator __last ) [inline]
```

Erases a [`__first`,`__last`) range of elements from an unordered_multimap.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be erased.
<code>__last</code>	Iterator pointing to the end of the range to be erased.

Returns

The iterator `__last`.

This function erases a sequence of elements from an `unordered_multimap`. Note that this function only erases the elements, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [3/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>  
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (   
    const_iterator __position ) [inline]
```

Erases an element from an `unordered_multimap`.

Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---------------------------------------------------

Returns

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an `unordered_multimap`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [4/4]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>  
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::erase (   
    iterator __position ) [inline]
```

Erases an element from an `unordered_multimap`.

Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---------------------------------------------------

Returns

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an `unordered_multimap`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

extract() [1/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>  
node_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::extract (   
    const key_type & __key ) [inline]
```

Extract a node.

extract() [2/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
node_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::extract (
    const_iterator __pos ) [inline]
```

Extract a node.

References [std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::end\(\)](#).

find() [1/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::find (
    const key_type & __x ) [inline]
```

Tries to locate an element in an unordered_multimap.

Parameters

_↵	Key to be located.
_X	

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ([end\(\)](#)) iterator.

find() [2/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
const_iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::find (
    const key_type & __x ) const [inline]
```

Tries to locate an element in an unordered_multimap.

Parameters

_↵	Key to be located.
_X	

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ([end\(\)](#)) iterator.

get_allocator()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
```

```
allocator_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::get_allocator ( )
const [inline], [noexcept]
```

Returns the allocator object used by the unordered_multimap.

hash_function()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
hasher std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::hash_function ( ) const [inline]
```

Returns the hash functor object with which the unordered_multimap was constructed.

insert() [1/10]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename _InputIterator >
void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    _InputIterator __first,
    _InputIterator __last ) [inline]
```

A template function that attempts to insert a range of elements.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be inserted.
<code>__last</code>	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

insert() [2/10]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename _Pair >
__enable_if_t< is_constructible< value_type, _Pair && >::value, iterator > std::unordered_multimap<
_Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    _Pair && __x ) [inline]
```

Inserts a std::pair into the unordered_multimap.

Parameters

<code>__x</code>	Pair to be inserted (see std::make_pair for easy creation of pairs).
------------------	----------------------------------------------------------------------

Returns

An iterator that points to the inserted pair.

Insertion requires amortized constant time.

insert() [3/10]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↔
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    const value_type & __x ) [inline]
```

Inserts a std::pair into the unordered_multimap.

Parameters

<code>__x</code>	Pair to be inserted (see std::make_pair for easy creation of pairs).
------------------	----------------------------------------------------------------------

Returns

An iterator that points to the inserted pair.

Insertion requires amortized constant time.

insert() [4/10]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename _Pair >
__enable_if_t< is_constructible< value_type, _Pair && >::value, iterator > std::unordered_multimap<
_Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    const_iterator __hint,
    _Pair && __x ) [inline]
```

Inserts a std::pair into the unordered_multimap.

Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__x</code>	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the element with key of __x (may or may not be the pair passed in).

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.↵associative.insert_hints for more on *hinting*.

Insertion requires amortized constant time.

insert() [5/10]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    const_iterator __hint,
    const value_type & __x ) [inline]
```

Inserts a std::pair into the unordered_multimap.

Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__x</code>	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints for more on *hinting*.

Insertion requires amortized constant time.

insert() [6/10]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    const_iterator __hint,
    node_type && __nh ) [inline]
```

Re-insert an extracted node.

References [std::move\(\)](#).

insert() [7/10]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    const_iterator __hint,
    value_type && __x ) [inline]
```

Inserts a `std::pair` into the `unordered_multimap`.

Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__x</code>	Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs).

Returns

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints for more on *hinting*.

Insertion requires amortized constant time.

References [std::move\(\)](#).

insert() [8/10]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    initializer_list< value_type > __l ) [inline]
```

Attempts to insert a list of elements into the `unordered_multimap`.

Parameters

↵	A std::initializer_list<value_type> of elements to be inserted.
↵	
↵	
↵	
/	

Complexity similar to that of the range constructor.

insert() [9/10]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    node_type && __nh ) [inline]
```

Re-insert an extracted node.

References [std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::end\(\)](#), and [std::move\(\)](#).

insert() [10/10]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    value_type && __x ) [inline]
```

Inserts a std::pair into the unordered_multimap.

Parameters

↵	Pair to be inserted (see std::make_pair for easy creation of pairs).
__x	

Returns

An iterator that points to the inserted pair.

Insertion requires amortized constant time.

References [std::move\(\)](#).

key_eq()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
key_equal std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::key_eq ( ) const [inline]
```

Returns the key comparison object with which the unordered_multimap was constructed.

load_factor()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
float std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::load_factor ( ) const [inline],
[noexcept]
```

Returns the average number of elements per bucket.

max_bucket_count()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>  
size_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::max_bucket_count ( ) const  
[inline], [noexcept]
```

Returns the maximum number of buckets of the unordered_multimap.

max_load_factor() [1/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>  
float std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::max_load_factor ( ) const [inline],  
[noexcept]
```

Returns a positive number that the unordered_multimap tries to keep the load factor less than or equal to.

max_load_factor() [2/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>  
void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::max_load_factor (   
    float __z ) [inline]
```

Change the unordered_multimap maximum load factor.

Parameters

<code>↵</code>	The new maximum load factor.
<code>__z</code>	

max_size()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>  
size_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::max_size ( ) const [inline],  
[noexcept]
```

Returns the maximum size of the unordered_multimap.

operator=() [1/3]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>  
unordered_multimap & std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::operator= (   
    const unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc > & ) [default]
```

Copy assignment operator.

operator=() [2/3]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵  
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>  
unordered_multimap & std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::operator= (   
    initializer_list< value_type > __l ) [inline]
```

Unordered_multimap list assignment operator.

Parameters

\leftrightarrow	An initializer_list.
$_ \leftrightarrow$	
\leftrightarrow	
$_ \leftrightarrow$	
/	

This function fills an unordered_multimap with copies of the elements in the initializer list $_ /$.

Note that the assignment completely changes the unordered_multimap and that the resulting unordered_multimap's size is the same as the number of elements assigned.

operator=() [3/3]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
unordered_multimap & std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::operator= (
    unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc > && ) [default]
```

Move assignment operator.

rehash()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::rehash (
    size_type __n ) [inline]
```

May rehash the unordered_multimap.

Parameters

$_ \leftrightarrow$	The new number of buckets.
$_ n$	

Rehash will occur only if the new number of buckets respect the unordered_multimap maximum load factor.

reserve()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::reserve (
    size_type __n ) [inline]
```

Prepare the unordered_multimap for a specified number of elements.

Parameters

$_ \leftrightarrow$	Number of elements required.
$_ n$	

Same as rehash(ceil(n / max_load_factor())).

size()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
```

```
size_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::size ( ) const [inline],
[noexcept]
```

Returns the size of the unordered_multimap.

swap()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::swap (
    unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc > & __x ) [inline], [noexcept]
```

Swaps data with another unordered_multimap.

Parameters

<code>↵</code>	An unordered_multimap of the same element and allocator types.
<code>__X</code>	

This exchanges the elements between two unordered_multimap in constant time. Note that the global std::swap() function is specialized such that std::swap(m1,m2) will feed to this function.

5.1026.1 Detailed Description

`template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>>
class std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >`

A standard container composed of equivalent keys (possibly containing multiple of each key value) in which the elements' keys are the elements themselves.

Template Parameters

<code>_Value</code>	Type of key objects.
<code>_Hash</code>	Hashing function object type, defaults to <code>hash<_Value></code> .
<code>_Pred</code>	Predicate function object type, defaults to <code>equal_to<_Value></code> .
<code>_Alloc</code>	Allocator type, defaults to <code>allocator<_Key></code> .

Meets the requirements of a [container](#), and [unordered associative container](#)
 Base is `_Hashtable`, dispatched at compile time via template alias `__umset_hashtable`.

5.1026.3 Constructor & Destructor Documentation

unordered_multiset() [1/7]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset ( ) [default]
```

Default constructor.

unordered_multiset() [2/7]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
    size_type __n,
    const hasher & __hf = hasher(),
    const key_equal & __eqf = key_equal(),
    const allocator_type & __a = allocator_type() ) [inline], [explicit]
```

Default constructor creates no elements.

Parameters

<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eqf</code>	A key equality functor.
<code>__a</code>	An allocator object.

unordered_multiset() [3/7]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _InputIterator >
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
    _InputIterator __first,
    _InputIterator __last,
    size_type __n = 0,
    const hasher & __hf = hasher(),
```

```
const key_equal & __eq1 = key_equal(),
const allocator_type & __a = allocator_type() ) [inline]
```

Builds an unordered_multiset from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eq1</code>	A key equality functor.
<code>__a</code>	An allocator object.

Create an unordered_multiset consisting of copies of the elements from [`__first`,`__last`). This is linear in N (where N is `distance(__first,__last)`).

unordered_multiset() [4/7]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
    const unordered_multiset< _Value, _Hash, _Pred, _Alloc > & ) [default]
```

Copy constructor.

unordered_multiset() [5/7]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
    unordered_multiset< _Value, _Hash, _Pred, _Alloc > && ) [default]
```

Move constructor.

unordered_multiset() [6/7]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
    initializer_list< value_type > __l,
    size_type __n = 0,
    const hasher & __hf = hasher(),
    const key_equal & __eq1 = key_equal(),
    const allocator_type & __a = allocator_type() ) [inline]
```

Builds an unordered_multiset from an initializer_list.

Parameters

<code>__l</code>	An initializer_list.
<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eq1</code>	A key equality functor.
<code>__a</code>	An allocator object.

Create an unordered_multiset consisting of copies of the elements in the list. This is linear in N (where N is `__l.size()`).

unordered_multiset() [7/7]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
    const allocator_type & __a ) [inline], [explicit]
```

Creates an unordered_multiset with no elements.

Parameters

<code>__a</code>	An allocator object.
------------------	----------------------

5.1026.4 Member Function Documentation**begin()** [1/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::begin ( ) const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered_multiset.

begin() [2/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::begin ( ) [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered_multiset.

begin() [3/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::begin (
    size_type __n ) [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

Returns

A read-only local iterator.

begin() [4/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::begin (
    size_type __n ) const [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

<code>_↔</code>	The bucket index.
<code>_n</code>	

Returns

A read-only local iterator.

bucket_count()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::bucket_count ( ) const [inline],
[noexcept]
```

Returns the number of buckets of the unordered_multiset.

cbegin() [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::cbegin ( ) const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered_multiset.

cbegin() [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::cbegin (
size_type __n ) const [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

<code>_↔</code>	The bucket index.
<code>_n</code>	

Returns

A read-only local iterator.

cend() [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::cend ( ) const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered_multiset.

Referenced by [std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert\(\)](#).

cend() [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
```

```
typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::cend (
    size_type __n ) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

\leftrightarrow	The bucket index.
<code>__n</code>	

Returns

A read-only local iterator.

clear()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::clear ( ) [inline], [noexcept]
```

Erases all elements in an `unordered_multiset`.

Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

count()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::count (
    const key_type & __x ) const [inline]
```

Finds the number of elements.

Parameters

\leftrightarrow	Element to located.
<code>__x</code>	

Returns

Number of elements with specified key.

emplace()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename... _Args>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::emplace (
    _Args &&... __args ) [inline]
```

Builds and insert an element into the `unordered_multiset`.

Parameters

<code>__args</code>	Arguments used to generate an element.
---------------------	----------------------------------------

Returns

An iterator that points to the inserted element.

Insertion requires amortized constant time.

emplace_hint()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename... _Args>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::emplace_hint (
    const_iterator __pos,
    _Args &&... __args ) [inline]
```

Inserts an element into the unordered_multiset.

Parameters

<code>__pos</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__args</code>	Arguments used to generate the element to be inserted.

Returns

An iterator that points to the inserted element.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints

Insertion requires amortized constant time.

empty()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
bool std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::empty ( ) const [inline], [noexcept]
```

Returns true if the unordered_multiset is empty.

end() [1/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::end ( ) const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered_multiset.

end() [2/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::end ( ) [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered_multiset.

Referenced by `std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::extract()`.

end() [3/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::end (
    size_type __n ) [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

$_n$	The bucket index.
-------	-------------------

Returns

A read-only local iterator.

end() [4/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::end (
    size_type __n ) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

$_n$	The bucket index.
-------	-------------------

Returns

A read-only local iterator.

equal_range() [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::pair< iterator, iterator > std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::equal_
_range (
    const key_type & __x ) [inline]
```

Finds a subsequence matching given key.

Parameters

$_x$	Key to be located.
-------	--------------------

Returns

Pair of iterators that possibly points to the subsequence matching given key.

equal_range() [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::pair< const_iterator, const_iterator > std::unordered_multiset< _Value, _Hash, _Pred, _Alloc
>::equal_range (
    const key_type & __x ) const [inline]
```

Finds a subsequence matching given key.

Parameters

<code>__x</code>	Key to be located.
------------------	--------------------

Returns

Pair of iterators that possibly points to the subsequence matching given key.

erase() [1/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::erase (
    const key_type & __x ) [inline]
```

Erases elements according to the provided key.

Parameters

<code>__x</code>	Key of element to be erased.
------------------	------------------------------

Returns

The number of elements erased.

This function erases all the elements located by the given key from an unordered_multiset.

Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [2/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::erase (
    const_iterator __first,
    const_iterator __last ) [inline]
```

Erases a [`__first`,`__last`) range of elements from an unordered_multiset.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be erased.
<code>__last</code>	Iterator pointing to the end of the range to be erased.

Returns

The iterator `__last`.

This function erases a sequence of elements from an `unordered_multiset`.

Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [3/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::erase (
    const_iterator __position ) [inline]
```

Erases an element from an `unordered_multiset`.

Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---------------------------------------------------

Returns

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an `unordered_multiset`.

Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [4/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::erase (
    iterator __position ) [inline]
```

Erases an element from an `unordered_multiset`.

Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---------------------------------------------------

Returns

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an `unordered_multiset`.

Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

extract() [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
node_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::extract (
    const key_type & __key ) [inline]
```

Extract a node.

extract() [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
node_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::extract (
    const_iterator __pos ) [inline]
```

Extract a node.

References [std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::end\(\)](#).

find() [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::find (
    const key_type & __x ) [inline]
```

Tries to locate an element in an unordered_multiset.

Parameters

_↔	Element to be located.
_X	

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

find() [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::find (
    const key_type & __x ) const [inline]
```

Tries to locate an element in an unordered_multiset.

Parameters

_↔	Element to be located.
_X	

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

get_allocator()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
allocator_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::get_allocator ( ) const
[inline], [noexcept]
```

Returns the allocator object used by the unordered_multiset.

hash_function()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
hasher std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::hash_function ( ) const [inline]
```

Returns the hash functor object with which the unordered_multiset was constructed.

insert() [1/8]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _InputIterator >
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
    _InputIterator __first,
    _InputIterator __last ) [inline]
```

A template function that inserts a range of elements.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be inserted.
<code>__last</code>	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

insert() [2/8]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
    const value_type & __x ) [inline]
```

Inserts an element into the unordered_multiset.

Parameters

<code>__x</code>	Element to be inserted.
------------------	-------------------------

Returns

An iterator that points to the inserted element.

Insertion requires amortized constant time.

insert() [3/8]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
    const_iterator __hint,
    const value_type & __x ) [inline]
```

Inserts an element into the unordered_multiset.

Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__x</code>	Element to be inserted.

Returns

An iterator that points to the inserted element.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints

Insertion requires amortized constant.

insert() [4/8]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
    const_iterator __hint,
    node_type && __nh ) [inline]
```

Re-insert an extracted node.

References [std::move\(\)](#).

insert() [5/8]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
    const_iterator __hint,
    value_type && __x ) [inline]
```

Inserts an element into the unordered_multiset.

Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__x</code>	Element to be inserted.

Returns

An iterator that points to the inserted element.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints

Insertion requires amortized constant.

References [std::move\(\)](#).

insert() [6/8]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
    initializer_list< value_type > __l ) [inline]
```

Inserts a list of elements into the unordered_multiset.

Parameters

↩	A <code>std::initializer_list<value_type></code> of elements to be inserted.
↩	
↩	
↩	
/	

Complexity similar to that of the range constructor.

insert() [7/8]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
    node_type && __nh ) [inline]
```

Re-insert an extracted node.

References `std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::cend()`, and `std::move()`.

insert() [8/8]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
    value_type && __x ) [inline]
```

Inserts an element into the `unordered_multiset`.

Parameters

↩	Element to be inserted.
__x	

Returns

An iterator that points to the inserted element.

Insertion requires amortized constant time.

References `std::move()`.

key_eq()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
key_equal std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::key_eq ( ) const [inline]
```

Returns the key comparison object with which the `unordered_multiset` was constructed.

load_factor()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
float std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::load_factor ( ) const [inline],
[noexcept]
```

Returns the average number of elements per bucket.

max_bucket_count()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::max_bucket_count ( ) const
[inline], [noexcept]
```

Returns the maximum number of buckets of the unordered_multiset.

max_load_factor() [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
float std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::max_load_factor ( ) const [inline],
[noexcept]
```

Returns a positive number that the unordered_multiset tries to keep the load factor less than or equal to.

max_load_factor() [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::max_load_factor (
    float __z ) [inline]
```

Change the unordered_multiset maximum load factor.

Parameters

	The new maximum load factor.
__z	

max_size()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::max_size ( ) const [inline],
[noexcept]
```

Returns the maximum size of the unordered_multiset.

operator=() [1/3]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
unordered_multiset & std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::operator= (
    const unordered_multiset< _Value, _Hash, _Pred, _Alloc > & ) [default]
```

Copy assignment operator.

operator=() [2/3]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
unordered_multiset & std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::operator= (
    initializer_list< value_type > __l ) [inline]
```

Unordered_multiset list assignment operator.

Parameters

\leftrightarrow	An initializer_list.
$_ \leftrightarrow$	
\leftrightarrow	
$_ \leftrightarrow$	
$/$	

This function fills an unordered_multiset with copies of the elements in the initializer list $_ /$.

Note that the assignment completely changes the unordered_multiset and that the resulting unordered_multiset's size is the same as the number of elements assigned.

operator=() [3/3]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
unordered_multiset & std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::operator= (
    unordered_multiset< _Value, _Hash, _Pred, _Alloc > && ) [default]
```

Move assignment operator.

rehash()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::rehash (
    size_type __n ) [inline]
```

May rehash the unordered_multiset.

Parameters

$_ \leftrightarrow$	The new number of buckets.
$_ n$	

Rehash will occur only if the new number of buckets respect the unordered_multiset maximum load factor.

reserve()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::reserve (
    size_type __n ) [inline]
```

Prepare the unordered_multiset for a specified number of elements.

Parameters

$_ \leftrightarrow$	Number of elements required.
$_ n$	

Same as rehash(ceil(n / max_load_factor())).

size()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::size ( ) const [inline],
[noexcept]
```

Returns the size of the unordered_multiset.

swap()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::swap (
    unordered_multiset< _Value, _Hash, _Pred, _Alloc > & __x ) [inline], [noexcept]
```

Swaps data with another unordered_multiset.

Parameters

\leftarrow	An unordered_multiset of the same element and allocator types.
$_X$	

This exchanges the elements between two sets in constant time. Note that the global std::swap() function is specialized such that std::swap(s1,s2) will feed to this function.

The documentation for this class was generated from the following file:

5.1028.1 Detailed Description

`template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
class std::unordered_set< _Value, _Hash, _Pred, _Alloc >`

A standard container composed of unique keys (containing at most one of each key value) in which the elements' keys are the elements themselves.

Template Parameters

<code>_Value</code>	Type of key objects.
<code>_Hash</code>	Hashing function object type, defaults to <code>hash<_Value></code> .
<code>_Pred</code>	Predicate function object type, defaults to <code>equal_to<_Value></code> .
<code>_Alloc</code>	Allocator type, defaults to <code>allocator<_Key></code> .

Meets the requirements of a `container`, and `unordered associative container`
Base is `_Hashtable`, dispatched at compile time via template alias `__uset_hashtable`.

5.1028.3 Constructor & Destructor Documentation

unordered_set() [1/7]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set ( ) [default]
Default constructor.
```

unordered_set() [2/7]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (
    size_type __n,
    const hasher & __hf = hasher(),
    const key_equal & __eq1 = key_equal(),
    const allocator_type & __a = allocator_type() ) [inline], [explicit]
```

Default constructor creates no elements.

Parameters

<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eq1</code>	A key equality functor.
<code>__a</code>	An allocator object.

unordered_set() [3/7]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _InputIterator >
std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (
    _InputIterator __first,
    _InputIterator __last,
    size_type __n = 0,
    const hasher & __hf = hasher(),
    const key_equal & __eq1 = key_equal(),
    const allocator_type & __a = allocator_type() ) [inline]
```

Builds an unordered_set from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eq1</code>	A key equality functor.
<code>__a</code>	An allocator object.

Create an unordered_set consisting of copies of the elements from [`__first`,`__last`). This is linear in N (where N is distance(`__first`,`__last`)).

unordered_set() [4/7]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (
    const unordered_set< _Value, _Hash, _Pred, _Alloc > & ) [default]
```

Copy constructor.

unordered_set() [5/7]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (
    unordered_set< _Value, _Hash, _Pred, _Alloc > && ) [default]
```

Move constructor.

unordered_set() [6/7]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (
    const allocator_type & __a ) [inline], [explicit]
```

Creates an unordered_set with no elements.

Parameters

<code>__a</code>	An allocator object.
------------------	----------------------

unordered_set() [7/7]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (
    initializer_list< value_type > __l,
    size_type __n = 0,
    const hasher & __hf = hasher(),
    const key_equal & __eq1 = key_equal(),
    const allocator_type & __a = allocator_type() ) [inline]
```

Builds an unordered_set from an initializer_list.

Parameters

<code>__l</code>	An initializer_list.
<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eq1</code>	A key equality functor.
<code>__a</code>	An allocator object.

Create an unordered_set consisting of copies of the elements in the list. This is linear in N (where N is `__l.size()`).

5.1028.4 Member Function Documentation

begin() [1/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::begin ( ) const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered_set.

begin() [2/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::begin ( ) [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered_set.

begin() [3/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::begin (
    size_type __n ) [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

$_n$	The bucket index.
-------	-------------------

Returns

A read-only local iterator.

begin() [4/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::begin (
    size_type __n ) const [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

$_n$	The bucket index.
-------	-------------------

Returns

A read-only local iterator.

bucket_count()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::bucket_count ( ) const [inline],
[noexcept]
```

Returns the number of buckets of the unordered_set.

cbegin() [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::cbegin ( ) const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered_set.

cbegin() [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::cbegin (
    size_type __n ) const [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

\leftarrow	The bucket index.
n	

Returns

A read-only local iterator.

cend() [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::cend ( ) const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered_set.

cend() [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::cend (
    size_type __n ) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

\leftarrow	The bucket index.
n	

Returns

A read-only local iterator.

clear()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::clear ( ) [inline], [noexcept]
```

Erases all elements in an unordered_set. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

count()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::count (
    const key_type & __x ) const [inline]
```

Finds the number of elements.

Parameters

<code>__x</code>	Element to located.
------------------	---------------------

Returns

Number of elements with specified key.

This function only makes sense for unordered_multisets; for unordered_set the result will either be 0 (not present) or 1 (present).

emplace()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
template<typename... _Args>
```

```
std::pair< iterator, bool > std::unordered_set< _Value, _Hash, _Pred, _Alloc >::emplace (
    _Args &&... __args ) [inline]
```

Attempts to build and insert an element into the unordered_set.

Parameters

<code>__args</code>	Arguments used to generate an element.
---------------------	----------------------------------------

Returns

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to build and insert an element into the unordered_set. An unordered_set relies on unique keys and thus an element is only inserted if it is not already present in the unordered_set.

Insertion requires amortized constant time.

emplace_hint()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
template<typename... _Args>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::emplace_hint (
    const_iterator __pos,
    _Args &&... __args ) [inline]
```

Attempts to insert an element into the `unordered_set`.

Parameters

<code>__pos</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__args</code>	Arguments used to generate the element to be inserted.

Returns

An iterator that points to the element with key equivalent to the one generated from `__args` (may or may not be the element itself).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `emplace()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints

Insertion requires amortized constant time.

`empty()`

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
bool std::unordered_set< _Value, _Hash, _Pred, _Alloc >::empty ( ) const [inline], [noexcept]
```

Returns true if the `unordered_set` is empty.

`end()` [1/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::end ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the `unordered_set`.

`end()` [2/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::end ( ) [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the `unordered_set`.

Referenced by `std::unordered_set< _Value, _Hash, _Pred, _Alloc >::extract()`.

`end()` [3/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::end (
    size_type __n ) [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

<code>_↔ _n</code>	The bucket index.
------------------------	-------------------

Returns

A read-only local iterator.

end() [4/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::end (
    size_type __n ) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

<code>_↔ _n</code>	The bucket index.
------------------------	-------------------

Returns

A read-only local iterator.

equal_range() [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::pair< iterator, iterator > std::unordered_set< _Value, _Hash, _Pred, _Alloc >::equal_range
(
    const key_type & __x ) [inline]
```

Finds a subsequence matching given key.

Parameters

<code>_↔ _x</code>	Key to be located.
------------------------	--------------------

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for multisets.

equal_range() [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::pair< const_iterator, const_iterator > std::unordered_set< _Value, _Hash, _Pred, _Alloc >::
::equal_range (
    const key_type & __x ) const [inline]
```

Finds a subsequence matching given key.

Parameters

<code>_↔</code>	Key to be located.
<code>_X</code>	

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for multisets.

erase() [1/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::erase (
    const key_type & __x ) [inline]
```

Erases elements according to the provided key.

Parameters

<code>_↔</code>	Key of element to be erased.
<code>_X</code>	

Returns

The number of elements erased.

This function erases all the elements located by the given key from an `unordered_set`. For an `unordered_set` the result of this function can only be 0 (not present) or 1 (present). Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [2/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::erase (
    const_iterator __first,
    const_iterator __last ) [inline]
```

Erases a [`__first`,`__last`) range of elements from an `unordered_set`.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be erased.
<code>__last</code>	Iterator pointing to the end of the range to be erased.

Returns

The iterator `__last`.

This function erases a sequence of elements from an `unordered_set`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [3/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::erase (
    const_iterator __position ) [inline]
```

Erases an element from an `unordered_set`.

Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---------------------------------------------------

Returns

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an `unordered_set`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [4/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::erase (
    iterator __position ) [inline]
```

Erases an element from an `unordered_set`.

Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---------------------------------------------------

Returns

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an `unordered_set`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

extract() [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
node_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::extract (
    const key_type & __key ) [inline]
```

Extract a node.

extract() [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
node_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::extract (
    const_iterator __pos ) [inline]
```

Extract a node.

References `std::unordered_set< _Value, _Hash, _Pred, _Alloc >::end()`.

find() [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::find (
    const key_type & __x ) [inline]
```

Tries to locate an element in an `unordered_set`.

Parameters

<code>__x</code>	Element to be located.
------------------	------------------------

Returns

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

find() [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::find (
    const key_type & __x ) const [inline]
```

Tries to locate an element in an `unordered_set`.

Parameters

<code>__x</code>	Element to be located.
------------------	------------------------

Returns

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

get_allocator()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
allocator_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::get_allocator ( ) const [inline],
[noexcept]
```

Returns the allocator object used by the `unordered_set`.

hash_function()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
hasher std::unordered_set< _Value, _Hash, _Pred, _Alloc >::hash_function ( ) const [inline]
```

Returns the hash functor object with which the unordered_set was constructed.

insert() [1/8]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
template<typename _InputIterator >
```

```
void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (
    _InputIterator __first,
    _InputIterator __last ) [inline]
```

A template function that attempts to insert a range of elements.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be inserted.
<code>__last</code>	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

insert() [2/8]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
std::pair< iterator, bool > std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (
    const value_type & __x ) [inline]
```

Attempts to insert an element into the unordered_set.

Parameters

<code>__x</code>	Element to be inserted.
------------------	-------------------------

Returns

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to insert an element into the unordered_set. An unordered_set relies on unique keys and thus an element is only inserted if it is not already present in the unordered_set.

Insertion requires amortized constant time.

insert() [3/8]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (
    const_iterator __hint,
    const value_type & __x ) [inline]
```

Attempts to insert an element into the unordered_set.

Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__x</code>	Element to be inserted.

Returns

An iterator that points to the element with key of `__x` (may or may not be the element passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `insert()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints

Insertion requires amortized constant.

insert() [4/8]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,  
typename _Alloc = allocator<_Value>>  
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (  
    const_iterator __hint,  
    value_type && __x ) [inline]
```

Attempts to insert an element into the `unordered_set`.

Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__x</code>	Element to be inserted.

Returns

An iterator that points to the element with key of `__x` (may or may not be the element passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `insert()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints

Insertion requires amortized constant.

References [std::move\(\)](#).

insert() [5/8]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,  
typename _Alloc = allocator<_Value>>  
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (  
    const_iterator ,  
    node_type && __nh ) [inline]
```

Re-insert an extracted node.

References [std::move\(\)](#).

insert() [6/8]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,  

```

```

typename _Alloc = allocator<_Value>>
void std::unordered_set<_Value, _Hash, _Pred, _Alloc >::insert (
    initializer_list< value_type > __l ) [inline]

```

Attempts to insert a list of elements into the unordered_set.

Parameters

↩	A std::initializer_list<value_type> of elements to be inserted.
↩	
↩	
↩	
/	

Complexity similar to that of the range constructor.

insert() [7/8]

```

template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
insert_return_type std::unordered_set<_Value, _Hash, _Pred, _Alloc >::insert (
    node_type && __nh ) [inline]

```

Re-insert an extracted node.

References [std::move\(\)](#).

insert() [8/8]

```

template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::pair< iterator, bool > std::unordered_set<_Value, _Hash, _Pred, _Alloc >::insert (
    value_type && __x ) [inline]

```

Attempts to insert an element into the unordered_set.

Parameters

↩	Element to be inserted.
__x	

Returns

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to insert an element into the unordered_set. An unordered_set relies on unique keys and thus an element is only inserted if it is not already present in the unordered_set.

Insertion requires amortized constant time.

References [std::move\(\)](#).

key_eq()

```

template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
key_equal std::unordered_set<_Value, _Hash, _Pred, _Alloc >::key_eq ( ) const [inline]

```

Returns the key comparison object with which the unordered_set was constructed.

load_factor()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
float std::unordered_set< _Value, _Hash, _Pred, _Alloc >::load_factor ( ) const [inline], [noexcept]
```

Returns the average number of elements per bucket.

max_bucket_count()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::max_bucket_count ( ) const [inline],
[noexcept]
```

Returns the maximum number of buckets of the unordered_set.

max_load_factor() [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
float std::unordered_set< _Value, _Hash, _Pred, _Alloc >::max_load_factor ( ) const [inline],
[noexcept]
```

Returns a positive number that the unordered_set tries to keep the load factor less than or equal to.

max_load_factor() [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::max_load_factor (
    float __z ) [inline]
```

Change the unordered_set maximum load factor.

Parameters

 <code>_z</code>	The new maximum load factor.
-----------------------------------------------------------------------------------------------------	------------------------------

max_size()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::max_size ( ) const [inline], [noexcept]
```

Returns the maximum size of the unordered_set.

operator=() [1/3]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
unordered_set & std::unordered_set< _Value, _Hash, _Pred, _Alloc >::operator= (
    const unordered_set< _Value, _Hash, _Pred, _Alloc > & ) [default]
```

Copy assignment operator.

operator=() [2/3]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
unordered_set & std::unordered_set< _Value, _Hash, _Pred, _Alloc >::operator= (
    initializer_list< value_type > __l ) [inline]
```

Unordered_set list assignment operator.

Parameters

↔	An initializer_list.
↔	
↔	
↔	
/	

This function fills an unordered_set with copies of the elements in the initializer list __l.

Note that the assignment completely changes the unordered_set and that the resulting unordered_set's size is the same as the number of elements assigned.

operator=() [3/3]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
unordered_set & std::unordered_set< _Value, _Hash, _Pred, _Alloc >::operator= (
    unordered_set< _Value, _Hash, _Pred, _Alloc > && ) [default]
```

Move assignment operator.

rehash()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::rehash (
    size_type __n ) [inline]
```

May rehash the unordered_set.

Parameters

↔	The new number of buckets.
n	

Rehash will occur only if the new number of buckets respect the unordered_set maximum load factor.

reserve()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::reserve (
    size_type __n ) [inline]
```

Prepare the unordered_set for a specified number of elements.

Parameters

↔	Number of elements required.
n	

Same as rehash(ceil(n / max_load_factor())).

size()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::size ( ) const [inline], [noexcept]
```

Returns the size of the unordered_set.

swap()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::swap (
    unordered_set< _Value, _Hash, _Pred, _Alloc > & __x ) [inline], [noexcept]
```

Swaps data with another unordered_set.

Parameters

<code>__x</code>	An unordered_set of the same element and allocator types.
------------------	-----------------------------------------------------------

This exchanges the elements between two sets in constant time. Note that the global `std::swap()` function is specialized such that `std::swap(s1,s2)` will feed to this function.

5.1029.1 Detailed Description

A non-thread-safe memory resource that manages pools of fixed-size blocks.

5.1029.2 Member Function Documentation

do_allocate()

```
void * std::pmr::unsynchronized_pool_resource::do_allocate (
    size_t __bytes,
    size_t __alignment ) [override], [protected], [virtual]
```

Implements [std::pmr::memory_resource](#).

do_deallocate()

```
void std::pmr::unsynchronized_pool_resource::do_deallocate (
    void * __p,
    size_t __bytes,
    size_t __alignment ) [override], [protected], [virtual]
```

Implements [std::pmr::memory_resource](#).

do_is_equal()

```
bool std::pmr::unsynchronized_pool_resource::do_is_equal (
    const memory\_resource & __other ) const [inline], [override], [protected], [virtual],
[noexcept]
```

Implements [std::pmr::memory_resource](#).

The documentation for this class was generated from the following file:

- [memory_resource](#)

5.1030 `std::uses_allocator< typename, typename >` Struct Template Reference

5.1030.1 Detailed Description

```
template<typename, typename>
struct std::uses_allocator< typename, typename >
```

Declare `uses_allocator` so it can be specialized in `<queue>` etc.

The documentation for this struct was generated from the following file:

- [memoryfwd.h](#)

5.1031 `std::uses_allocator< tuple< _Types... >, _Alloc >` Struct Template Reference

5.1032.1 Detailed Description

`template<class _Tp>`
`class std::valarray<_Tp>`

Smart array designed to support numeric processing.

A valarray is an array that provides constraints intended to allow for effective optimization of numeric array processing by reducing the aliasing that can result from pointer representations. It represents a one-dimensional array from which different multidimensional subsets can be accessed and modified.

Template Parameters

<code>_Tp</code>	Type of object in the array.
------------------	------------------------------

5.1032.2 Constructor & Destructor Documentation

valarray()

```
template<class _Tp >
std::valarray<_Tp>::valarray (
    const _Tp * __restrict__,
    size_t )
```

Construct an array initialized to the first n elements of t .

5.1032.3 Member Function Documentation

operator"!()

```
template<class _Tp >
_UnaryOp< __logical_not >::_Rt std::valarray<_Tp>::operator! ( ) const
```

Return a new valarray by applying unary ! to each element.

operator%=() [1/2]

```
template<class _Tp >
valarray<_Tp> & std::valarray<_Tp>::operator%= (
    const _Tp & )
```

Set each element e of array to $e \% t$.

operator%=() [2/2]

```
template<class _Tp >
valarray<_Tp> & std::valarray<_Tp>::operator%= (
    const valarray<_Tp> & )
```

Modulo elements of array by corresponding elements of v .

operator&=() [1/2]

```
template<class _Tp >
valarray<_Tp> & std::valarray<_Tp>::operator&= (
    const _Tp & )
```

Set each element e of array to $e \& t$.

operator&=() [2/2]

```
template<class _Tp >
valarray<_Tp> & std::valarray<_Tp>::operator&= (
    const valarray<_Tp> & )
```

Logical and corresponding elements of v with elements of array.

operator*=() [1/2]

```
template<class _Tp >
valarray<_Tp> & std::valarray<_Tp>::operator*= (
    const _Tp & )
```

Multiply each element of array by t .

operator*=() [2/2]

```
template<class _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator*= (
    const valarray< _Tp > & )
```

Multiply elements of array by corresponding elements of *v*.

operator+()

```
template<class _Tp >
_UnaryOp< __unary_plus >::_Rt std::valarray< _Tp >::operator+ ( ) const
```

Return a new valarray by applying unary + to each element.

operator+=() [1/2]

```
template<class _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator+= (
    const _Tp & )
```

Add *t* to each element of array.

operator+=() [2/2]

```
template<class _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator+= (
    const valarray< _Tp > & )
```

Add corresponding elements of *v* to elements of array.

operator-()

```
template<class _Tp >
_UnaryOp< __negate >::_Rt std::valarray< _Tp >::operator- ( ) const
```

Return a new valarray by applying unary - to each element.

operator-=() [1/2]

```
template<class _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator-= (
    const _Tp & )
```

Subtract *t* to each element of array.

operator-=() [2/2]

```
template<class _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator-= (
    const valarray< _Tp > & )
```

Subtract corresponding elements of *v* from elements of array.

operator/=() [1/2]

```
template<class _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator/= (
    const _Tp & )
```

Divide each element of array by *t*.

operator/=() [2/2]

```
template<class _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator/= (
    const valarray< _Tp > & )
```

Divide elements of array by corresponding elements of *v*.

operator<<=() [1/2]

```
template<class _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator<<= (
    const _Tp & )
```

Left shift each element *e* of array by *t* bits.

operator<<=() [2/2]

```
template<class _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator<<= (
    const valarray< _Tp > & )
```

Left shift elements of array by corresponding elements of *v*.

operator>>=() [1/2]

```
template<class _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator>>= (
    const _Tp & )
```

Right shift each element *e* of array by *t* bits.

operator>>=() [2/2]

```
template<class _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator>>= (
    const valarray< _Tp > & )
```

Right shift elements of array by corresponding elements of *v*.

operator^=() [1/2]

```
template<class _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator^= (
    const _Tp & )
```

Set each element *e* of array to $e \wedge t$.

operator^=() [2/2]

```
template<class _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator^= (
    const valarray< _Tp > & )
```

Logical xor corresponding elements of *v* with elements of array.

operator" |=() [1/2]

```
template<class _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator|= (
    const _Tp & )
```

Set each element *e* of array to $e \mid t$.

operator" |=() [2/2]

```
template<class _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator|= (
    const valarray< _Tp > & )
```

Logical or corresponding elements of *v* with elements of *array*.

operator~()

```
template<class _Tp >
_UnaryOp< __bitwise_not >::_Rt std::valarray< _Tp >::operator~ ( ) const
```

Return a new valarray by applying unary ~ to each element.

5.1034.1 Detailed Description

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
class std::vector< _Tp, _Alloc >
```

A standard container which offers fixed time access to individual elements in any order.

Template Parameters

<code>_Tp</code>	Type of element.
<code>_Alloc</code>	Allocator type, defaults to <code>allocator<_Tp></code> .

Meets the requirements of a [container](#), a [reversible container](#), and a [sequence](#), including the [optional sequence requirements](#) with the exception of `push_front` and `pop_front`.

In some terminology a vector can be described as a dynamic C-style array, it offers fast and efficient access to individual elements in any order and saves the user from worrying about memory and size allocation. Subscripting (`[]`) access is also provided as with C-style arrays.

5.1034.2 Constructor & Destructor Documentation

`vector()` [1/10]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
std::vector< _Tp, _Alloc >::vector ( ) [default]
```

Creates a vector with no elements.

`vector()` [2/10]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
std::vector< _Tp, _Alloc >::vector (
    const allocator_type & __a ) [inline], [explicit], [noexcept]
```

Creates a vector with no elements.

Parameters

<code>__a</code>	An allocator object.
------------------	----------------------

vector() [3/10]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
std::vector< _Tp, _Alloc >::vector (
    size_type __n,
    const allocator_type & __a = allocator_type() ) [inline], [explicit]
```

Creates a vector with default constructed elements.

Parameters

\leftrightarrow __n	The number of elements to initially create.
\leftrightarrow __a	An allocator.

This constructor fills the vector with __n default constructed elements.

vector() [4/10]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
std::vector< _Tp, _Alloc >::vector (
    size_type __n,
    const value_type & __value,
    const allocator_type & __a = allocator_type() ) [inline]
```

Creates a vector with copies of an exemplar element.

Parameters

__n	The number of elements to initially create.
__value	An element to copy.
__a	An allocator.

This constructor fills the vector with __n copies of __value.

vector() [5/10]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
std::vector< _Tp, _Alloc >::vector (
    const vector< _Tp, _Alloc > & __x ) [inline]
```

Vector copy constructor.

Parameters

\leftrightarrow __x	A vector of identical element and allocator types.
--------------------------	----------------------------------------------------

All the elements of __x are copied, but any unused capacity in __x will not be copied (i.e. capacity() == size() in the new vector).

The newly-created vector uses a copy of the allocator object used by __x (unless the allocator traits dictate a different object).

References [std::vector<_Tp, _Alloc >::begin\(\)](#), and [std::vector<_Tp, _Alloc >::end\(\)](#).

vector() [6/10]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
std::vector< _Tp, _Alloc >::vector (
    vector< _Tp, _Alloc > && ) [default], [noexcept]
```

Vector move constructor.

The newly-created vector contains the exact contents of the moved instance. The contents of the moved instance are a valid, but unspecified vector.

vector() [7/10]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
std::vector< _Tp, _Alloc >::vector (
    const vector< _Tp, _Alloc > & __x,
    const allocator_type & __a ) [inline]
```

Copy constructor with alternative allocator.

vector() [8/10]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
std::vector< _Tp, _Alloc >::vector (
    vector< _Tp, _Alloc > && __rv,
    const allocator_type & __m ) [inline], [noexcept]
```

Move constructor with alternative allocator.

vector() [9/10]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
std::vector< _Tp, _Alloc >::vector (
    initializer_list< value_type > __l,
    const allocator_type & __a = allocator_type() ) [inline]
```

Builds a vector from an initializer list.

Parameters

\leftrightarrow __l	An initializer_list.
\leftrightarrow __a	An allocator.

Create a vector consisting of copies of the elements in the initializer_list __l.

This will call the element type's copy constructor N times (where N is __l.size()) and do no memory reallocation.

vector() [10/10]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
template<typename _InputIterator , typename = std::_RequireInputIter<_InputIterator>>
std::vector< _Tp, _Alloc >::vector (
    _InputIterator __first,
    _InputIterator __last,
    const allocator_type & __a = allocator_type() ) [inline]
```

Builds a vector from a range.

Parameters

__first	An input iterator.
---------	--------------------

Parameters

<code>__last</code>	An input iterator.
<code>__a</code>	An allocator.

Create a vector consisting of copies of the elements from [first,last).

If the iterators are forward, bidirectional, or random-access, then this will call the elements' copy constructor N times (where N is distance(first,last)) and do no memory reallocation. But if only input iterators are used, then this will do at most 2N calls to the copy constructor, and logN memory reallocations.

References [std::__iterator_category\(\)](#).

~vector()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
std::vector<_Tp, _Alloc>::~~vector ( ) [inline], [noexcept]
```

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

References [std::_Destroy\(\)](#).

5.1034.3 Member Function Documentation**_M_allocate_and_copy()**

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
template<typename _ForwardIterator >
pointer std::vector<_Tp, _Alloc>::_M_allocate_and_copy (
    size_type __n,
    _ForwardIterator __first,
    _ForwardIterator __last ) [inline], [protected]
```

Memory expansion handler. Uses the member allocation function to obtain *n* bytes of memory, and then copies [first,last) into it.

_M_range_check()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
void std::vector<_Tp, _Alloc>::_M_range_check (
    size_type __n ) const [inline], [protected]
```

Safety check used only from at().

References [std::vector<_Tp, _Alloc>::size\(\)](#).

Referenced by [std::vector<_Tp, _Alloc>::at\(\)](#), and [std::vector<_Tp, _Alloc>::at\(\)](#).

assign() [1/3]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
template<typename _InputIterator , typename = std::_RequireInputIter<_InputIterator>>
void std::vector<_Tp, _Alloc>::assign (
    _InputIterator __first,
    _InputIterator __last ) [inline]
```

Assigns a range to a vector.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

This function fills a vector with copies of the elements in the range `[__first,__last)`.

Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned.

assign() [2/3]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
void std::vector< _Tp, _Alloc >::assign (
    initializer_list< value_type > __l ) [inline]
```

Assigns an initializer list to a vector.

Parameters

<code>↵</code>	An initializer_list.
<code>↵</code>	
<code>↵</code>	
<code>↵</code>	
<code>↵</code>	
<code>↵</code>	

This function fills a vector with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned.

assign() [3/3]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
void std::vector< _Tp, _Alloc >::assign (
    size_type __n,
    const value_type & __val ) [inline]
```

Assigns a given value to a vector.

Parameters

<code>__n</code>	Number of elements to be assigned.
<code>__val</code>	Value to be assigned.

This function fills a vector with `__n` copies of the given value. Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned.

at() [1/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
reference std::vector< _Tp, _Alloc >::at (
    size_type __n ) [inline]
```

Provides access to the data contained in the vector.

Parameters

<code>↵</code>	The index of the element for which data should be accessed.
<code>__n</code>	

Returns

Read/write reference to data.

Exceptions

<code>std::out_of_range</code>	If <code>__n</code> is an invalid index.
--------------------------------	------------------------------------------

This function provides for safer data access. The parameter is first checked that it is in the range of the vector. The function throws `out_of_range` if the check fails.

References [std::vector<_Tp, _Alloc>::_M_range_check\(\)](#).

at() [2/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
const_reference std::vector<_Tp, _Alloc>::at (
    size_type __n ) const [inline]
```

Provides access to the data contained in the vector.

Parameters

<code>__n</code>	The index of the element for which data should be accessed.
------------------	-------------------------------------------------------------

Returns

Read-only (constant) reference to data.

Exceptions

<code>std::out_of_range</code>	If <code>__n</code> is an invalid index.
--------------------------------	------------------------------------------

This function provides for safer data access. The parameter is first checked that it is in the range of the vector. The function throws `out_of_range` if the check fails.

References [std::vector<_Tp, _Alloc>::_M_range_check\(\)](#).

back() [1/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
const_reference std::vector<_Tp, _Alloc>::back ( ) const [inline], [noexcept]
```

Returns a read-only (constant) reference to the data at the last element of the vector.

References [std::vector<_Tp, _Alloc>::end\(\)](#).

back() [2/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
reference std::vector<_Tp, _Alloc>::back ( ) [inline], [noexcept]
```

Returns a read/write reference to the data at the last element of the vector.

References [std::vector<_Tp, _Alloc>::end\(\)](#).

Referenced by [std::piecewise_constant_distribution<_RealType>::max\(\)](#), and [std::piecewise_linear_distribution<_RealType>::max\(\)](#).

begin() [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_iterator std::vector< _Tp, _Alloc >::begin ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the vector. Iteration is done in ordinary element order.

begin() [2/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
iterator std::vector< _Tp, _Alloc >::begin ( ) [inline], [noexcept]
```

Returns a read/write iterator that points to the first element in the vector. Iteration is done in ordinary element order.

Referenced by `std::vector<_Tp, _Alloc>::vector()`, `std::match_results<_Bi_iter, _Alloc>::begin()`, `std::vector<_Tp, _Alloc>::crend()`, `std::vector<_Tp, _Alloc>::empty()`, `std::vector<_Tp, _Alloc>::erase()`, `std::vector<_Tp, _Alloc>::erase()`, `std::vector<_Tp, _Alloc>::end()`, `std::vector<_Tp, _Alloc>::front()`, `std::vector<_Tp, _Alloc>::insert()`, `std::vector<_Tp, _Alloc>::insert()`, `std::vector<_Tp, _Alloc>::i`, `__gnu_parallel::multiway_merge_exact_splitting()`, `std::operator<()`, `std::vector<_Tp, _Alloc>::operator=()`, `std::vector<_State<_Traits>::operator==()`, `std::vector<_Tp, _Alloc>::rend()`, and `std::vector<_Tp, _Alloc>::rend()`.

capacity()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
size_type std::vector<_Tp, _Alloc >::capacity ( ) const [inline], [noexcept]
```

Returns the total number of elements that the vector can hold before needing to allocate more memory.

cbegin()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
const_iterator std::vector< _Tp, _Alloc >::cbegin ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the vector. Iteration is done in ordinary element order.

Referenced by `std::vector<_Tp, _Alloc>::erase()`, `std::vector<_Tp, _Alloc>::erase()`, `std::vector<_Tp, _Alloc>::insert()`, `std::vector<_Tp, _Alloc>::insert()`, and `std::vector<_Tp, _Alloc>::insert()`.

cend()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
const_iterator std::vector< _Tp, _Alloc >::cend ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the vector. Iteration is done in ordinary element order.

clear()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
void std::vector<_Tp, _Alloc >::clear ( ) [inline], [noexcept]
```
