_Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    _Pair && __x ) [inline]
```

Inserts a std::pair into the unordered_multimap.

Parameters

<code>__↵</code> <code>__x</code>	Pair to be inserted (see std::make_pair for easy creation of pairs).
--------------------------------------	--

Returns

An iterator that points to the inserted pair.

Insertion requires amortized constant time.

insert() [3/10]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    const value_type & __x ) [inline]
```

Inserts a std::pair into the unordered_multimap.

Parameters

<code>__x</code>	Pair to be inserted (see std::make_pair for easy creation of pairs).
------------------	--

Returns

An iterator that points to the inserted pair.

Insertion requires amortized constant time.

insert() [4/10]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
template<typename _Pair >
__enable_if_t< is_constructible< value_type, _Pair && >::value, iterator > std::unordered_multimap<
_Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    const_iterator __hint,
    _Pair && __x ) [inline]
```

Inserts a std::pair into the unordered_multimap.

Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__x</code>	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.↵associative.insert_hints for more on *hinting*.

Insertion requires amortized constant time.

insert() [5/10]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
```

```
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    const_iterator __hint,
    const value_type & __x ) [inline]
```

Inserts a std::pair into the unordered_multimap.

Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__x</code>	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints for more on *hinting*.

Insertion requires amortized constant time.

insert() [6/10]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    const_iterator __hint,
    node_type && __nh ) [inline]
```

Re-insert an extracted node.

References [std::move\(\)](#).

insert() [7/10]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    const_iterator __hint,
    value_type && __x ) [inline]
```

Inserts a std::pair into the unordered_multimap.

Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__x</code>	Pair to be inserted (see std::make_pair for easy creation of pairs).

Returns

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints for more on *hinting*.

Insertion requires amortized constant time.

References [std::move\(\)](#).

insert() [8/10]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
void std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::insert (
    initializer_list< value_type > __l ) [inline]
```

Attempts to insert a list of elements into the unordered_multimap.

Parameters

↵	A std::initializer_list<value_type> of elements to be inserted.
_↵	
↵	
_↵	
/	

Complexity similar to that of the range constructor.

insert() [9/10]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::insert (
    node_type && __nh ) [inline]
```

Re-insert an extracted node.

References [std::unordered_multimap<_Key,_Tp,_Hash,_Pred,_Alloc>::cend\(\)](#), and [std::move\(\)](#).

insert() [10/10]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::insert (
    value_type && __x ) [inline]
```

Inserts a std::pair into the unordered_multimap.

Parameters

_↵	Pair to be inserted (see std::make_pair for easy creation of pairs).
_X	

Returns

An iterator that points to the inserted pair.

Insertion requires amortized constant time.

References [std::move\(\)](#).

key_eq()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
key_equal std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::key_eq ( ) const [inline]
```

Returns the key comparison object with which the unordered_multimap was constructed.

load_factor()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
float std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::load_factor ( ) const [inline],
[noexcept]
```

Returns the average number of elements per bucket.

max_bucket_count()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
size_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::max_bucket_count ( ) const
[inline], [noexcept]
```

Returns the maximum number of buckets of the unordered_multimap.

max_load_factor() [1/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
float std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::max_load_factor ( ) const [inline],
[noexcept]
```

Returns a positive number that the unordered_multimap tries to keep the load factor less than or equal to.

max_load_factor() [2/2]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::max_load_factor (
    float __z ) [inline]
```

Change the unordered_multimap maximum load factor.

Parameters

<code>_↵</code>	The new maximum load factor.
<code>_z</code>	

max_size()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
size_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::max_size ( ) const [inline],
[noexcept]
```

Returns the maximum size of the unordered_multimap.

operator=() [1/3]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>
unordered_multimap & std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::operator= (
    const unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc > & ) [default]
```

Copy assignment operator.

operator=() [2/3]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
unordered_multimap & std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::operator= (
    initializer_list< value_type > __l ) [inline]
```

Unordered_multimap list assignment operator.

Parameters

↵	An initializer_list.
_↵	
↵	
_↵	
/	

This function fills an unordered_multimap with copies of the elements in the initializer list __l.

Note that the assignment completely changes the unordered_multimap and that the resulting unordered_multimap's size is the same as the number of elements assigned.

operator=() [3/3]

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
unordered_multimap & std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::operator= (
    unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc > && ) [default]
```

Move assignment operator.

rehash()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::rehash (
    size_type __n ) [inline]
```

May rehash the unordered_multimap.

Parameters

_↵	The new number of buckets.
_n	

Rehash will occur only if the new number of buckets respect the unordered_multimap maximum load factor.

reserve()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::reserve (
    size_type __n ) [inline]
```

Prepare the unordered_multimap for a specified number of elements.

Parameters

_↵	Number of elements required.
_n	

Same as `rehash(ceil(n / max_load_factor()))`.

size()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
size_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::size ( ) const [inline],
[noexcept]
```

Returns the size of the `unordered_multimap`.

swap()

```
template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_↵
to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>
void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::swap (
    unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc > & __x ) [inline], [noexcept]
```

Swaps data with another `unordered_multimap`.

Parameters

<code>↵</code> <code>__x</code>	An <code>unordered_multimap</code> of the same element and allocator types.
------------------------------------	---

This exchanges the elements between two `unordered_multimap` in constant time. Note that the global `std::swap()` function is specialized such that `std::swap(m1,m2)` will feed to this function.

The documentation for this class was generated from the following file:

6.1046.1 Detailed Description

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>, type-
name _Alloc = allocator<_Value>>
class std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >
```

A standard container composed of equivalent keys (possibly containing multiple of each key value) in which the elements' keys are the elements themselves.

Template Parameters

<code>_Value</code>	Type of key objects.
<code>_Hash</code>	Hashing function object type, defaults to <code>hash<_Value></code> .
<code>_Pred</code>	Predicate function object type, defaults to <code>equal_to<_Value></code> .
<code>_Alloc</code>	Allocator type, defaults to <code>allocator<_Key></code> .

Meets the requirements of a [container](#), and [unordered associative container](#)

Base is `_Hashtable`, dispatched at compile time via template alias `__umset_hashtable`.

6.1046.2 Member Typedef Documentation

allocator_type

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
typedef _Hashtable::allocator_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >↵
::allocator_type
```

Public typedefs.

const_iterator

```

6.1046.3 Constructor & Destructor Documentation**unordered_multiset()** [1/7]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
```

```
typename _Alloc = allocator<_Value>>
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset ( ) [default]
Default constructor.
```

unordered_multiset() [2/7]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
    size_type __n,
    const hasher & __hf = hasher(),
    const key_equal & __eq1 = key_equal(),
    const allocator_type & __a = allocator_type() ) [inline], [explicit]
```

Default constructor creates no elements.

Parameters

<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eq1</code>	A key equality functor.
<code>__a</code>	An allocator object.

unordered_multiset() [3/7]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _InputIterator >
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
    _InputIterator __first,
    _InputIterator __last,
    size_type __n = 0,
    const hasher & __hf = hasher(),
    const key_equal & __eq1 = key_equal(),
    const allocator_type & __a = allocator_type() ) [inline]
```

Builds an unordered_multiset from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eq1</code>	A key equality functor.
<code>__a</code>	An allocator object.

Create an unordered_multiset consisting of copies of the elements from [`__first`,`__last`). This is linear in N (where N is distance(`__first`,`__last`)).

unordered_multiset() [4/7]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
    const unordered_multiset< _Value, _Hash, _Pred, _Alloc > & ) [default]
```

Copy constructor.

unordered_multiset() [5/7]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
    unordered_multiset< _Value, _Hash, _Pred, _Alloc > && ) [default]
```

Move constructor.

unordered_multiset() [6/7]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
    initializer_list< value_type > __l,
    size_type __n = 0,
    const hasher & __hf = hasher(),
    const key_equal & __eq1 = key_equal(),
    const allocator_type & __a = allocator_type() ) [inline]
```

Builds an unordered_multiset from an initializer_list.

Parameters

<code>__l</code>	An initializer_list.
<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eq1</code>	A key equality functor.
<code>__a</code>	An allocator object.

Create an unordered_multiset consisting of copies of the elements in the list. This is linear in N (where N is `__l.size()`).

unordered_multiset() [7/7]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
    const allocator_type & __a ) [inline], [explicit]
```

Creates an unordered_multiset with no elements.

Parameters

<code>__a</code>	An allocator object.
------------------	----------------------

6.1046.4 Member Function Documentation

begin() [1/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::begin ( ) const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered_multiset.

begin() [2/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::begin ( ) [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered_multiset.

begin() [3/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::begin (
    size_type __n ) [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

Returns

A read-only local iterator.

begin() [4/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::begin (
    size_type __n ) const [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

Returns

A read-only local iterator.

bucket_count()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::bucket_count ( ) const [inline],
[noexcept]
```

Returns the number of buckets of the unordered_multiset.

cbegin() [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::cbegin ( ) const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the `unordered_multiset`.

cbegin() [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::cbegin (
    size_type __n ) const [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

Returns

A read-only local iterator.

cend() [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::cend ( ) const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the `unordered_multiset`.

Referenced by `std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert()`.

cend() [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::cend (
    size_type __n ) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

Returns

A read-only local iterator.

clear()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
```

```
typename _Alloc = allocator<_Value>>
```

```
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::clear ( ) [inline], [noexcept]
```

Erases all elements in an unordered_multiset.

Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

contains() [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value> ,
```

```
typename _Alloc = allocator<_Value>>
```

```
template<typename _Kt >
```

```
auto std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::contains (
    const _Kt & __x ) const -> decltype(_M_h._M_find_tr(__x), void(), true) [inline]
```

Finds whether an element with the given key exists.

Parameters

 __x	Key of elements to be located.
--	--------------------------------

Returns

True if there is any element with the specified key.

contains() [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value> ,
```

```
typename _Alloc = allocator<_Value>>
```

```
bool std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::contains (
    const key_type & __x ) const [inline]
```

Finds whether an element with the given key exists.

Parameters

 __x	Key of elements to be located.
--	--------------------------------

Returns

True if there is any element with the specified key.

count() [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value> ,
```

```
typename _Alloc = allocator<_Value>>
```

```
template<typename _Kt >
```

```
auto std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::count (
    const _Kt & __x ) const -> decltype(_M_h._M_count_tr(__x)) [inline]
```

Finds the number of elements.

Parameters

<code>_↔</code>	Element to located.
<code>_X</code>	

Returns

Number of elements with specified key.

count() [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::count (
    const key_type & __x ) const [inline]
```

Finds the number of elements.

Parameters

<code>_↔</code>	Element to located.
<code>_X</code>	

Returns

Number of elements with specified key.

emplace()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename... _Args>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::emplace (
    _Args &&... __args ) [inline]
```

Builds and insert an element into the unordered_multiset.

Parameters

<code>__args</code>	Arguments used to generate an element.
---------------------	--

Returns

An iterator that points to the inserted element.

Insertion requires amortized constant time.

emplace_hint()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename... _Args>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::emplace_hint (
    const_iterator __pos,
    _Args &&... __args ) [inline]
```

Inserts an element into the `unordered_multiset`.

Parameters

<code>__pos</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__args</code>	Arguments used to generate the element to be inserted.

Returns

An iterator that points to the inserted element.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.↵html#containers.associative.insert_hints

Insertion requires amortized constant time.

empty()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
bool std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::empty ( ) const [inline], [noexcept]
```

Returns true if the `unordered_multiset` is empty.

end() [1/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::end ( ) const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the `unordered_multiset`.

end() [2/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::end ( ) [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the `unordered_multiset`.

Referenced by `std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::extract()`.

end() [3/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::end (
    size_type __n ) [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

<code>__↵</code>	The bucket index.
<code>__n</code>	

Returns

A read-only local iterator.

end() [4/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::end (
    size_type __n ) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

$_n$	The bucket index.
-------	-------------------

Returns

A read-only local iterator.

equal_range() [1/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _Kt >
auto std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::equal_range (
    const _Kt & __x ) -> decltype(_M_h._M_equal_range_tr(__x)) [inline]
```

Finds a subsequence matching given key.

Parameters

$_x$	Key to be located.
-------	--------------------

Returns

Pair of iterators that possibly points to the subsequence matching given key.

equal_range() [2/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _Kt >
auto std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::equal_range (
    const _Kt & __x ) const -> decltype(_M_h._M_equal_range_tr(__x)) [inline]
```

Finds a subsequence matching given key.

Parameters

$_x$	Key to be located.
-------	--------------------

Returns

Pair of iterators that possibly points to the subsequence matching given key.

equal_range() [3/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::pair< iterator, iterator > std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::equal_range (
    const key_type & __x ) [inline]
```

Finds a subsequence matching given key.

Parameters

<code>_↔</code> <code>_X</code>	Key to be located.
------------------------------------	--------------------

Returns

Pair of iterators that possibly points to the subsequence matching given key.

equal_range() [4/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::pair< const_iterator, const_iterator > std::unordered_multiset< _Value, _Hash, _Pred, _Alloc
>::equal_range (
    const key_type & __x ) const [inline]
```

Finds a subsequence matching given key.

Parameters

<code>_↔</code> <code>_X</code>	Key to be located.
------------------------------------	--------------------

Returns

Pair of iterators that possibly points to the subsequence matching given key.

erase() [1/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::erase (
    const key_type & __x ) [inline]
```

Erases elements according to the provided key.

Parameters

<code>_↔</code> <code>_X</code>	Key of element to be erased.
------------------------------------	------------------------------

Returns

The number of elements erased.

This function erases all the elements located by the given key from an unordered_multiset.

Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [2/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::erase (
    const_iterator __first,
    const_iterator __last ) [inline]
```

Erases a [*__first*,*__last*) range of elements from an unordered_multiset.

Parameters

<i>__first</i>	Iterator pointing to the start of the range to be erased.
<i>__last</i>	Iterator pointing to the end of the range to be erased.

Returns

The iterator *__last*.

This function erases a sequence of elements from an unordered_multiset.

Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [3/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::erase (
    const_iterator __position ) [inline]
```

Erases an element from an unordered_multiset.

Parameters

<i>__position</i>	An iterator pointing to the element to be erased.
-------------------	---

Returns

An iterator pointing to the element immediately following *__position* prior to the element being erased. If no such element exists, end() is returned.

This function erases an element, pointed to by the given iterator, from an unordered_multiset.

Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [4/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::erase (
    iterator __position ) [inline]
```

Erases an element from an unordered_multiset.

Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

Returns

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an unordered_multiset.

Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

extract() [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
node_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::extract (
    const key_type & __key ) [inline]
```

Extract a node.

extract() [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
node_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::extract (
    const_iterator __pos ) [inline]
```

Extract a node.

References `std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::end()`.

find() [1/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _Kt >
auto std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::find (
    const _Kt & __x ) -> decltype(_M_h._M_find_tr(__x)) [inline]
```

Tries to locate an element in an unordered_multiset.

Parameters

<code>__x</code>	Element to be located.
------------------	------------------------

Returns

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

find() [2/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _Kt >
auto std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::find (
    const _Kt & __x ) const -> decltype(_M_h._M_find_tr(__x))    [inline]
```

Tries to locate an element in an unordered_multiset.

Parameters

 __x	Element to be located.
--	------------------------

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (end()) iterator.

find() [3/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::find (
    const key_type & __x )    [inline]
```

Tries to locate an element in an unordered_multiset.

Parameters

 __x	Element to be located.
--	------------------------

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (end()) iterator.

find() [4/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::find (
    const key_type & __x ) const    [inline]
```

Tries to locate an element in an unordered_multiset.

Parameters

 __x	Element to be located.
--	------------------------

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (end()) iterator.

get_allocator()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
allocator_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::get_allocator ( ) const
[inline], [noexcept]
```

Returns the allocator object used by the unordered_multiset.

hash_function()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
hasher std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::hash_function ( ) const [inline]
```

Returns the hash functor object with which the unordered_multiset was constructed.

insert() [1/8]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _InputIterator >
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
    _InputIterator __first,
    _InputIterator __last ) [inline]
```

A template function that inserts a range of elements.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be inserted.
<code>__last</code>	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

insert() [2/8]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
    const value_type & __x ) [inline]
```

Inserts an element into the unordered_multiset.

Parameters

<code>__x</code>	Element to be inserted.
------------------	-------------------------

Returns

An iterator that points to the inserted element.

Insertion requires amortized constant time.

insert() [3/8]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
    const_iterator __hint,
    const value_type & __x ) [inline]
```

Inserts an element into the unordered_multiset.

Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__x</code>	Element to be inserted.

Returns

An iterator that points to the inserted element.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints

Insertion requires amortized constant.

insert() [4/8]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
    const_iterator __hint,
    node_type && __nh ) [inline]
```

Re-insert an extracted node.

References [std::move\(\)](#).

insert() [5/8]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
    const_iterator __hint,
    value_type && __x ) [inline]
```

Inserts an element into the unordered_multiset.

Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__x</code>	Element to be inserted.

Returns

An iterator that points to the inserted element.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints

Insertion requires amortized constant.

References [std::move\(\)](#).

insert() [6/8]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
    initializer_list< value_type > __l ) [inline]
```

Inserts a list of elements into the unordered_multiset.

Parameters

↔	A std::initializer_list<value_type> of elements to be inserted.
↔	
↔	
↔	
l	

Complexity similar to that of the range constructor.

insert() [7/8]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
    node_type && __nh ) [inline]
```

Re-insert an extracted node.

References [std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::cend\(\)](#), and [std::move\(\)](#).

insert() [8/8]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
    value_type && __x ) [inline]
```

Inserts an element into the unordered_multiset.

Parameters

↔	Element to be inserted.
x	

Returns

An iterator that points to the inserted element.

Insertion requires amortized constant time.

References [std::move\(\)](#).

key_eq()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
key_equal std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::key_eq ( ) const [inline]
```

Returns the key comparison object with which the unordered_multiset was constructed.

load_factor()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
float std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::load_factor ( ) const [inline],
[noexcept]
```

Returns the average number of elements per bucket.

max_bucket_count()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::max_bucket_count ( ) const
[inline], [noexcept]
```

Returns the maximum number of buckets of the unordered_multiset.

max_load_factor() [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
float std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::max_load_factor ( ) const [inline],
[noexcept]
```

Returns a positive number that the unordered_multiset tries to keep the load factor less than or equal to.

max_load_factor() [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::max_load_factor (
float __z ) [inline]
```

Change the unordered_multiset maximum load factor.

Parameters

 <code>__z</code>	The new maximum load factor.
--	------------------------------

max_size()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::max_size ( ) const [inline],
[noexcept]
```

Returns the maximum size of the unordered_multiset.

operator=() [1/3]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
unordered_multiset & std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::operator= (
    const unordered_multiset< _Value, _Hash, _Pred, _Alloc > & ) [default]
```

Copy assignment operator.

operator=() [2/3]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
unordered_multiset & std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::operator= (
    initializer_list< value_type > __l ) [inline]
```

Unordered_multiset list assignment operator.

Parameters

↩	An initializer_list.
↩	
↩	
↩	
/	

This function fills an unordered_multiset with copies of the elements in the initializer list __l.

Note that the assignment completely changes the unordered_multiset and that the resulting unordered_multiset's size is the same as the number of elements assigned.

operator=() [3/3]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
unordered_multiset & std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::operator= (
    unordered_multiset< _Value, _Hash, _Pred, _Alloc > && ) [default]
```

Move assignment operator.

rehash()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::rehash (
    size_type __n ) [inline]
```

May rehash the unordered_multiset.

Parameters

↩	The new number of buckets.
n	

Rehash will occur only if the new number of buckets respect the unordered_multiset maximum load factor.

reserve()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
void std::unordered_multiset<_Value, _Hash, _Pred, _Alloc >::reserve (
    size_type __n ) [inline]
```

Prepare the unordered_multiset for a specified number of elements.

Parameters

\leftrightarrow	Number of elements required.
<code>__n</code>	

Same as `rehash(ceil(n / max_load_factor()))`.

size()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_multiset<_Value, _Hash, _Pred, _Alloc >::size ( ) const [inline],
[noexcept]
```

Returns the size of the unordered_multiset.

swap()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_multiset<_Value, _Hash, _Pred, _Alloc >::swap (
    unordered_multiset<_Value, _Hash, _Pred, _Alloc > & __x ) [inline], [noexcept]
```

Swaps data with another unordered_multiset.

Parameters

\leftrightarrow	An unordered_multiset of the same element and allocator types.
<code>__x</code>	

This exchanges the elements between two sets in constant time. Note that the global `std::swap()` function is specialized such that `std::swap(s1,s2)` will feed to this function.

6.1048.1 Detailed Description

template<typename `_Value`, typename `_Hash` = hash<_Value>, typename `_Pred` = equal_to<_Value>, type-name `_Alloc` = allocator<_Value>>

class std::unordered_set< _Value, _Hash, _Pred, _Alloc >

A standard container composed of unique keys (containing at most one of each key value) in which the elements' keys are the elements themselves.

Template Parameters

<code>_Value</code>	Type of key objects.
<code>_Hash</code>	Hashing function object type, defaults to hash<_Value>.
<code>_Pred</code>	Predicate function object type, defaults to equal_to<_Value>.
<code>_Alloc</code>	Allocator type, defaults to allocator<_Key>.

Meets the requirements of a `container`, and `unordered associative container`

Base is `_Hashtable`, dispatched at compile time via template alias `__uset_hashtable`.

6.1048.3 Constructor & Destructor Documentation

unordered_set() [1/7]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set ( ) [default]
Default constructor.
```

unordered_set() [2/7]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (
    size_type __n,
    const hasher & __hf = hasher(),
    const key_equal & __eq1 = key_equal(),
    const allocator_type & __a = allocator_type() ) [inline], [explicit]
```

Default constructor creates no elements.

Parameters

<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eq1</code>	A key equality functor.
<code>__a</code>	An allocator object.

unordered_set() [3/7]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _InputIterator >
std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (
    _InputIterator __first,
    _InputIterator __last,
    size_type __n = 0,
    const hasher & __hf = hasher(),
    const key_equal & __eq1 = key_equal(),
    const allocator_type & __a = allocator_type() ) [inline]
```

Builds an unordered_set from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eq1</code>	A key equality functor.
<code>__a</code>	An allocator object.

Create an unordered_set consisting of copies of the elements from [`__first`,`__last`). This is linear in N (where N is distance(`__first`,`__last`)).

unordered_set() [4/7]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (
    const unordered_set< _Value, _Hash, _Pred, _Alloc > & ) [default]
```

Copy constructor.

unordered_set() [5/7]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (
    unordered_set< _Value, _Hash, _Pred, _Alloc > && ) [default]
```

Move constructor.

unordered_set() [6/7]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (
    const allocator_type & __a ) [inline], [explicit]
```

Creates an unordered_set with no elements.

Parameters

<code>__a</code>	An allocator object.
------------------	----------------------

unordered_set() [7/7]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (
    initializer_list< value_type > __l,
    size_type __n = 0,
    const hasher & __hf = hasher(),
    const key_equal & __eq1 = key_equal(),
    const allocator_type & __a = allocator_type() ) [inline]
```

Builds an unordered_set from an initializer_list.

Parameters

<code>__l</code>	An initializer_list.
<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eq1</code>	A key equality functor.
<code>__a</code>	An allocator object.

Create an unordered_set consisting of copies of the elements in the list. This is linear in N (where N is `__l.size()`).

6.1048.4 Member Function Documentation

begin() [1/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::begin ( ) const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the `unordered_set`.

begin() [2/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::begin ( ) [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the `unordered_set`.

begin() [3/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::begin (
    size_type __n ) [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

$_n$	The bucket index.
-------	-------------------

Returns

A read-only local iterator.

begin() [4/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::begin (
    size_type __n ) const [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

$_n$	The bucket index.
-------	-------------------

Returns

A read-only local iterator.

bucket_count()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
```

```
size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::bucket_count ( ) const [inline],
[noexcept]
```

Returns the number of buckets of the unordered_set.

cbegin() [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::cbegin ( ) const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the unordered_set.

cbegin() [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::cbegin (
    size_type __n ) const [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

\leftarrow	The bucket index.
n	

Returns

A read-only local iterator.

cend() [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::cend ( ) const [inline],
[noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the unordered_set.

cend() [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::cend (
    size_type __n ) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

\leftarrow	The bucket index.
n	

Returns

A read-only local iterator.

clear()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::clear ( ) [inline], [noexcept]
```

Erases all elements in an `unordered_set`. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

contains() [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _Kt >
auto std::unordered_set< _Value, _Hash, _Pred, _Alloc >::contains (
    const _Kt & __k ) const -> decltype(_M_h._M_find_tr(__k), void()), true) [inline]
```

Finds whether an element with the given key exists.

Parameters

<code>__k</code>	Key of elements to be located.
<code>__x</code>	

Returns

True if there is any element with the specified key.

contains() [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
bool std::unordered_set< _Value, _Hash, _Pred, _Alloc >::contains (
    const key_type & __x ) const [inline]
```

Finds whether an element with the given key exists.

Parameters

<code>__k</code>	Key of elements to be located.
<code>__x</code>	

Returns

True if there is any element with the specified key.

count() [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _Kt >
auto std::unordered_set< _Value, _Hash, _Pred, _Alloc >::count (
    const _Kt & __k ) const -> decltype(_M_h._M_count_tr(__k)) [inline]
```

Finds the number of elements.

Parameters

<code>_↔</code>	Element to located.
<code>_X</code>	

Returns

Number of elements with specified key.

This function only makes sense for unordered_multisets; for unordered_set the result will either be 0 (not present) or 1 (present).

count() [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::count (
    const key_type & __x ) const [inline]
```

Finds the number of elements.

Parameters

<code>_↔</code>	Element to located.
<code>_X</code>	

Returns

Number of elements with specified key.

This function only makes sense for unordered_multisets; for unordered_set the result will either be 0 (not present) or 1 (present).

emplace()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename... _Args>
std::pair< iterator, bool > std::unordered_set< _Value, _Hash, _Pred, _Alloc >::emplace (
    _Args &&... __args ) [inline]
```

Attempts to build and insert an element into the unordered_set.

Parameters

<code>__args</code>	Arguments used to generate an element.
---------------------	--

Returns

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to build and insert an element into the unordered_set. An unordered_set relies on unique keys and thus an element is only inserted if it is not already present in the unordered_set.

Insertion requires amortized constant time.

emplace_hint()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename... _Args>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::emplace_hint (
    const_iterator __pos,
    _Args &&... __args ) [inline]
```

Attempts to insert an element into the `unordered_set`.

Parameters

<code>__pos</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__args</code>	Arguments used to generate the element to be inserted.

Returns

An iterator that points to the element with key equivalent to the one generated from `__args` (may or may not be the element itself).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `emplace()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints

Insertion requires amortized constant time.

empty()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
bool std::unordered_set< _Value, _Hash, _Pred, _Alloc >::empty ( ) const [inline], [noexcept]
```

Returns true if the `unordered_set` is empty.

end() [1/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::end ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the `unordered_set`.

end() [2/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::end ( ) [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the `unordered_set`.
Referenced by `std::unordered_set< _Value, _Hash, _Pred, _Alloc >::extract()`.

end() [3/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::end (
    size_type __n ) [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

$_↔$ $_n$	The bucket index.
----------------	-------------------

Returns

A read-only local iterator.

end() [4/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_local_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::end (
    size_type __n ) const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

$_↔$ $_n$	The bucket index.
----------------	-------------------

Returns

A read-only local iterator.

equal_range() [1/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _Kt >
auto std::unordered_set< _Value, _Hash, _Pred, _Alloc >::equal_range (
    const _Kt & __k ) -> decltype(_M_h._M_equal_range_tr(__k)) [inline]
```

Finds a subsequence matching given key.

Parameters

$_↔$ $_x$	Key to be located.
----------------	--------------------

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for multisets.

equal_range() [2/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _Kt >
auto std::unordered_set< _Value, _Hash, _Pred, _Alloc >::equal_range (
    const _Kt & __k ) const -> decltype(_M_h._M_equal_range_tr(__k)) [inline]
```

Finds a subsequence matching given key.

Parameters

<code>_↵</code>	Key to be located.
<code>_X</code>	

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for multisets.

equal_range() [3/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::pair< iterator, iterator > std::unordered_set< _Value, _Hash, _Pred, _Alloc >::equal_range
(
    const key_type & __x ) [inline]
```

Finds a subsequence matching given key.

Parameters

<code>_↵</code>	Key to be located.
<code>_X</code>	

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for multisets.

equal_range() [4/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::pair< const_iterator, const_iterator > std::unordered_set< _Value, _Hash, _Pred, _Alloc >↵
::equal_range (
    const key_type & __x ) const [inline]
```

Finds a subsequence matching given key.

Parameters

<code>_↵</code>	Key to be located.
<code>_X</code>	

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for multisets.

erase() [1/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::erase (
    const key_type & __x ) [inline]
```

Erases elements according to the provided key.

Parameters

<code>__x</code>	Key of element to be erased.
------------------	------------------------------

Returns

The number of elements erased.

This function erases all the elements located by the given key from an `unordered_set`. For an `unordered_set` the result of this function can only be 0 (not present) or 1 (present). Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [2/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::erase (
    const_iterator __first,
    const_iterator __last ) [inline]
```

Erases a [`__first`,`__last`) range of elements from an `unordered_set`.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be erased.
<code>__last</code>	Iterator pointing to the end of the range to be erased.

Returns

The iterator `__last`.

This function erases a sequence of elements from an `unordered_set`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

erase() [3/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::erase (
    const_iterator __position ) [inline]
```

Erases an element from an `unordered_set`.

Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

Returns

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an `unordered_set`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

`erase()` [4/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::erase (
    iterator __position ) [inline]
```

Erases an element from an `unordered_set`.

Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

Returns

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an `unordered_set`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

`extract()` [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
node_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::extract (
    const key_type & __key ) [inline]
```

Extract a node.

`extract()` [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
node_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::extract (
    const_iterator __pos ) [inline]
```

Extract a node.

References `std::unordered_set<_Value, _Hash, _Pred, _Alloc>::end()`.

find() [1/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _Kt >
auto std::unordered_set< _Value, _Hash, _Pred, _Alloc >::find (
    const _Kt & __k ) -> decltype(_M_h._M_find_tr(__k))    [inline]
```

Tries to locate an element in an `unordered_set`.

Parameters

<code>__k</code>	Element to be located.
<code>__x</code>	

Returns

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

find() [2/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _Kt >
auto std::unordered_set< _Value, _Hash, _Pred, _Alloc >::find (
    const _Kt & __k ) const -> decltype(_M_h._M_find_tr(__k))    [inline]
```

Tries to locate an element in an `unordered_set`.

Parameters

<code>__k</code>	Element to be located.
<code>__x</code>	

Returns

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

find() [3/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::find (
    const key_type & __x )    [inline]
```

Tries to locate an element in an `unordered_set`.

Parameters

<code>__x</code>	Element to be located.
<code>__x</code>	

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (end()) iterator.

find() [4/4]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
const_iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::find (
    const key_type & __x ) const [inline]
```

Tries to locate an element in an unordered_set.

Parameters

 <code>__x</code>	Element to be located.
--	------------------------

Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (end()) iterator.

get_allocator()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
allocator_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::get_allocator ( ) const [inline],
[noexcept]
```

Returns the allocator object used by the unordered_set.

hash_function()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
hasher std::unordered_set< _Value, _Hash, _Pred, _Alloc >::hash_function ( ) const [inline]
```

Returns the hash functor object with which the unordered_set was constructed.

insert() [1/8]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
template<typename _InputIterator >
void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (
    _InputIterator __first,
    _InputIterator __last ) [inline]
```

A template function that attempts to insert a range of elements.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be inserted.
<code>__last</code>	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

insert() [2/8]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::pair< iterator, bool > std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (
    const value_type & __x ) [inline]
```

Attempts to insert an element into the unordered_set.

Parameters

<code>__x</code>	Element to be inserted.
------------------	-------------------------

Returns

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to insert an element into the unordered_set. An unordered_set relies on unique keys and thus an element is only inserted if it is not already present in the unordered_set. Insertion requires amortized constant time.

insert() [3/8]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (
    const_iterator __hint,
    const value_type & __x ) [inline]
```

Attempts to insert an element into the unordered_set.

Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__x</code>	Element to be inserted.

Returns

An iterator that points to the element with key of __x (may or may not be the element passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument insert() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.↵html#containers.associative.insert_hints

Insertion requires amortized constant.

insert() [4/8]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (
```

```
const_iterator __hint,
value_type && __x ) [inline]
```

Attempts to insert an element into the unordered_set.

Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__x</code>	Element to be inserted.

Returns

An iterator that points to the element with key of `__x` (may or may not be the element passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `insert()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints

Insertion requires amortized constant.

References [std::move\(\)](#).

insert() [5/8]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (
    const_iterator ,
    node_type && __nh ) [inline]
```

Re-insert an extracted node.

References [std::move\(\)](#).

insert() [6/8]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (
    initializer_list< value_type > __l ) [inline]
```

Attempts to insert a list of elements into the unordered_set.

Parameters

<code>__l</code>	A std::initializer_list<value_type> of elements to be inserted.
------------------	---

Complexity similar to that of the range constructor.

insert() [7/8]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
insert_return_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (
```

```
node_type && __nh ) [inline]
```

Re-insert an extracted node.

References [std::move\(\)](#).

insert() [8/8]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
std::pair< iterator, bool > std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (
    value_type && __x ) [inline]
```

Attempts to insert an element into the `unordered_set`.

Parameters

<code>__x</code>	Element to be inserted.
------------------	-------------------------

Returns

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a `bool` that is true if the element was actually inserted.

This function attempts to insert an element into the `unordered_set`. An `unordered_set` relies on unique keys and thus an element is only inserted if it is not already present in the `unordered_set`.

Insertion requires amortized constant time.

References [std::move\(\)](#).

key_eq()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
key_equal std::unordered_set< _Value, _Hash, _Pred, _Alloc >::key_eq ( ) const [inline]
```

Returns the key comparison object with which the `unordered_set` was constructed.

load_factor()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
float std::unordered_set< _Value, _Hash, _Pred, _Alloc >::load_factor ( ) const [inline], [noexcept]
```

Returns the average number of elements per bucket.

max_bucket_count()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::max_bucket_count ( ) const [inline],
[noexcept]
```

Returns the maximum number of buckets of the `unordered_set`.

max_load_factor() [1/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
float std::unordered_set< _Value, _Hash, _Pred, _Alloc >::max_load_factor ( ) const [inline],
[noexcept]
```

Returns a positive number that the `unordered_set` tries to keep the load factor less than or equal to.

max_load_factor() [2/2]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::max_load_factor (
    float __z ) [inline]
```

Change the unordered_set maximum load factor.

Parameters

<code>__z</code>	The new maximum load factor.
------------------	------------------------------

max_size()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::max_size ( ) const [inline], [noexcept]
```

Returns the maximum size of the unordered_set.

operator=() [1/3]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
unordered_set & std::unordered_set< _Value, _Hash, _Pred, _Alloc >::operator= (
    const unordered_set< _Value, _Hash, _Pred, _Alloc > & ) [default]
```

Copy assignment operator.

operator=() [2/3]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
unordered_set & std::unordered_set< _Value, _Hash, _Pred, _Alloc >::operator= (
    initializer_list< value_type > __l ) [inline]
```

Unordered_set list assignment operator.

Parameters

<code>__l</code>	An initializer_list.
------------------	----------------------

This function fills an unordered_set with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the unordered_set and that the resulting unordered_set's size is the same as the number of elements assigned.

operator=() [3/3]

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
unordered_set & std::unordered_set< _Value, _Hash, _Pred, _Alloc >::operator= (
    unordered_set< _Value, _Hash, _Pred, _Alloc > && ) [default]
```

Move assignment operator.

rehash()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::rehash (
    size_type __n ) [inline]
```

May rehash the unordered_set.

Parameters

<code>__n</code>	The new number of buckets.
------------------	----------------------------

Rehash will occur only if the new number of buckets respect the unordered_set maximum load factor.

reserve()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::reserve (
    size_type __n ) [inline]
```

Prepare the unordered_set for a specified number of elements.

Parameters

<code>__n</code>	Number of elements required.
------------------	------------------------------

Same as rehash(ceil(n / max_load_factor())).

size()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::size ( ) const [inline], [noexcept]
```

Returns the size of the unordered_set.

swap()

```
template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>,
typename _Alloc = allocator<_Value>>
void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::swap (
    unordered_set< _Value, _Hash, _Pred, _Alloc > & __x ) [inline], [noexcept]
```

Swaps data with another unordered_set.

Parameters

<code>__x</code>	An unordered_set of the same element and allocator types.
------------------	---

This exchanges the elements between two sets in constant time. Note that the global std::swap() function is specialized such that std::swap(s1,s2) will feed to this function.

6.1049.1 Detailed Description

A non-thread-safe memory resource that manages pools of fixed-size blocks.

6.1049.2 Member Function Documentation

do_allocate()

```
void * std::pmr::unsynchronized_pool_resource::do_allocate (
    size_t __bytes,
    size_t __alignment ) [override], [protected], [virtual]
```

Implements [std::pmr::memory_resource](#).

do_deallocate()

```
void std::pmr::unsynchronized_pool_resource::do_deallocate (
    void * __p,
    size_t __bytes,
    size_t __alignment ) [override], [protected], [virtual]
```

Implements [std::pmr::memory_resource](#).

do_is_equal()

```
bool std::pmr::unsynchronized_pool_resource::do_is_equal (
    const memory\_resource & __other ) const [inline], [override], [protected], [virtual],
[noexcept]
```

Implements [std::pmr::memory_resource](#).

6.1054.1 Detailed Description

```
template<class _Tp>
class std::valarray<_Tp>
```

Smart array designed to support numeric processing.

A valarray is an array that provides constraints intended to allow for effective optimization of numeric array processing by reducing the aliasing that can result from pointer representations. It represents a one-dimensional array from which different multidimensional subsets can be accessed and modified.

Template Parameters

<code>_Tp</code>	Type of object in the array.
------------------	------------------------------

6.1054.2 Constructor & Destructor Documentation

`valarray()`

```
template<class _Tp>
std::valarray<_Tp>::valarray (
    const _Tp * __restrict__,
    size_t )
```

Construct an array initialized to the first n elements of t .

6.1054.3 Member Function Documentation

`operator"!")()`

```
template<class _Tp>
_UnaryOp< __logical_not >::_Rt std::valarray<_Tp>::operator! ( ) const
```

Return a new valarray by applying unary ! to each element.

`operator%=()` [1/2]

```
template<class _Tp>
valarray<_Tp> & std::valarray<_Tp>::operator%= (
    const _Tp & )
```

Set each element e of array to $e \% t$.

`operator%=()` [2/2]

```
template<class _Tp>
valarray<_Tp> & std::valarray<_Tp>::operator%= (
    const valarray<_Tp> & )
```

Modulo elements of array by corresponding elements of v .

`operator&=()` [1/2]

```
template<class _Tp>
valarray<_Tp> & std::valarray<_Tp>::operator&= (
    const _Tp & )
```

Set each element e of array to $e \& t$.

operator&=() [2/2]

```
template<class _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator&= (
    const valarray< _Tp > & )
```

Logical and corresponding elements of *v* with elements of array.

operator*=() [1/2]

```
template<class _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator*= (
    const _Tp & )
```

Multiply each element of array by *t*.

operator*=() [2/2]

```
template<class _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator*= (
    const valarray< _Tp > & )
```

Multiply elements of array by corresponding elements of *v*.

operator+()

```
template<class _Tp >
UnaryOp< __unary_plus >::_Rt std::valarray< _Tp >::operator+ ( ) const
```

Return a new valarray by applying unary + to each element.

operator+=() [1/2]

```
template<class _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator+= (
    const _Tp & )
```

Add *t* to each element of array.

operator+=() [2/2]

```
template<class _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator+= (
    const valarray< _Tp > & )
```

Add corresponding elements of *v* to elements of array.

operator-()

```
template<class _Tp >
UnaryOp< __negate >::_Rt std::valarray< _Tp >::operator- ( ) const
```

Return a new valarray by applying unary - to each element.

operator-=() [1/2]

```
template<class _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator-= (
    const _Tp & )
```

Subtract *t* to each element of array.

operator-=() [2/2]

```
template<class _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator-= (
    const valarray< _Tp > & )
```

Subtract corresponding elements of *v* from elements of array.

operator/=([1/2]

```
template<class _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator/= (
    const _Tp & )
```

Divide each element of array by *t*.

operator/=([2/2]

```
template<class _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator/= (
    const valarray< _Tp > & )
```

Divide elements of array by corresponding elements of *v*.

operator<<=([1/2]

```
template<class _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator<<= (
    const _Tp & )
```

Left shift each element *e* of array by *t* bits.

operator<<=([2/2]

```
template<class _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator<<= (
    const valarray< _Tp > & )
```

Left shift elements of array by corresponding elements of *v*.

operator>>=([1/2]

```
template<class _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator>>= (
    const _Tp & )
```

Right shift each element *e* of array by *t* bits.

operator>>=([2/2]

```
template<class _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator>>= (
    const valarray< _Tp > & )
```

Right shift elements of array by corresponding elements of *v*.

operator^=([1/2]

```
template<class _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator^= (
    const _Tp & )
```

Set each element *e* of array to $e \wedge t$.

operator^=() [2/2]

```
template<class _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator^= (
    const valarray< _Tp > & )
```

Logical xor corresponding elements of *v* with elements of array.

operator" |=() [1/2]

```
template<class _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator|= (
    const _Tp & )
```

Set each element *e* of array to *e* | *t*.

operator" |=() [2/2]

```
template<class _Tp >
valarray< _Tp > & std::valarray< _Tp >::operator|= (
    const valarray< _Tp > & )
```

Logical or corresponding elements of *v* with elements of array.

operator~()

```
template<class _Tp >
__UnaryOp< __bitwise_not >::Rt std::valarray< _Tp >::operator~ ( ) const
```

Return a new valarray by applying unary ~ to each element.

6.1056.1 Detailed Description

`template<typename _Tp, typename _Alloc = std::allocator<_Tp>>`
class `std::vector< _Tp, _Alloc >`

A standard container which offers fixed time access to individual elements in any order.

Template Parameters

<code>_Tp</code>	Type of element.
<code>_Alloc</code>	Allocator type, defaults to <code>allocator<_Tp></code> .

Meets the requirements of a [container](#), a [reversible container](#), and a [sequence](#), including the [optional sequence requirements](#) with the exception of `push_front` and `pop_front`.

In some terminology a vector can be described as a dynamic C-style array, it offers fast and efficient access to individual elements in any order and saves the user from worrying about memory and size allocation. Subscripting (`[]`) access is also provided as with C-style arrays.

6.1056.2 Constructor & Destructor Documentation

vector() [1/10]

`template<typename _Tp , typename _Alloc = std::allocator<_Tp>>`
[std::vector](#)< _Tp, _Alloc >::vector () [default]

Creates a vector with no elements.

vector() [2/10]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
constexpr std::vector< _Tp, _Alloc >::vector (
    const allocator_type & __a ) [inline], [explicit], [constexpr], [noexcept]
```

Creates a vector with no elements.

Parameters

<code>__a</code>	An allocator object.
------------------	----------------------

vector() [3/10]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
constexpr std::vector< _Tp, _Alloc >::vector (
    size_type __n,
    const allocator_type & __a = allocator_type() ) [inline], [explicit], [constexpr]
```

Creates a vector with default constructed elements.

Parameters

<code>__n</code>	The number of elements to initially create.
<code>__a</code>	An allocator.

This constructor fills the vector with `__n` default constructed elements.

vector() [4/10]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
constexpr std::vector< _Tp, _Alloc >::vector (
    size_type __n,
    const value_type & __value,
    const allocator_type & __a = allocator_type() ) [inline], [constexpr]
```

Creates a vector with copies of an exemplar element.

Parameters

<code>__n</code>	The number of elements to initially create.
<code>__value</code>	An element to copy.
<code>__a</code>	An allocator.

This constructor fills the vector with `__n` copies of `__value`.

vector() [5/10]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
constexpr std::vector< _Tp, _Alloc >::vector (
    const vector< _Tp, _Alloc > & __x ) [inline], [constexpr]
```

Vector copy constructor.

Parameters

<code>__x</code>	A vector of identical element and allocator types.
------------------	--

All the elements of `__x` are copied, but any unused capacity in `__x` will not be copied (i.e. `capacity() == size()` in the new vector).

The newly-created vector uses a copy of the allocator object used by `__x` (unless the allocator traits dictate a different object).

References [std::vector<_Tp, _Alloc >::begin\(\)](#), and [std::vector<_Tp, _Alloc >::end\(\)](#).

vector() [6/10]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
std::vector<_Tp, _Alloc >::vector (
    vector<_Tp, _Alloc > && ) [default], [noexcept]
```

Vector move constructor.

The newly-created vector contains the exact contents of the moved instance. The contents of the moved instance are a valid, but unspecified vector.

vector() [7/10]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
constexpr std::vector<_Tp, _Alloc >::vector (
    const vector<_Tp, _Alloc > & __x,
    const __type_identity_t< allocator_type > & __a ) [inline], [constexpr]
```

Copy constructor with alternative allocator.

vector() [8/10]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
constexpr std::vector<_Tp, _Alloc >::vector (
    vector<_Tp, _Alloc > && __rv,
    const __type_identity_t< allocator_type > & __m ) [inline], [constexpr], [noexcept]
```

Move constructor with alternative allocator.

vector() [9/10]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
constexpr std::vector<_Tp, _Alloc >::vector (
    initializer_list< value_type > __l,
    const allocator_type & __a = allocator_type() ) [inline], [constexpr]
```

Builds a vector from an initializer list.

Parameters

<code>__l</code>	An initializer_list.
<code>__a</code>	An allocator.

Create a vector consisting of copies of the elements in the initializer_list `__l`.

This will call the element type's copy constructor N times (where N is `__l.size()`) and do no memory reallocation.

vector() [10/10]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
template<typename _InputIterator , typename = std::_RequireInputIter<_InputIterator>>
constexpr std::vector< _Tp, _Alloc >::vector (
    _InputIterator __first,
    _InputIterator __last,
    const allocator_type & __a = allocator_type() ) [inline], [constexpr]
```

Builds a vector from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__a</code>	An allocator.

Create a vector consisting of copies of the elements from [first,last).

If the iterators are forward, bidirectional, or random-access, then this will call the elements' copy constructor *N* times (where *N* is distance(first,last)) and do no memory reallocation. But if only input iterators are used, then this will do at most 2*N* calls to the copy constructor, and log*N* memory reallocations.

References [std::_iterator_category\(\)](#).

~vector()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
constexpr std::vector< _Tp, _Alloc >::~~vector ( ) [inline], [constexpr], [noexcept]
```

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

References [std::_Destroy\(\)](#).

6.1056.3 Member Function Documentation**_M_allocate_and_copy()**

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
template<typename _ForwardIterator >
constexpr pointer std::vector< _Tp, _Alloc >::_M_allocate_and_copy (
    size_type __n,
    _ForwardIterator __first,
    _ForwardIterator __last ) [inline], [constexpr], [protected]
```

Memory expansion handler. Uses the member allocation function to obtain *n* bytes of memory, and then copies [first,last) into it.

_M_range_check()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
constexpr void std::vector< _Tp, _Alloc >::_M_range_check (
    size_type __n ) const [inline], [constexpr], [protected]
```

Safety check used only from at().

References [std::vector< _Tp, _Alloc >::size\(\)](#).

Referenced by [std::vector< _Tp, _Alloc >::at\(\)](#), and [std::vector< _Tp, _Alloc >::at\(\)](#).

assign() [1/3]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
```

```
template<typename _InputIterator , typename = std::_RequireInputIter<_InputIterator>>>
constexpr void std::vector< _Tp, _Alloc >::assign (
    _InputIterator __first,
    _InputIterator __last ) [inline], [constexpr]
```

Assigns a range to a vector.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

This function fills a vector with copies of the elements in the range `[__first,__last)`.

Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned.

assign() [2/3]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>>
constexpr void std::vector< _Tp, _Alloc >::assign (
    initializer_list< value_type > __l ) [inline], [constexpr]
```

Assigns an initializer list to a vector.

Parameters

<code>↵</code>	An initializer_list.
<code>__↵</code>	
<code>↵</code>	
<code>__↵</code>	
<code>/</code>	

This function fills a vector with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned.

assign() [3/3]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>>
constexpr void std::vector< _Tp, _Alloc >::assign (
    size_type __n,
    const value_type & __val ) [inline], [constexpr]
```

Assigns a given value to a vector.

Parameters

<code>__n</code>	Number of elements to be assigned.
<code>__val</code>	Value to be assigned.

This function fills a vector with `__n` copies of the given value. Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned.

at() [1/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>>
```

```
constexpr reference std::vector< _Tp, _Alloc >::at (
    size_type __n ) [inline], [constexpr]
```

Provides access to the data contained in the vector.

Parameters

 __n	The index of the element for which data should be accessed.
--	---

Returns

Read/write reference to data.

Exceptions

std::out_of_range	If __n is an invalid index.
-----------------------------------	---

This function provides for safer data access. The parameter is first checked that it is in the range of the vector. The function throws [out_of_range](#) if the check fails.

References [std::vector< _Tp, _Alloc >::_M_range_check\(\)](#).

at() [2/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
constexpr const_reference std::vector< _Tp, _Alloc >::at (
    size_type __n ) const [inline], [constexpr]
```

Provides access to the data contained in the vector.

Parameters

 __n	The index of the element for which data should be accessed.
--	---

Returns

Read-only (constant) reference to data.

Exceptions

std::out_of_range	If __n is an invalid index.
-----------------------------------	---

This function provides for safer data access. The parameter is first checked that it is in the range of the vector. The function throws [out_of_range](#) if the check fails.

References [std::vector< _Tp, _Alloc >::_M_range_check\(\)](#).

back() [1/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
constexpr const_reference std::vector< _Tp, _Alloc >::back ( ) const [inline], [constexpr],
[noexcept]
```

Returns a read-only (constant) reference to the data at the last element of the vector.

References [std::vector< _Tp, _Alloc >::end\(\)](#).

back() [2/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
constexpr reference std::vector< _Tp, _Alloc >::back ( ) [inline], [constexpr], [noexcept]
```

Returns a read/write reference to the data at the last element of the vector.

References `std::vector<_Tp, _Alloc>::end()`.

Referenced by `std::piecewise_constant_distribution<_RealType>::max()`, and `std::piecewise_linear_distribution<_RealType>::max()`.

```
begin() [1/2]
```

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
constexpr const_iterator std::vector< _Tp, _Alloc >::begin ( ) const [inline], [constexpr],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the vector. Iteration is done in ordinary element order.

begin() [2/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
constexpr iterator std::vector< _Tp, _Alloc >::begin ( ) [inline], [constexpr], [noexcept]
```

Returns a read/write iterator that points to the first element in the vector. Iteration is done in ordinary element order.

Referenced by `std::vector<_Tp,_Alloc>::vector()`, `std::match_results<_Bi_iter,_Alloc>::begin()`, `std::vector<_Tp,_Alloc>::crend()`, `std::vector<_Tp,_Alloc>::empty()`, `std::vector<_Tp,_Alloc>::erase()`, `std::vector<_Tp,_Alloc>::erase()`, `std::vector<_Tp,_Alloc>::front()`, `std::vector<_Tp,_Alloc>::insert()`, `std::vector<_Tp,_Alloc>::insert()`, `std::vector<_Tp,_Alloc>::__gnu_parallel::multiway_merge_exact_splitting()`, `std::operator<()`, `std::vector<_Tp,_Alloc>::operator=()`, `std::operator==(())`, `std::vector<_Tp,_Alloc>::rend()`, and `std::vector<_Tp,_Alloc>::rend()`.

capacity()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
constexpr size_type std::vector< _Tp, _Alloc >::capacity ( ) const [inline], [constexpr], [noexcept]
```

Returns the total number of elements that the vector can hold before needing to allocate more memory.

cbegin()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
constexpr const_iterator std::vector<_Tp, _Alloc >::cbegin ( ) const [inline], [constexpr],
[noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the vector. Iteration is done in ordinary element order.

Referenced by `std::vector<_Tp, _Alloc>::erase()`, `std::vector<_Tp, _Alloc>::erase()`, `std::vector<_Tp, _Alloc>::insert()`, `std::vector<_Tp, _Alloc>::insert()`, and `std::vector<_Tp, _Alloc>::insert()`.

cend()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
constexpr const_iterator std::vector< _Tp, _Alloc >::cend ( ) const [inline], [constexpr], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the vector. Iteration is done in ordinary element order.

clear()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
constexpr void std::vector< _Tp, _Alloc >::clear ( ) [inline], [constexpr], [noexcept]
```

Erases all the elements. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

crbegin()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
constexpr const_reverse_iterator std::vector< _Tp, _Alloc >::crbegin ( ) const [inline], [constexpr], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the vector. Iteration is done in reverse element order.

References [std::vector< _Tp, _Alloc >::end\(\)](#).

crend()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
constexpr const_reverse_iterator std::vector< _Tp, _Alloc >::crend ( ) const [inline], [constexpr], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first element in the vector. Iteration is done in reverse element order.

References [std::vector< _Tp, _Alloc >::begin\(\)](#).

data()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
constexpr _Tp * std::vector< _Tp, _Alloc >::data ( ) [inline], [constexpr], [noexcept]
```

Returns a pointer such that `[data(), data() + size())` is a valid range. For a non-empty vector, `data() == &front()`.

emplace()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
template<typename... _Args>
constexpr iterator std::vector< _Tp, _Alloc >::emplace (
    const_iterator __position,
    _Args &&... __args ) [inline], [constexpr]
```

Inserts an object in vector before specified iterator.

Parameters

<code>__position</code>	A <code>const_iterator</code> into the vector.
<code>__args</code>	Arguments.

Returns

An iterator that points to the inserted data.

This function will insert an object of type `T` constructed with `T(std::forward<Args>(args)...) before the specified location`. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

empty()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
constexpr bool std::vector< _Tp, _Alloc >::empty ( ) const [inline], [constexpr], [noexcept]
```

Returns true if the vector is empty. (Thus `begin()` would equal `end()`.)

References [std::vector< _Tp, _Alloc >::begin\(\)](#), and [std::vector< _Tp, _Alloc >::end\(\)](#).

Referenced by [std::piecewise_constant_distribution< _RealType >::densities\(\)](#), [std::piecewise_linear_distribution< _RealType >::densities\(\)](#), [std::match_results< _Bi_iter, _Alloc >::end\(\)](#), [std::piecewise_constant_distribution< _RealType >::intervals\(\)](#), [std::piecewise_linear_distribution< _RealType >::intervals\(\)](#), [std::discrete_distribution< _IntType >::max\(\)](#), [std::piecewise_constant_distribution< _RealType >::max\(\)](#), [std::piecewise_linear_distribution< _RealType >::max\(\)](#).

[std::piecewise_constant_distribution<_RealType>::min\(\)](#), [std::piecewise_linear_distribution<_RealType>::min\(\)](#), [std::discrete_distribution<_IntType>::probabilities\(\)](#), [std::match_results<_Bi_iter, _Alloc>::ready\(\)](#), and [std::match_results<_Bi_iter,](#)

end() [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
constexpr const_iterator std::vector<\_Tp, \_Alloc>::end \( \) const [inline], [constexpr], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the vector. Iteration is done in ordinary element order.

end() [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
constexpr iterator std::vector<\_Tp, \_Alloc>::end \( \) [inline], [constexpr], [noexcept]
```

Returns a read/write iterator that points one past the last element in the vector. Iteration is done in ordinary element order.

Referenced by [std::vector<_Tp, _Alloc>::vector\(\)](#), [std::vector<_Tp, _Alloc>::back\(\)](#), [std::vector<_Tp, _Alloc>::back\(\)](#), [std::vector<_Tp, _Alloc>::cbegin\(\)](#), [std::vector<_Tp, _Alloc>::empty\(\)](#), [std::match_results<_Bi_iter, _Alloc>::end\(\)](#), [__gnu_parallel::multiway_merge_exact_splitting\(\)](#), [std::operator<\(\)](#), [std::vector<_Tp, _Alloc>::operator=\(\)](#), [std::operator==\(\)](#), [std::vector<_Tp, _Alloc>::push_back\(\)](#), [std::vector<_Tp, _Alloc>::rbegin\(\)](#), [std::vector<_Tp, _Alloc>::rbegin\(\)](#), and [std::vector<_Tp, _Alloc>::resize\(\)](#).

erase() [1/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
constexpr iterator std::vector<\_Tp, \_Alloc>::erase \(
    const_iterator __first,
    const_iterator __last ) [inline], [constexpr]
```

Remove a range of elements.

Parameters

<i>__first</i>	Iterator pointing to the first element to be erased.
<i>__last</i>	Iterator pointing to one past the last element to be erased.

Returns

An iterator pointing to the element pointed to by *__last* prior to erasing (or [end\(\)](#)).

This function will erase the elements in the range [*__first*,*__last*) and shorten the vector accordingly.

Note This operation could be expensive and if it is frequently used the user should consider using [std::list](#). The user is also cautioned that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

References [std::vector<_Tp, _Alloc>::begin\(\)](#), and [std::vector<_Tp, _Alloc>::cbegin\(\)](#).

erase() [2/2]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
constexpr iterator std::vector<\_Tp, \_Alloc>::erase \(
    const_iterator __position ) [inline], [constexpr]
```

Remove element at given position.

Parameters

<i>__position</i>	Iterator pointing to element to be erased.
-------------------	--

Returns

An iterator pointing to the next element (or end()).

This function will erase the element at the given position and thus shorten the vector by one.

Note This operation could be expensive and if it is frequently used the user should consider using `std::list`. The user is also cautioned that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

References `std::vector<_Tp, _Alloc>::begin()`, and `std::vector<_Tp, _Alloc>::cbegin()`.

front() [1/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
constexpr const_reference std::vector<_Tp, _Alloc>::front ( ) const [inline], [constexpr],
[noexcept]
```

Returns a read-only (constant) reference to the data at the first element of the vector.

References `std::vector<_Tp, _Alloc>::begin()`.

front() [2/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
constexpr reference std::vector<_Tp, _Alloc>::front ( ) [inline], [constexpr], [noexcept]
```

Returns a read/write reference to the data at the first element of the vector.

References `std::vector<_Tp, _Alloc>::begin()`.

Referenced by `std::piecewise_constant_distribution<_RealType>::min()`, and `std::piecewise_linear_distribution<_RealType>::min()`.

get_allocator()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
constexpr allocator_type std::_Vector_base<_Tp, _Alloc>::get_allocator ( ) const [inline],
[constexpr], [noexcept]
```

Get a copy of the memory allocation object.

Referenced by `std::match_results<_Bi_iter, _Alloc>::get_allocator()`.

insert() [1/5]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
template<typename _InputIterator , typename = std::_RequireInputIter<_InputIterator>>
constexpr iterator std::vector<_Tp, _Alloc>::insert (
    const_iterator __position,
    _InputIterator __first,
    _InputIterator __last ) [inline], [constexpr]
```

Inserts a range into the vector.

Parameters

<code>__position</code>	A <code>const_iterator</code> into the vector.
<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

Returns

An iterator that points to the inserted data.

This function will insert copies of the data in the range `[__first,__last)` into the vector before the location specified by `pos`.

Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

References [std::vector<_Tp, _Alloc>::begin\(\)](#), and [std::vector<_Tp, _Alloc>::cbegin\(\)](#).

insert() [2/5]

```
template<typename _Tp, typename _Alloc>
constexpr vector<_Tp, _Alloc>::iterator vector::insert (
    const_iterator __position,
    const value_type & __x ) [constexpr]
```

Inserts given value into vector before specified iterator.

Parameters

<code>__position</code>	A <code>const_iterator</code> into the vector.
<code>__x</code>	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a copy of the given value before the specified location. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

References [std::begin\(\)](#), [std::cbegin\(\)](#), [std::end\(\)](#), and [std::move\(\)](#).

insert() [3/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
constexpr iterator std::vector<_Tp, _Alloc>::insert (
    const_iterator __position,
    initializer\_list<value_type> __l ) [inline], [constexpr]
```

Inserts an `initializer_list` into the vector.

Parameters

<code>__position</code>	An iterator into the vector.
<code>__l</code>	An <code>initializer_list</code> .

This function will insert copies of the data in the `initializer_list l` into the vector before the location specified by `position`. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

References [std::vector<_Tp, _Alloc>::begin\(\)](#), and [std::vector<_Tp, _Alloc>::cbegin\(\)](#).

insert() [4/5]

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
constexpr iterator std::vector<_Tp, _Alloc>::insert (
    const_iterator __position,
    size_type __n,
    const value_type & __x ) [inline], [constexpr]
```

Inserts a number of copies of given data into the vector.

Parameters

<code>__position</code>	A <code>const_iterator</code> into the vector.
-------------------------	--

Parameters

<code>__n</code>	Number of elements to be inserted.
<code>__x</code>	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a specified number of copies of the given data before the location specified by *position*.

Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

References [std::vector<_Tp, _Alloc>::begin\(\)](#), and [std::vector<_Tp, _Alloc>::cbegin\(\)](#).

insert() [5/5]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
constexpr iterator std::vector<\_Tp, \_Alloc>::insert (
    const_iterator __position,
    value_type && __x ) [inline], [constexpr]
```

Inserts given rvalue into vector before specified iterator.

Parameters

<code>__position</code>	A <code>const_iterator</code> into the vector.
<code>__x</code>	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a copy of the given rvalue before the specified location. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

References [std::move\(\)](#).

max_size()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
constexpr size_type std::vector<\_Tp, \_Alloc>::max\_size ( ) const [inline], [constexpr], [noexcept]
```

Returns the `size()` of the largest possible vector.

Referenced by [std::match_results<_Bi_iter, _Alloc>::max_size\(\)](#).

operator=() [1/3]

```
template<typename _Tp , typename _Alloc >
constexpr vector<\_Tp, \_Alloc> & vector::operator= (
    const vector<\_Tp, \_Alloc> & __x ) [constexpr]
```

Vector assignment operator.

Parameters

<code>__x</code>	A vector of identical element and allocator types.
------------------	--

All the elements of `__x` are copied, but any unused capacity in `__x` will not be copied.

Whether the allocator is copied depends on the allocator traits.

References [std::__addressof\(\)](#), [std::_Destroy\(\)](#), [std::vector<_Tp, _Alloc >::begin\(\)](#), [std::begin\(\)](#), [std::vector<_Tp, _Alloc >::end\(\)](#), [std::end\(\)](#), [std::vector<_Tp, _Alloc >::size\(\)](#), and [std::size\(\)](#).

operator=() [2/3]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
constexpr vector & std::vector<_Tp, _Alloc >::operator= (
    initializer_list< value_type > __l ) [inline], [constexpr]
```

Vector list assignment operator.

Parameters

<code>↵</code>	An initializer_list.
<code>↵</code>	
<code>↵</code>	
<code>↵</code>	
<code>l</code>	

This function fills a vector with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned.

operator=() [3/3]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
constexpr vector & std::vector<_Tp, _Alloc >::operator= (
    vector<_Tp, _Alloc > && __x ) [inline], [constexpr], [noexcept]
```

Vector move assignment operator.

Parameters

<code>↵</code>	A vector of identical element and allocator types.
<code>x</code>	

The contents of `__x` are moved into this vector (without copying, if the allocators permit it). Afterwards `__x` is a valid, but unspecified vector.

Whether the allocator is moved depends on the allocator traits.

References [std::move\(\)](#).

operator[]() [1/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
constexpr const_reference std::vector<_Tp, _Alloc >::operator[] (
    size_type __n ) const [inline], [constexpr], [noexcept]
```

Subscript access to the data contained in the vector.

Parameters

<code>↵</code>	The index of the element for which data should be accessed.
<code>n</code>	

Returns

Read-only (constant) reference to data.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and `out_of_range` lookups are not defined. (For checked lookups see `at()`.)

operator[]() [2/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
constexpr reference std::vector< _Tp, _Alloc >::operator[] (
    size_type __n ) [inline], [constexpr], [noexcept]
```

Subscript access to the data contained in the vector.

Parameters

 <code>__n</code>	The index of the element for which data should be accessed.
--	---

Returns

Read/write reference to data.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and `out_of_range` lookups are not defined. (For checked lookups see `at()`.)

Referenced by `std::match_results< _Bi_iter, _Alloc >::operator[]()`.

pop_back()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
constexpr void std::vector< _Tp, _Alloc >::pop_back ( ) [inline], [constexpr], [noexcept]
```

Removes last element.

This is a typical stack operation. It shrinks the vector by one.

Note that no data is returned, and if the last element's data is needed, it should be retrieved before `pop_back()` is called.

push_back()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
constexpr void std::vector< _Tp, _Alloc >::push_back (
    const value_type & __x ) [inline], [constexpr]
```

Add data to the end of the vector.

Parameters

 <code>__x</code>	Data to be added.
--	-------------------

This is a typical stack operation. The function creates an element at the end of the vector and assigns the given data to it. Due to the nature of a vector this operation can be done in constant time if the vector has preallocated space available.

References `std::vector< _Tp, _Alloc >::end()`.

rbegin() [1/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
```

```
constexpr const_reverse_iterator std::vector<_Tp, _Alloc >::rbegin ( ) const [inline], [constexpr], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the vector. Iteration is done in reverse element order.

References [std::vector<_Tp, _Alloc >::end\(\)](#).

rbegin() [2/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
constexpr reverse_iterator std::vector<_Tp, _Alloc >::rbegin ( ) [inline], [constexpr], [noexcept]
```

Returns a read/write reverse iterator that points to the last element in the vector. Iteration is done in reverse element order.

References [std::vector<_Tp, _Alloc >::end\(\)](#).

rend() [1/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
constexpr const_reverse_iterator std::vector<_Tp, _Alloc >::rend ( ) const [inline], [constexpr], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first element in the vector. Iteration is done in reverse element order.

References [std::vector<_Tp, _Alloc >::begin\(\)](#).

rend() [2/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
constexpr reverse_iterator std::vector<_Tp, _Alloc >::rend ( ) [inline], [constexpr], [noexcept]
```

Returns a read/write reverse iterator that points to one before the first element in the vector. Iteration is done in reverse element order.

References [std::vector<_Tp, _Alloc >::begin\(\)](#).

reserve()

```
template<typename _Tp , typename _Alloc >
constexpr void vector::reserve (
    size_type __n ) [constexpr]
```

Attempt to preallocate enough memory for specified number of elements.

Parameters

_↵ _n	Number of elements required.
--	------------------------------

Exceptions

std::length_error	If <i>n</i> exceeds <code>max_size()</code> .
-----------------------------------	---

This function attempts to reserve enough memory for the vector to hold the specified number of elements. If the number requested is more than `max_size()`, `length_error` is thrown.

The advantage of this function is that if optimal code is a necessity and the user can determine the number of elements that will be required, the user can reserve the memory in advance, and thus prevent a possible reallocation of memory and copying of vector data.

References [std::_Destroy\(\)](#), and [std::size\(\)](#).

resize() [1/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
constexpr void std::vector< _Tp, _Alloc >::resize (
    size_type __new_size ) [inline], [constexpr]
```

Resizes the vector to the specified number of elements.

Parameters

<code>__new_size</code>	Number of elements the vector should contain.
-------------------------	---

This function will resize the vector to the specified number of elements. If the number is smaller than the vector's current size the vector is truncated, otherwise default constructed elements are appended.

References [std::vector< _Tp, _Alloc >::size\(\)](#).

Referenced by [__gnu_parallel::__shrink_and_double\(\)](#), and [__gnu_parallel::multiway_merge_exact_splitting\(\)](#).

resize() [2/2]

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
constexpr void std::vector< _Tp, _Alloc >::resize (
    size_type __new_size,
    const value_type & __x ) [inline], [constexpr]
```

Resizes the vector to the specified number of elements.

Parameters

<code>__new_size</code>	Number of elements the vector should contain.
<code>__x</code>	Data with which new elements should be populated.

This function will resize the vector to the specified number of elements. If the number is smaller than the vector's current size the vector is truncated, otherwise the vector is extended and new elements are populated with given data.

References [std::vector< _Tp, _Alloc >::end\(\)](#), and [std::vector< _Tp, _Alloc >::size\(\)](#).

shrink_to_fit()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
constexpr void std::vector< _Tp, _Alloc >::shrink_to_fit ( ) [inline], [constexpr]
```

A non-binding request to reduce capacity() to size().

size()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
constexpr size_type std::vector< _Tp, _Alloc >::size ( ) const [inline], [constexpr], [noexcept]
```

Returns the number of elements in the vector.

Referenced by [__gnu_parallel::__shrink\(\)](#), [__gnu_parallel::__shrink_and_double\(\)](#), [std::vector< _Tp, _Alloc >::M_range_check\(\)](#), [std::match_results< _Bi_iter, _Alloc >::empty\(\)](#), [__gnu_parallel::list_partition\(\)](#), [std::discrete_distribution< _IntType >::max\(\)](#), [std::vector< _Tp, _Alloc >::operator=\(\)](#), [std::operator==\(\)](#), [std::vector< _Tp, _Alloc >::resize\(\)](#), [std::vector< _Tp, _Alloc >::resize\(\)](#), and [std::match_results< _Bi_iter, _Alloc >::size\(\)](#).

swap()

```
template<typename _Tp , typename _Alloc = std::allocator<_Tp>>
```

```
constexpr void std::vector< _Tp, _Alloc >::swap (
    vector< _Tp, _Alloc > & __x ) [inline], [constexpr], [noexcept]
```

Swaps data with another vector.

Parameters

<code>__x</code>	A vector of the same element and allocator types.
------------------	---

This exchanges the elements between two vectors in constant time. (Three pointers, so it should be quite fast.) Note that the global `std::swap()` function is specialized such that `std::swap(v1,v2)` will feed to this function.

Whether the allocators are swapped depends on the allocator traits.

Referenced by [std::match_results< _Bi_iter, _Alloc >::swap\(\)](#).

6.1057.1 Detailed Description

```
template<typename _Alloc>
class std::vector< bool, _Alloc >
```

A specialization of vector for booleans which offers fixed time access to individual elements in any order.

Template Parameters

<code>_Alloc</code>	Allocator type.
---------------------	-----------------

Note that `vector<bool>` does not actually meet the requirements for being a container. This is because the reference and pointer types are not really references and pointers to `bool`. See DR96 for details.

See also

[vector](#) for function documentation.

In some terminology a vector can be described as a dynamic C-style array, it offers fast and efficient access to individual elements in any order and saves the user from worrying about memory and size allocation. Subscripting (`[]`) access is also provided as with C-style arrays.

The documentation for this class was generated from the following files:

6.1060.1 Detailed Description

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Tr = char_traits<_Elem>>
class std::wbuffer_convert<_Codecvt, _Elem, _Tr>
```

Buffer conversions.

6.1060.2 Member Typedef Documentation

`__streambuf_type`

```
template<typename _CharT, typename _Traits>
typedef basic_streambuf<char_type, traits_type> std::basic_streambuf<_CharT, _Traits>::__streambuf_type [inherited]
```

This is a non-standard type.

`char_type`

```
template<typename _CharT, typename _Traits>
typedef _CharT std::basic_streambuf<_CharT, _Traits>::char_type [inherited]
```

These are standard types. They permit a standardized way of referring to names of (or names dependent on) the template parameters, which are specific to the implementation.

int_type

```
template<typename _CharT , typename _Traits >
```

```
typedef traits_type::int_type std::basic_streambuf< _CharT, _Traits >::int_type [inherited]
```

These are standard types. They permit a standardized way of referring to names of (or names dependent on) the template parameters, which are specific to the implementation.

off_type

```
template<typename _CharT , typename _Traits >
```

```
typedef traits_type::off_type std::basic_streambuf< _CharT, _Traits >::off_type [inherited]
```

These are standard types. They permit a standardized way of referring to names of (or names dependent on) the template parameters, which are specific to the implementation.

pos_type

```
template<typename _CharT , typename _Traits >
```

```
typedef traits_type::pos_type std::basic_streambuf< _CharT, _Traits >::pos_type [inherited]
```

These are standard types. They permit a standardized way of referring to names of (or names dependent on) the template parameters, which are specific to the implementation.

traits_type

```
template<typename _CharT , typename _Traits >
```

```
typedef _Traits std::basic_streambuf< _CharT, _Traits >::traits_type [inherited]
```

These are standard types. They permit a standardized way of referring to names of (or names dependent on) the template parameters, which are specific to the implementation.

6.1060.3 Constructor & Destructor Documentation**wbuffer_convert() [1/2]**

```
template<typename _Codecvt , typename _Elem = wchar_t, typename _Tr = char_traits<_Elem>>
```

```
std::wbuffer_convert< _Codecvt, _Elem, _Tr >::wbuffer_convert ( ) [inline]
```

Default constructor.

wbuffer_convert() [2/2]

```
template<typename _Codecvt , typename _Elem = wchar_t, typename _Tr = char_traits<_Elem>>
```

```
std::wbuffer_convert< _Codecvt, _Elem, _Tr >::wbuffer_convert (
```

```
    streambuf * __bytebuf,
```

```
    _Codecvt * __pcvt = new _Codecvt,
```

```
    state_type __state = state_type() ) [inline], [explicit]
```

Constructor.

Parameters

<code>__bytebuf</code>	The underlying byte stream buffer.
<code>__pcvt</code>	The facet to use for conversions.
<code>__state</code>	Initial conversion state.

Takes ownership of `__pcvt` and will delete it in the destructor.

References `std::basic_streambuf< _CharT, _Traits >::setg()`, and `std::basic_streambuf< _CharT, _Traits >::setp()`.

6.1060.4 Member Function Documentation

`eback()`

```
template<typename _CharT , typename _Traits >
char_type * std::basic_streambuf< _CharT, _Traits >::eback ( ) const [inline], [protected],
[inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- `eback()` returns the beginning pointer for the input sequence
- `gptr()` returns the next pointer for the input sequence
- `egptr()` returns the end pointer for the input sequence

`egptr()`

```
template<typename _CharT , typename _Traits >
char_type * std::basic_streambuf< _CharT, _Traits >::egptr ( ) const [inline], [protected],
[inherited]
```

Access to the get area.

These functions are only available to other protected functions, including derived classes.

- `eback()` returns the beginning pointer for the input sequence
- `gptr()` returns the next pointer for the input sequence
- `egptr()` returns the end pointer for the input sequence

Referenced by `std::wbuffer_convert<_Codecvt, _Elem, _Tr>::underflow()`.

`epptr()`

```
template<typename _CharT , typename _Traits >
char_type * std::basic_streambuf< _CharT, _Traits >::epptr ( ) const [inline], [protected],
[inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- `pbase()` returns the beginning pointer for the output sequence
- `pptr()` returns the next pointer for the output sequence
- `epptr()` returns the end pointer for the output sequence

`gbump()`

```
template<typename _CharT , typename _Traits >
void std::basic_streambuf< _CharT, _Traits >::gbump (
    int __n ) [inline], [protected], [inherited]
```

Moving the read position.

Parameters

<code>__n</code>	The delta by which to move.
------------------	-----------------------------

This just advances the read position without returning any data.

getloc()

```
template<typename _CharT , typename _Traits >
locale std::basic_streambuf< _CharT, _Traits >::getloc ( ) const [inline], [inherited]
Locale access.
```

Returns

The current locale in effect.

If `pubimbue(loc)` has been called, then the most recent `loc` is returned. Otherwise the global locale in effect at the time of construction is returned.

gptr()

```
template<typename _CharT , typename _Traits >
char_type * std::basic_streambuf< _CharT, _Traits >::gptr ( ) const [inline], [protected], [inherited]
Access to the get area.
```

These functions are only available to other protected functions, including derived classes.

- `eback()` returns the beginning pointer for the input sequence
- `gptr()` returns the next pointer for the input sequence
- `egptr()` returns the end pointer for the input sequence

Referenced by [std::wbuffer_convert< _Codecvt, _Elem, _Tr >::underflow\(\)](#).

imbue()

```
template<typename _CharT , typename _Traits >
virtual void std::basic_streambuf< _CharT, _Traits >::imbue (
    const locale & __loc ) [inline], [protected], [virtual], [inherited]
```

Changes translations.

Parameters

<code>__loc</code>	A new locale.
--------------------	---------------

Translations done during I/O which depend on the current locale are changed by this call. The standard adds, *Between invocations of this function a class derived from streambuf can safely cache results of calls to locale functions and to members of facets so obtained.*

Note

Base class version does nothing.

Reimplemented in [std::basic_filebuf< _CharT, _Traits >](#), [std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >](#), [std::basic_filebuf< _CharT, std::char_traits< _CharT > >](#), and [std::basic_filebuf< char_type, traits_type >](#).

in_avail()

```
template<typename _CharT , typename _Traits >
streamsize std::basic_streambuf< _CharT, _Traits >::in_avail ( ) [inline], [inherited]
```

Looking ahead into the stream.

Returns

The number of characters available.

If a read position is available, returns the number of characters available for reading before the buffer must be refilled. Otherwise returns the derived `showmanyc()`.

overflow()

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Tr = char_traits<_Elem>>
_Wide_streambuf::int_type std::wbuffer_convert<_Codecvt, _Elem, _Tr>::overflow (
    typename _Wide_streambuf::int_type __c) [inline], [protected], [virtual]
```

Consumes data from the buffer; writes to the controlled sequence.

Parameters

<code>__c</code>	An additional character to consume.
------------------	-------------------------------------

Returns

`eof()` to indicate failure, something else (usually `__c`, or `not_eof()`)

Informally, this function is called when the output buffer is full (or does not exist, as buffering need not actually be done). If a buffer exists, it is *consumed*, with *some effect* on the controlled sequence. (Typically, the buffer is written out to the sequence verbatim.) In either case, the character `c` is also written out, if `__c` is not `eof()`.

For a formal definition of this function, see a good text such as Langer & Kreft, or [27.5.2.4.5]/3-7.

A functioning output streambuf can be created by overriding only this function (no buffer area will be used).

Note

Base class version does nothing, returns `eof()`.

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

References `std::basic_streambuf<_CharT, _Traits>::sputc()`.

pbackfail()

```
template<typename _CharT, typename _Traits>
virtual int_type std::basic_streambuf<_CharT, _Traits>::pbackfail (
    int_type __c = traits_type::eof()) [inline], [protected], [virtual], [inherited]
```

Tries to back up the input sequence.

Parameters

<code>__c</code>	The character to be inserted back into the sequence.
------------------	--

Returns

`eof()` on failure, *some other value* on success

Postcondition

The constraints of `gptr()`, `eback()`, and `pptr()` are the same as for `underflow()`.

Note

Base class version does nothing, returns eof().

Reimplemented in `std::basic_filebuf<_CharT, _Traits>`, `std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>`, `std::basic_filebuf<_CharT, std::char_traits<_CharT>>`, `std::basic_filebuf<char_type, traits_type>`, `__gnu_cxx::stdio_sync_filebuf<_CharT, _Traits, _Alloc>` and `std::basic_stringbuf<_CharT, _Traits, _Alloc>`.

pbase()

```
template<typename _CharT , typename _Traits >
char_type * std::basic_streambuf< _CharT, _Traits >::pbase ( ) const [inline], [protected],
[inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- `pbase()` returns the beginning pointer for the output sequence
- `pptr()` returns the next pointer for the output sequence
- `epptr()` returns the end pointer for the output sequence

pbump()

```
template<typename _CharT , typename _Traits >
void std::basic_streambuf< _CharT, _Traits >::pbump (
    int __n ) [inline], [protected], [inherited]
```

Moving the write position.

Parameters

<code>__n</code>	The delta by which to move.
------------------	-----------------------------

This just advances the write position without returning any data.

pptr()

```
template<typename _CharT , typename _Traits >
char_type * std::basic_streambuf< _CharT, _Traits >::pptr ( ) const [inline], [protected], [inherited]
```

Access to the put area.

These functions are only available to other protected functions, including derived classes.

- `pbase()` returns the beginning pointer for the output sequence
- `pptr()` returns the next pointer for the output sequence
- `epptr()` returns the end pointer for the output sequence

pubimbue()

```
template<typename _CharT , typename _Traits >
locale std::basic_streambuf< _CharT, _Traits >::pubimbue (
    const locale & __loc ) [inline], [inherited]
```

Entry point for imbue().

Parameters

<code>__loc</code>	The new locale.
--------------------	-----------------

Returns

The previous locale.

Calls the derived imbue(__loc).

pubseekoff()

```
template<typename _CharT , typename _Traits >
pos_type std::basic_streambuf< _CharT, _Traits >::pubseekoff (
    off_type __off,
    ios_base::seekdir __way,
    ios_base::openmode __mode = ios_base::in | ios_base::out ) [inline], [inherited]
```

Alters the stream position.

Parameters

<code>__off</code>	Offset.
<code>__way</code>	Value for ios_base::seekdir.
<code>__mode</code>	Value for ios_base::openmode.

Calls virtual seekoff function.

pubseekpos()

```
template<typename _CharT , typename _Traits >
pos_type std::basic_streambuf< _CharT, _Traits >::pubseekpos (
    pos_type __sp,
    ios_base::openmode __mode = ios_base::in | ios_base::out ) [inline], [inherited]
```

Alters the stream position.

Parameters

<code>__sp</code>	Position
<code>__mode</code>	Value for ios_base::openmode.

Calls virtual seekpos function.

pubsetbuf()

```
template<typename _CharT , typename _Traits >
basic_streambuf * std::basic_streambuf< _CharT, _Traits >::pubsetbuf (
    char_type * __s,
    streamsize __n ) [inline], [inherited]
```

Entry points for derived buffer functions.

The public versions of pubfoo dispatch to the protected derived foo member functions, passing the arguments (if any) and returning the result unchanged.

pubsync()

```
template<typename _CharT , typename _Traits >
int std::basic_streambuf< _CharT, _Traits >::pubsync ( ) [inline], [inherited]
```

Calls virtual sync function.

Referenced by [std::wbuffer_convert< _Codecvt, _Elem, _Tr >::sync\(\)](#), and [std::basic_istream< _CharT, _Traits >::sync\(\)](#).

sbumpc()

```
template<typename _CharT , typename _Traits >
int_type std::basic_streambuf< _CharT, _Traits >::sbumpc ( ) [inline], [inherited]
```

Getting the next character.

Returns

The next character, or eof.

If the input read position is available, returns that character and increments the read pointer, otherwise calls and returns [uflow\(\)](#).

Referenced by [std::basic_istream< _CharT, _Traits >::ignore\(\)](#), [std::basic_istream< char >::ignore\(\)](#), [std::istreambuf_iterator< _CharT, _Traits >::operator++\(\)](#), and [std::basic_istream< char >::seekg\(\)](#).

seekoff()

```
template<typename _CharT , typename _Traits >
virtual pos_type std::basic_streambuf< _CharT, _Traits >::seekoff (
    off_type ,
    ios_base::seekdir ,
    ios_base::openmode = ios_base::in | ios_base::out ) [inline], [protected], [virtual],
[inherited]
```

Alters the stream positions.

Each derived class provides its own appropriate behavior.

Note

Base class version does nothing, returns a `pos_type` that represents an invalid stream position.

Reimplemented in [std::basic_filebuf< _CharT, _Traits >](#), [std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >](#), [std::basic_filebuf< _CharT, std::char_traits< _CharT > >](#), [std::basic_filebuf< char_type, traits_type >](#), and [std::basic_stringbuf< _CharT, traits_type, _Alloc >](#).

seekpos()

```
template<typename _CharT , typename _Traits >
virtual pos_type std::basic_streambuf< _CharT, _Traits >::seekpos (
    pos_type ,
    ios_base::openmode = ios_base::in | ios_base::out ) [inline], [protected], [virtual],
[inherited]
```

Alters the stream positions.

Each derived class provides its own appropriate behavior.

Note

Base class version does nothing, returns a `pos_type` that represents an invalid stream position.

Reimplemented in [std::basic_filebuf< _CharT, _Traits >](#), [std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >](#), [std::basic_filebuf< _CharT, std::char_traits< _CharT > >](#), [std::basic_filebuf< char_type, traits_type >](#), and [std::basic_stringbuf< _CharT, traits_type, _Alloc >](#).

setbuf()

```
template<typename _CharT , typename _Traits >
virtual basic_streambuf< char_type, _Traits > * std::basic_streambuf< _CharT, _Traits >::setbuf
(
    char_type * ,
    streamsize ) [inline], [protected], [virtual], [inherited]
```

Manipulates the buffer.

Each derived class provides its own appropriate behavior. See the next-to-last paragraph of <https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.html#io.streambuf.buffering> for more on this function.

Note

Base class version does nothing, returns `this`.

Reimplemented in `std::basic_filebuf< _CharT, _Traits >`, `std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >`, `std::basic_filebuf< _CharT, std::char_traits< _CharT > >`, `std::basic_filebuf< char_type, traits_type >`, and `std::basic_stringbuf< _CharT, traits_type, allocator_type >`.

setg()

```
template<typename _CharT , typename _Traits >
void std::basic_streambuf< _CharT, _Traits >::setg (
    char_type * __gbeg,
    char_type * __gnext,
    char_type * __gend ) [inline], [protected], [inherited]
```

Setting the three read area pointers.

Parameters

<code>__gbeg</code>	A pointer.
<code>__gnext</code>	A pointer.
<code>__gend</code>	A pointer.

Postcondition

`__gbeg == eback()`, `__gnext == gptr()`, and `__gend == egptr()`

Referenced by `std::wbuffer_convert<_Codecvt, _Elem, _Tr >::wbuffer_convert()`.

setp()

```
template<typename _CharT , typename _Traits >
void std::basic_streambuf< _CharT, _Traits >::setp (
    char_type * __pbeg,
    char_type * __pend ) [inline], [protected], [inherited]
```

Setting the three write area pointers.

Parameters

<code>__pbeg</code>	A pointer.
<code>__pend</code>	A pointer.

Postcondition

`__pbeg == pbase()`, `__pbeg == pptr()`, and `__pend == ep_ptr()`

Referenced by `std::wbuffer_convert<_Codecv, _Elem, _Tr>::wbuffer_convert()`.

sgetc()

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::sgetc ( ) [inline], [inherited]
```

Getting the next character.

Returns

The next character, or eof.

If the input read position is available, returns that character, otherwise calls and returns `underflow()`. Does not move the read position after fetching the character.

Referenced by `std::basic_istream<_CharT, _Traits>::sentry::sentry()`, `std::basic_istream<_CharT, _Traits>::get()`, `std::basic_istream<_CharT, _Traits>::getline()`, `std::basic_istream<_CharT, _Traits>::ignore()`, `std::istreambuf_iterator<_CharT, _Traits>::operator++()`, and `std::basic_istream<char>::seekg()`.

sgetn()

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf<_CharT, _Traits>::sgetn (
    char_type * __s,
    streamsize __n ) [inline], [inherited]
```

Entry point for `xsggetn`.

Parameters

<code>__s</code>	A buffer area.
<code>__n</code>	A count.

Returns `xsggetn(__s, __n)`. The effect is to fill `__s[0]` through `__s[__n-1]` with characters from the input sequence, if possible.

showmanyc()

```
template<typename _CharT, typename _Traits>
virtual streamsize std::basic_streambuf<_CharT, _Traits>::showmanyc ( ) [inline], [protected],
[virtual], [inherited]
```

Investigating the data available.

Returns

An estimate of the number of characters available in the input sequence, or -1.

If it returns a positive value, then successive calls to `underflow()` will not return `traits::eof()` until at least that number of characters have been supplied. If `showmanyc()` returns -1, then calls to `underflow()` or `uflow()` will fail. [27.5.2.4.3]/1

Note

Base class version does nothing, returns zero.

The standard adds that *the intention is not only that the calls [to underflow or uflow] will not return eof() but that they will return immediately.*

The standard adds that *the morphemes of showmanyc are **es-how-many-see**, not **show-manic**.*

Reimplemented in [std::basic_filebuf<_CharT, _Traits>](#), [std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>](#), [std::basic_filebuf<_CharT, std::char_traits<_CharT>>](#), [std::basic_filebuf<char_type, traits_type>](#), and [std::basic_stringbuf<_CharT, _Traits>](#).

snextc()

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::snextc ( ) [inline], [inherited]
```

Getting the next character.

Returns

The next character, or eof.

Calls `sputc()`, and if that function returns `traits::eof()`, so does this function. Otherwise, `sgetc()`.

Referenced by [std::basic_istream<_CharT, _Traits>::sentry::sentry\(\)](#), [std::basic_istream<_CharT, _Traits>::get\(\)](#), [std::basic_istream<char>::seekg\(\)](#), and [std::basic_istream<char>::unget\(\)](#).

sputbackc()

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::sputbackc (
    char_type __c ) [inline], [inherited]
```

Pushing characters back into the input stream.

Parameters

<code>__c</code>	The character to push back.
------------------	-----------------------------

Returns

The previous character, if possible.

Similar to `sungetc()`, but `__c` is pushed onto the stream instead of *the previous character*. If successful, the next character fetched from the input stream will be `__c`.

Referenced by [std::basic_istream<_CharT, _Traits>::putback\(\)](#).

sputc()

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::sputc (
    char_type __c ) [inline], [inherited]
```

Entry point for all single-character output functions.

Parameters

<code>__c</code>	A character to output.
------------------	------------------------

Returns

__c, if possible.

One of two public output functions.

If a write position is available for the output sequence (i.e., the buffer is not full), stores __c in that position, increments the position, and returns `traits::to_int_type(__c)`. If a write position is not available, returns `overflow(↵__c)`.

Referenced by `std::basic_istream<_CharT, _Traits>::get()`, `std::ostreambuf_iterator<_CharT, _Traits>::operator=()`, and `std::wbuffer_convert<_Codecvt, _Elem, _Tr>::overflow()`.

sputn()

```
template<typename _CharT, typename _Traits>
streamsize std::basic_streambuf<_CharT, _Traits>::sputn (
    const char_type * __s,
    streamsize __n) [inline], [inherited]
```

Entry point for all single-character output functions.

Parameters

↵ __s	A buffer read area.
↵ __n	A count.

One of two public output functions.

Returns `xsputn(__s, __n)`. The effect is to write `__s[0]` through `__s[__n-1]` to the output sequence, if possible.

state()

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Tr = char_traits<_Elem>>
state_type std::wbuffer_convert<_Codecvt, _Elem, _Tr>::state ( ) const [inline], [noexcept]
```

The conversion state following the last conversion.

sungetc()

```
template<typename _CharT, typename _Traits>
int_type std::basic_streambuf<_CharT, _Traits>::sungetc ( ) [inline], [inherited]
```

Moving backwards in the input stream.

Returns

The previous character, if possible.

If a putback position is available, this function decrements the input pointer and returns that character. Otherwise, calls and returns `pbackfail()`. The effect is to *unget* the last character *gotten*.

Referenced by `std::basic_istream<_CharT, _Traits>::unget()`.

sync()

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Tr = char_traits<_Elem>>
int std::wbuffer_convert<_Codecvt, _Elem, _Tr>::sync ( ) [inline], [protected], [virtual]
```

Synchronizes the buffer arrays with the controlled sequences.

Returns

-1 on failure.

Each derived class provides its own appropriate behavior, including the definition of *failure*.

Note

Base class version does nothing, returns zero.

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

References `std::basic_streambuf<_CharT, _Traits>::pubsync()`.

uflow()

```
template<typename _CharT , typename _Traits >
virtual int_type std::basic_streambuf< _CharT, _Traits >::uflow ( ) [inline], [protected], [virtual],
[inherited]
```

Fetches more data from the controlled sequence.

Returns

The first character from the *pending sequence*.

Informally, this function does the same thing as `underflow()`, and in fact is required to call that function. It also returns the new character, like `underflow()` does. However, this function also moves the read position forward by one.

Reimplemented in `__gnu_cxx::stdio_sync_filebuf<_CharT, _Traits>`.

underflow()

```
template<typename _Codecvt , typename _Elem = wchar_t, typename _Tr = char_traits<_Elem>>
_Wide_streambuf::int_type std::wbuffer_convert< _Codecvt, _Elem, _Tr >::underflow ( ) [inline],
[protected], [virtual]
```

Fetches more data from the controlled sequence.

Returns

The first character from the *pending sequence*.

Informally, this function is called when the input buffer is exhausted (or does not exist, as buffering need not actually be done). If a buffer exists, it is *refilled*. In either case, the next available character is returned, or `traits::eof()` to indicate a null pending sequence.

For a formal definition of the pending sequence, see a good text such as Langer & Kreft, or [27.5.2.4.3]/7-14.

A functioning input streambuf can be created by overriding only this function (no buffer area will be used). For an example, see <https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.html>

Note

Base class version does nothing, returns `eof()`.

Reimplemented from `std::basic_streambuf<_CharT, _Traits>`.

References `std::basic_streambuf<_CharT, _Traits>::egptr()`, and `std::basic_streambuf<_CharT, _Traits>::gptr()`.

xsgetn()

```
template<typename _CharT , typename _Traits >
streamsize std::basic_streambuf< _CharT, _Traits >::xsgetn (
    char_type * __s,
    streamsize __n ) [protected], [virtual], [inherited]
```

Multiple character extraction.

Parameters

<code>__s</code>	A buffer area.
<code>__n</code>	Maximum number of characters to assign.

Returns

The number of characters assigned.

Fills `__s[0]` through `__s[__n-1]` with characters from the input sequence, as if by `sbumpc()`. Stops when either `__n` characters have been copied, or when `traits::eof()` would be copied.

It is expected that derived classes provide a more efficient implementation by overriding this definition.

Reimplemented in `std::basic_filebuf<_CharT, _Traits>`, `std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>`, `std::basic_filebuf<_CharT, std::char_traits<_CharT>>`, and `std::basic_filebuf<char_type, traits_type>`.

References `std::min()`.

xsputn()

```
template<typename _CharT , typename _Traits >
streamsize std::basic_streambuf< _CharT, _Traits >::xsputn (
    const char_type * __s,
    streamsize __n ) [protected], [virtual], [inherited]
```

Multiple character insertion.

Parameters

<code>__s</code>	A buffer area.
<code>__n</code>	Maximum number of characters to write.

Returns

The number of characters written.

Writes `__s[0]` through `__s[__n-1]` to the output sequence, as if by `sputc()`. Stops when either `n` characters have been copied, or when `sputc()` would return `traits::eof()`.

It is expected that derived classes provide a more efficient implementation by overriding this definition.

Reimplemented in `std::basic_filebuf<_CharT, _Traits>`, `std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>`, `std::basic_filebuf<_CharT, std::char_traits<_CharT>>`, and `std::basic_filebuf<char_type, traits_type>`.

References `std::min()`.

6.1060.5 Member Data Documentation**`_M_buf_locale`**

```
template<typename _CharT , typename _Traits >
locale std::basic_streambuf< _CharT, _Traits >::_M_buf_locale [protected], [inherited]
```

Current locale setting.

6.1061.1 Detailed Description

template<typename _Tp>
class std::weak_ptr< _Tp >

A non-owning observer for a pointer owned by a [shared_ptr](#).

Since

C++11

A [weak_ptr](#) provides a safe alternative to a raw pointer when you want a non-owning reference to an object that is managed by a [shared_ptr](#).

Unlike a raw pointer, a [weak_ptr](#) can be converted to a new [shared_ptr](#) that shares ownership with every other [shared_ptr](#) that already owns the pointer. In other words you can upgrade from a non-owning “weak” reference to an owning [shared_ptr](#), without having access to any of the existing [shared_ptr](#) objects.

Also unlike a raw pointer, a [weak_ptr](#) does not become “dangling” after the object it points to has been destroyed. Instead, a [weak_ptr](#) becomes *expired* and can no longer be converted to a [shared_ptr](#) that owns the freed pointer, so you cannot accidentally access the pointed-to object after it has been destroyed.

6.1062.1 Detailed Description

template<typename _RealType = double>
class std::weibull_distribution<_RealType>

A weibull_distribution random number distribution.

The formula for the normal probability density function is:

$$p(x|\alpha, \beta) = \frac{\alpha}{\beta} \left(\frac{x}{\beta}\right)^{\alpha-1} \exp\left(-\left(\frac{x}{\beta}\right)^{\alpha}\right)$$

6.1062.2 Member Typedef Documentation

result_type

```
template<typename _RealType = double>
typedef _RealType std::weibull\_distribution<_RealType>::result_type
```

The type of the range of the distribution.

6.1062.3 Member Function Documentation

a()

```
template<typename _RealType = double>
_RealType std::weibull\_distribution<_RealType>::a ( ) const [inline]
```

Return the *a* parameter of the distribution.

b()

```
template<typename _RealType = double>
_RealType std::weibull_distribution< _RealType >::b ( ) const [inline]
Return the b parameter of the distribution.
```

max()

```
template<typename _RealType = double>
result_type std::weibull_distribution< _RealType >::max ( ) const [inline]
Returns the least upper bound value of the distribution.
References std::numeric_limits< _Tp >::max().
```

min()

```
template<typename _RealType = double>
result_type std::weibull_distribution< _RealType >::min ( ) const [inline]
Returns the greatest lower bound value of the distribution.
```

operator()()

```
template<typename _RealType = double>
template<typename _UniformRandomNumberGenerator >
result_type std::weibull_distribution< _RealType >::operator() (
    _UniformRandomNumberGenerator & __urng ) [inline]
```

Generating functions.

References `std::weibull_distribution< _RealType >::operator()()`.

Referenced by `std::weibull_distribution< _RealType >::operator()()`.

param() [1/2]

```
template<typename _RealType = double>
param_type std::weibull_distribution< _RealType >::param ( ) const [inline]
Returns the parameter set of the distribution.
Referenced by std::operator>>().
```

param() [2/2]

```
template<typename _RealType = double>
void std::weibull_distribution< _RealType >::param (
    const param_type & __param ) [inline]
```

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

reset()

```
template<typename _RealType = double>
void std::weibull_distribution< _RealType >::reset ( ) [inline]
Resets the distribution state.
```

6.1062.4 Friends And Related Symbol Documentation

operator==

```
template<typename _RealType = double>
bool operator== (
    const weibull_distribution< _RealType > & __d1,
    const weibull_distribution< _RealType > & __d2 ) [friend]
```

Return true if two Weibull distributions have the same parameters.

6.1063.1 Detailed Description

```
template<typename _Codecvt, typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>, type-
name _Byte_alloc = allocator<char>>
```

```
class std::wstring_convert<_Codecvt, _Elem, _Wide_alloc, _Byte_alloc >
```

String conversions.

6.1063.2 Constructor & Destructor Documentation

wstring_convert() [1/4]

```
template<typename _Codecvt , typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::wstring_convert ( ) [inline]
Default constructor.
```

wstring_convert() [2/4]

```
template<typename _Codecvt , typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::wstring_convert (
    _Codecvt * __pcvt ) [inline], [explicit]
```

Constructor.

Parameters

<code>__pcvt</code>	The facet to use for conversions.
---------------------	-----------------------------------

Takes ownership of `__pcvt` and will delete it in the destructor.

wstring_convert() [3/4]

```
template<typename _Codecvt , typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::wstring_convert (
    _Codecvt * __pcvt,
    state_type __state ) [inline]
```

Construct with an initial conversion state.

Parameters

<code>__pcvt</code>	The facet to use for conversions.
<code>__state</code>	Initial conversion state.

Takes ownership of `__pcvt` and will delete it in the destructor. The object's conversion state will persist between conversions.

wstring_convert() [4/4]

```
template<typename _Codecvt , typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::wstring_convert (
    const byte_string & __byte_err,
    const wide_string & __wide_err = wide_string() ) [inline], [explicit]
```

Construct with error strings.

Parameters

<code>__byte_err</code>	A string to return on failed conversions.
<code>__wide_err</code>	A wide string to return on failed conversions.

6.1063.3 Member Function Documentation

converted()

```
template<typename _Codecvt , typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
size_t std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::converted ( ) const
[inline], [noexcept]
```

The number of elements successfully converted in the last conversion.

from_bytes() [1/4]

```
template<typename _Codecvt , typename _Elem = wchar_t, typename _Wide_alloc = allocator<_Elem>,
typename _Byte_alloc = allocator<char>>
wstring std::wstring_convert< _Codecvt, _Elem, _Wide_alloc, _Byte_alloc >::from_bytes (
    char __byte ) [inline]
```

Convert from bytes.

7.2.1 Detailed Description

The header provides an interface to the C++ ABI.

7.2.2 Function Documentation

`__cxa_demangle()`

```
char * __cxxabiv1::__cxa_demangle (
    const char * __mangled_name,
    char * __output_buffer,
    size_t * __length,
    int * __status )
```

Demangling routine. ABI-mandated entry point in the C++ runtime library for demangling.

Parameters

<code>__mangled_name</code>	A NUL-terminated character string containing the name to be demangled.
<code>__output_buffer</code>	A region of memory, allocated with malloc, of * <code>__length</code> bytes, into which the demangled name is stored. If <code>__output_buffer</code> is not long enough, it is expanded using realloc. <code>__output_buffer</code> may instead be NULL; in that case, the demangled name is placed in a region of memory allocated with malloc.
<code>__length</code>	If <code>__length</code> is non-null, the length of the buffer containing the demangled name is placed in * <code>__length</code> .
<code>__status</code>	If <code>__status</code> is non-null, * <code>__status</code> is set to one of the following values: 0: The demangling operation succeeded. -1: A memory allocation failure occurred. -2: <code>mangled_name</code> is not a valid name under the C++ ABI mangling rules. -3: One of the arguments is invalid.

Returns

A pointer to the start of the NUL-terminated demangled name, or NULL if the demangling fails. The caller is responsible for deallocating this memory using `free`.

The demangling is performed using the C++ ABI mangling rules, with GNU extensions. For example, this function is used in `__gnu_cxx::__verbose_terminate_handler`.

See https://gcc.gnu.org/onlinedocs/libstdc++/manual/ext_demangling.html for other examples of use.

Note

The same demangling functionality is available via `libiberty` (`<libiberty/demangle.h>` and `libiberty.h`) in GCC 3.1 and later, but that requires explicit installation (`-enable-install-libiberty`) and uses a different API, although the ABI is unchanged.

7.5.1 Detailed Description

This is a Standard C++ Library header.

The header `new` defines several functions to manage dynamic memory and handling memory allocation errors; see https://gcc.gnu.org/onlinedocs/libstdc++/manual/dynamic_memory.html for more.

7.5.2 Function Documentation

operator new()

```
void * operator new (  
    std::size_t )
```

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

`constexpr _Filter std::upper_bound (_Filter, _Filter, const _Tp &, _Compare)`

7.25.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<algorithm>`.

7.26 `algorithmfwd.h` File Reference

7.147.2 Macro Definition Documentation

[_GLIBCXX_DEQUE_BUF_SIZE](#)

```
#define _GLIBCXX_DEQUE_BUF_SIZE
```

This function controls the size of memory nodes.

Parameters

<code>__size</code>	The size of an element.
---------------------	-------------------------

Returns

The number (not byte size) of elements per node.

This function started off as a compiler kludge from SGI, but seems to be a useful wrapper around a repeated constant expression. The **512** is tunable (and no other code needs to change), but no investigation has been done since inheriting the SGI code. Touch `_GLIBCXX_DEQUE_BUF_SIZE` only if you know what you are doing, however: changing it breaks the binary compatibility!!

7.182.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<utility>`.

This file contains the parts of `<utility>` needed by other headers, so they don't need to include the whole of `<utility>`.

7.183.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<valarray>`.

7.189.1 Detailed Description

This file is a GNU debug extension to the Standard C++ Library.

7.190 `cassert` File Reference

7.190.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `assert.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

7.191 `complex` File Reference

Macros

- `#define _GLIBCXX_CCOMPLEX`

7.191.1 Detailed Description

This is a Standard C++ Library header.

7.192 ccomplex File Reference

Macros

- `#define _GLIBCXX_TR1_CCOMPLEX`

7.192.1 Detailed Description

This is a TR1 C++ Library header.

7.193 cctype File Reference

Namespaces

- namespace [std](#)

Macros

- `#define _GLIBCXX_CCTYPE`

7.193.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `cctype.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

7.194 cctype File Reference

Macros

- `#define _GLIBCXX_TR1_CCTYPE`

7.194.1 Detailed Description

This is a TR1 C++ Library header.

7.195 cerrno File Reference

Macros

- `#define _GLIBCXX_CERRNO`
- `#define errno`

7.195.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `errno.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

7.196 cenv File Reference

Macros

- `#define _GLIBCXX_CFENV`

7.196.1 Detailed Description

This is a Standard C++ Library header.

7.197 cenv File Reference

Macros

- `#define _GLIBCXX_TR1_CENV`

7.197.1 Detailed Description

This is a TR1 C++ Library header.

7.198 cfloat File Reference

Macros

- `#define _GLIBCXX_CFLOAT`
- `#define DECIMAL_DIG`
- `#define FLT_EVAL_METHOD`

7.198.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `float.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

7.199 cfloat File Reference

Macros

- `#define _GLIBCXX_TR1_CFLOAT`

7.199.1 Detailed Description

This is a TR1 C++ Library header.

7.209.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the *.h implementation files.

This is the C++ version of the Standard C Library header `math.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

7.210 cmath File Reference

Namespaces

- namespace [`__gnu_cxx`](#)

Macros

- `#define` `_EXT_CMATH`

7.210.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

7.214.1 Detailed Description

This is a TR1 C++ Library header.

7.215 complex.h File Reference

Macros

- `#define _GLIBCXX_COMPLEX_H`

7.215.1 Detailed Description

This is a Standard C++ Library header.

7.216 Concepts

Here is a list of all documented concepts with brief descriptions:

<code>std::assignable_from</code>	
[concept.assignable], concept assignable_from	791
<code>std::common_reference_with</code>	
[concept.commonref], concept common_reference_with	791
<code>std::common_with</code>	
[concept.common], concept common_with	791
<code>std::constructible_from</code>	
[concept.constructible], concept constructible_from	791
<code>std::convertible_to</code>	
[concept.convertible], concept convertible_to	792
<code>std::copy_constructible</code>	
[concept.copyconstructible], concept copy_constructible	792
<code>std::default_initializable</code>	
[concept.defaultinitializable], concept default_initializable	792

<code>std::derived_from</code>	
[concept.derived], concept <code>derived_from</code>	792
<code>std::destructible</code>	
[concept.destructible], concept <code>destructible</code>	792
<code>std::equivalence_relation</code>	
[concept.equiv], concept <code>equivalence_relation</code>	793
<code>std::indirectly_comparable</code>	
[alg.req.ind.cmp], concept <code>indirectly_comparable</code>	793
<code>std::indirectly_copyable</code>	
[alg.req.ind.copy], concept <code>indirectly_copyable</code>	793
<code>std::indirectly_movable</code>	
[alg.req.ind.move], concept <code>indirectly_movable</code>	793
<code>std::indirectly_readable</code>	
Requirements for types that are readable by applying operator*	793
<code>std::indirectly_swappable</code>	
[alg.req.ind.swap], concept <code>indirectly_swappable</code>	794
<code>std::indirectly_writable</code>	
Requirements for writing a value into an iterator's referenced object	794
<code>std::invocable</code>	
[concept.invocable], concept <code>invocable</code>	794
<code>std::mergeable</code>	
[alg.req.mergeable], concept <code>mergeable</code>	794
<code>std::move_constructible</code>	
[concept.moveconstructible], concept <code>move_constructible</code>	795
<code>std::permutable</code>	
[alg.req.permutable], concept <code>permutable</code>	795
<code>std::predicate</code>	
[concept.predicate], concept <code>predicate</code>	795
<code>std::ranges::bidirectional_range</code>	
A range for which <code>ranges::begin</code> returns a bidirectional iterator	795
<code>std::ranges::borrowed_range</code>	
[range.range] The <code>borrowed_range</code> concept	796
<code>std::ranges::common_range</code>	
A range for which <code>ranges::begin</code> and <code>ranges::end</code> return the same type	796
<code>std::ranges::contiguous_range</code>	
A range for which <code>ranges::begin</code> returns a contiguous iterator	796
<code>std::ranges::forward_range</code>	
A range for which <code>ranges::begin</code> returns a forward iterator	796

<code>std::ranges::input_range</code>	
A range for which <code>ranges::begin</code> returns an input iterator	797
<code>std::ranges::output_range</code>	
A range for which <code>ranges::begin</code> returns an output iterator	797
<code>std::ranges::random_access_range</code>	
A range for which <code>ranges::begin</code> returns a random access iterator	797
<code>std::ranges::range</code>	
[<code>range.range</code>] The range concept	797
<code>std::ranges::sized_range</code>	
[<code>range.sized</code>] The <code>sized_range</code> concept	797
<code>std::ranges::view</code>	
[<code>range.view</code>] The <code>ranges::view</code> concept	798
<code>std::ranges::viewable_range</code>	
A range which can be safely converted to a view	798
<code>std::regular_invocable</code>	
[<code>concept.regularinvocable</code>], concept <code>regular_invocable</code>	798
<code>std::relation</code>	
[<code>concept.relation</code>], concept <code>relation</code>	798
<code>std::same_as</code>	
[<code>concept.same</code>], concept <code>same_as</code>	799
<code>std::sortable</code>	
[<code>alg.req.sortable</code>], concept <code>sortable</code>	799
<code>std::strict_weak_order</code>	
[<code>concept.strictweakorder</code>], concept <code>strict_weak_order</code>	799
<code>std::uniform_random_bit_generator</code>	
Requirements for a uniform random bit generator	799
<code>std::weakly_incrementable</code>	
Requirements on types that can be incremented with <code>++</code>	799

7.217 `condition_variable` File Reference

Classes

- class [`std::condition_variable`](#)
- class [`std::_V2::condition_variable_any`](#)

Namespaces

- namespace [`std`](#)

Macros

- `#define` [`_GLIBCXX_CONDITION_VARIABLE`](#)

Enumerations

- enum class `std::cv_status` { `no_timeout` , `timeout` }

Functions

- void `std::notify_all_at_thread_exit` (`condition_variable` &, `unique_lock`< `mutex` >)

7.217.1 Detailed Description

This is a Standard C++ Library header.

7.218 csetjmp File Reference

Namespaces

- namespace `std`

Macros

- `#define _GLIBCXX_CSETJMP`
- `#define setjmp(env)`

7.218.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `setjmp.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

7.219 csignal File Reference

Namespaces

- namespace `std`

Macros

- `#define _GLIBCXX_CSIGNAL`

7.219.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `signal.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

7.220 cstdalign File Reference

Macros

- `#define _GLIBCXX_CSTDALIGN`

7.220.1 Detailed Description

This is a Standard C++ Library header.

7.221 cstdarg File Reference

Namespaces

- namespace [std](#)

Macros

- `#define _GLIBCXX_CSTDARG`
- `#define va_end(ap)`

7.221.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `stdarg.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

7.222 cstdarg File Reference

Macros

- `#define _GLIBCXX_TR1_CSTDARG`

7.222.1 Detailed Description

This is a TR1 C++ Library header.

7.223 cstdlib File Reference

Macros

- `#define _GLIBCXX_CSTDBOOL`

7.223.1 Detailed Description

This is a Standard C++ Library header.

7.224 cstdlib File Reference

Macros

- `#define _GLIBCXX_TR1_CSTDBOOL`

7.224.1 Detailed Description

This is a TR1 C++ Library header.

7.225 cstddef File Reference

Namespaces

- namespace [std](#)

Macros

- `#define __cpp_lib_byte`
- `#define _GLIBCXX_CSTDDEF`

Typedefs

- `template<typename _IntegerType >`
`using std::__byte_op_t = typename __byte_operand< _IntegerType >::__type`

Enumerations

- enum class `std::byte` : unsigned char

Functions

- `constexpr byte std::operator&(byte __l, byte __r) noexcept`
- `constexpr byte & std::operator&=(byte &__l, byte __r) noexcept`
- `template<typename _IntegerType >`
`constexpr __byte_op_t< _IntegerType > std::operator<<(byte __b, _IntegerType __shift) noexcept`
- `template<typename _IntegerType >`
`constexpr __byte_op_t< _IntegerType > & std::operator<<=(byte &__b, _IntegerType __shift) noexcept`
- `template<typename _IntegerType >`
`constexpr __byte_op_t< _IntegerType > std::operator>>(byte __b, _IntegerType __shift) noexcept`
- `template<typename _IntegerType >`
`constexpr __byte_op_t< _IntegerType > & std::operator>>=(byte &__b, _IntegerType __shift) noexcept`
- `constexpr byte std::operator^(byte __l, byte __r) noexcept`
- `constexpr byte & std::operator^=(byte &__l, byte __r) noexcept`
- `constexpr byte std::operator|(byte __l, byte __r) noexcept`
- `constexpr byte & std::operator|=(byte &__l, byte __r) noexcept`
- `constexpr byte std::operator~(byte __b) noexcept`
- `template<typename _IntegerType >`
`constexpr _IntegerType std::to_integer(__byte_op_t< _IntegerType > __b) noexcept`

7.225.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `stdint.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

7.226 cstdint File Reference

Namespaces

- namespace `std`

Macros

- `#define _GLIBCXX_CSTDINT`

7.226.1 Detailed Description

This is a Standard C++ Library header.

7.227 cstdint File Reference

Namespaces

- namespace `std`
- namespace `std::tr1`

Macros

- `#define _GLIBCXX_TR1_CSTDINT`

7.227.1 Detailed Description

This is a TR1 C++ Library header.

7.228 cstdio File Reference**Namespaces**

- namespace [std](#)

Macros

- `#define _GLIBCXX_CSTDIO`

7.228.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `stdio.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

7.229 cstdlib File Reference**Macros**

- `#define _GLIBCXX_TR1_CSTDIO`

7.229.1 Detailed Description

This is a TR1 C++ Library header.

7.230 cstdlib File Reference**Namespaces**

- namespace [std](#)

Macros

- `#define _GLIBCXX_CSTDLIB`
- `#define _GLIBCXX_INCLUDE_NEXT_C_HEADERS`

Functions

- `ldiv_t std::div (long __i, long __j)`

7.230.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `stdlib.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

7.231 cstdlib File Reference

Macros

- `#define _GLIBCXX_TR1_CSTDLIB`

7.231.1 Detailed Description

This is a TR1 C++ Library header.

7.232 cstring File Reference

Namespaces

- namespace [std](#)

Macros

- `#define _GLIBCXX_CSTRING`

Functions

- `void * std::memchr (void *__s, int __c, size_t __n)`
- `char * std::strchr (char *__s, int __n)`
- `char * std::strpbrk (char *__s1, const char *__s2)`
- `char * std::strrchr (char *__s, int __n)`
- `char * std::strstr (char *__s1, const char *__s2)`

7.232.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `string.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

7.233 ctgmath File Reference

Macros

- `#define _GLIBCXX_CTGMATH`

7.233.1 Detailed Description

This is a Standard C++ Library header.

7.234 ctgmath File Reference

Macros

- `#define _GLIBCXX_TR1_CTGMATH`

7.234.1 Detailed Description

This is a TR1 C++ Library header.

7.235 ctime File Reference

Namespaces

- namespace [std](#)

Macros

- `#define _GLIBCXX_CTIME`

7.235.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `time.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

7.236 ctime File Reference

Macros

- `#define _GLIBCXX_TR1_CTIME`

7.236.1 Detailed Description

This is a TR1 C++ Library header.

7.237 cuchar File Reference

Macros

- `#define _GLIBCXX_CUCHAR`

7.237.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `uchar.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

7.238 wchar File Reference

Namespaces

- namespace [std](#)

Macros

- `#define _GLIBCXX_CWCHAR`

Functions

- `wchar_t * std::wcschr (wchar_t *__p, wchar_t __c)`
- `wchar_t * std::wcpbrk (wchar_t *__s1, const wchar_t *__s2)`
- `wchar_t * std::wcsrchr (wchar_t *__p, wchar_t __c)`
- `wchar_t * std::wcsstr (wchar_t *__s1, const wchar_t *__s2)`
- `wchar_t * std::wmemchr (wchar_t *__p, wchar_t __c, size_t __n)`

7.238.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `wchar.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

7.239 `cwchar` File Reference

Namespaces

- namespace `std`
- namespace `std::tr1`

Macros

- `#define _GLIBCXX_TR1_CWCHAR`

7.239.1 Detailed Description

This is a TR1 C++ Library header.

7.240 `cwctype` File Reference

Namespaces

- namespace `std`

Macros

- `#define _GLIBCXX_CWCTYPE`

7.240.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `wctype.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

7.241 `cwctype` File Reference

Namespaces

- namespace `std`
- namespace `std::tr1`

Macros

- `#define _GLIBCXX_TR1_CWCTYPE`

7.241.1 Detailed Description

This is a TR1 C++ Library header.

7.242 assertions.h File Reference

Macros

- `#define __glibcxx_requires_non_empty_range(_First, _Last)`

7.247.1 Detailed Description

This file is a GNU debug extension to the Standard C++ Library.

7.247.2 Macro Definition Documentation

`__glibcxx_check_erase`

```
#define __glibcxx_check_erase(  
    _Position )
```

Verify that we can erase the element referenced by the iterator `_Position`. We can erase the element if the `_Position` iterator is dereferenceable and references this sequence.

`__glibcxx_check_erase_after`

```
#define __glibcxx_check_erase_after(  
    _Position )
```

Verify that we can erase the element after the iterator `_Position`. We can erase the element if the `_Position` iterator is before a dereferenceable one and references this sequence.

`__glibcxx_check_erase_range`

```
#define __glibcxx_check_erase_range(  
    _First,  
    _Last )
```

Verify that we can erase the elements in the iterator range `[_First, _Last)`. We can erase the elements if `[_First, _Last)` is a valid iterator range within this sequence.

`__glibcxx_check_erase_range_after`

```
#define __glibcxx_check_erase_range_after(  
    _First,  
    _Last )
```

Verify that we can erase the elements in the iterator range `(_First, _Last)`. We can erase the elements if `(_First, _Last)` is a valid iterator range within this sequence.

`__glibcxx_check_heap_pred`

```
#define __glibcxx_check_heap_pred(  
    _First,  
    _Last,  
    _Pred )
```

Verify that the iterator range `[_First, _Last)` is a heap w.r.t. the predicate `_Pred`.

`__glibcxx_check_insert`

```
#define __glibcxx_check_insert(  
    _Position )
```

Verify that we can insert into `*this` with the iterator `_Position`. Insertion into a container at a specific position requires that the iterator be nonsingular, either dereferenceable or past-the-end, and that it reference the sequence we are inserting into. Note that this macro is only valid when the container is a `_Safe_sequence` and the iterator is a `_Safe_iterator`.

`__glibcxx_check_insert_after`

```
#define __glibcxx_check_insert_after(  
    _Position )
```

Verify that we can insert into **this* after the iterator `_Position`. Insertion into a container after a specific position requires that the iterator be nonsingular, either dereferenceable or before-begin, and that it reference the sequence we are inserting into. Note that this macro is only valid when the container is a `_Safe_sequence` and the iterator is a `_Safe_↔` iterator.

`__glibcxx_check_insert_range`

```
#define __glibcxx_check_insert_range(
    _Position,
    _First,
    _Last,
    _Dist )
```

Verify that we can insert the values in the iterator range `[_First, _Last)` into **this* with the iterator `_Position`. Insertion into a container at a specific position requires that the iterator be nonsingular (i.e., either dereferenceable or past-the-end), that it reference the sequence we are inserting into, and that the iterator range `[_First, _Last)` is a valid (possibly empty) range which does not reference the sequence we are inserting into. Note that this macro is only valid when the container is a `_Safe_sequence` and the `_Position` iterator is a `_Safe_iterator`.

`__glibcxx_check_insert_range_after`

```
#define __glibcxx_check_insert_range_after(
    _Position,
    _First,
    _Last,
    _Dist )
```

Verify that we can insert the values in the iterator range `[_First, _Last)` into **this* after the iterator `_Position`. Insertion into a container after a specific position requires that the iterator be nonsingular (i.e., either dereferenceable or past-the-end), that it reference the sequence we are inserting into, and that the iterator range `[_First, _Last)` is a valid (possibly empty) range which does not reference the sequence we are inserting into. Note that this macro is only valid when the container is a `_Safe_sequence` and the `_Position` iterator is a `_Safe_iterator`.

`__glibcxx_check_partitioned_lower`

```
#define __glibcxx_check_partitioned_lower(
    _First,
    _Last,
    _Value )
```

Verify that the iterator range `[_First, _Last)` is partitioned w.r.t. the value `_Value`.

`__glibcxx_check_partitioned_lower_pred`

```
#define __glibcxx_check_partitioned_lower_pred(
    _First,
    _Last,
    _Value,
    _Pred )
```

Verify that the iterator range `[_First, _Last)` is partitioned w.r.t. the value `_Value` and predicate `_Pred`.

`__glibcxx_check_partitioned_upper_pred`

```
#define __glibcxx_check_partitioned_upper_pred(
    _First,
    _Last,
    _Value,
    _Pred )
```

Verify that the iterator range `[_First, _Last)` is partitioned w.r.t. the value `_Value` and predicate `_Pred`.

`__glibcxx_check_sorted_pred`

```
#define __glibcxx_check_sorted_pred(
    _First,
    _Last,
    _Pred )
```

Verify that the iterator range `[_First, _Last)` is sorted by the predicate `_Pred`.

`_GLIBCXX_DEBUG_VERIFY_COND_AT`

```
#define _GLIBCXX_DEBUG_VERIFY_COND_AT(
    _Cond,
    _ErrMsg,
    _File,
    _Line,
    _Func )
```

Macros used by the implementation to verify certain properties. These macros may only be used directly by the debug wrappers. Note that these are macros (instead of the more obviously *correct* choice of making them functions) because we need line and file information at the call site, to minimize the distance between the user error and where the error is reported.

7.290 rotate_fn_imps.hpp File Reference

7.290.1 Detailed Description

Contains imps for rotating nodes.

7.291 rotate_fn_imps.hpp File Reference

7.291.1 Detailed Description

Contains imps for rotating nodes.

7.292 traits.hpp File Reference

Classes

- `struct __gnu_pbds::detail::bin_search_tree_traits< Key, Mapped, Cmp_Fn, Node_Update, Node, _Alloc >`
- `struct __gnu_pbds::detail::bin_search_tree_traits< Key, null_type, Cmp_Fn, Node_Update, Node, _Alloc >`

Namespaces

- namespace `__gnu_pbds`

7.292.1 Detailed Description

Contains an implementation for `bin_search_tree_`.

7.293 traits.hpp File Reference

Namespaces

- namespace `__gnu_pbds`

Macros

- `#define PB_DS_DEBUG_VERIFY(_Cond)`

7.293.1 Detailed Description

Contains an implementation class for tree-like classes.

7.294 traits.hpp File Reference**Classes**

- [struct `__gnu_pbds::detail::tree_traits< Key, Mapped, Cmp_Fn, Node_Update, ov_tree_tag, _Alloc >`](#)
- [struct `__gnu_pbds::detail::tree_traits< Key, null_type, Cmp_Fn, Node_Update, ov_tree_tag, _Alloc >`](#)

Namespaces

- namespace [__gnu_pbds](#)

7.294.1 Detailed Description

Contains an implementation class for `ov_tree_`.

7.295 traits.hpp File Reference**Classes**

- [struct `__gnu_pbds::detail::trie_traits< Key, Mapped, _ATraits, Node_Update, pat_trie_tag, _Alloc >`](#)
- [struct `__gnu_pbds::detail::trie_traits< Key, null_type, _ATraits, Node_Update, pat_trie_tag, _Alloc >`](#)

Namespaces

- namespace [__gnu_pbds](#)

7.295.1 Detailed Description

Contains an implementation class for `pat_trie_`.

7.296 traits.hpp File Reference**Classes**

- [struct `__gnu_pbds::detail::tree_traits< Key, Mapped, Cmp_Fn, Node_Update, rb_tree_tag, _Alloc >`](#)
- [struct `__gnu_pbds::detail::tree_traits< Key, null_type, Cmp_Fn, Node_Update, rb_tree_tag, _Alloc >`](#)

Namespaces

- namespace [__gnu_pbds](#)

7.296.1 Detailed Description

Contains an implementation for `rb_tree_`.

7.297 traits.hpp File Reference

Classes

- struct [__gnu_pbds::detail::tree_traits< Key, Mapped, Cmp_Fn, Node_Update, splay_tree_tag, _Alloc >](#)
- struct [__gnu_pbds::detail::tree_traits< Key, null_type, Cmp_Fn, Node_Update, splay_tree_tag, _Alloc >](#)

Namespaces

- namespace [__gnu_pbds](#)

7.297.1 Detailed Description

Contains an implementation for splay_tree_.

7.298 binary_heap_.hpp File Reference

Classes

- class [__gnu_pbds::detail::binary_heap< Value_Type, Cmp_Fn, _Alloc >](#)

Namespaces

- namespace [__gnu_pbds](#)

Macros

- `#define PB_DS_ASSERT_VALID(X)`
- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`
- `#define PB_DS_DEBUG_VERIFY(_Cond)`
- `#define PB_DS_ENTRY_CMP_DEC`
- `#define PB_DS_RESIZE_POLICY_DEC`

7.298.1 Detailed Description

Contains an implementation class for a binary heap.

7.299 const_iterator.hpp File Reference

Classes

- class [__gnu_pbds::detail::binary_heap_const_iterator_< Value_Type, Entry, Simple, _Alloc >](#)

Namespaces

- namespace [__gnu_pbds](#)

Macros

- `#define PB_DS_BIN_HEAP_CIT_BASE`

7.299.1 Detailed Description

Contains an iterator class returned by the table's const find and insert methods.

7.300 `const_iterator.hpp` File Reference

Classes

- class [__gnu_pbds::detail::left_child_next_sibling_heap_const_iterator_< Node, _Alloc >](#)

Namespaces

- namespace [__gnu_pbds](#)

Macros

- `#define PB_DS_BASIC_HEAP_CIT_BASE`
- `#define PB_DS_CLASS_C_DEC`

7.300.1 Detailed Description

Contains an iterator class returned by the table's const find and insert methods.

7.301 `const_iterator.hpp` File Reference

7.301.1 Detailed Description

Contains an iterator class used for const ranging over the elements of the table.

This file is intended to be included inside a class definition, with `PB_DS_CLASS_C_DEC` defined to the name of the enclosing class.

7.302 `constructors_destructor_fn_imps.hpp` File Reference

7.302.1 Detailed Description

Contains an implementation class for `bin_search_tree_`.

7.303 `constructors_destructor_fn_imps.hpp` File Reference

7.303.1 Detailed Description

Contains an implementation class for `binary_heap_`.

7.304 `constructors_destructor_fn_imps.hpp` File Reference

7.304.1 Detailed Description

Contains an implementation for `binomial_heap_`.

7.305 `constructors_destructor_fn_imps.hpp` File Reference

7.305.1 Detailed Description

Contains an implementation class for a base of binomial heaps.

7.306 `constructors_destructor_fn_imps.hpp` File Reference

7.306.1 Detailed Description

Contains an implementation class for `left_child_next_sibling_heap_`.

7.307 constructors_destructor_fn_imps.hpp File Reference

7.307.1 Detailed Description

Contains an implementation class for ov_tree_.

7.308 constructors_destructor_fn_imps.hpp File Reference

7.308.1 Detailed Description

Contains an implementation class for a pairing heap.

7.309 constructors_destructor_fn_imps.hpp File Reference

7.309.1 Detailed Description

Contains an implementation class for pat_trie.

7.310 constructors_destructor_fn_imps.hpp File Reference

7.310.1 Detailed Description

Contains an implementation for rb_tree_.

7.311 constructors_destructor_fn_imps.hpp File Reference

7.311.1 Detailed Description

Contains an implementation for rc_binomial_heap_.

7.312 constructors_destructor_fn_imps.hpp File Reference

7.312.1 Detailed Description

Contains an implementation class for splay_tree_.

7.313 constructors_destructor_fn_imps.hpp File Reference

7.313.1 Detailed Description

Contains an implementation for thin_heap_.

7.314 debug_fn_imps.hpp File Reference

7.314.1 Detailed Description

Contains an implementation class for bin_search_tree_.

7.315 debug_fn_imps.hpp File Reference

7.315.1 Detailed Description

Contains an implementation class for a binary_heap.

7.316 debug_fn_imps.hpp File Reference

7.316.1 Detailed Description

Contains an implementation for binomial_heap_.

7.317 debug_fn_imps.hpp File Reference

7.317.1 Detailed Description

Contains an implementation class for a base of binomial heaps.

7.318 debug_fn_imps.hpp File Reference

7.318.1 Detailed Description

Contains implementations of cc_ht_map_'s debug-mode functions.

7.319 debug_fn_imps.hpp File Reference

7.319.1 Detailed Description

Contains implementations of gp_ht_map_'s debug-mode functions.

7.320 debug_fn_imps.hpp File Reference

7.320.1 Detailed Description

Contains an implementation class for left_child_next_sibling_heap_.

7.321 debug_fn_imps.hpp File Reference

7.321.1 Detailed Description

Contains implementations of cc_ht_map_'s debug-mode functions.

7.322 debug_fn_imps.hpp File Reference

7.322.1 Detailed Description

Contains an implementation class for ov_tree_.

7.323 debug_fn_imps.hpp File Reference

7.323.1 Detailed Description

Contains an implementation class for a pairing heap.

7.324 debug_fn_imps.hpp File Reference

7.324.1 Detailed Description

Contains an implementation class for pat_trie_.

7.325 debug_fn_imps.hpp File Reference

7.325.1 Detailed Description

Contains an implementation for rb_tree_.

7.326 debug_fn_imps.hpp File Reference

7.326.1 Detailed Description

Contains an implementation for rc_binomial_heap_.

7.327 `debug_fn_imps.hpp` File Reference

7.327.1 Detailed Description

Contains an implementation class for `splay_tree_`.

7.328 `debug_fn_imps.hpp` File Reference

7.328.1 Detailed Description

Contains an implementation for `thin_heap_`.

7.329 `entry_cmp.hpp` File Reference

Classes

- struct [__gnu_pbds::detail::entry_cmp<_VTp, Cmp_Fn, _Alloc, false>](#)
- struct [__gnu_pbds::detail::entry_cmp<_VTp, Cmp_Fn, _Alloc, true>](#)
- struct [__gnu_pbds::detail::entry_cmp<_VTp, Cmp_Fn, _Alloc, false>::type](#)

Namespaces

- namespace [__gnu_pbds](#)

7.329.1 Detailed Description

Contains an implementation class for a `binary_heap`.

7.330 `entry_pred.hpp` File Reference

Classes

- struct [__gnu_pbds::detail::entry_pred<_VTp, Pred, _Alloc, false>](#)
- struct [__gnu_pbds::detail::entry_pred<_VTp, Pred, _Alloc, true>](#)

Namespaces

- namespace [__gnu_pbds](#)

7.330.1 Detailed Description

Contains an implementation class for a `binary_heap`.

7.331 `erase_fn_imps.hpp` File Reference

7.331.1 Detailed Description

Contains an implementation class for `bin_search_tree_`.

7.332 `erase_fn_imps.hpp` File Reference

7.332.1 Detailed Description

Contains an implementation class for a `binary_heap`.

7.333 erase_fn_imps.hpp File Reference

7.333.1 Detailed Description

Contains an implementation class for a base of binomial heaps.

7.334 erase_fn_imps.hpp File Reference

7.334.1 Detailed Description

Contains implementations of cc_ht_map_'s erase related functions.

7.335 erase_fn_imps.hpp File Reference

7.335.1 Detailed Description

Contains implementations of gp_ht_map_'s erase related functions.

7.336 erase_fn_imps.hpp File Reference

7.336.1 Detailed Description

Contains an implementation class for left_child_next_sibling_heap_.

7.337 erase_fn_imps.hpp File Reference

7.337.1 Detailed Description

Contains implementations of lu_map_.

7.338 erase_fn_imps.hpp File Reference

7.338.1 Detailed Description

Contains an implementation class for ov_tree_.

7.339 erase_fn_imps.hpp File Reference

7.339.1 Detailed Description

Contains an implementation class for a pairing heap.

7.340 erase_fn_imps.hpp File Reference

7.340.1 Detailed Description

Contains an implementation class for pat_trie.

7.341 erase_fn_imps.hpp File Reference

7.341.1 Detailed Description

Contains an implementation for rb_tree_.

7.342 erase_fn_imps.hpp File Reference

7.342.1 Detailed Description

Contains an implementation for rc_binomial_heap_.

7.343 erase_fn_imps.hpp File Reference

7.343.1 Detailed Description

Contains an implementation class for splay_tree_.

7.344 erase_fn_imps.hpp File Reference

7.344.1 Detailed Description

Contains an implementation for thin_heap_.

7.345 find_fn_imps.hpp File Reference

7.345.1 Detailed Description

Contains an implementation class for bin_search_tree_.

7.346 find_fn_imps.hpp File Reference

7.346.1 Detailed Description

Contains an implementation class for a binary_heap.

7.347 find_fn_imps.hpp File Reference

7.347.1 Detailed Description

Contains an implementation class for a base of binomial heaps.

7.348 find_fn_imps.hpp File Reference

7.348.1 Detailed Description

Contains implementations of cc_ht_map_'s find related functions.

7.349 find_fn_imps.hpp File Reference

7.349.1 Detailed Description

Contains implementations of gp_ht_map_'s find related functions.

7.350 find_fn_imps.hpp File Reference

7.350.1 Detailed Description

Contains implementations of lu_map_.

7.351 find_fn_imps.hpp File Reference

7.351.1 Detailed Description

Contains an implementation class for a pairing heap.

7.352 find_fn_imps.hpp File Reference

7.352.1 Detailed Description

Contains an implementation class for pat_trie.

7.353 find_fn_imps.hpp File Reference**7.353.1 Detailed Description**

Contains an implementation for rb_tree_.

7.354 find_fn_imps.hpp File Reference**7.354.1 Detailed Description**

Contains an implementation class for splay_tree_.

7.355 find_fn_imps.hpp File Reference**7.355.1 Detailed Description**

Contains an implementation for thin_heap_.

7.356 info_fn_imps.hpp File Reference**7.356.1 Detailed Description**

Contains an implementation class for bin_search_tree_.

7.357 info_fn_imps.hpp File Reference**7.357.1 Detailed Description**

Contains an implementation class for a binary_heap.

7.358 info_fn_imps.hpp File Reference**7.358.1 Detailed Description**

Contains implementations of cc_ht_map_'s entire container info related functions.

7.359 info_fn_imps.hpp File Reference**7.359.1 Detailed Description**

Contains implementations of gp_ht_map_'s entire container info related functions.

7.360 info_fn_imps.hpp File Reference**7.360.1 Detailed Description**

Contains an implementation class for left_child_next_sibling_heap_.

7.361 info_fn_imps.hpp File Reference**7.361.1 Detailed Description**

Contains implementations of lu_map_.

7.362 info_fn_imps.hpp File Reference**7.362.1 Detailed Description**

Contains an implementation class for ov_tree_.

7.363 info_fn_imps.hpp File Reference

7.363.1 Detailed Description

Contains an implementation class for pat_trie.

7.364 info_fn_imps.hpp File Reference

7.364.1 Detailed Description

Contains an implementation for rb_tree_.

7.365 info_fn_imps.hpp File Reference

7.365.1 Detailed Description

Contains an implementation.

7.366 insert_fn_imps.hpp File Reference

7.366.1 Detailed Description

Contains an implementation class for bin_search_tree_.

7.367 insert_fn_imps.hpp File Reference

7.367.1 Detailed Description

Contains an implementation class for a binary_heap.

7.368 insert_fn_imps.hpp File Reference

7.368.1 Detailed Description

Contains an implementation class for a base of binomial heaps.

7.369 insert_fn_imps.hpp File Reference

7.369.1 Detailed Description

Contains implementations of cc_ht_map_'s insert related functions.

7.370 insert_fn_imps.hpp File Reference

7.370.1 Detailed Description

Contains implementations of gp_ht_map_'s insert related functions.

7.371 insert_fn_imps.hpp File Reference

7.371.1 Detailed Description

Contains an implementation class for left_child_next_sibling_heap_.

7.372 insert_fn_imps.hpp File Reference

7.372.1 Detailed Description

Contains implementations of lu_map_.

7.373 insert_fn_imps.hpp File Reference

7.373.1 Detailed Description

Contains an implementation class for `ov_tree_`.

7.374 insert_fn_imps.hpp File Reference

7.374.1 Detailed Description

Contains an implementation class for a pairing heap.

7.375 insert_fn_imps.hpp File Reference

7.375.1 Detailed Description

Contains an implementation for `rb_tree_`.

7.376 insert_fn_imps.hpp File Reference

7.376.1 Detailed Description

Contains an implementation for `rc_binomial_heap_`.

7.377 insert_fn_imps.hpp File Reference

7.377.1 Detailed Description

Contains an implementation class for `splay_tree_`.

7.378 insert_fn_imps.hpp File Reference

7.378.1 Detailed Description

Contains an implementation for `thin_heap_`.

7.379 iterators_fn_imps.hpp File Reference

7.379.1 Detailed Description

Contains an implementation class for `bin_search_tree_`.

7.380 iterators_fn_imps.hpp File Reference

7.380.1 Detailed Description

Contains an implementation class for a `binary_heap`.

7.381 iterators_fn_imps.hpp File Reference

7.381.1 Detailed Description

Contains implementations of `cc_ht_map_`'s iterators related functions, e.g., `begin()`.

7.382 iterators_fn_imps.hpp File Reference

7.382.1 Detailed Description

Contains an implementation class for `left_child_next_sibling_heap_`.

7.383 iterators_fn_imps.hpp File Reference

7.383.1 Detailed Description

Contains implementations of lu_map_.

7.384 iterators_fn_imps.hpp File Reference

7.384.1 Detailed Description

Contains an implementation class for ov_tree_.

7.385 iterators_fn_imps.hpp File Reference

7.385.1 Detailed Description

Contains an implementation class for pat_trie.

7.386 point_const_iterator.hpp File Reference

Classes

- class [__gnu_pbds::detail::binary_heap_point_const_iterator_< Value_Type, Entry, Simple, _Alloc >](#)

Namespaces

7.430 debug_store_hash_fn_imps.hpp File Reference**7.430.1 Detailed Description**

Contains implementations of cc_ht_map_'s debug-mode functions.

7.431 debug_store_hash_fn_imps.hpp File Reference**7.431.1 Detailed Description**

Contains implementations of gp_ht_map_'s debug-mode functions.

7.432 entry_list_fn_imps.hpp File Reference**7.432.1 Detailed Description**

Contains implementations of cc_ht_map_'s entry-list related functions.

7.433 erase_no_store_hash_fn_imps.hpp File Reference**7.433.1 Detailed Description**

Contains implementations of `cc_ht_map_'s` erase related functions, when the hash value is not stored.

7.434 erase_no_store_hash_fn_imps.hpp File Reference**7.434.1 Detailed Description**

Contains implementations of `gp_ht_map_'s` erase related functions, when the hash value is not stored.

7.435 erase_store_hash_fn_imps.hpp File Reference**7.435.1 Detailed Description**

Contains implementations of `cc_ht_map_'s` erase related functions, when the hash value is stored.

7.436 erase_store_hash_fn_imps.hpp File Reference**7.436.1 Detailed Description**

Contains implementations of `gp_ht_map_'s` erase related functions, when the hash value is stored.

7.437 find_store_hash_fn_imps.hpp File Reference**7.437.1 Detailed Description**

Contains implementations of `cc_ht_map_'s` find related functions, when the hash value is stored.

7.438 find_store_hash_fn_imps.hpp File Reference**7.438.1 Detailed Description**

Contains implementations of `gp_ht_map_'s` insert related functions, when the hash value is stored.

7.439 insert_no_store_hash_fn_imps.hpp File Reference**7.439.1 Detailed Description**

Contains implementations of `cc_ht_map_'s` insert related functions, when the hash value is not stored.

7.440 insert_no_store_hash_fn_imps.hpp File Reference**7.440.1 Detailed Description**

Contains implementations of `gp_ht_map_'s` insert related functions, when the hash value is not stored.

7.441 insert_store_hash_fn_imps.hpp File Reference**7.441.1 Detailed Description**

Contains implementations of `cc_ht_map_'s` insert related functions, when the hash value is stored.

7.442 insert_store_hash_fn_imps.hpp File Reference**7.442.1 Detailed Description**

Contains implementations of `gp_ht_map_'s` find related functions, when the hash value is stored.

7.443 `resize_fn_imps.hpp` File Reference

7.443.1 Detailed Description

Contains implementations of `cc_ht_map_`'s resize related functions.

7.444 `resize_fn_imps.hpp` File Reference

7.444.1 Detailed Description

Contains implementations of `gp_ht_map_`'s resize related functions.

7.445 `resize_no_store_hash_fn_imps.hpp` File Reference

7.445.1 Detailed Description

Contains implementations of `cc_ht_map_`'s resize related functions, when the hash value is not stored.

7.446 `resize_no_store_hash_fn_imps.hpp` File Reference

7.446.1 Detailed Description

Contains implementations of `gp_ht_map_`'s resize related functions, when the hash value is not stored.

7.447 `resize_store_hash_fn_imps.hpp` File Reference

7.447.1 Detailed Description

Contains implementations of `cc_ht_map_`'s resize related functions, when the hash value is stored.

7.448 `resize_store_hash_fn_imps.hpp` File Reference

7.448.1 Detailed Description

Contains implementations of `gp_ht_map_`'s resize related functions, when the hash value is stored.

7.449 `size_fn_imps.hpp` File Reference

7.449.1 Detailed Description

Contains implementations of `cc_ht_map_`'s entire container size related functions.

7.450 `cond_dealtor.hpp` File Reference

Classes

- class [`__gnu_pbds::detail::cond_dealtor< Entry, _Alloc >`](#)

Namespaces

- namespace [`__gnu_pbds`](#)

7.450.1 Detailed Description

Contains a conditional deallocator.

7.451 container_base_dispatch.hpp File Reference

Classes

- struct [__gnu_pbds::detail::container_base_dispatch< Key, Mapped, _Alloc, cc_hash_tag, Policy_TI >](#)
- struct [__gnu_pbds::detail::container_base_dispatch< Key, Mapped, _Alloc, gp_hash_tag, Policy_TI >](#)

- `#define PB_DS_V2S(X)`

7.451.1 Detailed Description

Contains associative container dispatching.

7.452 debug_map_base.hpp File Reference

7.452.1 Detailed Description

Contains a debug-mode base for all maps.

7.453 eq_by_less.hpp File Reference

Classes

- struct [__gnu_pbds::detail::eq_by_less< Key, Cmp_Fn >](#)

Namespaces

- namespace [__gnu_pbds](#)

7.453.1 Detailed Description

Contains an equivalence function.

7.454 hash_eq_fn.hpp File Reference

Classes

- struct [__gnu_pbds::detail::hash_eq_fn](#)< Key, Eq_Fn, _Alloc, false >
- struct [__gnu_pbds::detail::hash_eq_fn](#)< Key, Eq_Fn, _Alloc, true >

Namespaces

- namespace [__gnu_pbds](#)

7.454.1 Detailed Description

Contains 2 equivalence functions, one employing a hash value, and one ignoring it.

7.455 find_no_store_hash_fn_imps.hpp File Reference

7.455.1 Detailed Description

Contains implementations of gp_ht_map_'s find related functions, when the hash value is not stored.

7.456 gp_ht_map_.hpp File Reference

Classes

- class [__gnu_pbds::detail::gp_ht_map](#)< Key, Mapped, Hash_Fn, Eq_Fn, _Alloc, Store_Hash, Comb_Probe_Fn, Probe_Fn, Resize_

Namespaces

- namespace [__gnu_pbds](#)

Macros

- `#define PB_DS_CLASS_T_DEC`
- `#define PB_DS_GEN_POS`
- `#define PB_DS_GP_HASH_NAME`
- `#define PB_DS_GP_HASH_TRAITS_BASE`
- `#define PB_DS_HASH_EQ_FN_C_DEC`
- `#define PB_DS_RANGED_PROBE_FN_C_DEC`

7.456.1 Detailed Description

Contains an implementation class for general probing hash.

7.457 `iterator_fn_imps.hpp` File Reference

7.457.1 Detailed Description

Contains implementations of `gp_ht_map_'s` iterators related functions, e.g., `begin()`.

7.458 `direct_mask_range_hashing_imp.hpp` File Reference

7.458.1 Detailed Description

Contains a range-hashing policy implementation

7.459 `direct_mod_range_hashing_imp.hpp` File Reference

7.459.1 Detailed Description

Contains a range-hashing policy implementation

7.460 `linear_probe_fn_imp.hpp` File Reference

7.460.1 Detailed Description

Contains a probe policy implementation

7.461 `mask_based_range_hashing.hpp` File Reference

Classes

- class [__gnu_pbds::detail::mask_based_range_hashing< Size_Type >](#)

Namespaces

- namespace [__gnu_pbds](#)

7.461.1 Detailed Description

Contains a range hashing policy base.

7.462 `mod_based_range_hashing.hpp` File Reference

Classes

- class [__gnu_pbds::detail::mod_based_range_hashing< Size_Type >](#)

Namespaces

- namespace [__gnu_pbds](#)

7.462.1 Detailed Description

Contains a range hashing policy base.

7.463 `probe_fn_base.hpp` File Reference

Classes

- class [__gnu_pbds::detail::probe_fn_base< _Alloc >](#)

Namespaces

- namespace [__gnu_pbds](#)

7.463.1 Detailed Description

Contains a probe policy base.

7.464 quadratic_probe_fn_imp.hpp File Reference**7.464.1 Detailed Description**

Contains a probe policy implementation

7.465 ranged_hash_fn.hpp File Reference**Classes**

- class [__gnu_pbds::detail::ranged_hash_fn](#)< Key, Hash_Fn, _Alloc, Comb_Hash_Fn, false >
- class [__gnu_pbds::detail::ranged_hash_fn](#)< Key, Hash_Fn, _Alloc, Comb_Hash_Fn, true >

- `#define PB_DS_CLASS_T_DEC`
- `#define PB_DS_CLASS_T_DEC`
- `#define PB_DS_CLASS_T_DEC`

7.465.1 Detailed Description

Contains a unified ranged hash functor, allowing the hash tables to deal with a single class for ranged hashing.

7.466 ranged_probe_fn.hpp File Reference**Classes**

- class [__gnu_pbds::detail::ranged_probe_fn](#)< Key, Hash_Fn, _Alloc, Comb_Probe_Fn, Probe_Fn, false >
- class [__gnu_pbds::detail::ranged_probe_fn](#)< Key, Hash_Fn, _Alloc, Comb_Probe_Fn, Probe_Fn, true >
- class [__gnu_pbds::detail::ranged_probe_fn](#)< Key, null_type, _Alloc, Comb_Probe_Fn, null_type, false >

Namespaces

- namespace [__gnu_pbds](#)

Macros

- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`
- `#define PB_DS_CLASS_T_DEC`

7.466.1 Detailed Description

Contains a unified ranged probe functor, allowing the probe tables to deal with a single class for ranged probeing.

7.467 `sample_probe_fn.hpp` File Reference**Classes**

- class [__gnu_pbds::sample_probe_fn](#)

Namespaces

- namespace [__gnu_pbds](#)

7.467.1 Detailed Description

Contains a sample probe policy.

7.468 `sample_range_hashing.hpp` File Reference**Classes**

- class [__gnu_pbds::sample_range_hashing](#)

Namespaces

- namespace [__gnu_pbds](#)

7.468.1 Detailed Description

Contains a range hashing policy.

7.469 `sample_ranged_hash_fn.hpp` File Reference**Classes**

- class [__gnu_pbds::sample_ranged_hash_fn](#)

Namespaces

- namespace [__gnu_pbds](#)

7.469.1 Detailed Description

Contains a ranged hash policy.

7.470 `sample_ranged_probe_fn.hpp` File Reference**Classes**

- class [__gnu_pbds::sample_ranged_probe_fn](#)

Namespaces

- namespace [__gnu_pbds](#)

7.470.1 Detailed Description

Contains a ranged probe policy.

7.471 left_child_next_sibling_heap_.hpp File Reference

Classes

- class [__gnu_pbds::detail::left_child_next_sibling_heap< Value_Type, Cmp_Fn, Node_Metadata, _Alloc >](#)

Namespaces

- namespace [__gnu_pbds](#)

Macros

- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`

7.471.1 Detailed Description

Contains an implementation class for a basic heap.

7.472 node.hpp File Reference

Classes

- struct [__gnu_pbds::detail::left_child_next_sibling_heap_node_< _Value, _Metadata, _Alloc >](#)

Namespaces

- namespace [__gnu_pbds](#)

7.472.1 Detailed Description

Contains an implementation struct for this type of heap's node.

7.473 node.hpp File Reference

Classes

- struct [__gnu_pbds::detail::rb_tree_node_< Value_Type, Metadata, _Alloc >](#)

Namespaces

- namespace [__gnu_pbds](#)

7.473.1 Detailed Description

Contains an implementation for rb_tree_.

7.474 node.hpp File Reference

Classes

- struct [__gnu_pbds::detail::splay_tree_node_< Value_Type, Metadata, _Alloc >](#)

Namespaces

- namespace [__gnu_pbds](#)

7.474.1 Detailed Description

Contains an implementation struct for splay_tree_'s node.

7.475 entry_metadata_base.hpp File Reference

Namespaces

- namespace [__gnu_pbds](#)

7.475.1 Detailed Description

Contains an implementation for a list update map.

7.476 lu_map_.hpp File Reference

Classes

- class [__gnu_pbds::detail::lu_map< Key, Mapped, Eq_Fn, _Alloc, Update_Policy >](#)

Namespaces

- namespace [__gnu_pbds](#)

Macros

- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`
- `#define PB_DS_GEN_POS`
- `#define PB_DS_LU_NAME`
- `#define PB_DS_LU_TRAITS_BASE`

7.476.1 Detailed Description

Contains a list update map.

7.477 lu_counter_metadata.hpp File Reference

Classes

- class [__gnu_pbds::detail::lu_counter_metadata< Size_Type >](#)
- class [__gnu_pbds::detail::lu_counter_policy_base< Size_Type >](#)

Namespaces

- namespace [__gnu_pbds](#)

7.477.1 Detailed Description

Contains implementation of a lu counter policy's metadata.

7.478 sample_update_policy.hpp File Reference

Classes

- struct [__gnu_pbds::sample_update_policy](#)

Namespaces

- namespace [__gnu_pbds](#)

7.478.1 Detailed Description

Contains a sample policy for list update containers.

7.479 ov_tree_map_.hpp File Reference

Classes

- class [__gnu_pbds::detail::ov_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >::cond_dtor< Size_Type >](#)
- class [__gnu_pbds::detail::ov_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >](#)

Namespaces

- namespace [__gnu_pbds](#)

Macros

- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`
- `#define PB_DS_CONST_NODE_ITERATOR_NAME`
- `#define PB_DS_OV_TREE_NAME`
- `#define PB_DS_OV_TREE_TRAITS_BASE`

7.479.1 Detailed Description

Contains an implementation class for ov_tree.

7.480 pairing_heap_.hpp File Reference

Classes

- class [__gnu_pbds::detail::pairing_heap< Value_Type, Cmp_Fn, _Alloc >](#)

Namespaces

- namespace [__gnu_pbds](#)

Macros

- `#define PB_DS_ASSERT_NODE_CONSISTENT(_Node, _Bool)`
- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`
- `#define PB_DS_P_HEAP_BASE`

7.480.1 Detailed Description

Contains an implementation class for a pairing heap.

7.481 `insert_join_fn_imps.hpp` File Reference

7.481.1 Detailed Description

Contains an implementation class for `pat_trie`.

7.482 `pat_trie.hpp` File Reference

Classes

- class `__gnu_pbds::detail::pat_trie_map< Key, Mapped, Node_And_It_Traits, _Alloc >`

Namespaces

- namespace `__gnu_pbds`

Macros

- `#define PB_DS_ASSERT_NODE_VALID(X)`
- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`
- `#define PB_DS_PAT_TRIE_NAME`
- `#define PB_DS_PAT_TRIE_TRAITS_BASE`
- `#define PB_DS_RECURSIVE_COUNT_LEAFS(X)`

7.482.1 Detailed Description

Contains an implementation class for a patricia tree.

7.483 `pat_trie_base.hpp` File Reference

Classes

- class `__gnu_pbds::detail::pat_trie_base::_Clter< Node, Leaf, Head, Inode, Is_Forward_Iterator >`
- struct `__gnu_pbds::detail::pat_trie_base::_Head< _ATraits, Metadata >`
- struct `__gnu_pbds::detail::pat_trie_base::_Inode< _ATraits, Metadata >`
- class `__gnu_pbds::detail::pat_trie_base::_Iter< Node, Leaf, Head, Inode, Is_Forward_Iterator >`
- struct `__gnu_pbds::detail::pat_trie_base::_Leaf< _ATraits, Metadata >`
- struct `__gnu_pbds::detail::pat_trie_base::_Metadata< Metadata, _Alloc >`
- struct `__gnu_pbds::detail::pat_trie_base::_Metadata< null_type, _Alloc >`
- struct `__gnu_pbds::detail::pat_trie_base::_Node_base< _ATraits, Metadata >`
- class `__gnu_pbds::detail::pat_trie_base::_Node_citer< Node, Leaf, Head, Inode, _Clterator, Iterator, _Alloc >`
- class `__gnu_pbds::detail::pat_trie_base::_Node_iter< Node, Leaf, Head, Inode, _Clterator, Iterator, _Alloc >`
- struct `__gnu_pbds::detail::pat_trie_base::_Inode< _ATraits, Metadata >::const_iterator`
- struct `__gnu_pbds::detail::pat_trie_base::_Inode< _ATraits, Metadata >::iterator`
- struct `__gnu_pbds::detail::pat_trie_base`

Namespaces

- namespace `__gnu_pbds`

Macros

- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`
- `#define PB_DS_CONST_IT_C_DEC`
- `#define PB_DS_CONST_ODIR_IT_C_DEC`
- `#define PB_DS_IT_C_DEC`
- `#define PB_DS_ODIR_IT_C_DEC`
- `#define PB_DS_PAT_TRIE_NODE_CONST_ITERATOR_C_DEC`
- `#define PB_DS_PAT_TRIE_NODE_ITERATOR_C_DEC`

7.483.1 Detailed Description

Contains the base class for a patricia tree.

7.484 split_fn_imps.hpp File Reference**7.484.1 Detailed Description**

Contains an implementation class for pat_trie.

7.485 synth_access_traits.hpp File Reference**Classes**

- struct [__gnu_pbds::detail::synth_access_traits< Type_Traits, Set, _ATraits >](#)

Namespaces

- namespace [__gnu_pbds](#)

Macros

- `#define PB_DS_SYNTH_E_ACCESS_TRAITS_C_DEC`
- `#define PB_DS_SYNTH_E_ACCESS_TRAITS_T_DEC`

7.485.1 Detailed Description

Contains an implementation class for a patricia tree.

7.486 update_fn_imps.hpp File Reference**7.486.1 Detailed Description**

Contains an implementation class for pat_trie_.

7.487 priority_queue_base_dispatch.hpp File Reference**Classes**

- struct [__gnu_pbds::detail::container_base_dispatch< _VTp, Cmp_Fn, _Alloc, binary_heap_tag, null_type >](#)
- struct [__gnu_pbds::detail::container_base_dispatch< _VTp, Cmp_Fn, _Alloc, binomial_heap_tag, null_type >](#)
- struct [__gnu_pbds::detail::container_base_dispatch< _VTp, Cmp_Fn, _Alloc, pairing_heap_tag, null_type >](#)
- struct [__gnu_pbds::detail::container_base_dispatch< _VTp, Cmp_Fn, _Alloc, rc_binomial_heap_tag, null_type >](#)
- struct [__gnu_pbds::detail::container_base_dispatch< _VTp, Cmp_Fn, _Alloc, thin_heap_tag, null_type >](#)

Namespaces

- namespace [__gnu_pbds](#)

Macros

- `#define PB_DS_ASSERT_VALID(X)`
- `#define PB_DS_DEBUG_VERIFY(_Cond)`

7.487.1 Detailed Description

Contains an pqiative container dispatching base.

7.488 `rb_tree_.hpp` File Reference

Classes

- class [__gnu_pbds::detail::rb_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >](#)

Namespaces

- namespace [__gnu_pbds](#)

Macros

- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`
- `#define PB_DS_RB_TREE_BASE`
- `#define PB_DS_RB_TREE_BASE_NAME`
- `#define PB_DS_RB_TREE_NAME`
- `#define PB_DS_STRUCT_ONLY_ASSERT_VALID(X)`

7.488.1 Detailed Description

Contains an implementation for Red Black trees.

7.489 `rc.hpp` File Reference

Classes

- class [__gnu_pbds::detail::rc< _Node, _Alloc >](#)

Namespaces

- namespace [__gnu_pbds](#)

7.489.1 Detailed Description

Contains a redundant (binary counter).

7.490 `rc_binomial_heap_.hpp` File Reference

Classes

- class [__gnu_pbds::detail::rc_binomial_heap< Value_Type, Cmp_Fn, _Alloc >](#)

Namespaces

- namespace [__gnu_pbds](#)

Macros

- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`
- `#define PB_DS_RC_C_DEC`

7.490.1 Detailed Description

Contains an implementation for redundant-counter binomial heap.

7.491 cc_hash_max_collision_check_resize_trigger_imp.hpp File Reference

7.491.1 Detailed Description

Contains a resize trigger implementation.

7.492 hash_exponential_size_policy_imp.hpp File Reference

7.492.1 Detailed Description

Contains a resize size policy implementation.

7.493 hash_load_check_resize_trigger_imp.hpp File Reference

7.493.1 Detailed Description

Contains a resize trigger implementation.

7.494 hash_load_check_resize_trigger_size_base.hpp File Reference

Classes

- class [__gnu_pbds::detail::hash_load_check_resize_trigger_size_base< Size_Type, true >](#)

Namespaces

- namespace [__gnu_pbds](#)

7.494.1 Detailed Description

Contains an base holding size for some resize policies.

7.495 hash_prime_size_policy_imp.hpp File Reference

7.495.1 Detailed Description

Contains a resize size policy implementation.

7.496 hash_standard_resize_policy_imp.hpp File Reference

7.496.1 Detailed Description

Contains a resize policy implementation.

7.497 `sample_resize_policy.hpp` File Reference

Classes

- class [__gnu_pbds::sample_resize_policy](#)

Namespaces

- namespace [__gnu_pbds](#)

7.497.1 Detailed Description

Contains a sample resize policy for hash tables.

7.498 `sample_resize_trigger.hpp` File Reference

Classes

- class [__gnu_pbds::sample_resize_trigger](#)

Namespaces

- namespace [__gnu_pbds](#)

7.498.1 Detailed Description

Contains a sample resize trigger policy class.

7.499 `sample_size_policy.hpp` File Reference

Classes

- class [__gnu_pbds::sample_size_policy](#)

Namespaces

- namespace [__gnu_pbds](#)

7.499.1 Detailed Description

Contains a sample size resize-policy.

7.500 `splay_fn_imps.hpp` File Reference

7.500.1 Detailed Description

Contains an implementation class for `splay_tree_`.

7.501 `splay_tree_.hpp` File Reference

Classes

- class [__gnu_pbds::detail::splay_tree_map< Key, Mapped, Cmp_Fn, Node_And_It_Traits, _Alloc >](#)

Namespaces

- namespace [__gnu_pbds](#)

Macros

- `#define PB_DS_ASSERT_BASE_NODE_CONSISTENT(_Node)`
- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`
- `#define PB_DS_S_TREE_BASE`
- `#define PB_DS_S_TREE_BASE_NAME`
- `#define PB_DS_S_TREE_NAME`

7.501.1 Detailed Description

Contains an implementation class for splay trees.

7.502 standard_policies.hpp File Reference**Classes**

- struct [__gnu_pbds::detail::default_comb_hash_fn](#)
- struct [__gnu_pbds::detail::default_eq_fn< Key >](#)
- struct [__gnu_pbds::detail::default_hash_fn< Key >](#)
- struct [__gnu_pbds::detail::default_probe_fn< Comb_Probe_Fn >](#)
- struct [__gnu_pbds::detail::default_resize_policy< Comb_Hash_Fn >](#)
- struct [__gnu_pbds::detail::default_trie_access_traits< std::basic_string< Char, Char_Traits, std::allocator< char > > >](#)
- struct [__gnu_pbds::detail::default_update_policy](#)

Namespaces

- namespace [__gnu_pbds](#)

Macros

- `#define __dtrie_alloc`
- `#define __dtrie_string`

Enumerations

- enum { **default_store_hash** }

7.502.1 Detailed Description

Contains standard policies for containers.

7.502.2 Enumeration Type Documentation**anonymous enum**

`anonymous enum`

Enumeration for default behavior of stored hash data.

7.503 thin_heap.hpp File Reference**Classes**

- class [__gnu_pbds::detail::thin_heap< Value_Type, Cmp_Fn, _Alloc >](#)

Namespaces

- namespace [__gnu_pbds](#)

Macros

- `#define PB_DS_ASSERT_AUX_NULL(X)`
- `#define PB_DS_ASSERT_NODE_CONSISTENT(_Node, _Bool)`
- `#define PB_DS_BASE_T_P`
- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`

Enumerations

- enum { `num_distinct_rank_bounds` }

Variables

- static const std::size_t `__gnu_pbds::detail::g_a_rank_bounds` [num_distinct_rank_bounds]

7.503.1 Detailed Description

Contains an implementation class for a thin heap.

7.504 node_metadata_selector.hpp File Reference

Classes

- struct [__gnu_pbds::detail::tree_metadata_helper< Node_Update, false >](#)
- struct [__gnu_pbds::detail::tree_metadata_helper< Node_Update, true >](#)
- struct [__gnu_pbds::detail::tree_node_metadata_dispatch< Key, Data, Cmp_Fn, Node_Update, _Alloc >](#)

Namespaces

- namespace [__gnu_pbds](#)

7.504.1 Detailed Description

Contains an implementation class for trees.

7.505 node_metadata_selector.hpp File Reference

Classes

- struct [__gnu_pbds::detail::trie_metadata_helper< Node_Update, false >](#)
- struct [__gnu_pbds::detail::trie_metadata_helper< Node_Update, true >](#)
- struct [__gnu_pbds::detail::trie_node_metadata_dispatch< Key, Data, Cmp_Fn, Node_Update, _Alloc >](#)

Namespaces

- namespace [__gnu_pbds](#)

7.505.1 Detailed Description

Contains an implementation class for tries.

7.506 order_statistics_imp.hpp File Reference

7.506.1 Detailed Description

Contains forward declarations for order_statistics_key

7.507 order_statistics_imp.hpp File Reference

7.507.1 Detailed Description

Contains forward declarations for order_statistics_key

7.508 sample_tree_node_update.hpp File Reference

Classes

- class [__gnu_pbds::sample_tree_node_update< Const_Node_Iter, Node_Iter, Cmp_Fn, _Alloc >](#)

Namespaces

- namespace [__gnu_pbds](#)

7.508.1 Detailed Description

Contains a samle node update functor.

7.509 tree_trace_base.hpp File Reference

7.509.1 Detailed Description

Contains tree-related policies.

7.510 prefix_search_node_update_imp.hpp File Reference

7.510.1 Detailed Description

Contains an implementation of prefix_search_node_update.

7.511 sample_trie_access_traits.hpp File Reference

Classes

- struct [__gnu_pbds::sample_trie_access_traits](#)

Namespaces

- namespace [__gnu_pbds](#)

7.511.1 Detailed Description

Contains a sample probe policy.

7.512 sample_trie_node_update.hpp File Reference

Classes

- class [__gnu_pbds::sample_trie_node_update< Node_CItr, Node_Itr, ATraits, _Alloc >](#)

Namespaces

- namespace [__gnu_pbds](#)

7.512.1 Detailed Description

Contains a samle node update functor.

7.513 trie_policy_base.hpp File Reference**Classes**

- class [__gnu_pbds::detail::trie_policy_base< Node_Cltr, Node_Itr, _ATraits, _Alloc >](#)

Namespaces

- namespace [__gnu_pbds](#)

Macros

- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`

7.513.1 Detailed Description

Contains an implementation of `trie_policy_base`.

7.514 trie_string_access_traits_imp.hpp File Reference**7.514.1 Detailed Description**

Contains a policy for extracting character positions from a string for a vector-based PATRICIA tree

7.515 type_utils.hpp File Reference**Namespaces**

- namespace [__gnu_pbds](#)

Macros

- `#define PB_DS_STATIC_ASSERT(UNIQUE, E)`

Typedefs

- `typedef std::tr1::integral_constant< int, 0 > __gnu_pbds::detail::false_type`
- `typedef std::tr1::integral_constant< int, 1 > __gnu_pbds::detail::true_type`

7.515.1 Detailed Description

Contains utilities for handling types. All of these classes are based on Modern C++ by Andrei Alexandrescu.

7.516 types_traits.hpp File Reference

Classes

- struct [__gnu_pbds::detail::maybe_null_type< Key, Mapped, _Alloc, Store_Hash >](#)
- struct [__gnu_pbds::detail::maybe_null_type< Key, null_type, _Alloc, Store_Hash >](#)
- struct [__gnu_pbds::detail::no_throw_copies< Key, Mapped >](#)
- struct [__gnu_pbds::detail::no_throw_copies< Key, null_type >](#)
- struct [__gnu_pbds::detail::rebind_traits< _Alloc, T >](#)
- struct [__gnu_pbds::detail::select_value_type< Key, Mapped >](#)
- struct [__gnu_pbds::detail::select_value_type< Key, null_type >](#)
- struct [__gnu_pbds::detail::stored_data< _Tv, _Th, Store_Hash >](#)
- struct [__gnu_pbds::detail::stored_data< _Tv, _Th, false >](#)
- struct [__gnu_pbds::detail::stored_hash< _Th >](#)
- struct [__gnu_pbds::detail::stored_value< _Tv >](#)
- struct [__gnu_pbds::detail::types_traits< Key, Mapped, _Alloc, Store_Hash >](#)

Namespaces

- namespace [__gnu_pbds](#)

7.516.1 Detailed Description

Contains a traits class of types used by containers.

7.517 iterator.hpp File Reference

7.517.1 Detailed Description

Contains an iterator_class used for ranging over the elements of the table.

This file is intended to be included inside a class definition, with PB_DS_CLASS_C_DEC defined to the name of the enclosing class.

7.518 point_iterator.hpp File Reference

7.518.1 Detailed Description

Contains an iterator class returned by the tables' find and insert methods.

This file is intended to be included inside a class definition, with PB_DS_CLASS_C_DEC defined to the name of the enclosing class.

7.519 exception.hpp File Reference

Classes

- struct [__gnu_pbds::container_error](#)
- struct [__gnu_pbds::insert_error](#)
- struct [__gnu_pbds::join_error](#)
- struct [__gnu_pbds::resize_error](#)

Namespaces

- namespace [__gnu_pbds](#)

Functions

- void `__gnu_pbds::__throw_container_error()`
- void `__gnu_pbds::__throw_insert_error()`
- void `__gnu_pbds::__throw_join_error()`
- void `__gnu_pbds::__throw_resize_error()`

7.519.1 Detailed Description

Contains exception classes.

7.520 hash_policy.hpp File Reference

Classes

- class `__gnu_pbds::cc_hash_max_collision_check_resize_trigger< External_Load_Access, Size_Type >`
- class `__gnu_pbds::direct_mask_range_hashing< Size_Type >`
- class `__gnu_pbds::direct_mod_range_hashing< Size_Type >`
- class `__gnu_pbds::hash_exponential_size_policy< Size_Type >`
- class `__gnu_pbds::hash_load_check_resize_trigger< External_Load_Access, Size_Type >`
- class `__gnu_pbds::hash_prime_size_policy`
- class `__gnu_pbds::hash_standard_resize_policy< Size_Policy, Trigger_Policy, External_Size_Access, Size_Type >`
- class `__gnu_pbds::linear_probe_fn< Size_Type >`
- class `__gnu_pbds::quadratic_probe_fn< Size_Type >`

Namespaces

- namespace `__gnu_pbds`

Macros

- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_C_DEC`

- `#define PB_DS_CLASS_T_DEC`
- `#define PB_DS_CLASS_T_DEC`
- `#define PB_DS_SIZE_BASE_C_DEC`

7.520.1 Detailed Description

Contains hash-related policies.

7.521 list_update_policy.hpp File Reference

Classes

- class [__gnu_pbds::lu_counter_policy< Max_Count, _Alloc >](#)
- class [__gnu_pbds::lu_move_to_front_policy< _Alloc >](#)

Namespaces

- namespace [__gnu_pbds](#)

7.521.1 Detailed Description

Contains policies for list update containers.

7.522 priority_queue.hpp File Reference

Classes

- class [__gnu_pbds::priority_queue< _Tv, Cmp_Fn, Tag, _Alloc >](#)

Namespaces

- namespace [__gnu_pbds](#)

7.522.1 Detailed Description

Contains priority_queues.

7.523 tag_and_trait.hpp File Reference

Classes

- struct [__gnu_pbds::associative_tag](#)
- struct [__gnu_pbds::basic_branch_tag](#)
- struct [__gnu_pbds::basic_hash_tag](#)
- struct [__gnu_pbds::basic_invalidation_guarantee](#)

7.527.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

Author

Bob Walters

Provides reusable `_Pointer_adapter` for assisting in the development of custom pointer types that can be used with the standard containers via the `allocator::pointer` and `allocator::const_pointer` typedefs.

7.528 pool_allocator.h File Reference

Classes

- class `__gnu_cxx::__pool_alloc< _Tp >`
- class `__gnu_cxx::__pool_alloc_base`

Namespaces

- namespace [__gnu_cxx](#)

Functions

- `template<typename _Tp >
bool __gnu_cxx::operator== (const __pool_alloc< _Tp > &, const __pool_alloc< _Tp > &)`

7.528.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

7.529 [rb_tree](#) File Reference

Classes

- struct [__gnu_cxx::rb_tree](#)< [_Key](#), [_Value](#), [_KeyOfValue](#), [_Compare](#), [_Alloc](#) >

Namespaces

- namespace [__gnu_cxx](#)

Macros

- `#define _RB_TREE`

7.529.1 Detailed Description

This file is a GNU extension to the Standard C++ Library (possibly containing extensions from the HP/SGI STL subset).

7.530 [rc_string_base.h](#) File Reference

Classes

- class [__gnu_cxx::__rc_string_base](#)< [_CharT](#), [_Traits](#), [_Alloc](#) >

Namespaces

- namespace [__gnu_cxx](#)

7.530.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<ext/vstring.h>`.

7.538.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

Contains two exception-generating types (`throw_value`, `throw_allocator`) intended to be used as value and allocator types while testing exception safety in templated containers and algorithms. The allocator has additional log and debug features. The exception generated is of type `forced_exception_error`.

7.539 `type_traits.h` File Reference

Standard Stream Objects

The `<iostream>` header declares the eight standard stream objects. For other declarations, see <http://gcc.gnu.org/onlinedocs/libstdc++/manual/io.html> and the [I/O forward declarations](#)

They are required by default to cooperate with the global C library's `FILE` streams, and to be available during program startup and termination. For more information, see the section of the manual linked to above.

- `ostream` [std::cerr](#)
- `istream` [std::cin](#)

7.577.1 Detailed Description

This is a TS C++ Library header.

7.577.2 Function Documentation

`get_default_resource()`

```
memory_resource * std::experimental::fundamentals_v2::pmr::get_default_resource ( ) [inline],
[noexcept]
```

Get the current default resource.

`set_default_resource()`

```
memory_resource * std::experimental::fundamentals_v2::pmr::set_default_resource (
    memory_resource * __r ) [inline], [noexcept]
```

Change the default resource and return the previous one.

7.578.1 Detailed Description

This is a Standard C++ Library header.

7.578.2 Function Documentation

get_default_resource()

`memory_resource * std::pmr::get_default_resource () [noexcept]`

Get the current default memory resource pointer.

new_delete_resource()

`memory_resource * std::pmr::new_delete_resource () [noexcept]`

A `pmr::memory_resource` that uses `new` to allocate memory.

null_memory_resource()

`memory_resource * std::pmr::null_memory_resource () [noexcept]`

A `pmr::memory_resource` that always throws `bad_alloc`

set_default_resource()

`memory_resource * std::pmr::set_default_resource (
memory_resource * __r) [noexcept]`

Replace the default memory resource pointer.

7.584.1 Detailed Description

Parallel STL function calls corresponding to `stl_numeric.h`. The functions defined here mainly do case switches and call the actual parallelized versions in other files. Inlining policy: Functions that basically only contain one function call, are declared inline. This file is a GNU parallel extension to the Standard C++ Library.

7.588.1 Detailed Description

Parallel STL function calls corresponding to the `stl_algo.h` header.

The functions defined here mainly do case switches and call the actual parallelized versions in other files. Inlining policy: Functions that basically only contain one function call, are declared inline. This file is a GNU parallel extension to the Standard C++ Library.

7.589 `algo.h` File Reference

7.590.1 Detailed Description

Implementation of a dynamically load-balanced parallel quicksort.

It works in-place and needs only logarithmic extra memory. The algorithm is similar to the one proposed in P. Tsigas and Y. Zhang. A simple, fast parallel implementation of quicksort and its performance evaluation on SUN enterprise 10000. In 11th Euromicro Conference on Parallel, Distributed and Network-Based Processing, page 372, 2003.

This file is a GNU parallel extension to the Standard C++ Library.

7.591.1 Detailed Description

Sequential helper functions. This file is a GNU parallel extension to the Standard C++ Library.

7.592 `basic_iterator.h` File Reference**7.592.1 Detailed Description**

Includes the original header files concerned with iterators except for stream iterators. This file is a GNU parallel extension to the Standard C++ Library.

7.593 `checkers.h` File Reference**Namespaces**

- namespace `__gnu_parallel`

Functions

- `template<typename _Iter, typename _Compare >
bool __gnu_parallel::__is_sorted (_Iter __begin, _Iter __end, _Compare __comp)`

7.593.1 Detailed Description

Routines for checking the correctness of algorithm results. This file is a GNU parallel extension to the Standard C++ Library.

7.594 `compiletime_settings.h` File Reference**Macros**

- `#define _GLIBCXX_CALL(__n)`
- `#define _GLIBCXX_PARALLEL_ASSERTIONS`
- `#define _GLIBCXX_RANDOM_SHUFFLE_CONSIDER_L1`
- `#define _GLIBCXX_RANDOM_SHUFFLE_CONSIDER_TLB`
- `#define _GLIBCXX_SCALE_DOWN_FPU`
- `#define _GLIBCXX_VERBOSE_LEVEL`

7.594.1 Detailed Description

Defines on options concerning debugging and performance, at compile-time. This file is a GNU parallel extension to the Standard C++ Library.

7.594.2 Macro Definition Documentation

`_GLIBCXX_CALL`

```
#define _GLIBCXX_CALL(  
    __n )
```

Macro to produce log message when entering a function.

Parameters

<code>__n</code>	Input size.
------------------	-------------

See also

`_GLIBCXX_VERBOSE_LEVEL`

`_GLIBCXX_PARALLEL_ASSERTIONS`

```
#define _GLIBCXX_PARALLEL_ASSERTIONS
```

Switch on many `_GLIBCXX_PARALLEL_ASSERTIONS` in parallel code. Should be switched on only locally.

`_GLIBCXX_RANDOM_SHUFFLE_CONSIDER_L1`

```
#define _GLIBCXX_RANDOM_SHUFFLE_CONSIDER_L1
```

Switch on many `_GLIBCXX_PARALLEL_ASSERTIONS` in parallel code. Consider the size of the L1 cache for `gnu_parallel::__parallel_random_shuffle()`.

`_GLIBCXX_RANDOM_SHUFFLE_CONSIDER_TLB`

```
#define _GLIBCXX_RANDOM_SHUFFLE_CONSIDER_TLB
```

Switch on many `_GLIBCXX_PARALLEL_ASSERTIONS` in parallel code. Consider the size of the TLB for `gnu_parallel::__parallel_random_shuffle()`.

`_GLIBCXX_SCALE_DOWN_FPU`

```
#define _GLIBCXX_SCALE_DOWN_FPU
```

Use floating-point scaling instead of modulo for mapping random numbers to a range. This can be faster on certain CPUs.

`_GLIBCXX_VERBOSE_LEVEL`

```
#define _GLIBCXX_VERBOSE_LEVEL
```

Determine verbosity level of the parallel mode. Level 1 prints a message each time a parallel-mode function is entered.

7.596.1 Detailed Description

Defines on whether to include algorithm variants.

Less variants reduce executable size and compile time. This file is a GNU parallel extension to the Standard C++ Library.

7.596.2 Macro Definition Documentation

`_GLIBCXX_BAL_QUICKSORT`

```
#define _GLIBCXX_BAL_QUICKSORT
```

Include parallel dynamically load-balanced quicksort.

See also

`__gnu_parallel::Settings::sort_algorithm`

`_GLIBCXX_FIND_CONSTANT_SIZE_BLOCKS`

```
#define _GLIBCXX_FIND_CONSTANT_SIZE_BLOCKS
```

Include the equal-sized blocks variant for `std::find`.

See also

`__gnu_parallel::Settings::find_algorithm`

_GLIBCXX_FIND_EQUAL_SPLIT

```
#define _GLIBCXX_FIND_EQUAL_SPLIT
```

Include the equal splitting variant for `std::find`.

See also

`__gnu_parallel::_Settings::find_algorithm`

_GLIBCXX_FIND_GROWING_BLOCKS

```
#define _GLIBCXX_FIND_GROWING_BLOCKS
```

Include the growing blocks variant for `std::find`.

See also

`__gnu_parallel::_Settings::find_algorithm`

_GLIBCXX_MERGESORT

```
#define _GLIBCXX_MERGESORT
```

Include parallel multi-way mergesort.

See also

`__gnu_parallel::_Settings::sort_algorithm`

_GLIBCXX_QUICKSORT

```
#define _GLIBCXX_QUICKSORT
```

Include parallel unbalanced quicksort.

See also

`__gnu_parallel::_Settings::sort_algorithm`

_GLIBCXX_TREE_DYNAMIC_BALANCING

```
#define _GLIBCXX_TREE_DYNAMIC_BALANCING
```

Include the dynamic balancing variant for `_Rb_tree::insert_unique(_Iter beg, _Iter __end)`.

See also

`__gnu_parallel::_Rb_tree`

_GLIBCXX_TREE_FULL_COPY

```
#define _GLIBCXX_TREE_FULL_COPY
```

In order to sort the input sequence of `_Rb_tree::insert_unique(_Iter beg, _Iter __end)` a full copy of the input elements is done.

See also

`__gnu_parallel::_Rb_tree`

`_GLIBCXX_TREE_INITIAL_SPLITTING`

```
#define _GLIBCXX_TREE_INITIAL_SPLITTING
```

Include the initial splitting variant for `_Rb_tree::insert_unique(_Iter beg, _Iter __end)`.

See also

`__gnu_parallel::_Rb_tree`

7.606.1 Detailed Description

Implementation of sequential and parallel multiway merge.

Explanations on the high-speed merging routines in the appendix of

P. Sanders. Fast priority queues for cached memory. ACM Journal of Experimental Algorithmics, 5, 2000.

This file is a GNU parallel extension to the Standard C++ Library.

7.606.2 Macro Definition Documentation

`_GLIBCXX_PARALLEL_LENGTH`

```
#define _GLIBCXX_PARALLEL_LENGTH(
    __s )
```

Length of a sequence described by a pair of iterators.

7.607 `multiway_mergesort.h` File Reference

7.620.1 Detailed Description

Parallel implementations of set operations for random-access iterators. This file is a GNU parallel extension to the Standard C++ Library.

7.621 settings.h File Reference

Classes

- struct `__gnu_parallel::_Settings`

Namespaces

- namespace `__gnu_parallel`

Macros

- `#define _GLIBCXX_PARALLEL_CONDITION(__c)`

7.621.1 Detailed Description

Runtime settings and tuning parameters, heuristics to decide whether to use parallelized algorithms. This file is a GNU parallel extension to the Standard C++ Library.

7.621.2 Deciding whether to run an algorithm in parallel.

There are several ways the user can switch on and off the parallel execution of an algorithm, both at compile- and run-time.

Only sequential execution can be forced at compile-time. This reduces code size and protects code parts that have non-thread-safe side effects.

Ultimately, forcing parallel execution at compile-time makes sense. Often, the sequential algorithm implementation is used as a subroutine, so no reduction in code size can be achieved. Also, the machine the program is run on might have only one processor core, so to avoid overhead, the algorithm is executed sequentially.

To force sequential execution of an algorithm ultimately at compile-time, the user must add the tag `gnu_parallel::sequential_tag()` to the end of the parameter list, e. g.

```
std::sort(__v.begin(), __v.end(), __gnu_parallel::sequential_tag());
```

This is compatible with all overloaded algorithm variants. No additional code will be instantiated, at all. The same holds for most algorithm calls with iterators not providing random access.

If the algorithm call is not forced to be executed sequentially at compile-time, the decision is made at run-time. The global variable `__gnu_parallel::_Settings::algorithm_strategy` is checked. It is a tristate variable corresponding to:

- a. `force_sequential`, meaning the sequential algorithm is executed.
- b. `force_parallel`, meaning the parallel algorithm is executed.
- c. `heuristic`

For heuristic, the parallel algorithm implementation is called only if the input size is sufficiently large. For most algorithms, the input size is the (combined) length of the input sequence(`__s`). The threshold can be set by the user, individually for each algorithm. The according variables are called `gnu_parallel::_Settings::[algorithm]_minimal_n`.

For some of the algorithms, there are even more tuning options, e. g. the ability to choose from multiple algorithm variants. See below for details.

7.621.3 Macro Definition Documentation

`_GLIBCXX_PARALLEL_CONDITION`

```
#define _GLIBCXX_PARALLEL_CONDITION(  
    __c )
```

Determine at compile(?)-time if the parallel variant of an algorithm should be called.

Parameters

<code>__gnu_parallel::__c</code>	A condition that is convertible to bool that is overruled by <code>__gnu_parallel::Settings::algorithm_strategy</code> . Usually a decision based on the input size.

7.667.1 Detailed Description

This is a TS C++ Library header.

This header defines variable templates for the C++14 type traits.

Equivalent variable templates are defined in namespace `std` since C++17.

7.691.1 Detailed Description

Compatibility layer, mostly concerned with atomic operations.

This file is a GNU parallel extension to the Standard C++ Library and contains implementation details for the library's internal use.

7.692 compatibility.h File Reference

7.692.1 Detailed Description

This is an internal header file, included by other library sources. You should not attempt to use it directly.

7.693 cpu_defines.h File Reference

7.693.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<iosfwd>`.

7.694 ctype_base.h File Reference

Classes

- struct [std::ctype_base](#)

Namespaces
