template<typename _Rep>

Trait indicating whether to treat a type as a floating-point type.

The chrono library uses this trait to tell whether a `duration` can represent fractional values of the given precision, or only integral values.

You should specialize this trait for your own numeric types that are used with `duration` and can represent non-integral values.

Finds an entry by `__order`. Returns an iterator to the entry with the `__order` order, or an iterator to the container object's end if order is at least the size of the container object.

Returns the order of a prefix within a sequence. For example, if `[b, e]` is the smallest prefix, this method will return 0; if `r_key` is a key between the smallest and next key, this method will return 1; if `r_key` is a key larger than the largest key, this method will return the size of `r_c`.

### 6.1029.1 Detailed Description

Part of RTTI.

The `type_info` class describes type information generated by an implementation.

### 6.1029.2 Constructor & Destructor Documentation

**6.1029.2.1** `~type_info()` `virtual std::type_info::~~type_info ( ) [virtual]`

Destructor first. Being the first non-inline virtual function, this controls in which translation unit the vtable is emitted. The compiler makes use of that information to know where to emit the runtime-mandated `type_info` structures in the new-abi.

### 6.1029.3 Member Function Documentation

**6.1029.3.1** `before()` `bool std::type_info::before (const type_info & __arg) const [noexcept]`

Returns true if `*this` precedes `__arg` in the implementation's collation order.

**6.1029.3.2 name()** `const char * std::type_info::name ( ) const [inline], [noexcept]`

Returns an *implementation-defined* byte string; this is not portable between compilers!

### 6.1031.1 Detailed Description

The list of `chrono::tzdb` objects

A single object of this type is constructed by the C++ runtime, and can be accessed by calling `chrono::get_tzdb_list()`.

The front of the list is the current `tzdb` object and can be accessed via `chrono::get_tzdb_list().front()` or `chrono::get_tzdb()` or `*chrono::get_tzdb_list().begin()`.

The `chrono::reload_tzdb()` function will check for a newer version and if found, insert it at the front of the list.

Since

C++20

### 6.1031.2 Member Function Documentation

#### 6.1031.2.1 `erase_after()` `const_iterator` `std::chrono::tzdb_list::erase_after` (`const_iterator` \_\_p )

Remove the `tzdb` object *after* the one the iterator refers to.

Calling this function concurrently with any of `front()`, `begin()`, or `end()` does not cause a data race, but in general this function is not thread-safe. The behaviour may be undefined if erasing an element from the list while another thread is calling the same function, or incrementing an iterator into the list, or accessing the element being erased (unless it is accessed through an iterator).

#### Parameters

<code>__p</code>	A dereferenceable iterator.
------------------	-----------------------------

**Returns**

An iterator the element after the one that was erased (or `end()` if there is no such element).

**Since**

C++20

**6.1031.2.2 `front()`** `const tzdb & std::chrono::tzdb_list::front () const [noexcept]`

Access the current `tzdb` at the front of the list.

This returns a reference to the same object as `chrono::get_tzdb()`.

**Returns**

A reference to the current `tzdb` object.

**Since**

C++20

```
template<typename _Mutex>
class std::unique_lock< _Mutex >
```

A movable scoped lock type.

A `unique_lock` controls mutex ownership within a scope. Ownership of the mutex can be delayed until after construction and can be transferred to another `unique_lock` by move construction or move assignment. If a mutex lock is owned when the destructor runs ownership will be released.

### 6.1044.1 Detailed Description

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>, typename _Alloc =
allocator<std::pair<const _Key, _Tp>>>>
class std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >
```

A standard container composed of unique keys (containing at most one of each key value) that associates values of another type with the keys.

#### Template Parameters

<code>_Key</code>	Type of key objects.
<code>_Tp</code>	Type of mapped objects.
<code>_Hash</code>	Hashing function object type, defaults to <code>hash&lt;_Value&gt;</code> .
<code>_Pred</code>	Predicate function object type, defaults to <code>equal_to&lt;_Value&gt;</code> .
<code>_Alloc</code>	Allocator type, defaults to <code>std::allocator&lt;std::pair&lt;const _Key, _Tp&gt;&gt;</code> .

Meets the requirements of a [container](#), and [unordered associative container](#)

The resulting value type of the container is `std::pair<const _Key, _Tp>`.

Base is `_Hashtable`, dispatched at compile time via template alias `__umap_hashtable`.

Finds the number of elements.

## Parameters

## Parameters

<code>_↔</code>	Key to count.

**6.1044.4.17 emplace()** `template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>> template<typename... _Args> std::pair< iterator, bool > std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::emplace ( _Args &&... __args ) [inline]`

Attempts to build and insert a `std::pair` into the `unordered_map`.

## Parameters

<code>__args</code>	Arguments used to generate a new pair instance (see <code>std::piecewise_construct</code> for passing arguments to each part of the pair constructor).
---------------------	--

## Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to build and insert a (key, value) pair into the `unordered_map`. An `unordered_map` relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the `unordered_map`. Insertion requires amortized constant time.

**6.1044.4.18 `emplace_hint()`** `template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>> template<typename... _Args> iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::emplace_hint ( const_iterator __pos, _Args &&... __args ) [inline]`

Attempts to build and insert a `std::pair` into the `unordered_map`.

## Parameters

<code>__pos</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__args</code>	Arguments used to generate a new pair instance (see <code>std::piecewise_construct</code> for passing arguments to each part of the pair constructor).

## Returns

An iterator that points to the element with key of the `std::pair` built from `__args` (may or may not be that `std::pair`).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `emplace()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints) for more on *hinting*.

An iterator that points to the element with key of \_\_x (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument insert() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints) for more on *hinting*.

Insertion requires amortized constant time.

iterator std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::insert (
    const_iterator __hint,
    const value_type & __x ) [inline]

```

Attempts to insert a `std::pair` into the `unordered_map`.

#### Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__x</code>	Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs).

#### Parameters

<code>↔</code>	An initializer_list.
<code>↔</code>	
<code>↔</code>	
<code>↔</code>	
<code>/</code>	

This function fills an unordered\_map with copies of the elements in the initializer list \_\_l.

Note that the assignment completely changes the unordered\_map and that the resulting unordered\_map's size is the same as the number of elements assigned.

**6.1044.4.60 operator=()** [3/3] `template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>> unordered_map & std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::operator= ( unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc > && ) [default]`

Lookup requires constant time.

**6.1044.4.62 operator[]()** [2/2] `template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>> mapped_type & std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::operator[] ( key_type && __k ) [inline]`

#### Parameters

<code>↔</code>	The key for which data should be retrieved.
<code>_k</code>	

**Returns**

A reference to the data of the (key,data) pair.

Allows for easy lookup with the subscript ( [] )operator. Returns data associated with the key specified in subscript. If the key does not exist, a pair with that key is created using default values, which is then returned.

Lookup requires constant time.

`size_type __n ) [inline]`

May rehash the unordered\_map.

**Parameters**

<code>__n</code>	The new number of buckets.
------------------	----------------------------

Rehash will occur only if the new number of buckets respect the unordered\_map maximum load factor.

**6.1044.4.64 reserve()** `template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>`  
`void std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::reserve (`  
`size_type __n ) [inline]`

Prepare the unordered\_map for a specified number of elements.

**Parameters**

<code>__n</code>	Number of elements required.
------------------	------------------------------

Same as `rehash(ceil(n / max_load_factor()))`.

**6.1044.4.65 size()** `template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>`

Returns the size of the unordered\_map.

**6.1044.4.66 swap()** `template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>>`  
`void std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::swap (`  
`unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc > & __x ) [inline], [noexcept]`

Swaps data with another unordered\_map.

**Parameters**

<code>__x</code>	An unordered_map of the same element and allocator types.
------------------	---

This exchanges the elements between two `unordered_map` in constant time. Note that the global `std::swap()` function is specialized such that `std::swap(m1,m2)` will feed to this function.

**6.1044.4.67 try\_emplace() [1/2]** `template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>> template<typename... _Args> pair< iterator, bool > std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >::try_emplace ( const key_type & __k, _Args &&... __args ) [inline]`

Attempts to build and insert a `std::pair` into the `unordered_map`.

#### Parameters

<code>__k</code>	Key to use for finding a possibly existing pair in the <code>unordered_map</code> .
<code>__args</code>	Arguments used to generate the .second for a new pair instance.

#### Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to build and insert a (key, value) pair into the `unordered_map`. An `unordered_map` relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the `unordered_map`. If a pair is not inserted, this function has no effect.

Insertion requires amortized constant time.

Attempts to build and insert a `std::pair` into the `unordered_map`.

#### Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__k</code>	Key to use for finding a possibly existing pair in the <code>unordered_map</code> .
<code>__args</code>	Arguments used to generate the .second for a new pair instance.

#### Returns

An iterator that points to the element with key of the `std::pair` built from `__args` (may or may not be that `std::pair`).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `emplace()` does. However, if insertion did not take place, this function has no effect. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

### 6.1046.1 Detailed Description

```
template<typename _Key, typename _Tp, typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>, typename _Alloc =
allocator<std::pair<const _Key, _Tp>>>>
class std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >
```

A standard container composed of equivalent keys (possibly containing multiple of each key value) that associates values of another type with the keys.

#### Template Parameters

<code>_Key</code>	Type of key objects.
<code>_Tp</code>	Type of mapped objects.
<code>_Hash</code>	Hashing function object type, defaults to <code>hash&lt;_Value&gt;</code> .
<code>_Pred</code>	Predicate function object type, defaults to <code>equal_to&lt;_Value&gt;</code> .
<code>_Alloc</code>	Allocator type, defaults to <code>std::allocator&lt;std::pair&lt;const _Key, _Tp&gt;&gt;</code> .

Meets the requirements of a [container](#), and [unordered associative container](#)

The resulting value type of the container is `std::pair<const _Key, _Tp>`.

Base is `_Hashtable`, dispatched at compile time via template alias `__ummap_hashtable`.

Returns a positive number that the unordered\_multimap tries to keep the load factor less than or equal to.

**6.1046.4.52 max\_load\_factor()** `[2/2] template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>> void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::max_load_factor ( float __z ) [inline]`

Change the unordered\_multimap maximum load factor.

#### Parameters

<code>_z</code>	The new maximum load factor.
-----------------	------------------------------

**6.1046.4.53 max\_size()** `template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>> size_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::max_size ( ) const [inline], [noexcept]`

Returns the maximum size of the unordered\_multimap.

**6.1046.4.54 operator=()** `[1/3] template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>> unordered_multimap & std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::operator= ( const unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc > & ) [default]`

Copy assignment operator.

**6.1046.4.55 operator=()** `[2/3] template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>> unordered_multimap & std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::operator= ( initializer_list< value_type > __l ) [inline]`

Unordered\_multimap list assignment operator.

## Parameters

<code>↔</code>	An initializer_list.
<code>_↔</code>	
<code>↔</code>	
<code>_↔</code>	
<code>/</code>	

This function fills an `unordered_multimap` with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the `unordered_multimap` and that the resulting `unordered_multimap`'s size is the same as the number of elements assigned.

**6.1046.4.56 operator=()** [3/3] `template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>> unordered_multimap & std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::operator= ( unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc > && ) [default]`

Move assignment operator.

**6.1046.4.57 rehash()** `template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>> void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::rehash ( size_type __n ) [inline]`

May rehash the `unordered_multimap`.

## Parameters

<code>_↔</code>	The new number of buckets.
<code>_n</code>	

Rehash will occur only if the new number of buckets respect the `unordered_multimap` maximum load factor.

**6.1046.4.58 reserve()** `template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>> void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::reserve ( size_type __n ) [inline]`

Prepare the `unordered_multimap` for a specified number of elements.

## Parameters

<code>_↔</code>	Number of elements required.
<code>_n</code>	

Same as `rehash(ceil(n / max_load_factor()))`.

**6.1046.4.59 size()** `template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>> size_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::size ( ) const [inline], [noexcept]`

Returns the size of the `unordered_multimap`.

**6.1046.4.60 swap()** `template<typename _Key , typename _Tp , typename _Hash = hash<_Key>, typename _Pred = equal_to<_Key>, typename _Alloc = allocator<std::pair<const _Key, _Tp>>>  
void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::swap (   
    unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc > & __x ) [inline], [noexcept]`  
Swaps data with another unordered\_multimap.

#### Parameters

<code>__x</code>	An unordered_multimap of the same element and allocator types.
------------------	--

This exchanges the elements between two unordered\_multimap in constant time. Note that the global std::swap() function is specialized such that std::swap(m1,m2) will feed to this function.

### 6.1048.1 Detailed Description

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>, typename _Alloc =
allocator<_Value>>
```

```
class std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>
```

A standard container composed of equivalent keys (possibly containing multiple of each key value) in which the elements' keys are the elements themselves.

#### Template Parameters

<code>_Value</code>	Type of key objects.
<code>_Hash</code>	Hashing function object type, defaults to <code>hash&lt;_Value&gt;</code> .
<code>_Pred</code>	Predicate function object type, defaults to <code>equal_to&lt;_Value&gt;</code> .
<code>_Alloc</code>	Allocator type, defaults to <code>allocator&lt;_Key&gt;</code> .

Meets the requirements of a [container](#), and [unordered associative container](#)

Base is `_Hashtable`, dispatched at compile time via template alias `__umset_hashtable`.

```
template<typename _InputIterator >
void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
    _InputIterator __first,
    _InputIterator __last ) [inline]
```

    const value_type & __x ) [inline]
```

Inserts an element into the unordered\_multiset.

#### Parameters

**6.1048.4.40 insert()** [3/8] template<typename \_Value , typename \_Hash = hash<\_Value>, typename \_Pred = equal\_to<\_Value>, typename \_Alloc = allocator<\_Value>>

```
iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert (
    const_iterator __hint,
    const value_type & __x ) [inline]
```

Inserts an element into the unordered\_multiset.

## Parameters

#### Parameters

<code>__l</code>	An initializer_list.
------------------	----------------------

#### Parameters

## Parameters

<a href="#">↔</a>	An unordered_multiset of the same element and allocator types.
<a href="#">_X</a>	

This exchanges the elements between two sets in constant time. Note that the global `std::swap()` function is specialized such that `std::swap(s1,s2)` will feed to this function.

### 6.1050.1 Detailed Description

```
template<typename _Value, typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>, typename _Alloc =
allocator<_Value>>
class std::unordered_set< _Value, _Hash, _Pred, _Alloc >
```

A standard container composed of unique keys (containing at most one of each key value) in which the elements' keys are the elements themselves.

#### Template Parameters

<code>_Value</code>	Type of key objects.
<code>_Hash</code>	Hashing function object type, defaults to <code>hash&lt;_Value&gt;</code> .
<code>_Pred</code>	Predicate function object type, defaults to <code>equal_to&lt;_Value&gt;</code> .
<code>_Alloc</code>	Allocator type, defaults to <code>allocator&lt;_Key&gt;</code> .

Meets the requirements of a [container](#), and [unordered associative container](#)

Base is `_Hashtable`, dispatched at compile time via template alias `__uset_hashtable`.

```

Erases all elements in an unordered\_set. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**6.1050.4.13 count()** [1/2] `template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>

**6.1050.4.14 count()** [2/2] `template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>  
size_type std::unordered_set< _Value, _Hash, _Pred, _Alloc >::count (`

**Parameters**

<code>__k</code>	Element to located.
<code>__x</code>	

**Returns**

Number of elements with specified key.

This function only makes sense for unordered\_multisets; for unordered\_set the result will either be 0 (not present) or 1 (present).

**6.1050.4.15 emplace()** `template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>  
template<typename... _Args>  
std::pair< iterator, bool > std::unordered_set< _Value, _Hash, _Pred, _Alloc >::emplace (`  
`_Args &&... __args ) [inline]`

Attempts to build and insert an element into the unordered\_set.

**Parameters**

<code>__args</code>	Arguments used to generate an element.
---------------------	--

**Returns**

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to build and insert an element into the `unordered_set`. An `unordered_set` relies on unique keys and thus an element is only inserted if it is not already present in the `unordered_set`. Insertion requires amortized constant time.

```
6.1050.4.16 emplace_hint() template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>
template<typename... _Args>
iterator std::unordered_set< _Value, _Hash, _Pred, _Alloc >::emplace_hint (
    const_iterator __pos,
    _Args &&... __args ) [inline]
```

Attempts to insert an element into the `unordered_set`.

**Parameters**

<code>__pos</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__args</code>	Arguments used to generate the element to be inserted.

**Returns**

An iterator that points to the element with key equivalent to the one generated from `__args` (may or may not be the element itself).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `emplace()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints)

Insertion requires amortized constant time.

typename _Alloc = allocator<_Value>>

```

Erases elements according to the provided key.

#### Parameters

<code>__x</code>	Key of element to be erased.
------------------	------------------------------

#### Returns

The number of elements erased.

This function erases all the elements located by the given key from an `unordered_set`. For an `unordered_set` the result of this function can only be 0 (not present) or 1 (present). Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

<code>__last</code>	Iterator pointing to the end of the range to be erased.

#### Returns

The iterator `__last`.

This function erases a sequence of elements from an `unordered_set`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**6.1050.4.28 erase()** [3/4] `template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>`

 `const_iterator __position ) [inline]`

Erases an element from an `unordered_set`.

#### Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

**Returns**

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an `unordered_set`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

This function erases an element, pointed to by the given iterator, from an `unordered_set`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

_Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>  
template<typename _InputIterator >  
void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::insert (   
    _InputIterator __first,  
    _InputIterator __last ) [inline]`

**Parameters**

<code>__first</code>	Iterator pointing to the start of the range to be inserted.
<code>__last</code>	Iterator pointing to the end of the range.

**Parameters**

<code>_↵ __x</code>	Element to be inserted.
-------------------------	-------------------------

**Returns**

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to insert an element into the unordered\_set. An unordered\_set relies on unique keys and thus an element is only inserted if it is not already present in the unordered\_set. Insertion requires amortized constant time.

**6.1050.4.40 insert()** [3/8] `template<typename _Value , typename _Hash = hash<_Value>, typename _Pred = equal_to<_Value>, typename _Alloc = allocator<_Value>>`

`const_iterator __hint,`  
`const value_type & __x ) [inline]`

Attempts to insert an element into the unordered\_set.

#### Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__x</code>	Element to be inserted.

#### Returns

An iterator that points to the element with key of `__x` (may or may not be the element passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `insert()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: [https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert\\_hints](https://gcc.gnu.org/onlinedocs/libstdc++/manual/associative.html#containers.associative.insert_hints)

Insertion requires amortized constant.

#### Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__x</code>	Element to be inserted.

#### Returns

An iterator that points to the element with key of `__x` (may or may not be the element passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `insert()` does. ## 6.1057.1 Detailed Description

```
template<class _Tp>
class std::valarray<_Tp>
```

Smart array designed to support numeric processing.

A valarray is an array that provides constraints intended to allow for effective optimization of numeric array processing by reducing the aliasing that can result from pointer representations. It represents a one-dimensional array from which different multidimensional subsets can be accessed and modified.

### Template Parameters

<code>_Tp</code>	Type of object in the array.
------------------	------------------------------

#### 6.1059.1 Detailed Description

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
class std::vector< _Tp, _Alloc >
```

A standard container which offers fixed time access to individual elements in any order.

#### Template Parameters

<code>_Tp</code>	Type of element.
<code>_Alloc</code>	Allocator type, defaults to <code>allocator&lt;_Tp&gt;</code> .

Meets the requirements of a [container](#), a [reversible container](#), and a [sequence](#), including the [optional sequence requirements](#) with the exception of `push_front` and `pop_front`.

In some terminology a vector can be described as a dynamic C-style array, it offers fast and efficient access to individual

elements in any order and saves the user from worrying about memory and size allocation. Subscripting ( `[]` ) access is also provided as with C-style arrays.

constexpr std::vector<_Tp, _Alloc>::vector (   
size_type __n,

Creates a vector with default constructed elements.

### Parameters

<code>__n</code>	The number of elements to initially create.

size_type __n,  
const value_type & __value,  
const allocator_type & __a = allocator_type() ) [inline], [constexpr]`  
Creates a vector with copies of an exemplar element.

### Parameters

<code>__n</code>	The number of elements to initially create.
<code>__value</code>	An element to copy.
<code>__a</code>	An allocator.

This constructor fills the vector with `__n` copies of `__value`.

**6.1059.2.5 vector()** [5/10] `template<typename _Tp , typename _Alloc = std::allocator<_Tp>>`  
`constexpr std::vector< _Tp, _Alloc >::vector (`  
`const vector< _Tp, _Alloc > & __x ) [inline], [constexpr]`

Vector copy constructor.

#### Parameters

<code>__x</code>	A vector of identical element and allocator types.
------------------	--

All the elements of `__x` are copied, but any unused capacity in `__x` will not be copied (i.e. `capacity() == size()` in the new vector).

The newly-created vector uses a copy of the allocator object used by `__x` (unless the allocator traits dictate a different object).

`const allocator_type & __a = allocator_type() ) [inline], [constexpr]`

Builds a vector from an initializer list.

#### Parameters

<code>__l</code>	An initializer_list.
<code>__a</code>	An allocator.

Create a vector consisting of copies of the elements in the initializer\_list \_\_l.

This will call the element type's copy constructor N times (where N is \_\_l.size()) and do no memory reallocation.

**6.1059.2.10 vector()** [10/10] `template<typename _Tp , typename _Alloc = std::allocator<_Tp>>  
template<typename _InputIterator , typename = std::_RequireInputIter<_InputIterator>>  
constexpr std::vector<_Tp, _Alloc>::vector (  
    _InputIterator __first,  
    _InputIterator __last,  
    const allocator_type & __a = allocator_type() ) [inline], [constexpr]`

Builds a vector from a range.

#### Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__a</code>	An allocator.

Create a vector consisting of copies of the elements from [first,last).

If the iterators are forward, bidirectional, or random-access, then this will call the elements' copy constructor N times (where N is distance(first,last)) and do no memory reallocation. But if only input iterators are used, then this will do at most 2N calls to the copy constructor, and logN memory reallocations.

This function fills a vector with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned.

**6.1059.3.36 operator=()** [3/3] `template<typename _Tp , typename _Alloc = std::allocator<_Tp>>`  
`constexpr vector & std::vector< _Tp, _Alloc >::operator= (`  
`vector< _Tp, _Alloc > && __x ) [inline], [constexpr], [noexcept]`

Vector move assignment operator.

#### Parameters

<code>__x</code>	A vector of identical element and allocator types.
------------------	--

The contents of `__x` are moved into this vector (without copying, if the allocators permit it). Afterwards `__x` is a valid, but unspecified vector.

Whether the allocator is moved depends on the allocator traits.

References [std::move\(\)](#).

**6.1059.3.37 operator[]()** [1/2] `template<typename _Tp , typename _Alloc = std::allocator<_Tp>>`  
`constexpr const_reference std::vector< _Tp, _Alloc >::operator[] (`  
`size_type __n ) const [inline], [constexpr], [noexcept]`

Subscript access to the data contained in the vector.

#### Parameters

<code>__n</code>	The index of the element for which data should be accessed.
------------------	---

#### Returns

Read-only (constant) reference to data.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and `out_of_range` lookups are not defined. (For checked lookups see `at()`.)

**6.1059.3.38 operator[]()** [2/2] `template<typename _Tp , typename _Alloc = std::allocator<_Tp>>`  
`constexpr reference std::vector< _Tp, _Alloc >::operator[] (`  
`size_type __n ) [inline], [constexpr], [noexcept]`

Subscript access to the data contained in the vector.

#### Parameters

<code>__n</code>	The index of the element for which data should be accessed.
------------------	---

#### Returns

Read/write reference to data.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and `out_of_range` lookups are not defined. (For checked lookups see `at()`.)

Referenced by [std::match\\_results< \\_Bi\\_iter, \\_Alloc >::operator\[\]\(\)](#).

**6.1059.3.39 pop\_back()** `template<typename _Tp , typename _Alloc = std::allocator<_Tp>>`  
`constexpr void std::vector< _Tp, _Alloc >::pop_back ( ) [inline], [constexpr], [noexcept]`

Removes last element.

This is a typical stack operation. It shrinks the vector by one.

Note that no data is returned, and if the last element's data is needed, it should be retrieved before pop\_back() is called.

**6.1059.3.40 push\_back()** `template<typename _Tp , typename _Alloc = std::allocator<_Tp>>  
constexpr void std::vector<_Tp, _Alloc>::push_back (   
                    const value_type & __x ) [inline], [constexpr]`

Add data to the end of the vector.

#### Parameters

<code>__x</code>	Data to be added.
------------------	-------------------

This is a typical stack operation. The function creates an element at the end of the vector and assigns the given data to it. Due to the nature of a vector this operation can be done in constant time if the vector has preallocated space available.

References `std::vector<_Tp, _Alloc>::end()`.

**6.1059.3.41 rbegin()** [1/2] `template<typename _Tp , typename _Alloc = std::allocator<_Tp>>  
constexpr const_reverse_iterator std::vector<_Tp, _Alloc>::rbegin ( ) const [inline], [constexpr],  
[noexcept]`

Returns a read-only (constant) reverse iterator that points to the last element in the vector. Iteration is done in reverse element order.

References `std::vector<_Tp, _Alloc>::end()`.

**6.1059.3.42 rbegin()** [2/2] `template<typename _Tp , typename _Alloc = std::allocator<_Tp>>  
constexpr reverse_iterator std::vector<_Tp, _Alloc>::rbegin ( ) [inline], [constexpr], [noexcept]`

Returns a read/write reverse iterator that points to the last element in the vector. Iteration is done in reverse element order.

References `std::vector<_Tp, _Alloc>::end()`.

**6.1059.3.43 rend()** [1/2] `template<typename _Tp , typename _Alloc = std::allocator<_Tp>>  
constexpr const_reverse_iterator std::vector<_Tp, _Alloc>::rend ( ) const [inline], [constexpr],  
[noexcept]`

Returns a read-only (constant) reverse iterator that points to one before the first element in the vector. Iteration is done in reverse element order.

References `std::vector<_Tp, _Alloc>::begin()`.

**6.1059.3.44 rend()** [2/2] `template<typename _Tp , typename _Alloc = std::allocator<_Tp>>  
constexpr reverse_iterator std::vector<_Tp, _Alloc>::rend ( ) [inline], [constexpr], [noexcept]`

Returns a read/write reverse iterator that points to one before the first element in the vector. Iteration is done in reverse element order.

References `std::vector<_Tp, _Alloc>::begin()`.

**6.1059.3.45 reserve()** `template<typename _Tp , typename _Alloc >  
constexpr void vector::reserve (  
    size_type __n ) [constexpr]`

Attempt to preallocate enough memory for specified number of elements.

#### Parameters

<code>__n</code>	Number of elements required.
------------------	------------------------------

#### Exceptions

<code>std::length_error</code>	If <i>n</i> exceeds <code>max_size()</code> .
--------------------------------	---

This function attempts to reserve enough memory for the vector to hold the specified number of elements. If the number requested is more than `max_size()`, `length_error` is thrown.

The advantage of this function is that if optimal code is a necessity and the user can determine the number of elements that will be required, the user can reserve the memory in advance, and thus prevent a possible reallocation of memory and copying of vector data.

References [std::\\_Destroy\(\)](#), and [std::size\(\)](#).

**6.1059.3.46 resize()** [1/2] `template<typename _Tp , typename _Alloc = std::allocator<_Tp>>  
constexpr void std::vector< _Tp, _Alloc >::resize (  
    size_type __new_size ) [inline], [constexpr]`

Resizes the vector to the specified number of elements.

#### Parameters

<code>__new_size</code>	Number of elements the vector should contain.
-------------------------	---

This function will resize the vector to the specified number of elements. If the number is smaller than the vector's current size the vector is truncated, otherwise default constructed elements are appended.

constexpr void std::vector< _Tp, _Alloc >::resize (  
    size_type __new_size,  
    const value_type & __x ) [inline], [constexpr]`

Resizes the vector to the specified number of elements.

#### Parameters

<code>__new_size</code>	Number of elements the vector should contain.
<code>__x</code>	Data with which new elements should be populated.

This function will resize the vector to the specified number of elements. If the number is smaller than the vector's current size the vector is truncated, otherwise the vector is extended and new elements are populated with given data.

References [std::vector< \\_Tp, \\_Alloc >::end\(\)](#), and [std::vector< \\_Tp, \\_Alloc >::size\(\)](#).

`constexpr void std::vector< _Tp, _Alloc >::shrink_to_fit ( ) [inline], [constexpr]`

A non-binding request to reduce capacity() to size().

**6.1059.3.49 `size()`** `template<typename _Tp , typename _Alloc = std::allocator<_Tp>>`  
`constexpr size_type std::vector< _Tp, _Alloc >::size ( ) const [inline], [constexpr], [noexcept]`

**6.1059.3.50 `swap()`** `template<typename _Tp , typename _Alloc = std::allocator<_Tp>>`  
`constexpr void std::vector< _Tp, _Alloc >::swap (`

`vector< _Tp, _Alloc > & __x ) [inline], [constexpr], [noexcept]`

Swaps data with another vector.

#### Parameters

<code>__x</code>	A vector of the same element and allocator types.
------------------	---

This exchanges the elements between two vectors in constant time. (Three pointers, so it should be quite fast.) Note that the global `std::swap()` function is specialized such that `std::swap(v1,v2)` will feed to this function.

Whether the allocators are swapped depends on the allocator traits.

### 6.1060.1 Detailed Description

```
template<typename _Alloc>
class std::vector< bool, _Alloc >
```

A specialization of vector for booleans which offers fixed time access to individual elements in any order.

#### Template Parameters

<code>_Alloc</code>	Allocator type.
---------------------	-----------------

Note that `vector<bool>` does not actually meet the requirements for being a container. This is because the reference and pointer types are not really references and pointers to `bool`. See DR96 for details.

#### See also

[vector](#) for function documentation.

In some terminology a vector can be described as a dynamic C-style array, it offers fast and efficient access to individual elements in any order and saves the user from worrying about memory and size allocation. Subscripting ( `[]` ) access is also provided as with C-style arrays.

**6.1063.4.9 overflow()** `template<typename _Codecvt, typename _Elem = wchar_t, typename _Tr = char_traits<_Elem>>`

`_Wide_streambuf::int_type std::wbuffer_convert<_Codecvt, _Elem, _Tr>::overflow (`  
`typename _Wide_streambuf::int_type __c ) [inline], [protected], [virtual]`

Consumes data from the buffer; writes to the controlled sequence.

**Parameters**

<code>__c</code>	An additional character to consume.
------------------	-------------------------------------

**Returns**

`eof()` to indicate failure, something else (usually `__c`, or `not_eof()`)

Informally, this function is called when the output buffer is full (or does not exist, as buffering need not actually be done). If a buffer exists, it is *consumed*, with *some effect* on the controlled sequence. (Typically, the buffer is written out to the sequence verbatim.) In either case, the character `c` is also written out, if `__c` is not `eof()`.

For a formal definition of this function, see a good text such as Langer & Kreft, or [27.5.2.4.5]/3-7.

A functioning output streambuf can be created by overriding only this function (no buffer area will be used).

**Note**

Base class version does nothing, returns `eof()`.

Tries to back up the input sequence.

**Parameters**

<code>__c</code>	The character to be inserted back into the sequence.
------------------	--

**Returns**

`eof()` on failure, *some other value* on success

**Postcondition**

The constraints of `gptr()`, `eback()`, and `pptr()` are the same as for `underflow()`.

#### Returns

`__c`, if possible.

One of two public output functions.

If a write position is available for the output sequence (i.e., the buffer is not full), stores `__c` in that position, increments the position, and returns `traits::to_int_type(__c)`. If a write position is not available, returns `overflow(__c)`.

streamsize std::basic_streambuf<_CharT, _Traits>::sputn (  
    const char_type * __s,  
    streamsize __n ) [inline], [inherited]`

Entry point for all single-character output functions.

**Parameters**

<code>__s</code>	A buffer read area.
<code>__n</code>	A count.

One of two public output functions.

Returns `xspn(__s, __n)`. The effect is to write `__s[0]` through `__s[__n-1]` to the output sequence, if possible.

References [std::basic\\_streambuf<\\_CharT, \\_Traits>::xspn\(\)](#).

**6.1063.4.32 state()** `template<typename _Codecvt, typename _Elem = wchar_t, typename _Tr = char_traits<_Elem>>`

state\_type [std::wbuffer\\_convert<\\_Codecvt, \\_Elem, \\_Tr >::state \( \) const](#) [inline], [noexcept]

The conversion state following the last conversion.

**6.1063.4.33 sungetc()** `template<typename _CharT , typename _Traits >`

`int_type std::basic\_streambuf<\_CharT, \_Traits >::sungetc \( \) [inline], [inherited]`

Moving backwards in the input stream.

#### Returns

The previous character, if possible.

If a putback position is available, this function decrements the input pointer and returns that character. Otherwise, calls and returns `pbackfail()`. The effect is to *unget* the last character *gotten*.

References [std::basic\\_streambuf<\\_CharT, \\_Traits >::eback\(\)](#), [std::basic\\_streambuf<\\_CharT, \\_Traits >::gbump\(\)](#), [std::basic\\_streambuf<\\_CharT, \\_Traits >::gptr\(\)](#), and [std::basic\\_streambuf<\\_CharT, \\_Traits >::pbackfail\(\)](#).

**6.1063.4.34 sync()** `template<typename _Codecvt , typename _Elem = wchar_t, typename _Tr = char_traits<_Elem>>`

`int std::wbuffer\_convert<\_Codecvt, \_Elem, \_Tr >::sync \( \) [inline], [protected], [virtual]`

Synchronizes the buffer arrays with the controlled sequences.

#### Returns

-1 on failure.

Each derived class provides its own appropriate behavior, including the definition of *failure*.

#### Note

Base class version does nothing, returns zero.

Reimplemented from [std::basic\\_streambuf<\\_CharT, \\_Traits >](#).

References [std::basic\\_streambuf<\\_CharT, \\_Traits >::pubsync\(\)](#).

**6.1063.4.35 uflow()** `template<typename _CharT , typename _Traits >`

`virtual int_type std::basic\_streambuf<\_CharT, \_Traits >::uflow \( \) [inline], [protected], [virtual], [inherited]`

Fetches more data from the controlled sequence.

#### Returns

The first character from the *pending sequence*.

Informally, this function does the same thing as `underflow()`, and in fact is required to call that function. It also returns the new character, like `underflow()` does. However, this function also moves the read position forward by one.

Reimplemented in [\\_\\_gnu\\_cxx::stdio\\_sync\\_filebuf<\\_CharT, \\_Traits >](#).

References [std::basic\\_streambuf<\\_CharT, \\_Traits >::gbump\(\)](#), [std::basic\\_streambuf<\\_CharT, \\_Traits >::gptr\(\)](#), and [std::basic\\_streambuf<\\_CharT, \\_Traits >::underflow\(\)](#).

`_Wide_streambuf::int_type std::wbuffer_convert< _Codecvt, _Elem, _Tr >::underflow ( ) [inline],`  
`[protected], [virtual]`

Fetches more data from the controlled sequence.

#### Returns

The first character from the *pending sequence*.

Informally, this function is called when the input buffer is exhausted (or does not exist, as buffering need not actually be done). If a buffer exists, it is *refilled*. In either case, the next available character is returned, or `traits::eof()` to indicate a null pending sequence.

For a formal definition of the pending sequence, see a good text such as Langer & Kreft, or [27.5.2.4.3]/7-14.

A functioning input streambuf can be created by overriding only this function (no buffer area will be used). For an example, see <https://gcc.gnu.org/onlinedocs/libstdc++/manual/streambufs.html>

#### Note

Base class version does nothing, returns `eof()`.

Reimplemented from `std::basic_streambuf< _CharT, _Traits >`.

References `std::basic_streambuf< _CharT, _Traits >::egptr()`, and `std::basic_streambuf< _CharT, _Traits >::gptr()`.

`streamsize std::basic_streambuf< _CharT, _Traits >::xsgetn (`  
`char_type * __s,`  
`streamsize __n ) [protected], [virtual], [inherited]`

Multiple character extraction.

#### Parameters

<code>__s</code>	A buffer area.
<code>__n</code>	Maximum number of characters to assign.

#### Returns

The number of characters assigned.

Fills `__s[0]` through `__s[__n-1]` with characters from the input sequence, as if by `sbumpc()`. Stops when either `__n` characters have been copied, or when `traits::eof()` would be copied.

It is expected that derived classes provide a more efficient implementation by overriding this definition.

Reimplemented in `std::basic_filebuf< _CharT, _Traits >`, `std::basic_filebuf< _CharT, encoding_char_traits< _CharT > >`, `std::basic_filebuf< _CharT, std::char_traits< _CharT > >`, and `std::basic_filebuf< char_type, traits_type >`.

`streamsize std::basic_streambuf< _CharT, _Traits >::xsputn (`  
`const char_type * __s,`  
`streamsize __n ) [protected], [virtual], [inherited]`

Multiple character insertion.

## Parameters

<code>__s</code>	A buffer area.
<code>__n</code>	Maximum number of characters to write.

## Returns

The number of characters written.

Writes `__s[0]` through `__s[__n-1]` to the output sequence, as if by `sputc()`. Stops when either `n` characters have been copied, or when `sputc()` would return `traits::eof()`.

It is expected that derived classes provide a more efficient implementation by overriding this definition.

Reimplemented in `std::basic_filebuf<_CharT, _Traits>`, `std::basic_filebuf<_CharT, encoding_char_traits<_CharT>>`, `std::basic_filebuf<_CharT, std::char_traits<_CharT>>`, and `std::basic_filebuf<char_type, traits_type>`.

### 6.1064.1 Detailed Description

```
template<typename _Tp>
class std::weak_ptr<_Tp>
```

A non-owning observer for a pointer owned by a `shared_ptr`.

Since

C++11

A `weak_ptr` provides a safe alternative to a raw pointer when you want a non-owning reference to an object that is managed by a `shared_ptr`.

Unlike a raw pointer, a `weak_ptr` can be converted to a new `shared_ptr` that shares ownership with every other `shared_ptr` that already owns the pointer. In other words you can upgrade from a non-owning "weak" reference to an owning `shared_ptr`, without having access to any of the existing `shared_ptr` objects.

Also unlike a raw pointer, a `weak_ptr` does not become "dangling" after the object it points to has been destroyed. Instead, a `weak_ptr` becomes *expired* and can no longer be converted to a `shared_ptr` that owns the freed pointer, so you cannot accidentally access the pointed-to object after it has been destroyed.

#### 7.144.2 Macro Definition Documentation

##### 7.144.2.1 `_GLIBCXX_DEQUE_BUF_SIZE` `#define _GLIBCXX_DEQUE_BUF_SIZE`

This function controls the size of memory nodes.

#### Parameters

|                     |                         |
|---------------------|-------------------------|
| <code>__size</code> | The size of an element. |
|---------------------|-------------------------|

## Returns

The number (not byte size) of elements per node.

This function started off as a compiler kludge from SGI, but seems to be a useful wrapper around a repeated constant expression. The **512** is tunable (and no other code needs to change), but no investigation has been done since inheriting the SGI code. Touch `_GLIBCXX_DEQUE_BUF_SIZE` only if you know what you are doing, however: changing it breaks the binary compatibility!!

### 7.187.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `assert.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

### 7.244.1 Detailed Description

This file is a GNU debug extension to the Standard C++ Library.

### 7.244.2 Macro Definition Documentation

#### 7.244.2.1 `__glibcxx_check_erase` `#define __glibcxx_check_erase(` `_Position )`

Verify that we can erase the element referenced by the iterator `_Position`. We can erase the element if the `_Position` iterator is dereferenceable and references this sequence.

#### 7.244.2.2 `__glibcxx_check_erase_after` `#define __glibcxx_check_erase_after(` `_Position )`

Verify that we can erase the element after the iterator `_Position`. We can erase the element if the `_Position` iterator is before a dereferenceable one and references this sequence.

#### 7.244.2.3 `__glibcxx_check_erase_range` `#define __glibcxx_check_erase_range(` `_First,` `_Last )`

Verify that we can erase the elements in the iterator range `[_First, _Last)`. We can erase the elements if `[_First, _Last)` is a valid iterator range within this sequence.

#### 7.244.2.4 `__glibcxx_check_erase_range_after` `#define __glibcxx_check_erase_range_after(` `_First,` `_Last )`

Verify that we can erase the elements in the iterator range `(_First, _Last)`. We can erase the elements if `(_First, _Last)` is a valid iterator range within this sequence.

#### 7.244.2.5 `__glibcxx_check_heap_pred` `#define __glibcxx_check_heap_pred(` `_First,` `_Last,` `_Pred )`

Verify that the iterator range `[_First, _Last)` is a heap w.r.t. the predicate `_Pred`.

**7.244.2.6** `__glibcxx_check_insert` `#define __glibcxx_check_insert(`  
`_Position )`

Verify that we can insert into \*this with the iterator `_Position`. Insertion into a container at a specific position requires that the iterator be nonsingular, either dereferenceable or past-the-end, and that it reference the sequence we are inserting into. Note that this macro is only valid when the container is a `_Safe_sequence` and the iterator is a `_Safe_iterator`.

**7.244.2.7** `__glibcxx_check_insert_after` `#define __glibcxx_check_insert_after(`  
`_Position )`

Verify that we can insert into \*this after the iterator `_Position`. Insertion into a container after a specific position requires that the iterator be nonsingular, either dereferenceable or before-begin, and that it reference the sequence we are inserting into. Note that this macro is only valid when the container is a `_Safe_sequence` and the iterator is a `_Safe_iterator`.

**7.244.2.8** `__glibcxx_check_insert_range` `#define __glibcxx_check_insert_range(`  
`_Position,`  
`_First,`  
`_Last,`  
`_Dist )`

Verify that we can insert the values in the iterator range `[_First, _Last)` into \*this with the iterator `_Position`. Insertion into a container at a specific position requires that the iterator be nonsingular (i.e., either dereferenceable or past-the-end), that it reference the sequence we are inserting into, and that the iterator range `[_First, _Last)` is a valid (possibly empty) range which does not reference the sequence we are inserting into. Note that this macro is only valid when the container is a `_Safe_sequence` and the `_Position` iterator is a `_Safe_iterator`.

**7.244.2.9** `__glibcxx_check_insert_range_after` `#define __glibcxx_check_insert_range_after(`  
`_Position,`  
`_First,`  
`_Last,`  
`_Dist )`

Verify that we can insert the values in the iterator range `[_First, _Last)` into \*this after the iterator `_Position`. Insertion into a container after a specific position requires that the iterator be nonsingular (i.e., either dereferenceable or past-the-end), that it reference the sequence we are inserting into, and that the iterator range `[_First, _Last)` is a valid (possibly empty) range which does not reference the sequence we are inserting into. Note that this macro is only valid when the container is a `_Safe_sequence` and the `_Position` iterator is a `_Safe_iterator`.

**7.244.2.10** `__glibcxx_check_partitioned_lower` `#define __glibcxx_check_partitioned_lower(`  
`_First,`  
`_Last,`  
`_Value )`

Verify that the iterator range `[_First, _Last)` is partitioned w.r.t. the value `_Value`.

**7.244.2.11** `__glibcxx_check_partitioned_lower_pred` `#define __glibcxx_check_partitioned_lower_pred(`  
`_First,`  
`_Last,`  
`_Value,`  
`_Pred )`

Verify that the iterator range `[_First, _Last)` is partitioned w.r.t. the value `_Value` and predicate `_Pred`.

**7.244.2.12** `__glibcxx_check_partitioned_upper_pred` `#define __glibcxx_check_partitioned_upper_pred(`  
`_First,`  
`_Last,`  
`_Value,`  
`_Pred )`

Verify that the iterator range [`_First`, `_Last`) is partitioned w.r.t. the value `_Value` and predicate `_Pred`.

**7.244.2.13** `__glibcxx_check_sorted_pred` `#define __glibcxx_check_sorted_pred(`  
`_First,`  
`_Last,`  
`_Pred )`

Verify that the iterator range [`_First`, `_Last`) is sorted by the predicate `_Pred`.

**7.244.2.14** `_GLIBCXX_DEBUG_VERIFY_COND_AT` `#define _GLIBCXX_DEBUG_VERIFY_COND_AT(`  
`_Cond,`  
`_ErrMsg,`  
`_File,`  
`_Line,`  
`_Func )`

Macros used by the implementation to verify certain properties. These macros may only be used directly by the debug wrappers. Note that these are macros (instead of the more obviously *correct* choice of making them functions) because we need line and file information at the call site, to minimize the distance between the user error and where the error is reported.

### 7.535.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

Contains two exception-generating types (throw\_value, throw\_allocator) intended to be used as value and allocator types while testing exception safety in templated containers and algorithms. The allocator has additional log and debug features. The exception generated is of type forced\_exception\_error.

The `<iostream>` header declares the eight standard stream objects. For other declarations, see <http://gcc.gnu.org/onlinedocs/libstdc++/manual/io.html> and the [I/O forward declarations](#)

They are required by default to cooperate with the global C library's `FILE` streams, and to be available during program startup and termination. For more information, see the section of the manual linked to above.

### 7.581.1 Detailed Description

Parallel STL function calls corresponding to `stl_numeric.h`. The functions defined here mainly do case switches and call the actual parallelized versions in other files. Inlining policy: Functions that basically only contain one function call, are declared inline. This file is a GNU parallel extension to the Standard C++ Library.

### 7.585.1 Detailed Description

Parallel STL function calls corresponding to the `std::algo.h` header.

The functions defined here mainly do case switches and call the actual parallelized versions in other files. Inlining policy: Functions that basically only contain one function call, are declared inline. This file is a GNU parallel extension to the Standard C++ Library.

### 7.587.1 Detailed Description

Implementation of a dynamically load-balanced parallel quicksort.

It works in-place and needs only logarithmic extra memory. The algorithm is similar to the one proposed in P. Tsigas and Y. Zhang. A simple, fast parallel implementation of quicksort and its performance evaluation on SUN enterprise 10000. In 11th Euromicro Conference on Parallel, Distributed and Network-Based Processing, page 372, 2003.

This file is a GNU parallel extension to the Standard C++ Library.

### 7.618.1 Detailed Description

Runtime settings and tuning parameters, heuristics to decide whether to use parallelized algorithms. This file is a GNU parallel extension to the Standard C++ Library.

### 7.618.2 Deciding whether to run an algorithm in parallel.

There are several ways the user can switch on and off the parallel execution of an algorithm, both at compile- and run-time.

Only sequential execution can be forced at compile-time. This reduces code size and protects code parts that have non-thread-safe side effects.

Ultimately, forcing parallel execution at compile-time makes sense. Often, the sequential algorithm implementation is used as a subroutine, so no reduction in code size can be achieved. Also, the machine the program is run on might have only one processor core, so to avoid overhead, the algorithm is executed sequentially.

To force sequential execution of an algorithm ultimately at compile-time, the user must add the tag `gnu_parallel::sequential_tag()` to the end of the parameter list, e. g.

```
std::sort(__v.begin(), __v.end(), __gnu_parallel::sequential_tag());
```

This is compatible with all overloaded algorithm variants. No additional code will be instantiated, at all. The same holds for most algorithm calls with iterators not providing random access.

If the algorithm call is not forced to be executed sequentially at compile-time, the decision is made at run-time. The global variable `__gnu_parallel::_Settings::algorithm_strategy` is checked. It is a tristate variable corresponding to:

- a. `force_sequential`, meaning the sequential algorithm is executed.
- b. `force_parallel`, meaning the parallel algorithm is executed.
- c. `heuristic`

For heuristic, the parallel algorithm implementation is called only if the input size is sufficiently large. For most algorithms, the input size is the (combined) length of the input sequence(s). The threshold can be set by the user, individually for each algorithm. The according variables are called `gnu_parallel::_Settings::[algorithm]_minimal_n`.

For some of the algorithms, there are even more tuning options, e. g. the ability to choose from multiple algorithm variants. See below for details.

### 7.618.3 Macro Definition Documentation

#### 7.618.3.1 `__GLIBCXX_PARALLEL_CONDITION` `#define __GLIBCXX_PARALLEL_CONDITION( __c )`

Determine at compile(?)-time if the parallel variant of an algorithm should be called.

##### Parameters

<code>__c</code>	A condition that is convertible to bool that is overruled by <code>__gnu_parallel::__Settings::algorithm_strategy</code> .
<code>__c</code>	Usually a decision based on the input size.

### 7.703.1 Detailed Description

The header provides an interface to the C++ ABI.

### 7.703.2 Function Documentation

**7.703.2.1 [\\_\\_cxa\\_demangle\(\)](#)** char \* [\\_\\_cxxabiv1::\\_\\_cxa\\_demangle](#) (  
const char \* [\\_\\_mangled\\_name](#),  
char \* [\\_\\_output\\_buffer](#),  
size\_t \* [\\_\\_length](#),  
int \* [\\_\\_status](#) )

Demangling routine. ABI-mandated entry point in the C++ runtime library for demangling.

#### Parameters

<a href="#">__mangled_name</a>	A NUL-terminated character string containing the name to be demangled.
<a href="#">__output_buffer</a>	A region of memory, allocated with malloc, of * <a href="#">__length</a> bytes, into which the demangled name is stored. If <a href="#">__output_buffer</a> is not long enough, it is expanded using realloc. <a href="#">__output_buffer</a> may instead be NULL; in that case, the demangled name is placed in a region of memory allocated with malloc.

**Parameters**

<code>__length</code>	If <code>__length</code> is non-null, the length of the buffer containing the demangled name is placed in <code>*__length</code> .
<code>__status</code>	If <code>__status</code> is non-null, <code>*__status</code> is set to one of the following values: 0: The demangling operation succeeded. -1: A memory allocation failure occurred. -2: <i>mangled_name</i> is not a valid name under the C++ ABI mangling rules. -3: One of the arguments is invalid.

**Returns**

A pointer to the start of the NUL-terminated demangled name, or NULL if the demangling fails. The caller is responsible for deallocating this memory using `free`.

The demangling is performed using the C++ ABI mangling rules, with GNU extensions. For example, this function is used in `__gnu_cxx::__verbose_terminate_handler`.

See [https://gcc.gnu.org/onlinedocs/libstdc++/manual/ext\\_demangling.html](https://gcc.gnu.org/onlinedocs/libstdc++/manual/ext_demangling.html) for other examples of use.

**Note**

The same demangling functionality is available via `libiberty` (`<libiberty/demangle.h>` and `libiberty.h`) in GCC 3.1 and later, but that requires explicit installation (`-enable-install-libiberty`) and uses a different API, although the ABI is unchanged.

## 7.706.1 Detailed Description

This is a Standard C++ Library header.

The header `new` defines several functions to manage dynamic memory and handling memory allocation errors; see [https://gcc.gnu.org/onlinedocs/libstdc++/manual/dynamic\\_memory.html](https://gcc.gnu.org/onlinedocs/libstdc++/manual/dynamic_memory.html) for more.

## 7.706.2 Function Documentation

### 7.706.2.1 **operator new()** void \* operator new (

std::size\_t )

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.
